r he's busy with the task he means to do.

WISDOM OF A DOG.

Senator was a magnificent black-d-white pointer, whose great in-lligence and long years of service d greatly endeared him to his mas-r—who was an officer in the army -and his mistress. They had no ildren, and lavished their great fection on him. Being full of ars, and a greatly privileged char-ter, Senator had pre-empted a rug fore the grate fire as his sleeping ace, and always in the evening he as to be seen taking his ease in that ace.

One evening there was a card party the house, and one of the tables ppened to be placed over Senator's sting place. Senator did not like at, and after trying several places, ne of which just suited him, he gan to yawn and stretch, and com-g to the obstructing table, tried to ush it out of the way. He was of urse reproved by the lady of the use, and it was evident that he as very unhappy. He wandered und disconsolately, quite upset be-use he could not get back to his vorite resting place.

All at once he made up his mind; e ran over to a divan on which the fficers had thrown their caps; he ized one in his mouth, came over the officer sitting nearest the fire-lace, and shoved the cap into the of-cer's lap, with a whine as much as say, "Please go, I am past my leepy time!"

It is unnecessary to add that his ppeal was heeded, and that Senator t once got his place.—Youth's Com-anion.

She was a little girl, and very po-te. It was the first time she had een on a visit alone, and she had een carefully instructed how to be-ave. "If they ask you to dine with hem," father had said, "you must ay, 'No, thank you; I have already ined.'" "Come along, Mildred," aid her little friend's father. "You nust have a bite with us." "No, hank you," said the little girl, with lignity, "I have already bitten."—Exchange.

The flavor and quality of eggs are reatly affected by the food eaten by he fowls.

BANKING BY MAIL.

[Written for Pacific Rural Press by T. E. Ivey, Los Angeles.]

By looking backward a few years, we are able to comprehend and appreciate the wonderful advancement and achievement of man in every line of endeavor. From the pine torch and tallow candle to the incandescent light, and from the two wheel Spanish cart that carried the padres from mission to mission in this beautiful land of sunshine not so many years ago, to the limousine which glides along the boulevards so noiselessly and quickly, are striking examples of progress and the inventive genius of man.

Probably there has been no greater progress in any line of business than that of banking; a business which affects everyone, whether they be rich or poor. The value of every article of wearing apparel, all or at least nearly all that we eat, every tool we use, the home that shelters us, at some time finds its way into the banks to be divided up among the laborers, the manufacturers, the mechanics, the farmers and those whose genius has created a demand for newer and better articles, and has made it possible for us to use and make use of the thousands of things which bring comfort and contribute to our well being.

Not so many years ago a very large percentage of the money in the United States was buried or hidden by its owners for safe keeping. This money was thus taken out of circulation, out of the channels of commerce, and placed where it did no one any good, and many times the owners,—fathers and mothers of children dependent upon them,—were robbed or death claimed them, and the hiding place of their treasures never discovered. The principal reason for thus hiding the money of course was the scarcity and inaccessibility of the banks and the question of their solvency.

There is scarcely any comparison between the old private bank of the early days and the modern bank of today, surrounded as it is by every safeguard that man can devise for the protection of the depositor. California is particularly fortunate in having banking laws which almost entirely eliminate the possibility of failures. For the different departments, i. e.: Savings, Commercial and Trust Departments, separate reserves are kept. The law provides on what kinds of property loans can be made,—thus out of, the Savings Department loans can only be made on first mortgages at not more than 60 per cent of the appraised valuations. Thoroughly competent and experienced examiners make periodical examination of the bank, and the Superintendent of Banks is empowered to take charge of any institution which fails to live up to the laws that have been enacted by our State.

A fact which hardly seems possible but which is nevertheless true, is that comparatively few of the people living in the suburbs of cities, on farms and in the more remote places, take advantage of the accommodations offered by the large city banks. They seem to forget that the same mail carrier who brings them a letter from "back East," and leaves their weekly newspaper, can just as easily make their deposits for them, cash their checks, buy their drafts, and in fact, do all their banking business without the least danger of loss and with no expenditure of time or carfare.

There are many other advantages in doing business with a bank in the city.

In the first place, by having a bank account with a city bank, you have a place to go to, a friend to call upon, someone to direct you to any place you might care to visit, who will unselfishly advise you on any subject on which you need advice. The city banker's time is devoted entirely to the banking business,—he doesn't try to sell you something or ask of you any favors. He prospers as you prosper, and the more successful you become, the better it pleases him.

The ease and simplicity with which one can open an account is of much value to those living outside the city. All that is necessary is to buy a postoffice order, or send a draft, check or the money, enclosing it in a letter addressed to the bank with the information that you desire to open an account,—or if you desire to write a letter for information before making your deposit, you will receive a courteous reply with all the particulars you desire. The withdrawing of funds is just as simple,—mail your book to the bank with a letter requesting the amount of money you wish and the book will be returned to you together with the money desired, by registered insured mail, the charge being merely postage and the cost of insurance, which will be small when the time saved is considered.

A man, in justice to himself, should have a savings account. There comes a time in every man's life, even though he be honest and hard working, and having the respect and confidence of everyone, when he must give way to a younger man. He cannot always keep up the standard of work which perhaps he himself, in his earlier days, has set; or sickness may come, or accident. How many of your friends are able, even though they be ready, to help you in times like these?

There is nothing which gives a man more confidence, makes him better able to meet conditions as they come, or to take advantage of any opportunity for his betterment, than to have, at his instant demand, a substantial savings account. If a man teaches his children to save while they are young, it will be a great blessing to them in later years.

FIGURES GIVEN ARE INDEPENDENT AND RELIABLE

Pacific Rural Press Market Report

PRICES QUOTED AS PAID TO PRODUCERS.

San Francisco, March 29, 1916.

WHEAT.

With reports of a crop damage in the East. the larger markets have shown an upward tendency, which is to some extent reflected on the Coast. There appears to be very little on hand here, and buyers look for higher prices in the north. Local quotations, however, stand about as before.

Cal. Club, ctl	$1.65@1.70
Northern Bluestem	1.85@1.90
Northern Red	1.85@1.95

BARLEY.

The local barley market again shows a firmer tone this week. Buyers are taking a little more interest, and offerings have been light, with indications that the local supply is getting down to small proportions.

Shipping, ctl	$1.40 @1.42½
Choice Feed, ctl.	1.35 @1.37½

OATS.

White oats are quoted a little lower, with plenty of stock and no large demand, other grades standing as before.

Red Feed	$1.35@1.37½
Red Seed	1.45@1.65
White	1.45@1.50

CORN.

The Eastern corn market shows a little firmer tendency, but there has been no definite upward movement. Good white Egyptian is a little stronger here, but holders of inferior stock are anxious to sell at lower prices.

Eastern Yellow, ctl.	$1.80@1.85
Milo Maize	1.40@1.45
Kaffir	1.60@1.65
Egyptian	1.50@1.57½

BEANS.

This week has brought the first sign of revival in beans that has been observed in a long time, and there is still no assurance of improvement. The Eastern market on large whites has advanced a little, and some inquiries are coming in, causing a slight advance here; and Stockton interests report a better movement in several lines, though this is now borne out by the San Francisco trade. Limas are quoted a little higher, but the market is in poor shape, with little demand and unusually large stocks for this time of year. Bayos and Blackeyes are both lower.

(On wharf, San Francisco.)

Bayos, per ctl.	$4.50@4.60
Blackeyes	3.00@3.10
Cranberry Beans	4.75@4.85
Horse Beans	3.00@3.25
Small Whites (south)	5.75@5.80
Large Whites	5.75@5.90
Pinks	4.30@4.40
Limas (south)	4.35@4.45
Red Kidney	6.50@6.75
Mexican Reds	4.50@4.65
Tepary Beans	4.00

SEEDS.

The seed market is quieting down all round, as the planting season in the lines quoted is over. Values are steadily held.

Melilotus Alba, lb.	23 c
Melilotus Indica	6 c
Bur Clover	11 c
Oregon Vetch	5 c
Soy Beans	6 c
Canada Peas	5¼ @ 6 c
Alfalfa, per lb.	22 @24 c
Sudan Grass	40 c

HAY.

Arrivals are still decreasing, but the local market has been sluggish and easy, with frequent concessions in price, as most buyers have loaded up during the last few weeks. The country market is stronger, with stocks very light in most quarters, and a continuation of present shipments would soon clean them up. There is still considerable buying in the interior, but the demand is dropping off now, and while there is a good deal of shipping up and down the coast there is no export inquiry. Crop conditions are very encouraging. Alfalfa is lower, with new hay expected shortly.

No. 1 Wheat	$13.00@16.50
No. 2	12.00@14.50
Tame Oats	12.00@18.00
Wild Oats	12.00@14.00
Alfalfa	12.00@15.00
Stock Hay	10.00@12.00
Straw, per bale	25@ .40

PRUNE AND 'COT GROWERS SHOULD SIT TIGHT.

THE Prune and Apricot Growers' Information Bureau has issued this advice: Sell no prunes or apricots at present prices—3½ to 4c for prunes and 8 to 9c for apricots. Very few 1915 apricots on hand and indications of a light crop in 1916. The canned apricot market is practically bare and offers of $28 to $30 do not find many sellers. Canners expected to pack a fair quantity.

The latest estimates show that not more than 6000 tons of spot prunes are available and that these are mostly in growers' hands. Comparatively few futures have been sold and growers are advised against selling before something more definite is known of the coming crop. Prune bloom was heavy but damage from winds and frost cannot yet be estimated Futures advanced in New York from 3½ to 4c, but should not sell for less than 4½c. Hold.

[Word just received from J. G. Bernecke, M. D., of Orange county says: "Complete crop failure of apricots in Orange county. Worse even than 1907. Not enough left for the birds. We'll not ship a pound to the British for love or money."—Eds.]

FEEDSTUFFS.

There has not been much change in prices for some time. With green feed quite plentiful in most quarters, the demand has been greatly curtailed.

(Wholesale prices per ton, carload lots, San Francisco.)

Beet pulp, per ton	$22.50@23.50
Alfalfa Meal, per ton.	20.00@21.00
Alfalfa Molasses Meal per ton	21.00@22.00
Bran, per ton	25.50@26.50
Oil Cake	Nominal
Cocoanut Cake or Meal	23.00@25.00
Cracked Corn	40.50@41.50
Middlings	33.00@34.00
Rolled Barley	29.00@30.00
Tankage	45.00
Rolled Oats	29.50@31.00

VEGETABLES.

Arrivals of asparagus exceeded 7,000 boxes the first of the week, and though lighter since, prices continue to decline. The canners are now taking the surplus at the inside prices, while large shipments are going East. String beans are still pretty firmly held, and peppers are higher, with few offered. Rhubarb is easier, with abundant supplies. Peas are plentiful and cheap. Celery is scarce and high, with little of good quality offered, and lettuce also is higher. Some southern tomatoes have appeared, but Mexican stock still predominates.

Cabbage, ctl.	50@60 c
Cauliflower, doz	50@60 c
String Beans	10@15 c
Peppers, bell, lb.	15@20 c
Rhubarb, box, Bay	50@90 c
Peas	3@ 5 c
Tomatoes, Mex., box	1.50
Eggplant, lb.	10@15 c
Celery, crate	2.50@3.25
Artichokes, doz	20@50 c
Lettuce, small, crate	.75@1.25
Asparagus, box	1.50@2.00

POTATOES AND ONIONS.

Supplies of potatoes in the Delta district are getting down to very narrow compass, and prices have been advanced on both local and Oregon stock, with reports of a general shortage in sight. Delta onions are practically cleaned up, but Oregon stock is lower, with plenty offered. Some Australian have arrived, but values have not yet been established.

Oregon Burbanks	$1.75@2.10
Salinas Burbanks	2.10@2.25
Delta Burbanks	1.25@1.85
Sweet Potatoes, ctl.	2.30@2.50
Onions, Delta, ctl.	1.85@2.25
Onions, Oregon	1.30@1.50
Garlic, per lb.	8@10 c

POULTRY.

Young stock is still held at rather high prices, broilers still bringing 40 cents, and fryers as high as 35 cents, but the prices have curtailed the demand and the market is weak. Hens, however, are fairly firm at the old figure, and smooth young roosters are higher. Belgian hares are also doing better.

Turkeys, dressed	27@30c
Live Turkeys, lb	20@22c
Broilers, 15 lbs. to doz. and less, lb.	38@40c
do, over 15 lbs. to doz.	35@38c
Fryers	30@35c
Hens, extra, per lb	20c
Small	20c
Smooth Young Roosters, per lb.	23@24c
Squabs, per doz.	3.00@4.00
Geese, per pair	2.25@3.00
Ducks, young, lb.	18@19c
Old	17@18c
Belgian Hares	10@11½

Special Live Stock Market Report.

Everything in the livestock market is on a skyrocket basis. Cattle are hard to buy in the country, holders not being easily tempted to part with their stock, now that feed conditions are more certain. From all districts reports come that feed is good and the cattle doing well, but local packers are not expecting any grass cattle before May 1, and no large runs till after June 1. It looks like cattle will be worth at least a half dollar more per cwt. this year than last.

Packers were killing on spring lambs all of last week, but do not expect any strong supply before the middle of April. There is a continued scarcity of wethers and sheep and the market is strong at prices quoted.

Because of the fact that Idaho and Utah hogs were costing in excess of what local conditions would warrant, packers have quit shipping in from those sections. This places the market in the hands of California producers again, who seem possessed to force lightweights on the packer, even at a sacrifice in price. At least one large packer has turned a deaf ear to this supply the last week, absolutely declining to buy them at any price. Future prospects are bright enough to warrant everybody putting these fellows on the grain route for a time.

WOOL.

Wool is decidedly quieter, especially on six month and fall grades. This applies to the local situation as well as to conditions in the East. A local buyer states that a trip to Fresno last week failed to reveal any buying in that district and a similar trip in the lower end of the Sacramento Valley by the writer showed the same condition prevailing there. There is a fair volume of wool being moved in the Eastern markets, but it is strictly a buyers' market. Eastern prices remain about the same.

Pub'isher's Department

Our columns this week look pretty good to us. For the past three weeks we have been offered more advertising than we could well care for. From now until fall we will carry more reading than advertising, and from the articles in hand we can promise our readers some very interesting issues of the Rural Press during that time.

One hundred and sixty-six new subscribers were added to our list last week. We are still gaining.

Many ranchers are intending to install pumping plants this spring, is the report of the Luitwieler Pumping Engine Company. H. L. Miller, manager of the Los Angeles concern, states that business is in a prosperous condition. "Carload shipments of pumps have this month been made to San Francisco and Tucson, Arizona, for use in irrigation work."

SWINDLING AGENTS.

During the past week we have had called to our attention two forms of obtaining money under false pretenses under the name of the Pacific Rural Press by fakirs in the country. One was from near Stockton where the man represented that he was furnishing rugs at a very low price to those who would renew their subscriptions to the Rural Press; another man was out taking photographs, charging $1 per dozen, 25 cents in advance, and stating that the Rural Press would print the pictures in its columns. Both these schemes were not authorized. We have no premium or special scheme offers. Our field men have a letter of credentials direct from this office and they will make no subscription offer other than the regular price—nor have they anything to sell other than the books we publish or advertising space in our columns. Before paying money to a stranger who makes any offer in our name other than the above, demand his letter of credentials. If he can not show one let us know at once, please, and we will attend to the matter.

CALIFORNIA HOG BOOK GUIDE FOR BEGINNER AND AID TO VETERAN.

(From Sacramento Bee.)

"The California Hog Book," by W. S. Guilford, President of the Glenn County Berkshire Breeders' Association, is written in such a style that the reader is convinced he could take the book with him onto a ranch and, with proper application, become a successful swine raiser.

Such a book could be written only by one who is thoroughly familiar with the hog, personally as well as theoretically. To turn out such an intimate dissertation on the profitable meat producer, the writer must have spent much time actually working with swine and getting a close understanding of their needs and troubles.

The text is strikingly in contrast with the many books turned out by some college professors who view the animal from a distance, leaving the disagreeable work of care to the herdsman and thus failing to gain experience which would enable them to write more intelligently.

Though the book ranks with the best in the land on raising of the swine, it was written for Californians who are in the hog-raising business or who may become hog raisers. In addition to containing a complete story of the origin of the modern hog, the different breeds of swine and the care of the animal, much information is given concerning successful California breeders and their methods.

At this time, the book is particularly valuable, because California has a rapidly-developing swine industry. Most of the information heretofore available was written for snow countries, where different housing methods are needed, but "The California Hog Book" deals with methods applicable to this State. It should prove a sure guide to the beginner.

Guilford comes to the defense of the hog in his book, pointing out that the animal will seek a clean wallow if given the chance. Much space is given to the computing of rations.

In his preface the author points out that California now does not raise sufficient pork to supply the home demand. He shows that there is no need for such a situation—California has ideal conditions for the raising of hogs even more economically than in the corn belt.

The book contains about 80,000 words and is published by the Pacific Rural Press of San Francisco at $2 per copy.

At the age of four weeks squabs are usually ready to be marketed.

New

Orchard and Farm Plow

FOR SMALL TRACTORS.

With this Plow you can work within 12 inches of the trees in throwing the soil either to or from the tree.

Lowest Orchard Tractor Plow—highest point being 36 inches when out of ground.

No levers to interfere with limbs.

No **slow** cumbersome **worm gear** lifts as farmers will not tolerate them.

For Open Field Work—when the soil is dry and hard—this plow has no equal. It will stay in the ground and won't kick out. **No side draft.**

Steered by tractor—no plowman needed. Made in all sizes and units to suit either large or small tractors.

If you want **ONE** plow for all kinds of work, investigate this one.

Write for further particulars.

The Truck Problem

WHAT'S THE ANSWER?

To put it briefly—you will find your answer in the G M C line. Not that we claim to make the only good motor trucks, but our position is peculiarly fortunate in that the General Motors Co. builds both gasoline and electric trucks in a wide range of sizes—and therefore can advise you without prejudice as to the size and kind of truck that will serve you most profitably.

To be profitable a motor truck installation must fit the service. Experience has proved that for some situation gasoline trucks are best—for others, electric trucks. Often, both are needed to economically solve the problem.

Our New 1¼ Ton Worm Drive is the right answer in some cases.

There is a demand for a light truck with worm drive for Ambulances, Busses, Fire Apparatus, general ranch use, etc. To meet this demand we have produced a new 1¼ ton worm drive truck, which we believe is the last word in motor truck construction. We court a comparison with any other truck made.

Operating the largest exclusive truck factory in the world, making both gasoline and electric trucks covering a range of sizes from 1000 lbs. to 6 tons, making both worm and chain drive, offering you the service of experienced transportation men to help you analyze your haulage problem and give you absolutely unprejudiced advice—that's our position and that's the answer to the truck question when it confronts you.

"A TRUCK TO FIT YOUR BUSINESS."

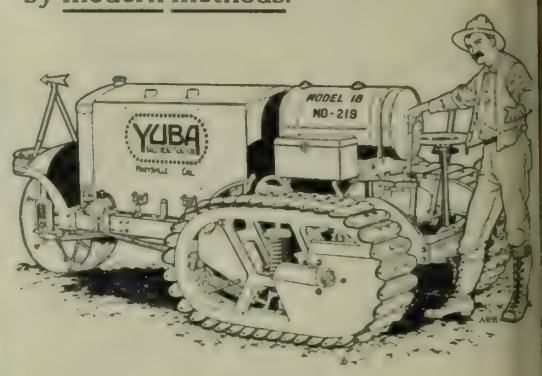
Save Time and Money



You have all the time there is.

You have 24 hours—it's the use you make of them that counts.

The business farmer, like the business man of the city, is learning to economize time.

To get the work done quicker and better is now the aim, and at the same time to do it at less cost.

There are improved methods in everything else. The business farmer is alert to the advantages to be gained by modern methods.

The Yuba Ball Tread Tractor is the economizer of time and money.

It replaces all the horses on the farm all the time. With the Yuba Ball Tread you can plow, harrow, cultivate, haul, thresh, quicker and at less expense than with horses.

With it you introduce efficiency methods, time-economizing methods, wage-saving methods, and, best of all, deeper plowing, more thorough cultivation, and these mean better crops, therefore, better profits.

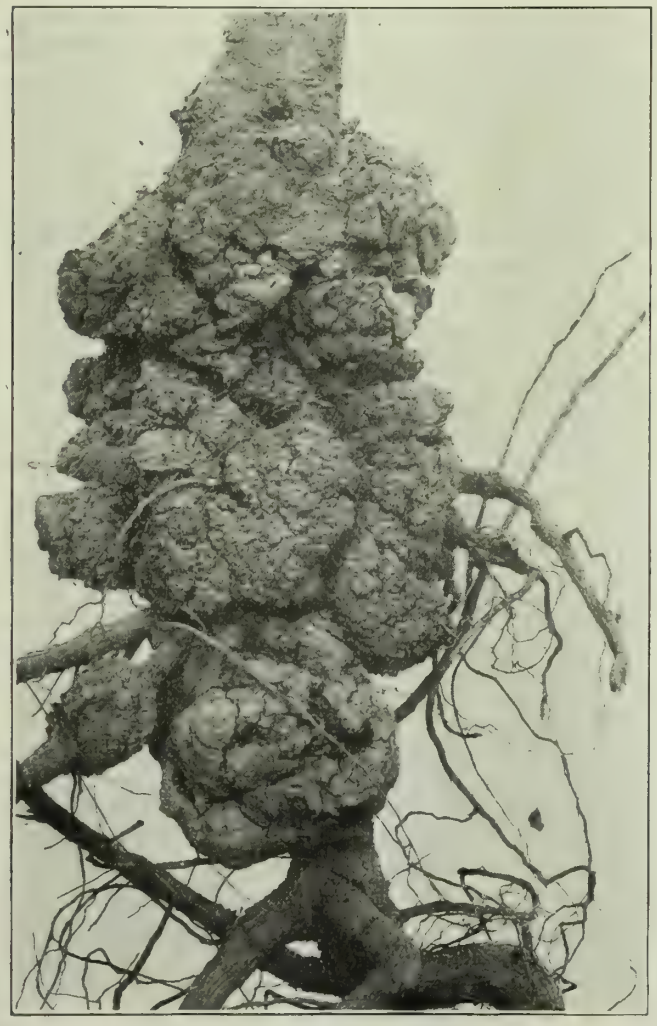
The Control of Crown Gall, or Root Knot.

An outline of results from long observation and experimentation with specific suggestions for treatment.



[Written for Pacific Rural Press by Clayton O. Smith, University of California.]

CONSIDERABLE interest is being shown by orchardists, nurserymen and tree inspectors, in the disease known as crown gall. This is common on the stone fruits and almonds.

This disease is now known to be caused by a definite parasitic species of bacteria which live in the cells of the affected plant, causing their abnormal multiplication, thus developing a more or less semispherical enlargement or gall on the underground part of of the trunks and roots of the tree.

Considerable study has been given to this particular disease in an attempt to find practical methods of control. This will be briefly considered under: (1) resistant stock as shown by experimental work; (2) sterilization of root by chemicals; (3) use of clean stock and planting in uninfected soil; (4) tree surgery.

A stock resistant to crown gall is desirable, providing it also has the other favorable characteristics, such as vigorous growth and adaptability for a considerable number of the varieties to be propagated. Experiment has shown a considerable variation of the different species and varieties of prunus in respect to their susceptibility and resistance to artificial inoculations with crown gall. The preliminary method of testing out the different member of the genus prunus has been to make artificial puncture inoculations at short intervals during the growing season. This method is a rapid and easily applied test of resistance. At the close of the year's growth the final data were secured, although it was often necessary to make observations a year later to secure the final results. Those secured the first year, however, are sufficiently accurate to give an indication of the actual resistance of the stock to this disease. Pure cultures of the causal organism are always used.

Natural infection of crown gall on four-year-old peach tree.

Degrees of Resistance.—The following tables summarize this work and show the percentage of successful infections on the different species and varieties:

Apricots: Prunus Armeniaca (Mikado), 27 per cent; P. dasycarpa (Purple), 40; P. Mandschurica (Chinese), 42; P. Mume (Japanese), 91; P. Armeniaca (Royal), 97; Miscellaneous (California varieties), 60 to 90.

Peaches: Prunus Mira (Wild Chinese), 10 per cent; P. Persica—(Muir), 85; (Salway), 90; (Elberta), 94.

Almonds: Amygdalus communis (Bitter), 85 per cent; A. davidiana (Chinese), 88; A. communis (Sweet), 95; Miscellaneous (Sweet varieties), 80 to 90.

Plums: Prunus pumila (Sand Plum), 0 per ce...; P. domestica (Italian Prune), 7; P. insititia (Purple Duane Stock), 7; P. domestica (German Prune), 10; P. insititia (Damson), 10; P. domestica (Green Gage), 25; P. cerasifera (hybrid) (Mariana), 85; P. triflora (Burbank), 90; P. munsoniana (Wild Goose), 92; P. cerasifera (Myrobolan), 95; P. triflora (hybrid) (Wickson), 98; P. Simonii (Simon), 99.

Comments.—Further tests in growing the pits or small trees in infected soil, show that the stocks showing stronger resistance to artificial inoculations are practially entirely resistant to the disease when growing in infected soil. The above table, while not exhaustive in the number and different kinds of trees tested, yet suggests certain varieties that can be further considered experimentally. In general, the varieties belonging to Prunus domestica are resistant, although some are very susceptible. What should cause this variation is uncertain. A stock of the domestica or possibly of the Damson type is now being used in a some what limited way for plums, apricots and nectarines. This is called at the present time Purple Duane stock, or simply P. D. stock. This is not the true Duane plum, but a small blue plum having the flavor of the Damson. It shows resistance and has given satisfactory results as a stock, and should be further tested in commercial plantings. The Italian and German prunes may be good stock for the prunes and other of the domestica plums. The Sand plum has been used to a limited extent as a dwarf stock in the Middle West. It probably will not be a popular stock for California, because of its dwarfing characteristic. It also does not grow well in the heavier soils. The apricot, plum and peach unite well with the Sand plum. It is interesting because of the entire resistance to artificial inoculations of the species known as P. pumila.

Apricots.—Among the apricots are several of Asiatic origin that are promising from the standpoint of gall resistance. These will be tested out as soon as pits can be secured. There is every reason, however, to believe that stock of these apricots will be as good as those in general use with the additional characteristic of crown gall resistance.

Germicides.—The use of germicides in treating peach roots have given discouraging results. Two-year-old peach roots were treated with different germicides to determine their injury to the roots, or their beneficial effects, if any, in preventing the growth of gall when the tree was planted in infected soil. The following preparations were used: Bordeaux paste, same formula as is used for the citrus gummosis; Bordeaux mixture, 4-6-50 and 12-15 50; concentrated Ortho lime sulphur, 1-10 and 1-20. The roots were dipped in the solution used and planted after it had slightly dried on the roots. The

San Diego	0	12.47	8.93	72	50

THE WEEK

PROBABLY the most important and wide-reaching incidents of the week have been the efforts of the prune growers to measure their desire and capacity for organization, and these incidents will culminate in a great assembly in San Jose on April 14, as set forth in detail in the entablature on another page of this issue. It is the business duty of every prune grower to get to this assembly if he can without too great sacrifice. As we are told, it is the intention of the directors of the "Information Bureau of Prune and Apricot Growers" recently organized, to put up to the people a proposition for immediate entry upon an effort to secure a competent control organization to handle the crop of 1917. We believe the effort is wise, because it is none too soon to begin an undertaking which, in the nature of things, will require much preparatory work. In all our writing on the subject of organization for prune handling during the last four months or more, we have steadily held in view an ultimate arrival of a strong organization, as an outgrowth of simpler ventures in that direction which would protect growers from stampeding and incidentally make them wiser about production and marketing and teach them to know each other better. We did not consider them aligned and munitioned for a great drive upon the center of the great problem confronting their industry. We thought it would be safer to wait for reports from the air-craft and submarine commanders which the Information Bureau would naturally bring into action. However, the war-council of the industry orders an immediate advance and so we say with the rest: "Go to it, boys; see how far you can get!"

Therefore, we are anxious that the meeting in San Jose on April 14 shall be large and intelligible. It will not do much good to have a mass-convention roar under spell-binding oratory. You never can tell by the size of the roar whether the roarers have any prunes in their pockets, or whether they are only carrying shriveled spuds for rheumatism. If the actual producers of prunes will go to the assembly sternly resolved to put the clackers through a lye-dip and force an opportunity to declare just what they themselves are ready to do, in a business way, toward the support of an efficient control-organization, then the effort may make a fair start from some sort of a real foundation. Every grower should go to the convention firmly resolved that he will not permit the assembly to merely make a record as a windstorm!

SHIPS OF ESTATE.

THINKING of prunes and the British embargo, one comes irresistibly to ships, for there is plenty of talk going that George does not like prunes less but ships for bomb-shells more; also, perhaps, he does not like to waste gold on prunes while he needs to feed the interior allies with explosives. However that may all be, California's surplus farm products are dependent on ships to get abroad, either from this coast, or the other—because the cross-country railways only get as far as the wharves, either of the Pacific or Atlantic, as the case may be. And so it becomes very desirable that the war should close—not alone that food may be available to hungry Europeans, but because we shall have empty ships to carry it to them. We have read many declarations of how scarce ships are, but nothing has impressed us so vividly as the gossip about how hard people are trying to buy ships. Take two, from a number of specific instances, given by a writer in the Oakland Tribune:

Mayor Rolph had a contract out for the building of the steamer Annette Rolph when the sensational boom in freights started. The price was some $600,000. He sold the vessel on the ways at what was considered a big advance; that purchaser sold to another, and that purchaser resold to Rolph, for nearly double the original price, who sold again at another nice profit. The difference between the contract price and the final price was $1,150,000.

The Republic, formerly the German cruiser Walkeire, recently arrived from Papeete, where she was lying in ten fathoms of water. She cost Sudden & Christenson $29,000 as she lay. They expended $100,000 in righting her. She came home under her own steam, bringing a valuable vargo, and they now have a steamer for which they have already refused $1,250,000.

"Howl, ye ships of Tarsish," lest all the phantom craft of antiquity be raised to mock ye and even the ark of Noah sail in to seize your charters!

SHIPS OF STATE.

ALTHOUGH there may be present and immediate hardships to shippers of California's surplus products, the outlook has dark dangers only to such reckless gamblers in ships as those who pay the prices indicated above. So far as future availability of ships is concerned, the best possible promise of it is found in the present demand for any floating thing which can hold most of the water on the outside of it. The eagerness for ships will generate more ships as nothing else can do and that will be the surety of reasonable freight rates when there is no more war-stuff to go. Besides, assurance toward the same end will be found in the increasing American interest in ships and a popular demand that the Stars and Stripes return to its old sovereignty of the seas. This will result in a public attitude in this country toward fairness to those who put money in ships. The same public feeling will carry the administration propositions that the government shall build plenty of dual-purpose ships. Thus, in both private and public ways, this country will be growing speedily toward a maritime greatness and ocean-carrying power commensurate with our position in manufacturing and surplus food production, the canal will realize the prophesies of its prospectuses and "Sail on, O Ship of State!" will be an order capable of execution. Therefore, the greater pinch in ships now the greater the freedom anon, and the greater force for development will be the sitting of California by the sea.

MY COUNTRY, 'TIS OF THEE.

IT IS probable that Europe may emerge from the present war thoroughly sobered and possibly repentant for her crimes against humanity. There are many indications that internal revolutions will follow external conflicts. In some cases there may be changes in forms of government which are anti-humanistic and thoroughly hateful in this era of the age of man. In other cases there may be little change in outward form, but notable changes in standards and measurements of human classifications. In all cases there promises to be striking change in spiritual ideals and in the conceptions of human rights. In all these ways coming generations must realize whatever compensation it can derive from the sufferings of this generation. It is not reasonable to expect warring nations to see that for this alone they are murdering each other; they must have visions of empires saved or extended to keep their ruling classes and their financiers at their job of leading and supporting the wretched business and to develop patriotic fervor in their subject masses. Therefore, it is not wise for neutral nations, which will still have to live upon the world, to take too seriously the declarations which belligerent nations make of what they will do in event of their victories—for they all still talk of winning. Great Britain has published a plan for solidifying her empire and inter-trading between the parts of her dominion on five continents, discriminating against the rest of the world. Italy has declared that she will make it "possible for Italian children in America to have an Italian as well as an American education. Professors are to be sent from Italy and specialists in all kinds of Italian culture are to be employed to live in Italian settlements in America. Italy has no intention of rendering her emigrant's disloyal to the United States. She proposes through Italian culture to enable them to attain the same degree of material prosperity that German kultur has given to the German-American." But it seems that kultur is not all the German-American would like to give us. A prima donna, whose husband was recently arrested on suspicion of bomb-plotting, said this: "Yes, I would myself blow up munition factories. I would give up everything else and go from one place to another, carrying ruin with me, if I only could warn the workers in time to save themselves. That I would do gladly and more—for Germany." And this is the lady to whom Americans have paid a million dollars, perhaps, in gate money for musical

kultur during the last decade! Surely culture with a "k" is a hard proposition.

FOREIGN COLONIES IN UNITED STATES.

ALL this seems to mean that the European empires will look upon the United States, not as a nation, but as a great raw country, on which to plant colonies, where people shall be made to learn, not loyalty to the country of their adoption, but allegiance to the countries whence they came; to gather up money for the enrichment of these countries, and to grow men for the European armies of the future—which, by the way, we hope will never exist. However, the principle is the same, whether there is prevention of armament or not. Obviously, the United States must protect herself against such exploitation. We have room in this country for many more good people, but we should make it very sure that American opportunity is given only to those who are willing to aspire to American citizenship by renunciation of foreign allegiance at the port of arrival, by all who come for settlement. We have now plenty of British-Americans, German-Americans, Italian-Americans, and all other hyphenates, not en route to citizenship, to last us for a century. There are enough of them to declare our national admiration of all those countries, and we can live in love with them so long as they keep the peace. Henceforward we should require declaration of intention for citizenship, with all that such declaration implies. To have a lot of ostensible Americans, wearing togs to foreign thrones under their shirt-collars, is not only a menace to American solidarity and patriotism, but a potential disturbance of the peace, which should not be longer tolerated. We have not taken hitherto much interest in so-called "American" organizations or policies because they seem to be at enmity with the attitude of the United States, as maintained by our ancestors, but now, with all the world inclined to look upon this country as a place to pick up things to send home or a place to blow up when any alien thinks he has made all he can out of it, we are gaining conviction that the old political outcry, "America for Americans," may be getting to be rather a good and necessary thing.

NOT CRUEL BUT SILLY.

THE prima donnas seem to be getting on our nerves this week. We have already quoted one who is apparently steeped in anarchism, and now comes another with words to the public which are not cruel but silly. These ladies should stick to song; they make us saddest when they speak. If, however, they will allow reporters to speak them in public they must be chided for what they say. Here is a prima donna's advice for young men who contemplate marrying: "Take your bride to a ranch and keep her there for at least a year. You will have a far greater chance of keeping her affections than if you coop her up in a small city apartment, where she is apt to become dissatisfied with seeing so many about her who enjoy greater advantages."

While we do not believe that a young husband should yank his bride around for entertainment as he would an old maid aunt, and while a certain brief retirement may be grateful to a bride after having been rebuilt by her dressmaker, and made a holy show of for months by all her girl friends, we are quite sure that if you try to make her tolerate your own solitary society for a year you will have to lock her up. And this will happen just the same, either on a ranch or in a city apartment. If your bride is any good she will need to get busy, either socially or domestically, or both. If she belongs to the countryside and has a love for it, or if she is a rare one who acquires such a love because you are a part of it, the ranch-home will delight her. If she belongs to the city, or acquires love for it because you are a part of it, exactly the same thing will happen in a city apartment. In either case do not think for a moment that your shadow will cover all she desires, or that either city or country has anything to do with it. And then, how is a young man, who can only provide "a small city apartment" for his bride, to take her to a ranch "for a year at least." One cannot get onto and away from a ranch like that, and what is his job to be during this Edenic period? How can he get it and how can he chuck it and get the extra money he is apt to need in about a year? No; all such advice as we have quoted above is punk. Young people should plan to enter real life at their marriage and to pursue it seriously but joyfully forthwith in whatever place bread-winning is assured by what the young man has already accomplished, for this is the only basis upon which marriage is justifiable. There will be slips enough without starting with one.

But the reporter informs us that this prima donna lady owns several ranches and is an advocate of the "back-to-the-land movement." There is no real, reasonable farming in that movement, and that probably accounts for the advice, but there is a contradiction in it even from that point of view. If the young man has money enough to buy or hire a country villa, with an outfit of motors and servants, for a year, he may get comfort from such rural life, but if he is as well fixed as that he will not take his bride to a small apartment from which she could see so many other people better fixed, for he could buy or hire a town house as good as they enjoy. The question is, then, whether a young swell and his bride should live in town or country, and that is a matter beyond our knowledge. The trouble is that such questions are put forth as of agricultural importance when they are of no agricultural concern whatever. From the point of real, way-winning activity, either in city or country, the prima donna's advice is simply silly—and yet careless writers put forth such statements as though they were tributes to the desirability of farming life. They have nothing to do with it.

Queries and Replies.

Querists must give name and address.

What Are Non-Bearing Trees Worth?

To the Editor: What would be the relative value of trees, say apricots and almonds, in the course of their development, planting one-year-old trees from the nursery. To illustrate more clearly, trees I bought at the nursery this year, supposed to be two years old from the seed, properly cultivated, what would be their increased value in the spring of 1917, and every following spring up to the period of time when they would commence to produce sufficient crop to be self-supporting?—W. M., San Francisco.

Their increment of value must be a matter of opinion, because until they bear a crop there is no income upon which a capitalization estimate can be based, and beyond that there is a chance that they will never bear anything profitable. On the other hand, they do have a potential value because they may be very profitable at some future time, or they may, before that time, make the land sell at a higher price, or they may make the landscape look and smell better. As all such considerations, pro and con, are matters of opinion, you and the buyer must haggle over them and usually the better talker will get away with the bargain. Concretely, they may be said to be worth just what any one will pay for them.

Now as your question implies that you may be the seller, we will give you this basis for setting up your side. Charge against the orchard the cost, or a fair estimate, of the value of the land; the cost of preparing for planting, the cost of the trees and whatever labor is used in planting, pruning, cultivating, protecting, irrigating, etc. When you have the total add a year's interest at your local bank interest rate. That gives you the net value at the end of the first year (when the trees are two years old from the bud). For the next year add all the charges for maintenance of the orchard during the second year—including interest on the net value at the end of the preceding year; and so on year by year, adding cost, taxes and interest on all preceding values or expenditures. For although the earth would burn itself up every ten or fifteen years if interest were charged on unproductive land, in the case of orchard it is different, for the land is at work upon a long-distance crop and is entitled to wages calculated as interest. All these things enter into calculation of net value at any time during the non-earning period.

But you may say: "Where do my earnings as promoter come in?" To the net value as above you may add a reward for your insight and enterprise in making the improvement, your share of the benefit from the building of a new school house in the next section, or from the prospect of a new trolley line coming up the valley, or from the fact that the previous spring's frost line passed half a mile below your place. Add therefore to the net value, as above, whatever you wish the buyer to recognize as the unearned increment to which you are entitled. Some have been known to add 100 per cent for this, but probably 10 per cent would be fairer. Whatever you decide to add in this way, whisper it to the buyer, for the assessor is sometimes bothered about the value of improvements and may take the seller's idea and soak him accordingly. And having made your figure to the prospective buyer, it's up to you to decide, in the discussion of it, which is to be the hammer and which the anvil. The value of your trees which have earned nothing will be what you can get someone to pay for them.

Pith-darkening in Young Trees.

To the Editor: In setting out some young trees I find that when I top them some of them are white throughout while the pith in others will be a very dark color—brown, almost black. Is this a sign of anything seriously wrong with the stock, or what does it indicate?—Planter, Gilroy.

We never saw any full demonstration of the cause of it. Our observation is that it is negligible if the wood around the pith and especially the inner bark is not discolored.

Reasonable Expectations from Walnuts.

[By Prof. Leon D. Batchelor, Citrus Experiment Station, Riverside.]

It is amusing to read, from time to time, the expected walnut yields figured by some enthusiast who has based his calculations on the production of a certain door-yard tree, multiplied by most any given number per acre. This would be harmless pastime if such little examples were to be read only by persons familiar with commercial walnut growing or by those not likely to invest in it, but if beginners in this industry base their expectations on any such figuring, disappointment is likely to result. In a recent article in a well-known nut journal, the writer asks the reader to "figure for himself" 250 pounds per tree at 15c per pound and 27 trees to the acre, at 40 feet apart, etc.

The 250 pounds per tree is thought by the writer of the above quotation to be the average production of a small number of solitary trees. Thus far the little example in plain arithmetic sounds reasonable, though above the average. The 15c per pound, however, is far more than commercial nut growers have averaged for their entire crops for the past five or ten years. This is merely mentioned in passing, however.

The real place where pencil and paper results will differ from actual realization is in figuring an average of 250 pounds per tree with the trees crowded to the rate of 27 trees per acre (40 ft. x 40 ft.). It is a matter of common observation that the walnut tree will not thrive when crowded in grove form as well as many other fruit trees. On almost every hand one finds the border trees of a mature grove more productive than center trees. California groves on good walnut soils are in many cases too crowded with trees planted 50 ft. x 50 ft. (17 trees per acre). Some of the older growers feel that 60 ft. x 60 ft. is close enough for mature walnut trees (12 per acre). Again, the average production of the bearing walnut groves in California is less than 1000 lbs. per acre (although there are numerous door-yard trees, with ample room for development, which are producing 250 pounds or more). A grove which produces 1500 pounds per acre is better than the average, and one which will average to annually produce 2000 pounds per acre is very rare; an occasional production of 3000 pounds is sometimes heard of, but such cases are "hard to find."

This discussion may enlighten anyone who starts to "figure for himself" the little example which reads 250 pounds per tree × 27 trees per acre, equals 7750 pounds per acre (not to speak of the 15c per pound).

Of course the newer walnut regions may far excel the California groves in production, and for the sake of owners it is hoped they will. On the other hand, if prospective walnut planters in the newer sections merely anticipate such yields as have been realized in one of the largest and most successful tried sections of the world, possibly there will be less disappointment in store when the pencil and paper give way to walnut sacks.

Walnut growing is a very stable, conservative branch of the fruit industry, but the trees have not literally "rained" gold dollars except in theory.

Growing Fruit Wood Instead of Suckers.

[Written for Pacific Rural Press.]

"The June drop of oranges comes from the inside. They drop because the branches have been shaded so that while they set fruit buds, the latter are so weak that they can't mature the fruit. A tree left to itself will produce branches and fruit. After about three crops on a branch, it bears scarcely enough to pay for its keep. Weight of fruit pulls the branch downward and new shoots come out along its upper side. After two or three crops it might as well be cut back to the most promising new shoot, for it would be shaded too much and is then declining in vigor anyway." Thus spoke A. H. Nelson, who owns and works the Canyon Vista ranch, including 85 acres of oranges on Mentone Bench, San Bernardino county.

The thing to do is to renew the trees, according to Mr. Nelson. Take off the undergrowth which is an expensive boarder, and thus lighten up the tree for the rest.

"One man said he could throw a cat through my trees without touching a branch, after I have pruned them." Such heavy cutting does not damage orange trees as it would deciduous fruits.

"When I started this system eight years ago, people said I wouldn't get a good crop for three years, but next year it was as good as before, and it has trebled since. There must be a general slaughter to actually renew the top."

Mr. Nelson aims to prune 1-3 of the orchard every third year, simply suckering during the two years. This is because the crop is not so heavy after the pruning, but two big crops follow that lighter one.

Few Suckers.—It might be expected that much suckerous growth would follow such heavy pruning. However, only a few suckers come. Mr. Nelson accounts for this by saying that a sucker is simply a branch striving for light. In such open trees that same growth makes fruit wood instead. Suckers make but little fruit, and that grades choice to bad, while the abundant growth on the trunk and main limbs of this orchard is affirmed to average a box per tree. And contrary to the experience of many in the Redlands district, this fruit is as fine in all good qualities as the best. It does not sunburn, is not threshed about in the wind, has finer skin and better flavor, but is later in ripening. After the big freeze such inside growth was abundant and many cut it off, but Mr. Nelson thinks this a mistake. The summer after the freeze, he pruned the Valencias very severely. The crop in 1914 averaged 3½ boxes; in 1915, seven boxes; and is set as heavily this year.

One block of 20 acres near the bank of the river was pruned right after the freeze and produced lots of such growth. This block was not suckered since June, 1915, yet early in February, 1916, scarcely a sucker was to be seen.

To encourage the inside growth, the triennial pruning includes the making of an inverted cone into the tops of the trees. One reason for the lack of suckers is that at this time the ground is disk plowed 10 to 12 inches deep in two directions, giving a root pruning also.

Prunes in Spring.—April pruning is preferred, especially if the fruit can be picked first, since that leaves the "June growth" on which fruit buds may form for the next crop. The shock to the tree is much less in April than in June, because the leaves have mostly been on nearly all their allotted year, and would shed in May or June anyway. At all events, nothing is cut from a tree after August.

AVOCADOS TO PLANT.

[Written for Pacific Rural Press.]

"There is so much misinformation regarding avocado varieties," says T. U. Barber of the Hart and Barber Avocado Nurseries, that the California Avocado Growers' Ass'n is trying to get a committee of competent disinterested men to undertake classification and description of varieties which have already fruited in California and shown themselves worthy of planting.

There are many varieties whose propagators claim are the best and only ones, often before they have fruited at all in this country. There are also many varieties whose good points are exploited, ignoring disabling characteristics such as poor bearing or shipping quality.

Commercial plantings up to 10 acres are being made this year by people who last year wanted only a few trees. The commercial varieties, according to Mr. Barber, are the thick-skinned or "hard shelled" type which have the reputation of standing shipment better than thin-skinned varieties. The two types, howver, are not competitors, as varieties of the one ripen through nearly nine months while the others ripen during the fall three months. The former are destined for distant markets, while the latter are primarily for California consumption. Plantings ought to be made with the purpose of ripening fruit the year around, and only those varieties which have proved good should be planted in a large way.

For commercial orchards, the Taft is Hart and Barber's best seller, with many Maserves, Challenge, and Solano being ordered. The last named is less oily but is favored; on account of its great edible proportion, flavor and season. Judging by orders already in, their stock of this variety will be all sold. Of thin-skinned varieties Harmon and Northrop are in strongest demand, but are not recommended for commercial planting. The Val de Flor, an imported variety which is fruiting here this year, is also being planted quite heavily to fill the fall market. It has a leathery skin which will make it more valuable as a shipping fruit than others of thin-skin type.

One man bought avocado trees Mar. 13 from the Hart & Barber nurseries to plant 10 acres.

Is there a question you'd like to ask about fertilizer, its effect when applied to soils of varying kinds—or for the benefit of crop sof varying kinds?

We are a sort of clearing house for ideas, gathered from farmers.

These ideas blended into our answers to your inquiries may be of great value to you.

Why Not Everybody Push Prunes?

[Written for Pacific Rural Press.]

To the Editor: I have read a good many valuable articles in your paper in regard to the handling of prunes. There seem to be no two of the same opinion in regard to it.

I do not belong to anything and am only looking from a distance, but in my opinion there is nothing the matter with the Farmers' Educational and Co-operative Union of America. They seem to be organized in most every State in America. What are they for if not to help one another? Why can't the prune growers of California ship their prunes to each state camp at cost, say a four-cent base. We can grow them for that and in that way the toiler of America could get a prune to eat and get it at a right price.

Did you ever stop to consider how many prunes per capita could be consumed right here in America? It looks to me that if we could cut out the grafters we couldn't supply our own demand. I raised a family of eight children and when I was living back East I had 200 pounds shipped me for my year's supply and then I would run out before the next crop came in. There are hundreds of families in Nebraska that would take 100 to 200 pounds if they could get them at the right price. Last year I shipped over 2500 pounds to my home town by local freight, which costs $2.20 per cwt.

Why do not the prune growers of this State join hands with the rest of the United States and co-operate, one with another, for their mutual benefit? Then we will not need any information bureau, for each State head camp or local camp can make their wants known. But if we charge them two prices they won't have any wants.

There is another queer phase of this prune question. I lived nearly 40 years in Nebraska and I never saw a California prune but once, with the exception of those I shipped there. They all came from Oregon, artificially dried and often burnt at that.

I fear lest our two colonels have come to some mutual agreement and both have got hold of the ends of two strings and gone to chewing so fast that neither can speak.

But still I see Col. Weinstock has done 70 cents' worth of business. Hurrah! But say, those gentlemen he has put in at the head of his advisory committee? Do they hold high offices in other concerns? If so, why not so? Of course there are all kinds of rumors afloat and I am asking this for information.

Gilroy. **J. W. Richman.**

[There is certainly nothing the matter with the Farmers' Union so far as we know. They are doing a splendid work, no doubt, but they can no more handle a crop of 200,000,000 lbs. of prunes (which we are likely to have any good year) by their methods, than they could handle all the hogs grown in this country. There are not farmers enough in this country to eat all our prunes if they tackle them three times a day. But they are doing well and you are doing well in industrial shipments, but most of the prunes must be eaten in great centers of population. Every capable means of distribution must be employed. It is our business to use them in such a way that producers get their fair share of what the consumer pays.

We do not know anything more about Col. Weinstock's advisers than you do. We presume he is hiving bees which know how to gather honey with the idea of pulling out their stings. You need not worry over the colonel's advisers. If he wanted to crack a safe he would not send for a Sunday school superintendent.—Eds.]

GET READY FOR RED SPIDER.

To the Editor: I have a young almond orchard badly infested with red spider. Will it be possible to reduce them by the dry sulphur method, or will I have to spray for them? Have you ever heard of anyone doing much good with dry sulphur? Red spider seems to be pretty tough, and it appears to me it would be hard to kill by just blowing a little dry sulphur over it. I suppose the commercial lime-sulphur solution would be the thing to use, in case I have to spray.—F. N., Livermore.

[The time to hit the red spider is when the young spiders are hatching out. This varies according to local climate, but is usually about May 1. They can then be killed by fine dry sulphuring, using a good blower,—when no strong wind is blowing. This does not kill by contact but by generating sulphur fumes as the heat increases. This is the most common remedy. It has to be used several times during the summer. Lime-sulphur spray is also good if diluted to summer strength, according to directions by the manufacturers, but there is danger of spotting the fruit—but this would not matter with the almond.—Eds.]

PLANTS TREES DEEP.

[Written for Pacific Rural Press.]

It is all right to transplant trees deeper than they were before, if the soil is sandy, and most of the water is deeper, according to M. Rusznak of Ontario. He transplanted a four-year apricot tree three years ago 15 inches deeper than before and it is doing as well as a transplant could. The bark is not rotted underground but has sent out roots. On one strip, the ground is dry and the trees small. They could not be planted deeper.

This orchard is dry farmed, and even after a wet winter dry ground can be found in the spring two or three feet under the surface.

One of Mr. Rusznak's neighbors transplanted trees six or seven years ago, four inches deeper than they had stood a year or two in orchard form too close together. They are doing fine now.

A very interesting meeting was held at the Sylvan club house, Modesto, on April 13. E. Millard, the State Secretary of the Farmers' Union, was present, and organized a Farmers' Union local. Locals are to be established all through Stanislaus county, with the Modesto local as the unit. A membership of 30 was secured at the opening meeting, and Mr. Millard stated that it was his first experience in organizing so large a local as a result of one meeting.

California Fruits and How to Grow Them

EDWARD J. WICKSON.

Seventh Edition, Extended and Revised.

Contains over 500 pages of text with many illustrations. Goes thoroughly into every phase of that immense industry, California Fruit Growing.

In the preliminary chapters, the important subjects of Climate and Soils are handled in a masterly manner, with the necessary modifications called for by the immense latitude, the topography of the country and the different regions with their relation to coast, valley and mountain.

The book then goes into the subject of Fruit-Growing from the nursery, on through budding and grafting, preparation for planting; planting, pruning the trees and thinning fruit; cultivation, fertilization and irrigaton right along to picking, canning and preserving, with chapters on injurous insects, tree diseases and the protection of the trees therefrom. Every fruit and nut which can be grown commercially in California or countries possessing a similar climate, has received the attention which the forty years' experience of the author makes of incomparable value to the fruit grower.

Price, $3.00, Postpaid.

Olives Need Plenty of Care.

[Written for Pacific Rural Press.]

Olive growers in the Hemet district seem to be afflicted with alternate heavy and light crops which they have not yet managed to equalize.

Yet, when one gets 9 tons of salable Missions from 70 trees about 23 years old, he can stand it to get only two tons next year. This is the record of M. B. Moulton of Hemet year before last and last year. The present season is yielding about 12 tons, including the first crop from 30 grafted trees.

"You can get a heavy crop of olives if you give the trees good care," says Mr. Moulton. "I ought to have pruned out some of the wood before the big crops were half grown, so the fruit would have been larger and would not have prevented bud formation for the next crop."

Barnyard manure at the rate of 15 four-horse loads per acre has been applied, and Mr. Moulton hopes to manure heavily in alternate years.

The soil is deep granite loam, sloping enough for easy irrigation by furrows once per month.

"I think it would pay to thin the fruit. One man can thin a tree in half a day and a box of fruit would pay for it."

Large olives sell at Hemet for $200 to $250 per ton, while small ones go at $60 or $70, according to Mr. Moulton. They vary between those prices according to which of half a dozen grades they belong in.

PRUNE GROWERS WILL TRY FOR STRONG ORGANIZATION.

The State Central Committee of the California Prune and Apricot Growers' Information Bureau met on March 30th in San Francisco. Mr. David Felsenthal of Fillmore, California, was made the accredited Committeeman for District 5, which comprises San Luis Obispo, Santa Barbara and Ventura Counties.

Besides acting on routine matters, the Committee, following a conference with Col. Weinstock, voted to call a mass meeting of growers for April 14th at San Jose, California. At this meeting the Information Bureau will present for the consideration of the growers assembled, a plan for the establishment of a State-wide marketing organization. This plan will be based, in a general way, on the scheme followed by the raisin growers in their organization. The Committee was led to promote the formation of a selling association by the State-wide increase in the sentiment among the growers for such an organization. This feeling has been particularly strong since the news of the embargo reached the growers. Although the embargo as a market factor is perhaps not so important in itself as the high ocean freight rates are, it and Col. Weinstock are the agencies that have caused and are now causing the California prune and apricot growers to think of their marketing problems more seriously than ever before.

The State Central Committee was also much impressed with the prune and apricot production, export, and domestic consumption statistics for the five-year period ending 1902 as compared with similar figures for the five-year period ending 1914. These figures showed that the production of California prunes had remained practically stationary, that the domestic consumption of prunes was less than half what it had been, and that the quantities exported were five times greater; they also showed that the present production of apricots was materially larger, that the domestic consumption was not more than half what it had been and that the apricot export trade in 1914 was many times larger than it was in 1902.

This sad showing, as regards domestic consumption, is doubtless due in a large measure to a lack of centralized control of the industry. Without such control the proper exploitation of the home market has been impossible, and until such control is developed the consumption of prunes and apricots will fall off in the domestic market in proportion to the increase in the use of other fruits by the same markets.

The Growers' Information Bureau desires the largest possible attendance at the mass meeting on April 14th and extends a cordial invitation to all growers and those interested in their problems to be present at the Garden Theater, 2:00 p. m.

Grape Mildew Prevention Begins Now.

[Written for Pacific Rural Press.]

"Prevent grape mildew—don't try to cure it, the watchful waiting policy won't work," say the De Lano Bros. of Fresno county, who claim not to have had any mildew on their grapes for years; and had none on their vines last year, though vineyards all around them were affected. One adjoining vineyard lost half of its Malaga crop from mildew last year.

"Mildew first attacks grapes while they are in bloom." The first sulphuring comes when the leaves are just well opened. Even at this stage mildew has been observed on Thompsons. The second sulphuring comes before blooming if bad weather follows the first; and they are sure to sulphur while the grapes are in bloom. Another dose comes when they are the size of peas. The vineyard is then irrigated; and another sulphuring follows this, especially if weather has been favorable for mildew. After each rain, some more is applied.

Such repeated sulphurings are not so expensive as they might seem, nor are they so expensive as the cultiva-

tion and care of a vineyard which produces mildewed grapes. Half of a 110-pound sack of sulphur is enough for six acres the first time; one sack the second; 1½ sacks for each of the rest.

It is rapidly and thoroughly applied from machines carried on the shoulders and worked with bellows. A hose from the machine ends in a stiff pipe with the end spread out so that the sulphur is shot through the vine in a thin sheet. By working this pipe up and down while the bellows is worked, the under sides of the leaves are coated—a very important but oft-neglected part of the work. Its best effect is when held far enough away to allow the cloud of sulphur to settle uniformly on the leaves, unaffected by the force of the blast.

Only resublimed sulphur is used. Sublimed sulphur, according to De Lano Bros., won't fog from the machine or stick smoothly on the leaves, and is actually worth less than half the price of the resublimed article.

DECIDUOUS FRUIT PROSPECTS IN U. S.

[Written for Pacific Rural Press by J. L. Nagle, General Manager California Fruit Exchange, Sacramento.]

The following reports have been compiled to date of the fruit crop prospects in the heavy producing states of the United States:

Georgia.—A severe freeze March 16th at Fort Valley unquestionably affected from 50 per cent to 60 per cent of the crop of Early Belle and Georgia Belle Peaches. Reports from Marshallville and Byron indicate like damage also. Up to the present writing the Elbertas have not been damaged.

Colorado. — Temperatures in the fruit districts have been unusually high for this season of the year, causing the trees to swell to a point where they are just about to blossom and bud. Freezing weather generally prevails in April and May and there is some likelihood of damage to the Colorado crop on account of the trees being advanced over several previous years'.

Michigan.—There was a very open winter, especially in the month of January, but since then all the streams have been frozen to 15 deg. or more. Trees are still dormant and it is too early to predict crop conditions.

Missouri. — On account of the heavy crop in this state last year, growers and shippers are of the belief that the crop will be considerably lighter this season. It is also reported that the Ozark peach crop from Arkansas, which is a keen competitor of California, will be much lighter. More reliable information regarding the above will be furnished as soon as there is a change in the Eastern situation.

Texas.—There has been nothing to date to interfere with the Texas peach crop. This state always experiences a late freeze and as the crop is well advanced and as there has been an extreme drought, this latter condition may cause the peaches to drop before harvesting. We expect further information on this very shortly.

Ohio.—The fruit districts of this state have never experienced such cold weather so late in the season and although this has retarded the flowing of sap, it may have been a protection to the trees, though the temperature has ranged from ten degrees or lower several nights during this month. This may mean a good crop but a late one unless there is a frost during the blossoming season.

Virgini .—It is reported that from present indications this state will have a small crop.

Oklahoma.—The only fruit crop of any consequence to this state is peaches. There are no figures showing exact shipments in cars or bushels for any past season. However it is estimated that the state shipped about 6500 cars last year.

Root Knot on Berries.

Root knots on berries are made by the same botanical beast which makes knots on the roots of fruit trees. The planter should run away from it.

To the Editor: In cultivating a small patch of blackberries this winter I noticed that one of the vines had a large lump or knot on its roots. The knot has a very rough and uneven surface, resembling a large wart somewhat. Is there any method by which this growth can be stopped or will the destruction of the vine be necessary? Some of my friends have secured cuttings from me; will there be any danger of their plants developing this same ailment? —H. C. H., Nicolaus.

[Answered by Prof. W. T. Horne, University of California.]

Replying to the inquiry of H. L. H., of Nicolaus, Sutter county, California, I think there can be no doubt that the lump or knot on blackberry is crown gall. This disease occurs on a considerable number of plants and is said to be more severe on the blackberries and loganberries than on almost any other kind of tree or shrub. One very curious feature of this disease is that very large swellings may form on the roots of a plant without appearing to do very great harm, so that the plant may live for a number of years with reasonably good vigor while it has extraordinary growths on the roots. However, I think that in time these growths will multiply on the roots so that the vitality of the plant will be weakened and its productiveness impaired. I am told that in berry patches the galls spread rapidly enough so that the infected patch becomes unprofitable after some years.

I do not believe that there is any measure which is liable to be effective for checking the growth of these galls, nor their spread from plant to plant. It might be a good idea when a plant is found to have a gall to remove it as completely as possible and burn it, but I am not sure that this procedure will be very successful in preventing the appearance of new galls. I think that practically the only thing that can be done is to keep the field as long as it is profitable and then destroy it and plant in other land where it is believed that affected plants have not been growing.

If cuttings are taken from a diseased plant at a distance from where the gall is found I do not believe there can be very serious danger of transferring the disease. However, if it is one of the blackberries which is propagated by taking up suckers or if it is one of the Himalaya or Mammoth type in which tips are rooted, if these are near the diseased plant I should think there would be considerable danger of transferring the disease. It is my idea that it is a soil trouble mainly, and will only rarely affect plants above the surface of the ground. I have made inquiry occasionally of berry growers in the commercial districts, but they have not usually reported serious losses in their own experience from this trouble.

An old vineyard or an old peach or almond orchard is very liable to be infested with crown gall, and such places should be avoided, especially for nursery or planting of susceptible kinds of fruit.

Berkeley.

MAKING A NEW VINE-STUMP.

To the Editor: My muscat vines eight years old are full of black knots all over the stumps. Is there any remedy?—A. L., Dinuba.

[When the vine stump becomes so gnarly that it does not make good canes and crop, a new stump can be made by training up a sucker from near or below the ground, tying it to a good stake and pinching the end when it is three or four feet long. This will induce branching below and from this the arms for a head can be selected at the following winter pruning. The old stump, if it is still bearing, can be left until the second winter pruning after the sucker was staked and then sawn off smoothly just above the starting place of the new stem or stump.—Eds.]

FREEZE KILLS PEARS WORTH $25,000.

[Written for Pacific Rural Press.]

"I lost $25,000 on my 80 acres of pears last night," said a well-known fruit grower of the Tehachapi district following the cold night of Mar. 23. He lost the rest of it the next night, for the snow slush began to freeze before sundown, and was frozen hard in the morning.

This cold snap, according to the gentleman, was to be expected at this season, and would have done no damage had there not been unseasonably warm weather since Feb. 10. This had brought many of the pears into full bloom, though most of the buds had not yet opened. Apples were better protected by leaves, and many of them were not opened yet.

"Here are two pear trees 25 years old, that never lost a crop till they were frozen last year, and again this year," said he.

Here is an illustration of the need of frost fighting outfits as urged last fall and again recently in Pacific Rural Press. The $25,000 would have bought several outfits and the supplies for this orchard; and there is little doubt that they would have saved the crops of both years.

IRRIGATING PEACH SOIL.

[Written for Pacific Rural Press.]

The peach soil about Cucamonga is generally a light sandy loam in which the water sinks downward, normally, faster than it goes sidewise. This would result in the trees nearest the furrow-heads getting too much water.

To get even distribution from one end to the other, probably the best system is that practiced by V. G. Lucas, who handles about 250 acres of peaches for the Lucas Ranching Co.

About three miner's inches are run into each furrow for an hour, by which time the water has reached the other end 40 rods away. This gives a sort of moist layer in the furrows through which water does not seep so readily as through the dry dirt.

On the same day about an inch of water is turned into each of these furrows and watched for perhaps an hour, gauging the stream so it will just reach the other end without overflowing. This time the smaller head also takes only an hour to go through.

Then it can run all night without attention. It seems to seep equally all along constantly.

CANADIAN FIELD PEAS.

To the Editor: I would like information about Canadian field peas; when to plant them; whether affected by frost; and their feeding value, especially to sheep. Can oats be profitably planted with them?—E. G., Modesto.

[They should be sown in the fall to make plenty of growth during rainy season, for they are hardy against our ordinary valley frosts. They can be grown with oats or rye very successfully for winter feeding, though probably the common vetch is better for that purpose.—Eds.]

Garden and Farming Book

—tells what to plant, and how to plant it. Contains everything you want to know about citrus and deciduous fruits, ornamental trees, plants and shrubs, flowers, vegetables, etc. Also contains list of garden tools, fertilizers, poultry foods and remedies. MUNITIONS FOR COL. WEINSTOCK.

To the Editor: At a meeting of the Contra Costa County Fruit Growers' Association held at Concord, Contra Costa Co., Cal., on March 11th, 1916, the following resolution was unanimously adopted:

"Whereas, owing to conditions in Europe and to the recent British embargo, our producers of canned and dried fruits are confronted with entirely unprecedented conditions—increasing production, and curtailing of our markets; and

"Whereas, we, the Contra Costa County Fruit Growers' Association, believe that by strong state-wide organization of producers of prunes, apricots and pears, and through suitable advertising and selling campaigns similar to the raisin producers, and only through such organizations, can conditions be ameliorated and our entire product be successfully and profitably marketed in North and South America; therefore, we pledge our support to the State Market Commissioner in his efforts to organize our producers of prunes and apricots in order that we may place our industry on a sound basis. We suggest the advisability of pear growers taking steps toward organization.

T. H. Hook, Secretary.

Concord.

SOAKING EUCALYPTUS LOGS.

To the Editor: In your issue of the 25th inst., I noticed a question asking the editor how to season eucalyptus wood to avoid checking. There is but one way to accomplish this perfectly—to season the log under water before it is cut into lumber. By doing this all of the sap will be dissolved and the water, taking its place, will evaporate from the wood as soon as it is exposed to the air, without checking. Lumber sawn from green logs can be treated in the same manner with a much shorter time required before the product can be seasoned.

Brentwood. F. E. Slutman.

[Our recollection is that this experiment was carefully tried some years ago without demonstration such as our correspondent anticipates. In the report on Eucalyptus Timber by H. D. Tiemann of the Forest Products Laboratory, Madison, Wisconsin, to the U. S. Forest Service it is shown that checking and warping of blue is due to internal tissue-stress and not to any sap content which can be soaked or boiled out, and he worked for months on the problem in the eucalyptus forests near Berkeley, which in default of timber production have been felled for firewood.—Eds.]

CHERRY IRRIGATION.

[Written for Pacific Rural Press.]

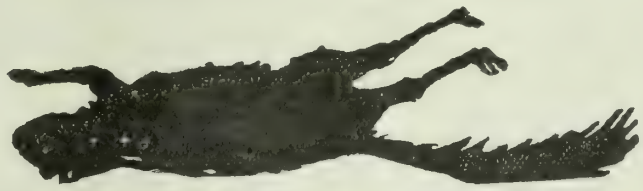
At the Highland Home ranch near Beaumont cherries are the pioneers of several hundred acres in that district. They are irrigated every four weeks after dry weather comes until just before the fruit begins to color at ⅔ of full size. This makes the cherries fill out; but no more water is given until after picking, as that would make the fruit keep poorly. Late irrigation helps strengthen fruit buds.

The water is run down the gravelly southern slope through four furrows per row, keeping it away from the trunks.

Choice, Healthy Citrus Trees

Washington Navel and Valencia Orange, Lemon and Grapefruit; two-year-old budded stock. Trees in perfect condition—grown in exposed positions. Best citrus stock scientific culture can produce.

We have three citrus nurseries—Escondido, Anaheim and Los Angeles. If you are near these points we can save you money by shipping direct from nurseries. Special prices on large shipments.



$2 Combination Offer

Four trees—Washington Navel and Valencia Orange, Lemon and Grapefruit, $2. Additional trees, 50 cts. each—single trees, 65 cts. each. All trees carefully balled—perfect condition for planting. Write or ask for Mr. Peck.

Ridding the Farm of Weeds.

[Editor's Note.—This is the last of a series of five articles on weed eradication that have been prepared by Mr. O. W. Newman, Ass't Sec'y State Commission of Horticulture.]

MORNING GLORY CONTROL.

There are three methods employed against morning glory, all of which are effective and of value in their place.

Smothering has been practiced on small patches of morning glory, Canada thistle, creeping malva, and others with considerable success. It has been tried especially where the pest had not become scattered, and found to be efficient. It must be remembered that a much larger area than that immediately occupied by the plants must be covered, otherwise sprouts will be found springing up beyond the covering. Straw, manure, boards, tar paper, and old sacks have been used. The object is to exclude the light as much as possible.

Morning glory can also be absolutely eradicated by constant cutting. Experiments by the University of California and the State Commission of Horticulture have demonstrated this beyond a doubt. Plowing is not the best method of cutting this weed. Use an Acme weed cutter and set the knife to pass about six inches below the surface of the ground. Repeat the cutting every six or ten days, according to the rapidity of growth. Do not let green leaves appear. If the green leaves are allowed to appear they begin to manufacture more food for the underground rootstocks, and the work expended is wasted. Irrigate the land where possible, as this stimulates the dormant roots to send up shoots and hastens their final exhaustion by the cutting off of these shoots with the weed cutter.

Under this method if the morning glory is in the field it is possible to grow a crop before the weed cutting begins. Plow in the spring and sow to grain. After harvest plow again and then commence to use the weed cutter.

Chemicals. — Experiments with chemical weed killers have demonstrated that morning glory and many other weeds can be controlled. We hope before long to complete experiments which will prove that morning glory and Johnson grass can be completely eradicated by the use of chemical sprays. It is possible that a chemical spray may also be found to control yellow star thistle.

Spray with iron sulphate, 100 pounds to 52 gallons of water, or use arsenite of soda, 1½ pounds to 52 gallons of water. Copper sulphate can also be used, 15 pounds to 52 gallons of water. Caution: Where arsenite of soda is used care should be taken not to inhale the fumes or the dust, or get the spray in the face while operating, as it is poisonous. The time to spray morning glory to get the most effective results is in the dry season, when the plants will absorb the spray readily.

SHOULD NOT CO-OPERATIVE ORGANIZATIONS BE COMPELLED?

To the Editor: May I express myself in regard to the personal equation and to the banking suggestions of Col. Irish in your issue of March 4?

Do I owe Col. Irish an apology for spotting him as a politician? If so I hasten to do what is right. Personally I appreciate him too much, both as an institution and a man, to wish to say anything offensive. However, who but a politician would think of placing so many officers as he does in a $25,000 bank, which he asks us to contemplate in the Press of March 4th? And again: let it be noted that I did not insinuate that the gentleman is a statesman either. For it is the prerogative of a statesman to spend his time making laws to take effect several years hence (as our congressmen have been doing with the Philippine Bill), consequently these statesmen have not time to be thinking what to do with rural credits and other pressing questions of the present time, while Col. Irish evidently believes in raising some easy (?) money pretty quick.

But I wish in this letter to call the attention of Col. Irish to several compulsory co-operative schemes, existing and organized under the laws of California, and also to point out that the personal equation gets knocked into the most beautiful cocked hat therein that one might wish to see. What is an "irrigation district" but a co-operative association organized and run as a political subdivision. And why should the State not have laws permitting the raisin growers to organize a similar association into which every raisin grower must associate or an orange growers' association or any other of our important fruit-growing industries? If an irrigation district is

TOP DRESS all your Crops with **Nitrate of Soda** alone, no matter what other fertilizers you may have used. 100 pounds to the acre for seeded, and 200 pounds to the acre for cultivated crops will do the work. The increase will yield large profits over the cost.

Second Thousand Answered Questions in

CALIFORNIA Agriculture

Our latest book, just from the press, contains 256 pages of text, cloth bound, and sells for $1.50 per copy.

This book is made up of questions and answers. Divided into nine parts, covering fruit growing; vegetable growing; grains and forage crops; soils, fertilizers and irrigation; live stock and dairy; feeding animals; diseases of animals; poultry keeping; pests and diseases of plants.

The live stock and dairy, the diseases of animals, and pests and diseases of plants are very fully covered. We believe that there has never before been printed such a complete list of sprays and poisons and tables for use as are here given.

You need this book in your library. It will come in handy every day in answering some bothersome question which may need quick action. The carefully compiled index tells you where to locate the information you want at a glance.

We want to send you a copy. Send for our special offer made to every one of our subscribers.

PACIFIC RURAL PRESS

525 Market Street, San Francisco.

formed and my lands are included in the district boundaries, I have no recourse but to pay my taxes and secure what benefits I may, though I may be raising crops which do not need irrigation and I might not derive five cents' worth of benefit. On the other hand, it is an easy matter to demonstrate that every raisin grower in the State is helped by the association and hence all should be compelled to help the association in return.

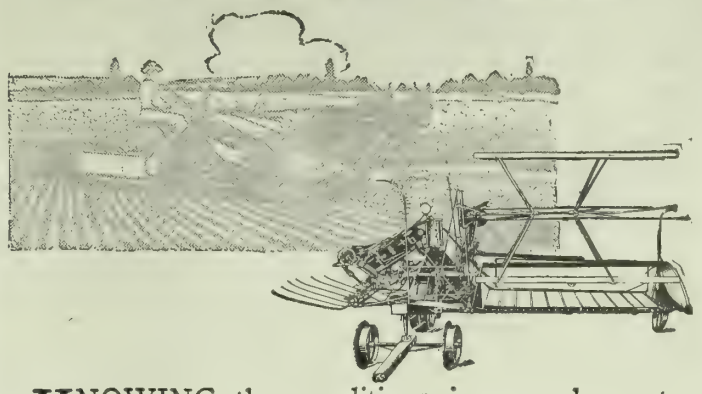
You see we not only need some cheaper money, and State aid in marketing. We need even more. We need laws to enable the fruit growers to form "compulsory co-operative associations" or "fruit growers' community of interest associations," and these would enable the fruit growers of this state to add as much more wealth to the State as the great and rich irrigation districts have done.

Merced. E. W. Doane.

A NEW CORN FOR DRY CLIMATES.

To the Editor: I have not seen a notice in your paper regarding Papago sweet corn. This was introduced by the University of Arizona. It makes more fodder than any green stuff I have planted, as one kernel will make six or eight stalks and each stalk makes an ear. I got better results than with Sudan grass, pie melons or feterita and I think it worthy of trial for silage purposes as the stalks are small in circumference but grow tall. The plant was first brought to light by Prof. G. F. Freeman, of the Arizona Experimental Station in the summer of 1910 while visiting the Papago Indian villages in the desert valleys of southern Arizona. Several strains were found and later crossed in the hope of combining the good qualities of each. Regarding the plant Prof. Freeman says: "The first year after the cross was made the average weight of the ripe ears was about 31 grams. Some, of course, were larger, weighing as much as 100 grams or more. Even these were small when compared with the larger varieties of eastern sweet corn. It was therefore planned to breed this corn for a few years in order to increase somewhat, if possible, the size of the ear and grain before giving it to the public for general planting. After four years of breeding, the average weight of the ear has been more than doubled, and the size and depth of grain has been materially increased. There are no indications that limits for these characters have as yet been reached, but as the variety now stands its superiority over eastern sorts for planting in the Southwest is so marked that it would be unjust to withhold it longer from public use."

I have no seed to sell.



Raymond, Cal. A. O. Nelson.

WHO HAS A GOOD WAY WITH REDWOOD SPROUTS?

To the Editor: Do you know of any effectual, permanent method of killing or preventing second growth redwood that sprouts from both stump and roots of logged off redwood trees? I am interested in some of this land and am unable to utilize it for pasture on account of this second growth which continues to sprout even after brush has been burnt over the stump. Any information you can give will be greatly appreciated.—F. L. L., Bethany.

[We know nothing but burning, bark chopping and grubbing. Will some one answer from redwood experience? Success with other trees may not fit.—Eds.]

Own An IHC Binder

KNOWING the conditions in your harvest fields as well as you do, it will be an easy matter for you to pick out the right grain binder for your work. Note the details of construction—How is the main frame built? Is the main wheel large enough and wide enough to give plenty of traction? Is there a simple means provided for quickly and easily taking the strain off the canvas at night, or when the binder is out of use? Are ball and roller bearings provided to lighten the draft? Will the elevator take care of both light and heavy stands of grain? Is the knotter simple and sure in action? These are the things that count.

In the **IHC** binders—**Champion, Deering, McCormick, Milwaukee, Osborne** and **Plano**—these things and all other details are taken care of. Own an I H C binder.

The same arguments hold good for the twine you use. Ask for and insist upon getting an I H C twine, made to work in the binder you buy, and sold at the lowest price consistent with I H C quality.

Your local dealer can furnish you with I H C binders, repairs and twine. See him or write to us for complete information.

"STANDARD" IRRIGATION
FLUME, GATES, PIPE, SIPHONS

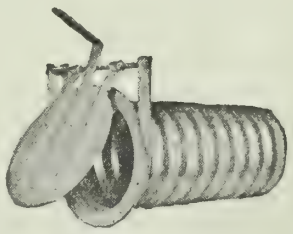
made of commercially pure iron by the Standard Corrugated Pipe Co., are recognized as standard and best for Pacific Coast conditions because of three superiorities:

1---Perfection of material. 2---Excellence of engineering design and mechanical construction. 3---Fair cost and long life under severest service.

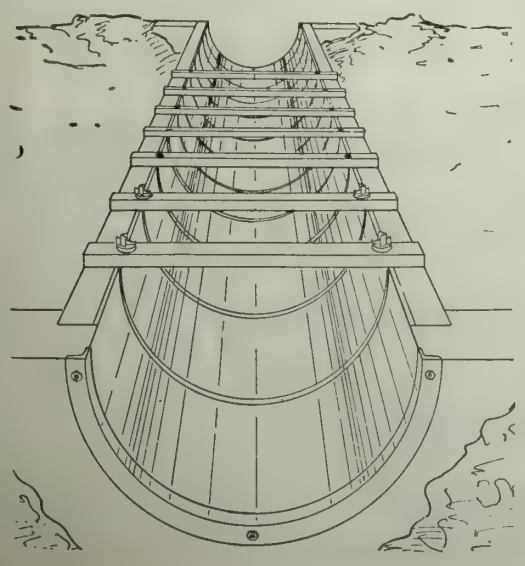
Year by year this company has been extending the sale and uses of its "Standard" irrigation equipment throughout California and the Pacific States, and its products have been installed under the widest possible variety of conditions, in municipal, State and government work, on irrigation projects and ranches large and small.

Our engineers have watched our equipment under all these conditions with the single purpose of making instant improvements if necessary. As a result, "Standard" goods are known throughout this field for their quality, strength and long life. They are designed by men of practical irrigation experience and make good because they fit the condition they are made for. Wherever installed "Standard" goods become permanent, lasting improvements on the property.

Large or Small Flume—Large or Small Gates—Large or Small Pipe—Large or Small Siphons—all are built with the same quality of material, design and workmanship and the man ordering ten dollars' worth gets the same quality as the man ordering ten thousand dollars' worth. They are all built of commercially pure iron and are rust and corrosive resistant to such a degree that they practically last forever.



This is the season for the installation of irrigation equipment. Flume, Culvert, Siphon, or Gate improvements and changes should be made **now.**

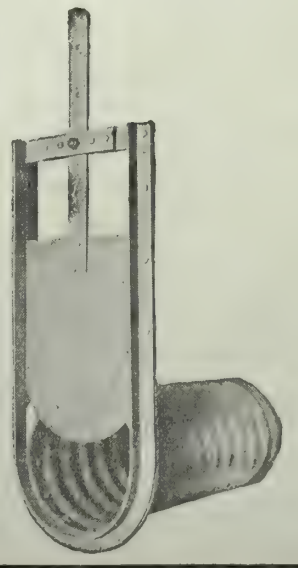


We are in position to make early deliveries **now.**

Where economy of water and elimination of trouble in handling is a necessity, Standard Equipment will fill your needs just exactly as well as it has satisfied all our other customers.

We represent our goods as the best that can be made. Let us know your needs and we will prove Standard Corrugated Pipe Co.'s products are best.

Send us a list or a sketch of what you want and we will give you immediate information, prices, etc.



Standard Drop and Flood Gates

(See Cuts at Right.)

for use with our Standard Corrugated Pipe and Standard Flume are known throughout California wherever water is used or handled. They are not freaks or experiments. They are known for efficiency and long life because their material and design are right for agricultural or commercial needs. Gate at top is automatic in operation—controlled by pressure on the front or back of valve. Gate below is drop pattern, adjustable to quarter-inch openings—cannot jam or stick. Can be locked in position. You cannot equal these gates for practical permanent use. Write for detailed information about Flume, Gates, Pipe or Siphons.

N. B.—All our products are made in California and shipped from our factories in San Francisco and Los Angeles. No long waits for arrival of Eastern goods.

Standard Corrugated Pipe Co.

516 Rialto Bldg., San Francisco.

737 Lawrence St. Los Angeles.

Efficiency in Labor on the Farm.

To the Editor: In your issue of February 19, Harry F. Stone gives some figures and opinion based thereon in regard to working six or seven days in a week, professing to show that more could be accomplished in six days' work than in seven.

If the figures show anything at all they show that Mr. Stone's brother was doing more in the start than he was capable of carrying out, and that in the second week's work he was getting accustomed to the kind of work. A competent picker, when accustomed to the work, makes the same stunt every day, irrespective of resting on the seventh day, and when it is necessary to work on the seventh there is no diminution in the output, nor is there any increase in the output by virtue of a day's rest.

A case in point came under the writer's knowledge recently, when orange pickers were crowded on account of wet weather and worked overtime to catch up with shipments. The women packers worked away into the night, making probably fifty per cent more time with just as much packed per hour as when shorter hours were worked. At the end of a week or ten days the packers lost in weight but not in efficiency. Working by the box they were up to full capacity all the time.

Where jobs are continuous there is no discrimination in the output, day by day. Shorter hours do undoubtedly increase the efficiency as was proved in Australia on the adoption of the eight-hour law day among mechanics, as about as much was done in eight hours as had been customary in ten.

In the Province of Canterbury, New Zealand, where an eight-hour day was always the custom among farmers as well, they got along just as well as where a 10 hour day prevailed.

As an equivalent to the shorter hours there were perhaps fewer breathing spells. Not so very long ago and before the advent of modern labor-saving devices, in harvest especially, the day's work was from sunrise to sunset and the earlier pioneers were at work, both men and women, about all of their working time. Today, where the eight hour prevails in farm work in busy times, pay by the hour is customary.

Every small farmer that does his own work knows that in the generality of cases where the ordinary hand is hired that his own time is oftentimes worth two of the hired hand, not only from his own increased diligence, but from using his brain to take advantage of every situation.

Riverside. James Boyd.

HONEY PLANTS AND BEE MOTHS.

To the Editor: I have a number of swarms of bees, but the honey we get here is quite dark and not very salable. I can move them up towards the foothills. There is plenty of manzanita and chaparral. Would that make a good quality of white honey? Also, is there any known remedy to keep moths out of the hives?—Enquirer, Lodi.

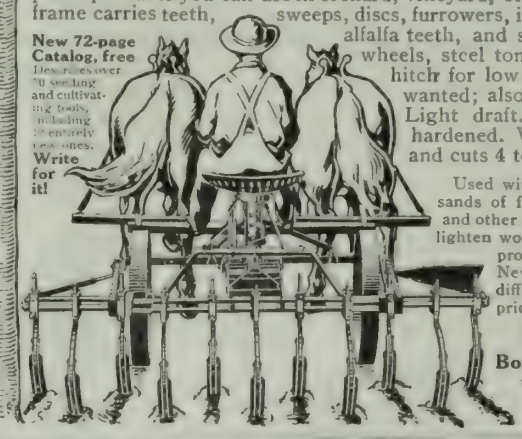
[Manzanita yields good honey: from white to amber—according to different regions, apparently. Chaparral is credited with amber honey, but the name "chaparral" covers various shrubs which may differ considerably in honey characters. There is no royal way to free hives from moths. They have to be watched for and the frames and hives cleared of them. Strong colonies protect themselves largely, but should be watched also.—Eds.]

COW PEAS IN CORN.

To the Editor: Referring to a query which appeared in your issue of March 18, about the desirability of growing cow peas in corn, I have been experimenting with cow peas and different kinds of corn for the last seven years and find I have the best results by mixing the two together; using one quart of cow peas to two quarts of corn and planted in drills three and a half feet apart, thinning the corn to one stalk every 18 to 24 inches apart. I find I can get more corn per acre by planting cow peas with the corn than I can without and the peas will produce well in the corn, the vines running to the top of the corn and setting so many beans that they often break the stalks over. This applies to Whip-poor-will cow peas, as they will make four times the vine and I think more peas than the Blackeyes.

Snelling. G. T. Allen.

A GOVERNMENT BONE MINE.

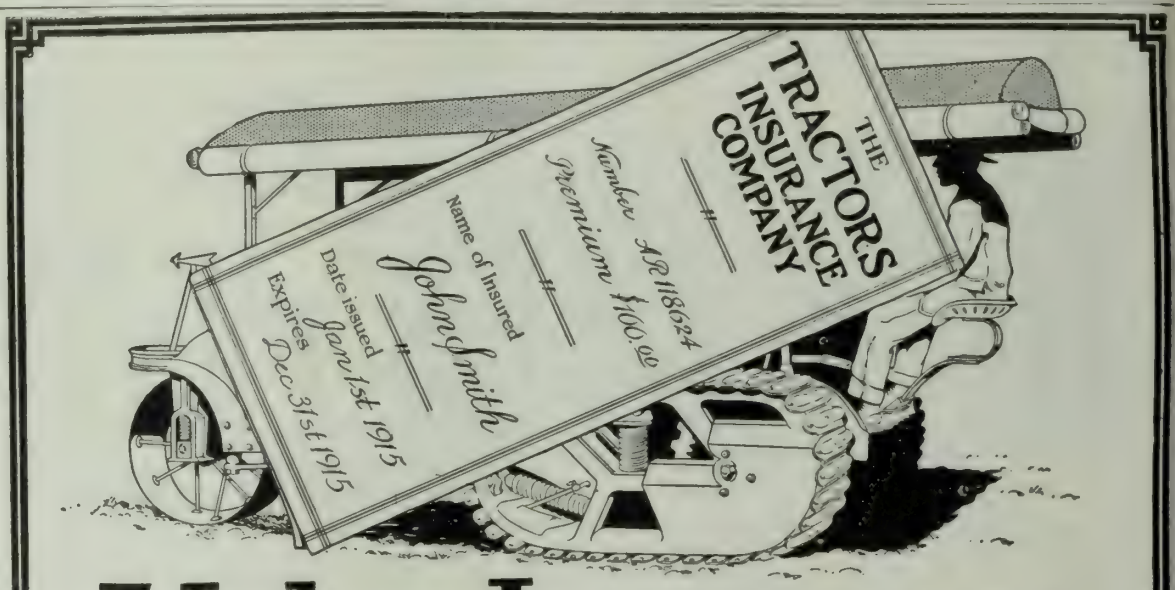


Millions of dollars' worth of seal and seal-bone deposits on the shores of the Pribilof islands, in Alaskan waters, a vast store of Government-owned fertilizer available for practical use! Secretary Redfield transmitted a report of the Bureau of Fisheries, telling of the Pribilof deposits, representing the accumulations of a century or more and constituting probably the largest deposits of bone in the world. Although they have not been fully surveyed, the report says, one of the deposits is a mile long by half a mile wide and fully six feet deep. Mr. Redfield directs attention to the fact that raw ground bone was bringing $35 a ton in December.

Planet Jr. Orchard Cultivator

—the fruit grower's greatest ally

A giant for strength! A steam-engine for work! A miser for economy! This **No. 41 Planet Jr Orchard Cultivator** is the biggest crop and profit producer you can use in orchard, vineyard, or hopyard. The strong frame carries teeth, sweeps, discs, furrowers, irrigating steels, plows, alfalfa teeth, and special weeders. Low wheels, steel tongue, tree shield, side-hitch for low trees, fore-carriage if wanted; also spring trip standards. Light draft. All steels especially hardened. Works deep or shallow, and cuts 4 to 6½ feet wide.



New 72-page Catalog, free Describes over 70 seeding and cultivating tools, including 20 entirely new ones. **Write for it!**

Used with great success by thousands of fruit growers in California and other sections. *You* need one to lighten work and help increase your profits. Fully guaranteed. New low prices. Made in 5 different styles at various prices.

Yuba Insurance

People oftentimes pay a substantial premium for insurance against delays. No company insures the farmer against delays—but you can be reasonably sure of securing the same protection.

The Yuba Ball Tread Tractor costs a little more than the average tractor. This increased cost is your premium.

Better material, better workmanship, a higher efficiency and a lower upkeep are your insurance—that the Yuba is able to do your work without the danger of costly breakdowns.

Carefully-managed corporations, that buy on merit and quality alone, and employ engineers to do their purchasing, are Yuba owners.

They appreciate the value of Yuba Insurance.

WHAT ABOUT SPINELESS CACTUS?

To the Editor: John Fox, horticultural commissioner of Napa Co., in the March 25th issue of the Press, wrote of the spineless cactus in a not very complimentary vein.

Actual experience with the spineless cactus I have had none, but from what I have seen, heard and read about it, I believe that there is a great future before it in countries which have tens of thousands of acres so poor that they will grow nothing but cactus.

I believe that cactus has a very low feeding value, so has such vegetables as white and yellow turnips, yet they are grown in immense quantities in the east and in Europe for stock-feeding purposes.

We have millions of acres in the state that will grow cactus and nothing else. Once planted, it is there forever. If it has any feeding value at all, the lands would play an important part in keeping dry-fed stock in condition.

One would naturally think from the length of time the cactus has been before the farmer that it would be thoroughly tried out before this. A couple of years ago I was passing by a place where there was what looked to me a nice patch of cactus. I went in to inquire about it. The owner said it was a fake and swindle; that the men selling it ought to be in jail, etc. I inquired the age of it. He said it had been planted 15 months. To me it had made a marvelous growth. The biggest plant had increased 14 fold, and yet the owner was displeased with it. He had heard tell of it producing 100 tons per acre: nothing short of that amount would satisfy him. The land on which it was growing was volcanic ash. Corn planted on this land would grow one foot in height, tassel out and die. Alfalfa might germinate, but the first day would cook it.

A few weeks ago a neighbor sold me a cow for chicken feed. She was down to skin and bone. She had been having all the dry hay that she wanted, but no green stuff. She was pretty ancient, but had my neighbor had a patch of spineless to draw upon to feed with the dry hay, I don't believe that I would have got her for chicken feed.

No doubt thousands of head of stock have died for lack of green feed this winter. I hope that some of your readers who have had actual experience in growing and feeding cactus, and have no plants for sale, will give their experience, stating quality of land where grown, and what it would do if planted to other crops etc. **Chas Blom.**

[We have frequently asked for such testimony. Who feels it practically worth having, for actual use, not for sale to others? Mr. Blom has the common error that cactus will grow everywhere. It does not do that naturally. It picks its own places in the desert, and the better the land the more cactus you see. But we will not quarrel about that. Who has it and is glad of it?—Ed.]

Kills Prairie Dogs, Ground Squirrels, G. Hogs, Pocket Gophers. Saves alfalfa. Experimentalstationsapprove. 1400 tablets, P. P. $1.25. Warranted. Mole Tablets, 75c. Ask Druggist or send direct. Booklet Free. Ft. Dodge Chem.Co., Ft. Dodge, Ia

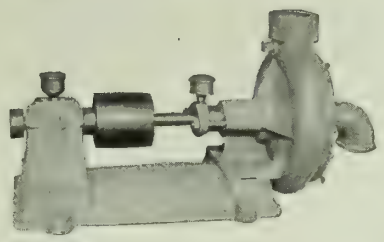
WHAT CITIES PAY FOR MONEY.

"Of the 238 incorporated cities of California," says State Controller Chambers, "198 have bonded debts, running from comparatively small sums to large totals. I find that previous to 1900 nearly all the bond issues were upon a 6 per cent basis; from 1900 to 1907, the rate ran 4, 4½ and 5 per cent, and from that year to date the rate has been from 4½ to 5 per cent. The highest rate I find was for a levee bond issue by the city of Marysville, in 1876, at 8 per cent. The amount originally authorized was $58,000, and of this sum $3500 still remains unpaid."

MARKETING AND FARM CREDITS.

"Marketing and Farm Credits," for 1915, contains the addresses given at the third annual sessions of the National Conference on Marketing and Farm Credits in joint program with the National Council of Farmers' Co-operative Associations. It contains 544 pages and is full of interesting facts about the two great business problems that farmers must solve for themselves. The price is $1 (postage 15 cents extra), from Secretary Charles W. Holman, Madison, Wisconsin.

SUMMER-SOWING ALFALFA.



To the Editor: Alfalfa may be sowed in mid-summer with fair success. The system I use works fairly well; however, I believe early spring is the best time for alfalfa planting.

First I irrigate the ground, then work it up well as soon as possible after wetting. Then I sow milo or some other head corn and harrow in after. After the corn has started and needs water again, sow the alfalfa and irrigate. **Frank Hasper.**

Seeley, Imperial county.

P. & O. No. 40 Combined Corn and Bean Planter

Furnished with open center or solid concave tires.

The Combined Corn and Bean Planter here illustrated is a machine built by one of the largest manufacturers of planters in the world, particularly to meet the requirements of the Pacific coast trade.

It is not a made-over machine, but is built from the ground up for Coast needs. This fact, together with the reputation of the P. & O. Company for building tools right in every detail, insures absolute satisfaction to every user of this planter.

It's the Way They are Built

FEATURES:

Equipped with a full set of plates for planting any of the different kinds of corn or beans commonly planted in California, including Egyptian and Kaffir corn.

Adjustable to any width rows from 28 to 44 inch. The check-rower machine is adjustable for checking rows 3 ft. 4 in., 3 ft. 6 in., and 3 ft. 8 in.

Accurate planting insured by the sight feed. Sight feed has a large opening, and the seed is visible at all times to the operator as it drops from the hopper to the upper valve.

Quick, detachable runners held on the shank by one bolt. Easily removed for sharpening.

Write for descriptive circular and address of nearest agent.

General Agricultural Review.

DECIDUOUS FRUITS.

Apricots will go less than 45 per cent of a crop in Kings county this year.

Unless a late frost is encountered apple growers of the Pajaro valley expect to have a large crop this year.

Late pruned peach trees on the C. F. Walker ranch in Fresno county are showing better leaf growth than early pruned trees.

"What will control red spider on prune trees better than dry sulphur?" inquires J. E. Hester of Visalia.

According to fruit buyers in Alameda county the apricot crop there will not be more than one-third of a normal one. Cherries are also reported to have been damaged.

Cherries are estimated at 50 per cent of a full crop in Santa Cruz county. Apple growers are spraying the first time for the codling moth, cankerworm and mildew.

Fruit crop prospects around Beaumont are unusually good at this time, according to reports from there, the only likelihood of damage now being from late frosts.

Peach blight around Selma does not seem to have been prevented by fall spraying with Bordeaux and spring spraying with lime sulphur, according to L. T. McKnight.

One of the largest orchards set out this year in the vicinity of Vacaville is that of the Hartley Orchard Co., who are planting 350 acres to prunes, apricots, shipping plums and early peaches.

M. Rusznak of Ontario delivered 47 tons of prime Tuscans to the canneries from 390 trees 8 years old, instead of 9 tons from 5 acres as stated in issue of April 1 under "Dry Farming Peaches."

Almond growers in Sutter county state that there is no truth in the published statement that there was likelihood of the Sutter association withdrawing from the State Almond Ass'n.

Because a number of trees in Sutter county are dying from some unknown disease Ralph E. Smith has been called into consultation by County Horticultural Commissioner H. P. Stabler.

A small orchard of almonds has been planted by Glenn Hall of Greenfield, Monterey county, this spring. The trees will be interplanted with gooseberries, which do well in the district.

According to S. Scurich of Watsonville there have been apples shipped to Los Angeles from Oregon which were badly affected with scab and in other ways unfit for consumption. He suggests that the Apple Distributors look into the matter.

Almonds, prunes and pears have led in this year's orchard plantings in Lake county according to Horticultural Commissioner F. G. Stokes. A few walnuts of the Mayette and Franquette varieties have been planted.

Steps have been taken toward the organization of a pear growers' organization by a number of pear growers in the Delta district. Efforts will be made to control the sale of pears to canneries through a Statewide association.

After a careful survey of the peach orchards around Gridley, made by a committee from the Farmers' Union, the statement was issued that owing to frost damage the peach crop of that district will not be more than 50 per cent normal.

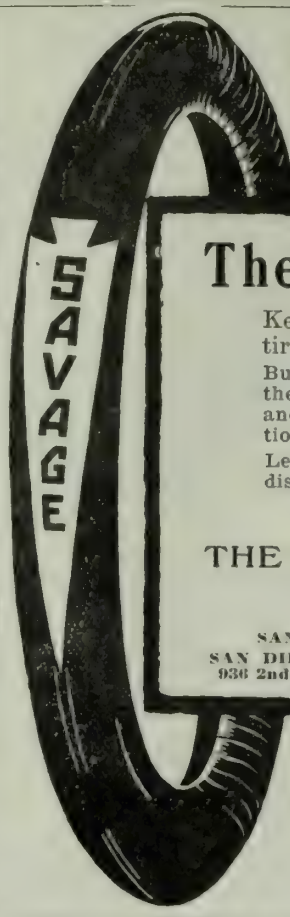
According to Horticultural Commissioner Beers of Santa Barbara county, the apricot crop will be short all over the county because of a cold rain that prevented fertilization. The size of fruit will be much improved from the small setting, however.

There is some objection among dried peach growers to the clause in the new Peach Association contract which makes it optional with the association whether it will allow withdrawal of members' crops to sell to canneries, according to E. E. Ford of Kings county.

According to the El Centro Progress some of the most experienced apricot growers in the State have purchased land in Imperial Valley and will make large plantings of that fruit, thus dispelling the feeling that Imperial Valley is not a good district for deciduous fruit growing.

The first attempt at frost fighting with orchard heaters in the Napa valley was successfully made recently by Fred Groeneveld and E. A. Price, who were able to keep the temperature in their prune orchards above 32 degrees, although it was down to 28 degrees on adjacent land.

Prof. F. T. Bioletti of the University of California, in co-operation with the California Associated Raisin Co., has been carrying on demonstrations in Fresno county as to the proper way of applying sulphur. Prof. Bioletti advises sulphuring early in the season before there are any signs of mildew.



While on a recent trip among the fig orchards of Merced county, Prof. A. J. Condit of the University of California suggested that Smyrna fig growers organize to have Capri fig trees planted in the foothills to insure a supply each year at a reasonable price. Capri fig trees in both Merced and Fresno counties were generally frozen last winter.

While apricot blossoming was heavier in Monterey county than usual, according to J. B. Hickman of Aromas, the recent change in weather reduced the crop to fully 50 per cent of a normal one. This may be still further reduced later by the brown rot. Apple trees in that district are blooming freely, but it is too early to predict the size of the crop.

Contrary to reports of 60 per cent of an apricot crop in Tulare county, Horticultural Commissioner Chas. Collins writes us that the crop is exceedingly spotted, some orchards being good but very many having practically nothing. He believes 30 per cent of a normal crop to be a fair estimate. He says peaches are heavy but that varieties subject to curl leaf are sustaining considerable damage. It is too early yet to tell what the result will be. Prunes promise a heavy crop. Citrus trees are blooming very full and vineyards are looking well with no frost injury to speak of.

CITRUS AND SEMI-TROPICAL.

About 10,000 avocado trees have been sold in Southern California for planting this season and there are as many more that will be sold, ac-

Write for particulars regarding our 1916 Portable Horse Power and Gas Balers, guaranteed to excel all others in workmanship, durability and capacity. We make both 3 and 5 Wire Bale Presses.

cording to T. U. Barber of Los Angeles.

May 16 will be Ripe Olive Day and growers, packers and State officials are all working toward a State-wide festival in recognition of the advances made in the olive industry.

Not over 40 per cent of avocado seeds planted for nursery purposes result in trees which are successfully budded and sold, according to a nurseryman who has been in the game practically from the start.

Exhibitions of fruit are desired at the California Avocado Growers' Ass'n meetings, so it is planned to hold them in spring and fall. The next one is scheduled for April 29. It will include a good program and the interested public is invited to attend.

One of the largest citrus land deals ever made in the northern part of California was the purchasing recently of the J. M. Howell ranch of 5,000 acres near Corning by Seattle capitalists who have secured the services of W. B. Ames of San Dimas to superintend the planting of over 600 acres of Washington navels this spring.

A report from Dinuba says that Valencia orange growers in that district are expecting a maximum yield of fine fruit this year. As many of the trees are just coming into bearing the crop will be much larger than ever before and growers are receiving advance offers of over $1 a box. Most of the crop will be shipped through the Northern Tulare County Citrus Ass'n.

VINES AND VINEYARDS.

Ramsey Bros. of Woodland have planted 30 acres of Sultana grape vines this spring.

Fresno county grapes, especially those pruned early, were pretty badly frosted late in March.

J. W. Jeffrey, who is making a survey of the grape vines in the State Department of Viticulture, has found 10,350,000 vines in Napa and Contra Costa counties.

Don't irrigate grapes till after the fruit is set. Dry them out temporarily by plowing the dirt away from them, says Frank Henry of Fresno county.

When you plant vines where rabbits, etc., are likely to hurt them, tear a hole in the bottom of a paper bag, slip it down over the cutting, throw a little dirt into it, and the animals will not bother it, says Frank Henry.

As a result of the campaign started the first of January by the directors of the California Associated Raisin Ass'n, 45,533 acres have been signed up, giving the company control of 90 per cent of the raisin crop,, according to a published statement in the daily papers. The association now has a total membership of 7500 members, an increase of 1500 since the first of the year.

FIELD CROPS.

Indications are that both the barley and bean acreage in Monterey county will be larger this year than last.

A dispatch from Yolo county says that the report which has been circulated to the effect that a large number of hop vines in that county are to be pulled up is not true.

B. Graves, who owns a mountain ranch near the Newhall ranch in Monterey county, has succeeded in growing good crops of alfalfa on rolling hills without any irrigation water. He is now putting in several hundred acres at an elevation of 1500 feet above sea level.

Rice growers in San Joaquin county have formed an organization to be known as the San Joaquin County Rice Growers' Ass'n. The association was organized for protection against the weed pest but it is announced that later in the year it may co-operate with the Sacramento Valley Rice Growers' Ass'n in selling the crop of its members.

Rice shipments have again been started from Butte county to Porto Rico after a delay of three days, pending an order received by the railroads not to accept any more rice for shipment by way of New Orleans as ships were not available from there to Porto Rican ports. The new order allows shipments by Virginia. About two-thirds of the California crop is being marketed in that country.

MISCELLANEOUS.

The California Vegetable Union will ship 100 cars of cabbage from Garden Grove, Orange county, this spring.

Pump irrigating 15,000 acres near Terra Bella is to be the work of a co-operative organization of farmers already organized. Offers have been made to buy the bonds.

As a result of success so far encountered in the manufacture of potato flour at the recently equipped mill in San Joaquin county, the mill is to be doubled in size.

An Oregon apiary company has shipped two carloads of bees into the Porterville district where they will be distributed among the orange groves to make orange honey.

A petition is being circulated in the Atwater district of Merced county for the construction of a drainage district to handle the surplus water of the district in the winter months.

AVOCADO SEED LIMITED.

Only 40,000 to 50,000 avocado seeds are now available per year for nursery purposes, according to Hart and Barber of Los Angeles, whereas when the Federal quarantine was put onto seeds from Mexico, some 250,000 had been imported, were held in cold storage several months, and most of them finally burned. A large part of the present avocado nursery stock is from seeds imported before the quarantine was applied in 1914, therefore the supply of fruitless budded stock for orchard planting is bound to be limited for some years to come or until local seed production fills demand.

John Deere Disc Plows for Tractors

For Field or Orchard

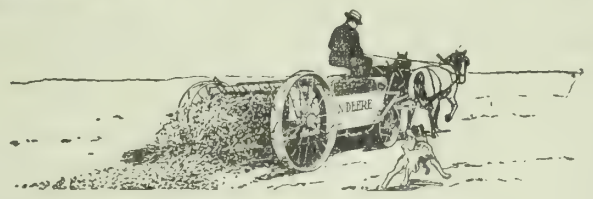
MADE especially for use in the West. Work successfully in every soil where a disc plow should be used.

Plow anywhere from five to twelve inches deep.

One-man outfits—controlled by man on the tractor. Work with any standard tractor.

Can be used either for field or orchard work simply by changing the land axle.

All levers down close to plow when at work—plow can be operated close to trees and under limbs without injuring them.



Easily transported—special lever at the rear for lifting discs high and level.

Over fifteen inches clearance under beam; twenty inches between discs.

Twenty-four or twenty-six-inch discs with chilled metal bearings—constructed so that bearings do not drag along wall of furrow when plowing deep.

Can be reduced to four discs by taking off one intermediate section and telescoping connecting rods.

Write for free booklets describing the John Deere Tractor Disc Plow No. 10 for field work and No. 11 for orchard and vineyard.

John Deere Spreader

The Spreader with the Beater on the Axle

ONLY hip high to the top. Wheels out of way when loading. Mounting the beater on the axle is patented. Write for Spreader booklet.

Three exclusive John Deere Spreader features:

[1] Beater on the axle—nothing else like it. [1]

[2] Revolving Rake—load moving back to beater revolves the rake. Draft actually less. Even spread certain—no bunching. [2]

[3] Ball Bearing Eccentric Apron Drive—requires no attention. Performs wonders in the working of the spreader. [3]

John Deere Plows for Light Tractors

For Orchards and Vineyards

PRACTICAL—one-man outfits. Work with any standard tractor. Controlled by man on the tractor.

High and Level Lift—Pull the rope and all bottoms raise high and level. Another pull lets them down. Plows do not clog or gather trash on the turn.

No levers—plows leveled and depth regulated by screw device. Can be run close to trees and vines without injuring branches.

Regular with three or four 12-inch bottoms. Quick Detachable Shares—save 80% time changing shares. Write for free booklet describing light tractor plows for orchard and vineyard, or regular field work.

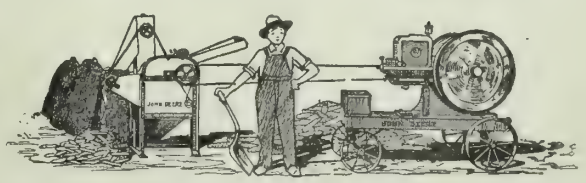
Van Brunt Drills

With Adjustable Gate Force Feed

THEY plant any small seed, alfalfa to bearded oats, peas or beans.

Amount sown per acre easily regulated merely by shifting feed gauge levers.

All the ground sown, because the Van Brunt adjustable gate force feed and special agitator in the hopper compel seed to leave hopper in even, continuous streams—no bunching or choking up—and an equal amount goes into each furrow.



An even stand of grain is secured, because pressure springs compel all the discs to cut furrows of even depth, and the closed delivery places seed at bottom of these furrows.

Van Brunt Drills do not clog up. Scrapers keep discs absolutely clean.

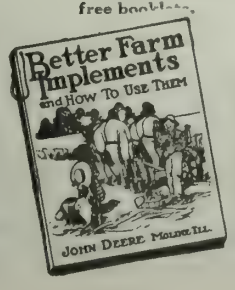
Smooth running—each wheel drives half the feeds, equally distributing the work. A direct, double, gear drive from the continuous axle.

High grade discs with bearings that are guaranteed to last lifetime of drill. Either single or double discs.

Grass seeder attachment can be furnished which will drill or sow broadcast as desired. Write us for free booklets.

R. & V. Engines

Dependable Farm Power



"R & V" Triumph—always develops rated horse power—made in 1, 1½, 2½, 4, 6, 8,10, 12, 16 and 20 H. P. sizes, stationary and portable.

Easily started; perfect speed control (speed can be varied 40 per cent without stopping engine). Complies with insurance regulations. Hopper cooled—a simple, efficient system that does not require long pipes and numerous fittings.

High grade throughout. Inspect the extra guard ring over piston pin to prevent possibility of scoring cylinder. Ask about the "R & V" oscillating magneto. Write for free booklet.

John Deere Dealers Everywhere

Better Farm Implements and How to Use Them

BOOK FREE—168 page reference book—tells all about a complete line of farm implements and how to adjust and use many of them. A practical encyclopedia of farm implements. Worth dollars. Describes and illustrates: Plows for Light Tractors; Steel and Chilled Walking and Riding Plows; Disc Plows; Cultivators; Spring Tooth and Spike Tooth Harrows; Lister Plows and Cultivators; Disc Harrows; Alfalfa and Beet Tools; Farm and Mountain Wagons; Teaming Gears; Manure Spreaders; Inside Cup and Portable Grain Elevators; Corn Shellers; Hay Loaders, Stackers, Sweep Rakes, Mowers, Self-Dump Sulky and Side Delivery Rakes; Hay Presses; Kaffir Headers; Grain Drills and Seeders; Grain Binders; Corn Binders; Gasoline Engines. This book sent free to every one who states what special implements he is interested in and asks for Package No. L-152.

John Deere, Moline, Illinois

Mechanical Power on the Farm.

ORCHARD TRACTOR RUSHES WORK.

[Written for Pacific Rural Press.]

"Here is the handiest tractor I know of. We worked in and out of the trees with this double-disk all day yesterday without breaking a branch." So spoke Mr. Brabrook of Edwards and Brabrook, who have a lemon orchard set on the quintuple system near La Habra. "She is guided by regulating the speed of each track independently of the other."

He was, at the time following the disk with a big stick to clean out the adobe mud which stuck it up even while the little Bullock Creeping Grip tractor of 16-8 h.p. skimmed along on top of the soft dirt on its tracks, five feet of which were always resting on the ground. The disks, unweighted, tipped the scales at 1460 pounds.

"The only objection to this tractor is that it spoils Scott's complexion," said Mr. Edwards. "It does the work," and a heavier engine would only weight down the ground more."

"It pulled these 24 disks the other day, with three men and 400 pounds on them," said Mr. Scott, the driver. "It pulled out 40 boxes of lemons on a sled through the soft ground and across a muddy ditch about two feet deep and three feet wide. If there had been a front weel on the tractor we would sure have been stuck. It burned 12 gallons of distillate yesterday on the disks. Fifteen gallons would do a hard day's work. We can disk 20 acres both ways twice between each two rows in 18 hours."

"Why don't you weight the disk down today?" asked Mr. Edwards.

"Because we want to get over the orchard as soon as we can, just scratching the top, breaking the crust, and cutting the clods to pieces. Anyhow it clogs up enough in the wet ground running light. We will save moisture by getting over the ground lightly and soon. Then we can really cultivate deep at our leisure."

PROBABLY CARBURETER TROUBLE.

To the Editor: I have a 4 h.p. jump spark engine which is giving me a great deal of trouble. It sometimes misses fire two or three times and then emits a dense black smoke, then picks up gasoline and uses it for five or six revolutions steady without cutting out. Then it may run steady for a short time, but again repeats the process. I wrote the makers about it and they suggested that I get a magneto. I did so but it acts the same way running a pump. I used it last summer running a 10-inch Smalley cutter and thought possibly I was giving it too much to do. But as it is acting the same way on the pump, that could not be the reason. The thought occurred to me that it might be the spark coil and that it missed sometimes. I started the engine up to see if I could tell if the buzzer missed, but could not notice it move at all. Kindly advise me what to do.—A Subscriber, Denair.

[Answered by Prof. J. B. Davidson, University Farm, Davis.]

[It is not possible to make a definite diagnosis of the trouble from the symptoms described, but the indications are that the trouble is with the fuel supply rather than the spark, although ignition troubles might give some symptoms similar to those described.

An engine provided with a fuel pump which is not working perfectly will often act in the way described, the fuel becoming so low in the carbureter that an explosive mixture has not formed, resulting in a missed-cycle, which is followed by continued action of the pump and an excess of fuel for the engine. The fact that black smoke is thrown down following the missed explosion would indicate that there is something wrong with the carbureter.

We advise the owner to look into the matter of fuel supply carefully and see whether or not the pump keeps the fuel at a uniform height in the carbureter overflow cup all the time. The trouble is more apt to happen on light loads than heavy loads, and is confined to engines with pumps which operate only when there is a working stroke.

Referring to the spark coil, some jump spark coils will not work well with magnetos. This trouble is due to the action of the magneto coils. But we take it that the trouble is not due to the magneto inasmuch as it has been described as being the same when batteries were used.]

POWER HORSE-CLIPPER.

[Written for Pacific Rural Press.]

Clipping fifteen horses or mules in nine hours is the rate claimed by C. J. Eckles and his partner of Santa Ana with their power-clipping machine. Mr. Eckles said they had clipped over 700 head during the season beginning about Oct. 5 and ending Mar. 1. Later clipping is inadvisable on account of sunburn.

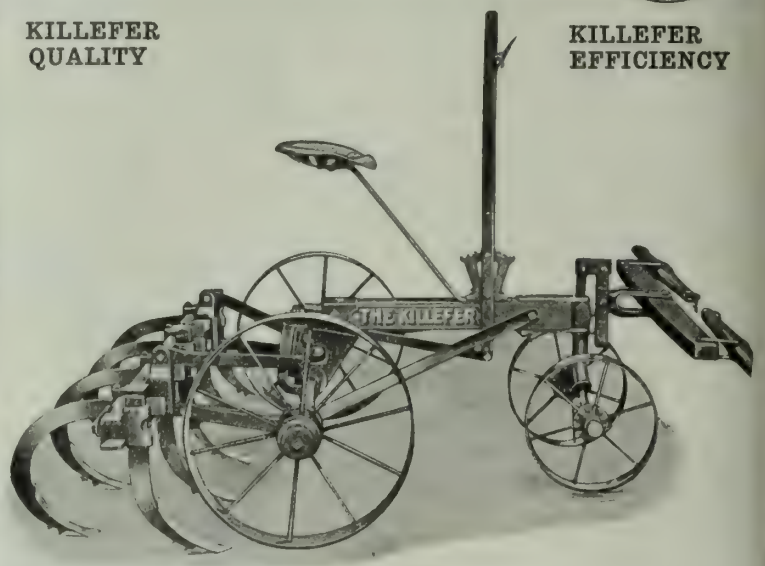
The outfit consists of a 2 h.p. gas engine set on the front end of a wagon-bed frame which supports a 6-foot tall framework over the back wheels. The frame consists of vertical pieces connected at the top by a crosspiece which projects perhaps a foot. The verticals are supported by braces down to the center of the wagon bed. Across these braces rests a shaft run by a belt from the engine.

The shaft has a belt wheel on each end which runs a belt wheel hung under each of the projecting ends of the crosspiece on top. A loose wheel on the same axis takes the belt when the clipper on that side is not to be run. Another tight wheel on the same axis runs a belt rope out to a pulley on the end of a gaspipe which projects 4 feet beyond the wagon end and hangs pivoted on the projecting top piece with a counter weight at the other end, so its projecting end may be raised or lowered at will.

The projecting pulley runs a "rolling chain" inside a flexible tube eight feet down to the clippers, which are thus handy to reach every part of the animal. One man works on each side, and with good luck they get through in 30 minutes.

TRACTOR TURNS AROUND IN BOX CAR.

[Written for Pacific Rural Press.]



"I saw an orchard tractor climb onto an auto truck and turn around on it this morning," said F. A. Tutt, Pacific Rural Press representative at Los Angeles.

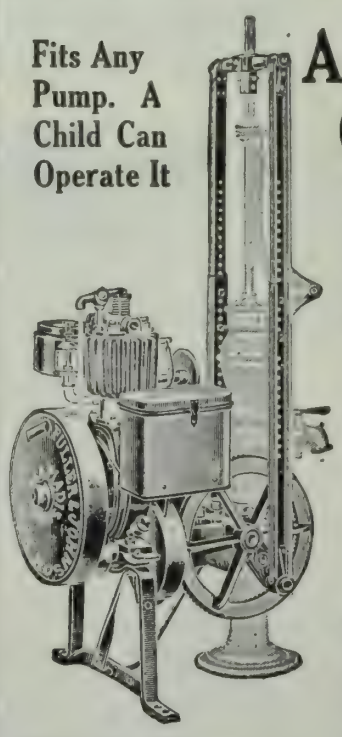
"The truck was six feet wide. It backed up to the curb and two 3x16

Our Standard Cultivator (K)

KILLEFER QUALITY

KILLEFER EFFICIENCY

This Cultivator is constructed on the same lines as our Heavy Duty Tractor Cultivator, but of lighter material for team use. The lifting device is connected directly with the axle and in raising and lowering the frame the axle turns in large bearings. This makes a powerful lift, doing away with the many joints required in parallel lift machines, and makes the frame bar doubly rigid and without any tendency to dip or run deep at the ends. Placing the standards between the bars gives a much stronger frame bar and more clearance between the standards which allow us to work trashy ground successfully.



The axles are not rough iron, but are made of steel with turned bearings. The wheels are the most perfect dust proof ever put on the market with hubs that can be easily and cheaply replaced when worn. These hubs are not rough cast, but are turned to fit the axles and supplied with Safety Compression Grease Cups.

This cultivator was built for a two-horse machine, but the use of extremely high carbon steel for frame bars and standards has given us a cultivator that is being used successfully for four-horse work.

The Killefer Manufacturing Co.

Fits Any Pump. A Child Can Operate It

A Vital Necessity On Every Farm

This Farm Pump Engine should be on every farm, not because of the time, work and money it saves but because of its great adaptability for all kinds of farm labor. This engine will supply from 270 to 2450 gallons of water per hour on the hottest, coldest and calmest days. It will enable you to have all the water you want for your stock, household use and for washing your wagons, farm implements, etc, And in addition, the

Fuller & Johnson Farm Pump Engine

will run your cream separator, washing machine, churn, grinder or any other mechanism that is run by hand power. This Farm Pump Engine runs steadily, easily, without watching and without vibration. It comes to you ready for instant use, there are no extra parts to buy and it can be attached to any pump without extra fittings, special platform or foundation.

Write Now for Interesting Literature

The literature on the Farm Pump Engine describes in detail just what it will do. It shows clearly and briefly how it can save its owner work and money, and the many testimonials we have prove conclusively that the claims of the makers as to what it can do are not only truthful but very conservative.

The Fuller & Johnson Farm Pump Engine is the lowest priced machine of its kind on the market. It is also the only one of its kind made which will give such a variety of long, dependable service.

THE MORTON TURBINE PUMP IS YOUR LOGICAL CHOICE BECAUSE—

It saves you money in initial cost of pumping plant.
It pumps more water with less horse power.
It pumps 250 gallons per minute from a seven-inch well.
It pumps 1000 gallons per minute from a ten-inch well.
It pumps 2000 gallons per minute from a twelve-inch well.
Every bearing is protected from sand and water and is lubricated by force feed.
The best well—the sandy well—is the home for the MORTON TURBINE PUMP.

inch planks about 15 feet long were laid from the sidewalk to the truck bed, making a four-foot rise. That Bullock Creeping Grip tractor ran up the planks with its own power and turned around. It weighs 6600 pounds—still it didn't break the plank. They say it can run into a box car, turn around and come out, or it can turn around on the scales that weigh it. The engine develops 16 horsepower, and they claim 10 horsepower at the drawbar."

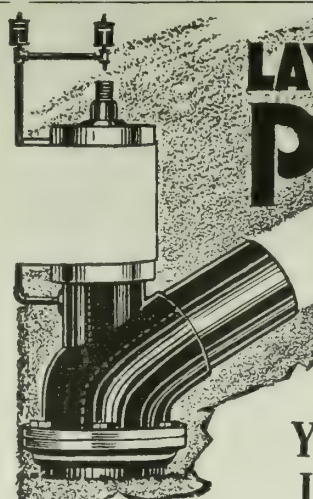
CITRUS SPRAYING REQUIRES POWER.

[Written for Pacific Rural Press.]

How to spray citrus trees thoroughly was shown to all interested by the Shure-kil spray people under direction of President L. A. Pratt during the Orange Show at San Bernardino.

The automobile carried several parties daily to an orchard near Rialto, where the demonstration was at work. The latter had fixed up a 2 h.p. Fairbanks-Morse engine and pump on the back of an automobile, so it could be moved about very readily. It maintained 225 pounds pressure. The trees averaged about 12 feet in diameter and the same height.

Two Imperial 45 degree nozzles were fixed side by side about four inches apart at the end of a cane spray rod some dozen feet long. This made part of the spray come out at about right angles to the rod and part straight endwise from it, filling all the intermediate space with spray. This was its own protection for the operator. The nozzles were smooth knobs without any projections to catch in the brush.



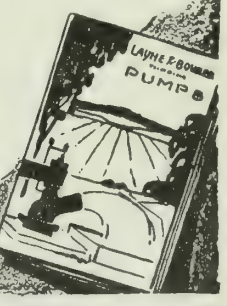
Scale are more often found on the under sides of leaves, so that the principal attention is directed to them. The first motion is to shove the spray rod through a convenient opening and to drench the trunk and main limbs, always working from the ground upward; but turning the nozzles downward to soak the top sides of the limbs. Then the nozzles were worked slowly outward through the leaves and small branches, almost always shooting the spray upward. The tops of the leaves would catch settling spray and drippings, so did not need as much attention as the under sides. The process was repeated at every convenient opening, probably six or eight entries in the circumference of some trees. Then the next stage above was treated similarly, and still another stage in some trees. Then the nozzle rod would be held nearly vertical to get spray on every spot in the top of the tree.

The good effects of such thorough spraying were seen on a number of trees that had been sprayed some weeks before. Scarcely a live scale could be found, though there were plenty of them on the unsprayed trees.

PICTURE FRAMES.

The stationers' and other shops where picture framing is done are showing some very attractive hand-modeled frames for photographs. These are made with a pedestal so that the picture can be placed on a mantel or dressing table and are in dull gold and bronze colorings.

LAYNE & BOWLER PUMPS



All the Water You Want at Your Instant Command

By owning an efficient pumping plant, the irrigator is independent of the water requirements of his neighbors; water is available 24 hours a day; an adequate amount of water is instantly at hand; the installation and operation calls for a minimum expenditure and not a bit of water is lost, as is the case when the canal system is used.

Install the Layne & Bowler Pump and be absolutely assured of the very cheapest water at all times. Let the world's largest water developers solve your pumping problems. Our free advisory service is maintained for the benefit of the thousands of prospective irrigators.

We manufacture pumps for every requirement. Also the famous Keystone and Shutter Well Screen.

The Control of Crown Gall, or Root Knot.

(Continued from page 441.)

concentrated lime sulfur and the two stronger solutions of Bordeaux (Bordeaux paste and 12-15-50) killed or injured many of the small trees, so that a number failed to start. The prevention of gall development on the treated trees was so slight as to be of no practical importance, although there was a slight reduction in amount of gall as compared with the untreated trees. It was not sufficient, however, to be of any economic importance. The weaker strength, 4-6-50 Bordeaux mixture, showed no decrease of gall infection as compared with untreated check trees. Concentrated Ortho lime sulfur killed all the treated trees. From the experiments thus far conducted, the treatment of peach roots with germicides is not to be encouraged.

Use Clean Ground. — The importance of growing nursery stock in soil free from infection of the crown gall organism cannot be too strongly emphasized. Most nurserymen make an effort to grow their stock in clean soil, but this is not an easy matter, for there is no way of absolutely knowing such soil, aside from the actual test by growing a crop of nursery stock. If the infected trees could with certainty all be eliminated from the stock to be planted, the problem would not be as important. The small galls are difficult to detect and many of them may be in an incipient condition where detection is impossible. In certain parts of the State, special efforts are being made by planters to secure clean stock.

The nurseries themselves are often visited by interested parties about tree-digging time, and only the ones showing a reasonable freedom from infection are considered when the trees are purchased.

Almost as important as clean stock, is soil free from infection. This will be less important as the more resistant stock comes into general use. Soil is often naturally infected, either because recently cleared from the native trees and shrubs, or because diseased orchards or vineyards have just been removed. Nurseries have come to our attention that were badly infected with crown gall where they were planted in virgin soil recently cleared from the natural trees and shrubs.

It would be safer to wait two or three years before replanting stone fruit trees in soil recently cleared from diseased trees. In the meantime, some annual crop could be grown. Citrus and olive are resistant and could be planted at once, as could also resistant stock of Prunus. For the stone fruits, and possibly also for walnuts, a longer time (two or three years) should be given between plantings, especially where the trees taken out were known to be infected with crown gall.

Surgery. — Tree surgery is occasionally employed in removing the galls from large orchard trees. It is a mistake to wait and allow trees to grow three or four years in the orchard before they are examined for evidence of this disease. Trees should be dug around and examined the winter or spring following planting. Some may be found very seriously affected. These should be marked, either for treatment or to be dug up and replaced if seriously affected. Do not try to treat small trees if badly galled. It is a waste of time, and nursery stock is too cheap to chance keeping a diseased tree.

The method of tree surgery can only be used on the part of the tree near the surface of the soil; that is, on the crown and upper roots. This fortunately is the part of the tree most seriously affected. The work should be carefully done to be efficient. All the diseased tissue should be removed with a chisel. A sharp knife is also useful, as well as a hatchet.

After treatment, a good germicide must be used. A Bordeaux

Artificial gall in hard shell almond. Puncture inoculated July, 1911, to January 23, 1912, with pure cultures of gall organism.

paste solution, similar to that used for citrus gummosis, is possibly as good as any preparation. This as recommended by Professor H. S. Fawcett, is made as follows: 12 pounds of bluestone (copper sulphate) dissolved in 8 gallons of water in a wooden, earthen or glass vessel; and 24 pounds of quick-lime slaked in 8 gallons of water. When the lime is cool, stir together about equal parts by volume of each for making enough mixture to last for one day only. The bluestone is easiest dissolved by suspending it in a sack at the top of the water over night. If the bluestone is pulverized and suspended in warm water it dissolves rapidly. Good lime that is not air-slaked should be used, and after slaking it with the water it should be cooled before used in making paste. If covered to avoid evaporation each ingredient will keep indefinitely, but after mixing, the paste slowly deteriorates. Where it is being used over a number of days or weeks, just enough of the wet slaked lime and the bluestone solution should be mixed to make paste enough to last for one day, leaving the remainder unmixed in separate vessels. It may be applied with large brushes, as is whitewash.

Conclusions. — Resistant stock is the most satisfactory way in which this disease will be controlled. In

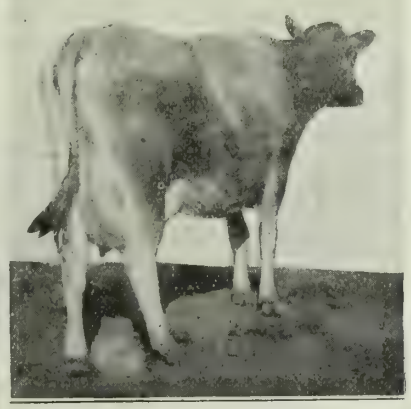
a short time, several of these may be available. Treatment of roots with disinfectants can not be recommended. Clean stock in clean soil is the only plan that can now be suggested. Tree surgery will never be generally used, as it requires too much time and work and may need to be done over again the next season, as the gall is very likely to reappear on the margin of the treated area. The place where the dirt has been dug away preceding treatment, does not need to be refilled.

Foundation Jerseys at Auction.

[Written for Pacific Rural Press.]

We are advised by R. A. Watson, manager of the Rancho Dos Rios herd of registered Jerseys, that with the exception of four or five high-class herd sires, their offering at public auction May 6 will be foundation females.

As these will comprise practically their entire milking herd of over 100 head, their sale will offer both prospective breeders and dairymen an unequaled opportunity of securing foundation herds at public auction, for it has been a common practice of consignors to offer a large percentage of bulls.



Dos Rios Pogis, 89008 A. J. C. C. To be sold at auction, May 6.

As indicating the relatively high quality of the animals to be sold Mr. Watson points out that because of the size of their herd, which is the largest in the State, they have been able to select their milking herd with more than usual care, and as a result the animals in this sale are equally as good if not better than most of the dispersal sales have to offer, and much better than the ordinary consignment sale where the breeder is compelled to reserve most of his choicest stock for future breeding operations. The only reason they are being sold is to make room for an unusual number of heifers about to freshen and a scarcity of feed on the ranch for so many cattle.

For the dairyman wishing high-class grades the sale is an exceptional opportunity, as practically all of the cows offered are of pure breeding but cannot be registered in the American Jersey Cattle Club. This is due to the fact that their dams and grandams were registered in the Pacific Coast association before that association went out of business, and as the American club did not recognize the coast club, the animals automatically became grades in name although they are as purely bred as the A. J. C. C. animals in the herd.

The breeding of these animals is practically the same on the sires' side as the A. J. C. C. cows, registered A. J. C. C. bulls, having been used ever since the herd was established and great care has been exercised in choosing herd sires from the greatest producing strains of the breed.

One of the registered cows to be offered in Rancho Dos Rios sale.

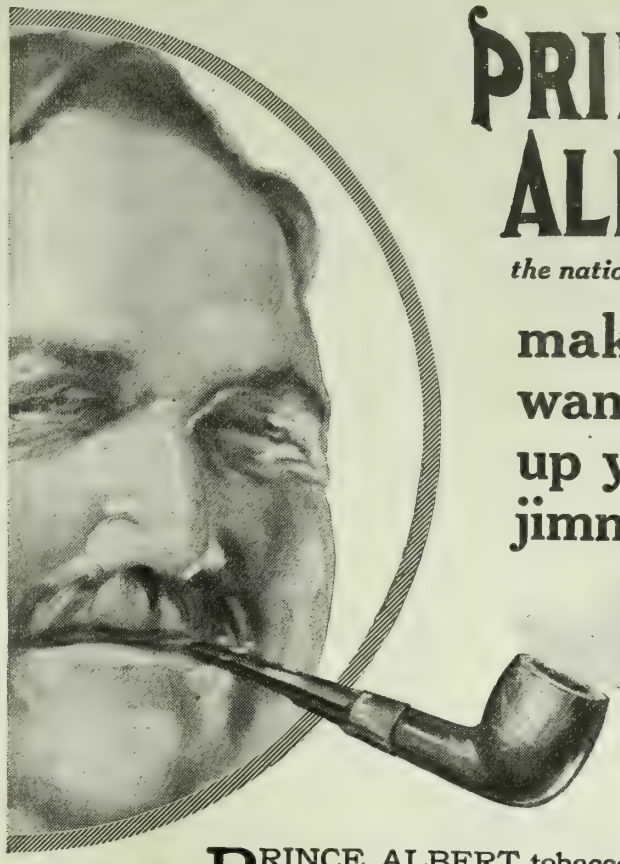
Altogether this sale offers the buyer many advantages superior to any dairy cattle sale of late years on the Coast and buyers from all parts of the Coast will doubtless make it a point to be in attendance.

MUST HORSE BE LICENSED?

To the Editor: Is it necessary for anyone who has a horse colt and breeds his own mares and a few others in the neighborhood, but not at a public stand, to obtain a license? —N. B. W., Thalheim.

[Answered by Dr. Chas. Keane, State Veterinarian.]

[In my opinion, the stallion registration law clearly contemplates that the only instance when a stallion or jack is not required to have a license is when such animal is used entirely in the service of the owner.



The fact that your subscriber breeds his stallion to mares of neighbors undoubtedly places the animal in the position of "standing publicly."]

WILL SUDAN POISON CATTLE?

To the Editor: Can you pasture cattle and sheep on Sudan grass without danger of poisoning them? K. C., Lodi.

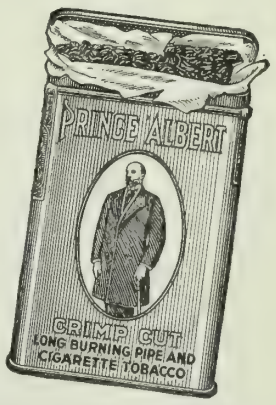
[Inasmuch as Sudan grass has most of the characteristics of Johnson grass there might be danger from prussic acid poisoning if the growth has become rank. This danger exists with Johnson grass, but we do not know for certain about the condition holding true with Sudan grass. Perhaps some subscriber will tell us his experience in this respect.—Eds.]

W. W. Phillips of Fresno will soon have a purebred herd of Holsteins.

PRINCE ALBERT

the national joy smoke

makes you want to fire up your old jimmy pipe!



Copyright 1916 by R. J. Reynolds Tobacco Co.

PRINCE ALBERT tobacco throws open the gates to *every* man fond of a pipe or a makin's cigarette—*it's so friendly!* Just makes smoke joy possible for all degrees of tender tongues and tastes! The patented process cuts out bite and parch! And you can't get better proof than the fact that Prince Albert is today smoked not only throughout the United States, *but all over the world!*

First thing you do next, locate that old jimmy pipe or the makin's papers; invest 5c or 10c for a supply of P. A. And fall to like you are on the right track. For Prince Albert is better than the kindest word we ever have said about it. And you'll find that's a fact!

You can buy Prince Albert everywhere in the toppy red bag, 5c; or the tidy red tin, 10c; in pound or half-pound tin humidors or in the handsome crystal-glass pound humidor with sponge-moistener top that keeps P. A. fit-as-a-thoroughbred!

R. J. REYNOLDS TOBACCO CO., Winston-Salem, N. C.

On the reverse side of this tidy red tin you will read: "Process Patented July 30th, 1907," which has made *three* men smoke pipes where *one* smoked before!

Baby Beeves Successful.

[Written for Pacific Rural Press.]

One hundred and thirty baby beeves weighing 800 pounds each at 12 to 14 months have been sold by the Tehachapi Land and Cattle Co. to be delivered in Los Angeles Apr. 10, according to Roland Hill. They were put into the feed lot last October as weanlings.

Alfalfa hay has been kept before them all the time. At the start, each calf received, besides hay, 10 pounds red kafir silage and ½ pound cottonseed meal. This was gradually increased until on full feed they cleaned up promptly 22 to 25 pounds silage and 2½ pounds cottonseed meal per day, besides about 20 pounds alfalfa hay.

During the last 75 days of feeding, they received corn, starting with a pound and increasing to five pounds 20 days later.

The red kafir was cut when the kernels were hard but the stalks green. It would have made poor silage if cut before the kernels hardened, according to Mr. Hill. Enough water was added so that it would drip out when a handful was squeezed, but not enough so there would be standing water in the bottom of the silo. That would make it sour.

Shelter Provided.—The feeding stock has the run of a corral 175x250 feet in which the alfalfa racks are filled from cars run out on tracks between them. Open-fronted sheds kept dry, provide comfortable places to lie down in. Old railroad ties make a cheap but effective floor in front of the mangers.

"The big thing is to get them onto full feed gradually and be careful never to get them off feed, and provide dry places for them to lie down," says Mr. Hill.

"We have about 100 purebred Hereford bulls, using them to improve our range cattle. That helps account for the good babies. We prefer Herefords for range cattle if we can keep up the bone and size, because we think they are the best rangers and the earliest maturing cattle.

"We will fatten several hundred babies next year. They put on the gain more economically than the two and three year olds, and slightly better than the yearlings."

ARE BLACK-WOOLED SHEEP DESIRABLE?

To the Editor: A number of people in this community who have splendid flocks of purebred Shropshire sheep are getting from one to three or four coal black lambs. This is not at all unusual with Merinos, but is an uncommon occurrence with Shropshires. These people have all been careful to breed to the best registered bucks. I would like to know if the original Shropshires were black or whether unfortunately for the breeder, some foreign blood has been introduced into these flocks by some of the imported rams. I would like to know also if you can advise me whether you think it would be profitable for me to buy up these purebred blacks and start a black flock. Of course if there is no advantage in the black fleece there would probably be nothing gained.—Subscriber, Solano county.

[Mr. T. Ballard, shepherd of the San Ramon Rancho flock of Shropshires, states that when the Shropshire was made a breed, one of the crosses was a horned black sheep, and that no matter how careful one is, purebred Shrops throw a black lamb once in a while.

Prof. Miller of the University Farm at Davis advises us that even were black fleeces desirable, it would entail a great deal of expense to try to maintain a flock of black sheep as they would not breed true to color.

A large wool dealer in San Francisco states that at the present time black wool is worth some more than white wool on account of the war, but that usually it is quoted about 10 per cent less than other wool. The probabilities are that it would not be a paying venture.—Eds.]

INTER-STATE SHIPPING OF FRESH MEAT.

To the Editor: Kindly advise me whether I can send dressed hogs or veal from here to San Francisco without the interstate stamp on it. I would have to ship by way of Nevada to make rail connections.—H. A., Standish.

[The U. S. Bureau of Animal Industry allows interstate shipments of fresh meats without inspection when the shipper makes out a printed certificate, a copy of which is sent to the Chief of the Bureau of Animal Industry, Washington, D. C., by the railroad or carrier. In your case, however, it would not be possible to ship to San Francisco, because the local board of health would not allow the meat to enter the city.—Eds.]

FETERITA POOR SILAGE.

[Written for Pacific Rural Press.]

Feterita made poorer silage than kafir or Indian corn on the Ontario Dairy ranch according to Chas. O. Johnson, who has charge. Indian corn was put four feet deep in the bottom of the silo, then three feet of feterita, then 10 feet of kafir corn, then Indian corn to the top of a 30-foot silo.

"The kafir and Indian corn were quite ripe; the stalks were drying and ears hard on Indian corn, but the silage was fine. The Kafir should have been cut 10 days earlier so the grains would have been a little softer. When too ripe they pass through the cattle whole, to some extent. The feterita was in just the right condition, but cattle did not like it and lost in their flow of milk," says Mr. Johnson. "The cattle liked corn silage best, though they did as well on the kafir, which was rich and good. The feterita stalks were dry, light, fibrous; there was nothing to it, and the kernels were poorer. We had to feed nearly double the quantity.

"To our 26 cows and a dozen calves we fed four bales of hay per day besides 3 scoops each of corn silage, or two scoops of kafir, or about five of feterita. For six weeks we fed only silage and barley straw on account of the high price of hay. Silage was the only thing that would have carried us through the winter. We commenced to feed it on Thanksgiving, and it lasted till the middle of March."

Clarifying Dairy Legislation Situation.

To the Editor: I notice in your issue of Mch. 25, in answer to A Subscriber, Mr. Andreason says that "Milk that is sold at wholesale to creameries, or distributing plants, is not affected by this law," etc.

1st. I believe he is mistaken in making this assertion so broad in as far as distributing plants are concerned. If the delivery is not affected directly by the law it certainly will be indirectly. How can a dealer get certified milk, guaranteed milk, grade A milk or even grade B milk, out of milk that has not been produced under rules, regulations and temperatures established by an inspection department, approved by the State Dairy Bureau, which in turn have been approved by the pure food and drug laboratory?

2nd. Does the exemption in section one, which reads, "except in bulk to the wholesale trade," apply to the whole act, or does it only apply to tuberculin tests and pasteurization? If so, all milk and cream that go to the creamery, as well as to the distributing plant, will also have to come under the rules and regulations of the inspection department.

3rd. As the title of this act says it is "An act to prevent the sale of impure and unwholesome milk," and as section three of the act declares that all milk, except certified milk, guaranteed milk, grade A milk and grade B milk is impure and unwholesome—is the exemption of any force, or is it unconstitutional under Sec. 24 of the Constitution?

4th. Does the exemption only apply before an inspection department has been appointed, or rather "put in, to sell any milk otherwise than as hereinafter provided in this act?"

Will you submit these questions to Mr. Andreason? The last three are interpreted differently and it would be a great favor to the dairymen of this district if he would get an opinion from the Attorney-General upon them.—Geo. W. Ashley, Stockton.

[Comments by F. W. Andreason, Sect'y State Dairy Bureau.]

1st. While producers of milk can sell it in bulk to the wholesale trade without having their cows tested and without pasteurizing it, it is true, as Mr. Ashley writes, that the new law (Chapter 742, Statutes 1915) will affect them in that they will have to sell to the distributors according to grade. Certified milk must be from tuberculin tested cows and must bear the certification of a milk commission appointed by a county medical society, organized under, and chartered by, the medical society of the State of California.

Guaranteed milk must be from tuberculin,tested cows, from a dairy that scores more than 70 per cent on the score card adopted by the Bureau of Animal Industry, U. S. Department of Agriculture, and a permit or approval in writing to sell guaranteed milk must be obtained from the inspecting department.

Grade A milk, if sold at wholesale to a distributing plant where the pasteurizing is done, must come from dairies that score not less than 60 per cent on the score card mentioned above and must contain less than two hundred thousand bacteria per cubic centimeter before pasteurization. The maximum temperature at which the milk must be delivered at the pasteurizing plant must be determined by the inspecting department.

Dairies that score less than 60 per cent on the said score card, or whose milk contains more than two hundred thousand bacteria per cubic centimeter, must sell same as Grade B milk.

Milk containing one million, or more, bacteria per cubic centimeter must be marked "Not suitable for human consumption" in letters not less than one-quarter inch in length and one-twelfth inch stroke.

Milk and cream sold to creameries and cheese factories must come under the same rule as market milk sold to milk distributing plants.

2nd. I have asked the Attorney General for his opinion as to whether all milk and cream sold in the State must be graded, or whether it is only milk and cream sold in a city, county, or city and county in which a milk inspection service, approved by the State Dairy Bureau, has been established, that must be graded. The clause "except in bulk to the wholesale trade" was undoubtedly intended to apply to all milk and cream which is to be shipped into a city to be pasteurized at the distributing plant, or at the creamery

Cities can assume control of all milk and cream that comes within its limits, but much of the cream is produced a hundred miles or more from such city and the inspection of the dairy producing this cream is usually done by the State Dairy Bureau. For the purpose of this act milk shall be construed to include cream.

3rd. The constitutionality of the act, or part of the act, can only be determined by the courts.

4th. There is no doubt but that it was intended that producers of milk and cream could sell their product to creameries and milk distributing plants, without pasteurizing it and without causing their cows to be tuberculin tested, provided that the dairy from which it came was in a sanitary condition Section 7, of the said chapter, has this provision in it:

"Milk for pasteurization must be kept at a temperature established by the inspecting department up to the time of delivery to the pasteurization plant and rapidly cooled after pasteurization to a temperature of fifty degrees Fahrenheit or below and so maintained to the time of delivery of the same. Pasteurization shall be by the holding method at a temperature not less than one hundred forty degrees Fahrenheit; provided, that milk for drinking purposes shall not be heated to above one hundred forty-five degrees Fahrenheit."

Further on it has the following provision:

"If milk is re-pasteurized it must not be sold except as not suitable for human consumption."

I think this shows that Grade A and Grade B milk may be delivered in a raw state at the pasteurizing plant. Definitions of these grades of milk in sections 6 and 7 also show that where the milk is pasteurized it need not be from tuberculin tested cows.

The Brainard ranch near Corcoran received last week a carload of registered dairy stock from Los Angeles; and having disposed of their former herd, will keep only registered stock.

Good-by, Guess Work

THE New Sharples "Suction-Feed" is the only cream separator which eliminates guess work from cream production. All other separators have to be turned at exactly the speed indicated on the crank or they will lose from 7 to 13 pounds of butterfat per cow per year. The Purdue Experiment Station and other scientific investigators have proven these figures (see Bulletin No. 116, Vol. 13.)

This "guess" speed is used by 19 operators out of 20, because it is impossible to turn the crank at exactly the right speed.—It is much easier to turn it slower—and, whenever you do, you lose cream. Even a speed indicator will help but very little, as you won't and can't watch it every minute.

So we say to you dairymen: Quit guessing about your separator speed and your separator profits. Use

THE NEW SHARPLES SUCTION-FEED

Separator and know that you get *all the cream all the time.*

Whether you turn faster or slower, the bowl of the Suction-Feed *drinks in just the right quantity of milk.* The feature is entirely automatic; if you are tired, you turn slower (which is easier) and, if in a hurry, you turn faster and finish so much sooner. No matter how you turn, the New Sharples always skims clean.

The Sharples cream is always of *even thickness,* whether you turn fast or slow. The Supply can is but knee high so you can fill it without any back breaking effort. The three-piece Sharples bowl is lighter and simpler than any other—*no discs to wash.*

All these money-saving and trouble-preventing features are described in a handsome catalogue; ***"Velvet" for Dairymen.*** Send for a copy, now, while you think of it. Address Dept. **31**.

DAIRYING.

The Chowchilla Colonization Co. recently sent R. A. March to select five cows from the T. J. Gilkerson herd at Hanford.

The contractor who was recently arrested in Imperial county for serving oleomargarine to boarders without proper notices being posted was fined $50.

Over 400 Hinman milking machines have recently been sent to England, supposedly to take the place of hand milkers who can be used to advantage in the army.

Mr. N. Alberteni of Holtville has just started into the cheese industry. His first shipment to the Los Angeles exchange amounted to 578 lbs. of cream cheese. He expects to ship about the same amount every week.

Two 150-ton Ideal silos are being constructed on the ranch of Mrs. W. N. Lester near Denair, Stanislaus county. Indian corn will be grown for silage.

Dairying in the Chowchilla section of Merced county is rapidly forging ahead, a report from there saying that M. J. Schoonderwoerd will soon make a trip to the southern part of the State where he hopes to purchase 600 head of dairy cows.

The Henderson Co. of Sacramento report that Precia Crane Hengerveld, a four-year-old Holstein, made 18.6 pounds of butter in seven days, after dropping two calves in 10 months. Constance Mechthilda Aaggie, a two-year-old, made 50 pounds in 30 days.

At a meeting recently held at Woodland by dairymen of Yolo, Solano and Colusa counties a joint cow-testing association for the three counties was organized. Over 950 cows have been signed up, divided as follows: 530 in Yolo county, 270 in Solano and 154 in Colusa.

H. P. Hatfield, an experienced dairy farmer, will establish a dairy calf-raising farm in California in the near future. His object is to take the best heifer calves from the dairymen, mark and record them and when matured return them to dairymen at a contract price to be mutually agreed upon.

H. H. Sisson, manager of the Sunnybrook Ranch at Willits, reports the sale of a young Holstein bull sired by De Kol Fobes Homestead 6th and out of Maggie of Highland Netherland Paul, to Frank Willlams of Willits; also a young bull sired by Ruby Gem Canary Lad and out of Miss Piebe De Kol Colantha, to Mrs. Chris Hansen of Willits.

The N. H. Locke Co. report the sale of Biddy's King of L., a grandson of King's Valet and Empress Lass to T. B. Roy of San Geronimo. He is a son of Valet's Golden Biddy of L., 1912 grand champion at Sacramento. They have also sold Rhymes Fox of L. to W. H. McKittrick of Bakersfield and Squirrels Fox of L to C. L. Flanders of Lockeford.

A. M. Bibens of Modesto has sold to Mrs. Ida McClure a yearling heifer and a very choice three-year-old cow from his herd of registered Holsteins. He recently purchased from H. L. Benedict of East Syracuse, New York, the young bull Aggie Cornucopia Pauline Count 40th, whose grand dam held the world's record for butterfat for nine years.

According to J. R. Downs, of the Southern Pacific railroad, the new plant of the Imperial Valley Creamery at El Centro will do more toward putting the dairy industry of Imperial county on a sound basis than anything that has ever happened, as equipment is being installed which will permit of eastern shipments of butter when the quotations in this State are low.

The average score of contestants in the University Butter Scoring Contest, held in San Francisco, March 28, was 92.27, which was higher than any single entry average during the entire year of 1915. This is encouraging inasmuch as it indicates a disposition on the part of dairymen and creamerymen to produce a quality of butter that will sell on any market.

There were 10 cows in the Gridley Cow Testing Ass'n that produced more than 50 pounds of butterfat during the month of March, according to S. F. Bonner, secretary of the association. The highest producer for the month was a Holstein owned by J. H. Guill of Chico with 63.5 pounds fat. Other high cows were owned by J. Troncatly of Tudor, S. O. Mealy of Gridley and F. Vincent of Chico.

From six acres of land near Turlock Mr. F. Bennet cut 18 tons of oat hay last ear. Afterward the land was planted to Egyptian corn, which was headed and later the stalks were put into the silo. When he started to feed the silage he found the cows would not eat it till after he had poured diluted molasses water over it, in proportions of five gallons of water to one of molasses. Mr. Bennet figures that it did not cost much more to blow the stalks into the silo than it would have been to haul the stalks off, and as it was, they helped to supply a large amount of fairly good roughage for the cows' ration.

SWINE.

The Browning Stock Farm of Woodland has purchased a choice six-month-old Poland China boar from Hale Marsh of Modesto.

The Davis ranch near Holtville, of which Mr. Scott is manager, vaccinated 450 Poland China hogs last winter with $210 worth of serum, according to Dr. R. W. Ritter.

A meeting of the directors of the California Swine Breeders' Ass'n was held April 7, at which time plans for the furthering of the swine-breeding industry of the State were discussed.

Purebred Berkshires are being used by the Gardena Agricultural High School. Their boar, Gardena Master, is of Masterpiece blood and was bought from Mr. Hall of Perris, who got him from Kansas.

A registered Duroc Jersey sow belonging to Frank Sorter of Hughson had a litter of 15 pigs and is raising them all. For the first couple of weeks they were fed by hand, as the sow had but 12 teats.

According to C. B. Cunningham of Mills, Sacramento county, the demand for registered Chester Whites has been good all winter and spring and as a result he has been pretty well cleaned out of gilts and service boars.

Stephen S. Day of Sacramento has just sold 65 head of grain-fed Berkshires, culls from his breeding herd, for nine cents a pound. It is prices like this that makes the farmer take a more optimistic view of hog raising than he did a few months ago.

Chas. R. Hanna of Riverside has three sows bred to Superba, the grand champion Panama-Pacific Poland China boar. He recently sold a boar pig to Uncle Sam for the Indian School at Valentine, Ariz. Its mother is from a family of last year's Iowa State Fair winners.

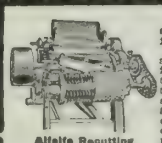
W. H. Rough of Arlington received this spring a sow which was the highest priced Poland China pig out of the highest priced litter sold in 1913, Big Anna Orange. She sold at $245 as a gilt. Mr. Rough has sold a sow and a boar pig from her to be delivered when weaned, to the man he got her from, for $175.

W. A. Young, Poland China breeder of Lodi, reports the sale of two three-months-old registered pigs to Wm. P. Matthias of Trafford, Pennsylvania. These pigs were sired by I. B. A. Wonder, the sale having been made at the P. P. I. E. on account of the showing made by Mr. Young's herd sire. These are probably the first California Polands that have been shipped so far east. Mr. Young also reports the sale of a bred sow to Robt. Jickling of Elmira, a sow pig to A. W. Ellyson of Swanton, a bred sow to the Truxton Indian School, Arizona, a service boar to H. C. Clark of Standish, two suckling pigs to Geo. C. Gosling of Napa, and a service boar to C. A. Blakelsey of Sanger.

BEEF CATTLE.

Stewart and Russell of Ventura county are pasturing 600 head of Hereford cattle on the 200-acre Baker ranch southeast of Holtville, Imperial county.

H. L. Murphy left for the east early this week, where he will buy another carload of Shorthorn bulls and show cows for California customers.



The Murdock Land Co. of Chico have just shipped four head of registered Devon bulls from the east. This company has a small herd of registered Devon cows which they propose to enlarge.

C. D. Hillman of Pasadena has purchased the Fred Emmons ranch of 10,185 acres in Monterey county. This with 45,000 acres near Paso Robles which he recently purchased will be stocked with several thousand head of cattle.

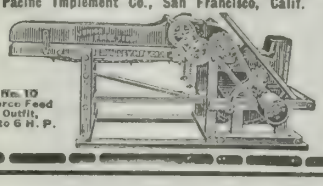
R. M. Dunlap has just returned from the East with a carload of Shorthorn and Hereford bulls for the W. N. Russ Co. of Ferndale and five registered Hereford females for A. E. Noyse of Sutter City, Sutter county. One of the Herefords was second prize heifer at the Minnesota State Fair at Hamlin last year. They will be used for founding a purebred Hereford herd by Mr. Noyse.

Thornton Glide of Davis states that he does not expect to show Shorthorns at the State Fair at Sacramento this year. He says that he has decided on this action because of the numerous losses, from a breeding standpoint, that result from high fitting. Mr. Glide still has a fine bunch of outstanding service bulls

Cut Your Feeding Costs In Half

Alfalfa Recutting Attachment

Yes, sir! Clean in two. Don't say you *can't*. For *thousands* of farmers are doing it *every day*.
They are *selling* their No. 1 hay and milling their *off grades* for feeding. They are fattening cattle, sheep, hogs and poultry with the *finest* alfalfa chop you ever saw. They are making *combination* feeds of alfalfa with oats, corn and peas. Many are milling clover, rice straw, bean straw, pea vines and *dried cornstalks*. Alfalfa leaves, stems and all is made into a fine grade of chop without injuring the color of the hay. The only way you can do this and get a positive guarantee of big capacity (1200 to 2200 lbs. of meal per hour) is with the wonderful recutting attachment in sizes 12 to 26.



Grip Hook Feed Table

Smalley (7 sizes) Silo-Filler (7 sizes)

No grinding or hammering. Powerful, whirling, bevel-edge blades cut like a lawn mower. Feed is fine, even and uniform resulting in *greater tonnage* in the silo. Famous grip hook, force feed table saves work of *two men*. Wide flaring sides and deep throat on every cutter.
Patented, low speed, one pulley chain drive not only makes a *cleaner, faster* job, but saves one-fifth to one-fourth *power cost* and cuts out *unnecessary wear* on belt. Blower is built *independent* of cutter so fan speed can be increased or decreased *without changing speed of knives or shaft*.
Powerfully built for hard, long service. See for yourself how *thousands* of farmers are cutting feeding costs in two, saving time, labor and power costs; getting better and greater silo tonnage. Send for the handsome, illustrated FREE *Book today*. It tells the story.

Smalley Mfg. Co., Dept 11, Manitowoc, Wis.
Pacific Implement Co., San Francisco, Calif.

LIVESTOCK DIRECTORY.

Rates in this directory, 3c per word each issue; o if carried weekly for one year, 2½c per word.

SWINE.

BIG TYPE POLAND CHINAS—One to a carload. Any age, either sex. 600 on hand. They have plenty of size, extra good hams and shoulders, strong arched backs great length, depth and thickness of body, with good looks as well. Many are sired by IOWA WONDER, a 1000-pounder in show condition. I believe his pigs are the best in California. Visitors say the are the best they have ever seen. He sires the kind that grow faster and larger, have more, better and stronger pigs, and are more practicable and profitable—the kind that are highly satisfactory. Extra special prices on account of being overstocked. I have hogs galore. Prices will surprise you. Satisfaction guaranteed. Write Geo. A. Smith, Corcoran, Cal.

BILLIKEN HERD OF IMPROVED CHESTER WHITES—The Money Makers. Everything registered and cholera immune. Nothing to offer for immediate delivery. Sows now farrowing. The pigs from these sows will be ready to ship during late May and June. Am booking orders now for these. The offering represents the very best and most popular blood lines the breed produces. Sires and dams by Champions and Grand Champions. Let me have your orders early. C. B. Cunningham, Mills, Sacramento County, California.

REGISTERED DUROC-JERSEYS—ALL AGES—We are booking orders for Spring pigs out of sows sired by full brothers of "I Am Perfection Wonder," sire of Grand Champion sow at Panama-Pacific, and from others equally well bred. Also offering about 30 exceptionally choice fall boars and gilts. This stock is in first-class condition, breeding guaranteed and of the finest blood in existence. Prices reasonable. For particulars, write, Haden Smith, Route 1, Box 97A, Woodland, Cal.

HAMPSHIRE SWINE—Both males and females from Grand Champion 700-lb boar and Grand and Junior Champion sow. Also Guernsey bull calves from Grand Champion bull. BELLA VISTA HERD, J. W. Henderson, 1st National Bank B'dg., Berkeley, Cal.

REGISTERED BERKSHIRES — World's Fair Grand Champion at the head of the herd. Also winners of Senior, Junior and Reserve Grand Champions. Stock of all ages for sale. Grapewild Farms, A. B. Humphrey, Prop., Escalon, San Joaquin Co., Cal.

BERKSHIRES—I have one of the best herds on the Pacific Coast including Grand Champion Sow, Reserve Grand Champion Boar under one year, Third Aged Boar, etc. Frank A. Brush, Santa Rosa, Cal.

BIG TYPE POLAND CHINAS—My hogs are sired by California Wonder and Big Chief, imported direct from Iowa. There is no better blood. All hogs eligible to registration. C. A. Cooley, Durham, Cal.

BLATCHFORD'S PIG MEAL weans easily and safely; no trouble; no milk. Write for free folder, "The Safety Route from Pighood to Porkage." Coulson Co., Petaluma.

CROLEY'S BALANCED PIG FEED for growing youngsters; also cheaper hog feeds for big hogs. Geo H. Croley Co., Inc., 631-637 Brannan St., San Francisco.

REGISTERED PUREBRED BERKSHIRE PIGS — Weanlings—both sexes. Reasonable prices. Write for full information. J. E. Hall, Sebastopol, Cal.

LARGE, QUICK MATURING registered Berkshires. Both sexes, $10 each for weanlings. Older ones at farmer's prices. J. M. Bomberger, Modesto, Cal.

LITTLE BLACK ESSEX—Service boars and weanlings. Only herd in the State. Limited supply. Yolo Essex Herd, L. W. Millsap, Yolo, Cal.

RANCHO RUBIUS—Durocs all sold except one service boar and a few October pigs. Spring litters will be "best ever." Elmer Lamb, Ceres, Cal.

DEL DAYO FARM (Old Haggin Bottom Ranch)—Breeders of registered Berkshires. Both sexes for sale. Stephen S. Day, Box 1140, Sacramento.

ROSELAWN STOCK FARM—Registered Poland Chinas and Shorthorn cattle. Young stock, both sexes, for sale. T. R. Gibson Estate, Woodland, Cal.

IMPERIAL STOCK FARM BERKSHIRES—Registered stock of all ages. Price and description on application. R. J. Merrill & Son, Morgan Hill.

LAKESIDE STOCK FARM POLAND CHINAS are money makers. Satisfaction or money refunded. Geo. V. Beckman & Sons, Lodi, Cal.

PLAINFIELD STOCK FARM—Registered Berkshires and Durocs. Young stock for sale, both sexes. H. M. Bullard, Woodland, Cal.

REGISTERED BERKSHIRES—For sale bred sows. Boars ready for service and weanling pigs. C. H. Thompson, Novato, Cal.

PIGS OUT OF SUPERBA—Panama-Pacific Grand Champion Poland China. Booking orders now. Chas. R. Hanna, Riverside, Cal.

DAIRY CATTLE.

REGISTERED HOLSTEINS—Grandsons of King Segis and of world's record cow Creamelle Vale. Will build up the production and value of your herd. Write or call and see them. F. H. Stenzel, San Lorenzo, Cal.

FOR SALE—About 80 head grade Holstein, Durham & Jersey heifers from six months to three years old, all first-class. Prices very reasonable. J. S. Smith, Box 515, San Jose, Cal.

FOR SALE—20 head purebred Holstein cows producing now 100 gals. 4 per cent milk daily. Also herd bull Prince Lorenzo De Kol, Reg. No. 136003 H. F. H. B. G. W. Stone, Byron.

WANTED—About 25 good dairy cows to be paid for in 12 equal monthly installments. Payment secured by mortgage on stock. Party reliable. Box 205, Pacific Rural Press.

on hand that range men will do well to look over.

R. M. Dunlap is on his way from the East with a carload of Hereford bulls which he has just purchased in the East to fill California orders.

The Northern California Stockmen's Association held a meeting at Redding recently at which time range regulations were discussed with the supervisors of Trinity, Shasta, Klamath and Lassen forests. The stockmen contended that the underbrush must be burned and the forest officials said the bureau would co-operate, but that the burning must be done entirely under the regulations made by the service.

MISCELLANEOUS.

What is said to be the first shipment of corn in bulk ever received at Stockton was 200 tons of yellow corn shipped by Charles Adams recently.

A white strawberry is a curiosity being grown by Mrs. C. A. Hopkins of Lodi. The original plants were found growing wild in Indiana. The berries are of a yellowish white appearance and very sweet. They are said to be prolific bearers.

The pea canneries at Oakdale are having two 425-ton silos erected at their plant to preserve the pea vines and hulls as a stock feed instead of burning them as has been the previous practice. The silage will be sold to dairymen.

Prof. Miller of the University of California states that sheep should be much more extensively grown on the smaller farms of the State, but that it is not necessary, or, for that matter, desirable, to try to maintain a very large flock on a purely alfalfa ranch. While alfalfa is undoubtedly a great feed for sheep, it cannot be pastured to advantage on account of bloat. He believes, however, that every ranch could well afford to have a few sheep and on ranches where some grain is grown he thinks a larger flock should be kept.

VANDERA HERD OF JERSEYS is now offering the heifer calves from register of merit cows with official yearly records. Guy H. Miller, Route 1, Modesto, Cal

REGISTERED HOLSTEIN SERVICE BULLS—Ages 4 to 5 years. From excellent families. Prices on application. Miller & Lux, Colony Farm, Dos Palos, Cal.

JERSEY BULLS—Serviceable age. Sons of Gertie's Lad, who has two daughters that made over 600 lbs. butters as two-year-olds. A. A. Jenkins, Tulare.

TULARE GUERNSEY AND HOLSTEIN FARM is offering young bulls of both breeds. Excellent breeding. Prices reasonable. W. J. Higdon, Tulare, Cal.

FRANK MEACHAM, Petaluma, California — Breeder Red Polled Cattle, both sexes. Take electric cars at Santa Rosa or Petaluma for Live Oak.

HOLSTEIN BULLS—Well marked, large, straight individuals. Tuberculin tested. $100 up. Packwood Farm Herd. W. F. Mitchell, Visalia.

BREEDERS OF REGISTERED SHORTHORNS — Milk strain. Choice young stock for sale. John Lynch Ranch, Box 321, Petaluma, Cal.

CALVES RAISED WITHOUT MILK—Cost less than half as much as the milk-raised calves. Write for free book to COULSON CO., Petaluma.

CROLEY'S CALF FEED with skim-milk will raise fine dairy heifers cheaply. Geo. H. Croley Co., Inc., 631-637 Brannan St., San Francisco.

BULL CALVES from a grandson of Colantha Johanna Lad and from a son of King of the Pontiacs. J. W. Benoit, Route C, Modesto, Cal.

THE McCLOUD RIVER LUMBER CO., McCloud, Cal.—High-class thoroughbred Holstein bulls for sale. Write for prices and pedigrees.

TWO REGISTERED HOLSTEIN BULLS out of A. R. O. cows. Sired by King Mead. Ready for service. J. H. Harlan Co., Woodland, Cal.

REGISTERED HOLSTEIN CATTLE and Duroc-Jersey Hogs. Prices always reasonable. W. H. Ginn and Son, Corcoran, Cal.

FOR SALE—Pure-bred Guernsey Bull, 2 years old. Advanced registry breeding. E. L. Skidmore, Route C, Tulare, Cal.

BREEDERS OF REGISTERED HOLSTEIN cattle and Berkshire pigs. Whittier State School, Whittier, Cal

HOLSTEIN-FRIESIAN CATTLE and Berkshire Hogs. H. B. Goecken, Breeder, Goecken Heights, Livermore, Cal

INNISFAIL DAIRY SHORTHORNS—Registered young bulls for sale. Alexander & Kellogg, Suisun, Cal.

Right Now

you need a

DE LAVAL

CREAM SEPARATOR

1st—If you are still using some gravity or setting process of creaming—

BECAUSE your cows have likely freshened now and your supply of milk is greater.

BECAUSE your spring work requires every minute of your time and a good cream separator will be a great time and labor saver.

BECAUSE your young calves will thrive best with warm, sweet separator skim-milk.

BECAUSE with your increased milk flow your greater waste of cream, without a good cream separator, must run into more money than you can afford to lose.

2nd—If you have a very old De Laval or an inferior separator whether new or old—

BECAUSE the losses of the poor separator from incomplete skimming, and the tainted product of the hard-to-clean and unsanitary separator mean most when your volume of milk is the greatest.

BECAUSE of the ample and "more than advertised" capacity of the De Laval, you can separate more quickly and save time when time means most to you.

BECAUSE an Improved De Laval Cream Separator is so much simpler and more easily handled and cared for than any other, and you can't afford to waste time these busy days fussing with an inferior or half worn-out machine.

BECAUSE the De Laval Separator of today is just as superior to other separators as other separators are to gravity setting.

Let the De Laval start saving cream for you right now. See the nearest De Laval agent at once, or if you do not know him, write us direct for any desired information.

Veterinary Queries and Answers.

[Answered by Dr. H. B. Wintringham, Petaluma.]

[Subscribers wishing an immediate reply should send money order for $1.00. No charge for questions answered through this department. Name and address of subscriber must accompany each query.]

DIPPING FOR CATTLE VERMIN.

To the Editor: I am enclosing sample of vermin which are among my cattle. I have tried sheep dip but it is not effective. Can you advise me of a wash that will kill them?—A. B. D.

[Dip your cattle in lime-sulphur dip twice, at ten-day intervals.]

TEAT TUMORS.

To the Editor: I have a cow that has just freshened. One of her front teats has a lump in it about the size of a bean and I am unable to get any milk out of it unless I put a silver tube in the teat. I have another cow just fresh that seems to have the same trouble, only not so bad. What causes this trouble, and is there any cure for it?—A. K., Franklin.

[These are teat tumors and can be removed surgically.]

COLLODION FOR LEAKY TEATS.

To the Editor: In the issue of February 19, I notice an inquiry regarding "leaky teats." I have known this trouble to be cured successfully by touching the end of the teat with collodion. This can be purchased at any drug store and 25 cents' worth should be enough for use on the teats of one cow for several weeks, if properly used. Evaporation is very rapid and the bottle should be kept in a cool place.—J. M. Zinn, Hynes.

[Collodion will do the work, but must be kept up indefinitely.]

SADDLE HORSE DOESN'T DO WELL.

To the Editor: Last fall I purchased a saddle mare in the city. She was then sleek and fat. I have been feeding her all the best barley hay she will eat and a couple of pounds of barley grain each day, and she is allowed to run on green grass every day. She seems to be in perfect health but is losing flesh. Am I feeding her correctly?—R. H. E., Raymond.

[Cut out the barley hay and substitute oat hay. Clean out the barley beards in her mouth which are causing the trouble.]

HORSE HAD BLOOD DISEASE.

To the Editor: I had a mare that got little lumps all over her body. The hair would then come off and leave a loose scab which would in turn come off and leave a skin sore. The legs were swollen after about a week, but were receding toward the last. Her condition did not seem to improve so I had her shot. I examined her after she was dead and found an amber colored liquid came from her nose after the blood, of about the same consistency as the blood. What was the trouble?—F. H. F., Lovelock, Nevada.

[This was some blood disease and probably could have been cured by prescribing some arsenical preparation.]

ALFALFA AFFECTS HORSE.

To the Editor: I have a young horse that appears to be in good condition and health, but does not have proper control of his legs. He wabbles when he walks and in turning around seems to get tangled up. He staggers and acts as if he was going to fall after getting up. Work does not seem to hurt him and he does not tire easily. He urinates freely, but this I attribute to his feed, alfalfa hay. He has been in this condition over a year and has grown gradually worse. Can I do anything for him?—Subscriber, Reedley.

[The trouble is caused from the continuous feeding of alfalfa, which causes these symptoms in some horses. Change feed to grain hay.]

TREATMENT FOR MAMMITIS.

To the Editor: I have a young cow that lost the use of one quarter of her udder by mammitis when fresh last April. Is there anything I can do to make that quarter develop and give milk? She will be fresh in May.—H. H. B., Turlock.

[The best treatment in this case is to massage the quarter for at least 15 minutes, two or three times a day.]

COWS HAVE INFECTIOUS DISEASE.

To the Editor: Eight of our cows freshened this month and last; all passing a bloody discharge for two or three weeks after calving. They all carried calves the full time and cleaned well. I also have a cow that has been coughing about two months;; not hacking but severe and sounds metallic. Some days she coughs almost steadily and other days very little. She is in good condition, but we cannot get her with calf. She calved nine months ago. Can you advise me what to do?—L. G. M., Sutter.

[Your cows' trouble is of some infectious nature. Wash them out daily with 1-1000 solution potassium permanganate. It would be advisable to have a veterinarian out to your place and have all your animals tested for tuberculosis as a cough of this nature is useless to treat until a diagnosis of tuberculosis is, or is not, established.]

WHEN TO BREED A JERSEY.

To the Editor: What is the best age to breed a Jersey heifer? I have discussed the subject with various ranchers, but no two of them agree as to the best age of this breed to have a calf. I have a 14-months-old Jersey, but will not breed her till I hear from you.—A Subscriber, Roseville.

[Answered by N. L. Locke, Lockeford.]

[Our practice is to breed a Jersey heifer to have first calf at about two years of age. This should depend upon development of the heifer. If she is small and undeveloped give her more time; and if large and well grown you might start earlier. We are satisfied there is nothing lost by giving a heifer plenty of time as long as she is developing nicely and not getting too beefy.]

HOGS AMONG APPLE TREES.

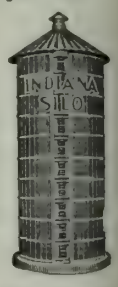
[Written for Pacific Rural Press.]

Hogs aren't likely to hurt good-sized apple trees except that they will rear up against them and learn to shake the fruit off, and sometimes get hold of low-hanging limbs to get the fruit, according to G. F. Emmons. Mr. Emmons has worked a great deal in the Watsonville district where people turn hogs into the orchards to clean out morning glory.

But he would not have hogs in the orchard because they pack the ground so hard both by tramping and lying on it. This is especially noticeable at plowing time. They root around tree trunks to find cool, moist earth to lie in. Then they pack the dirt down so that it either does not turn off the plow, or is loosened in big chunks. This is especially bad when hogs have been in the orchard while the ground was wet.

Profit-sharing Silo Prices

Early last Fall we saw that prices on silo lumber and steel were going up, so we contracted for our 1916 supply long ahead! Since then *steel* has advanced 100% and silo *lumber* about 20%.



Manufacturers without the capital or foresight to *anticipate* this increase, are now *advancing* prices. We could do so, too, and make the extra profit. But as long as our supply holds out, we will accept orders for the

INDIANA SILO

at our present prices. Though we contracted for a 1916 supply last Fall, the way orders are piling up our supply of material bought at old prices, will soon disappear. Then we will be *forced* to charge the increase.

Sixty thousand American farmers say the "Indiana" pays from 50% to 100% on the investment each year. Could ***you*** ask for more.

Our new Silo Book "A" tells ***why***. Contains valuable facts on feeding silage. Send for your ***free*** copy today. Don't delay. A postal will do.

BLACK-EYE BEANS FOR STOCK.

To the Editor: Will you kindly advise through your paper the proper time for planting Black-eye beans in this locality and how long it would require them to mature to the proper stage for feeding milk cows and also if they make good hog feed? Is it best to feed them before they become hard or afterward? Is there any danger of overfeeding, after stock has become accustomed to them?—E. T. W., Selma.

[We do not know of anyone having had experience in feeding Black-eyes or any of the other cow peas in the manner you describe. Perhaps some reader knows and will tell us about it. In the Southern states cow peas are used extensively as a pasture crop for all kinds of live-stock and many times are put up for hay.

Prof. Henry in his book "Feeds and Feeding" says that it is desirable to turn the stock into the field after the pods are well matured, although stock may be turned into the field when the vines are five inches high. In the latter case, however, care should be taken not to over-pasture the crop.

They are a legume and consequently rich in protein. Because the vines do not ripen evenly it is difficult to make good hay from them, but it is done, pods, beans and all. We find no reference to there being danger of overfeeding the cow pea forage, but like alfalfa hay some grain would doubtless be desirable to more evenly balance the ration.

Beans can be planted as soon as danger of frosts is over, which of course varies in different parts of the State. Probably with you any time after May 1 will be safe, although no one can be sure of this. They will mature in 70 to 90 days. Eds.]

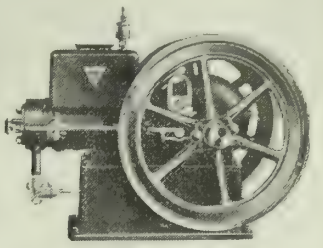
HORSE BREAKER STILL ALIVE.

To the Editor: I thought you might be interested in knowing whether I am still in the land of the living or somewhere else. I have been much entertained and amused by the remedies suggested for the cure of my mare's habit.

As I do not belong to the Wild West Show or the 101 Ranch outfit I have not tried the quirt and spur method advised by one writer, and I do not feel inclined to get tangled up in all that rigging. I think I will try some more safe and sane method. I believe in "Safety" first, last and all the time.

I secured a bulletin from the U. S. Department of Agriculture on breaking and taming colts and one method it mentioned for gentling a colt was to tie its head to its tail, making it go in a circle. When it gives up it will stand to be harnessed, saddled or mounted. Do you think that method would work on a mare 14 or 15 years old?—G. E. Wright, Manton.

[It's hard to teach an old dog new tricks, but maybe you can do it with your mare. It might make a circus ring performer out of her without the need of quirt and spurs.—Eds.]



The purebred three-year-old Shire mare owned by the Ramina Ranch at Tehachapi, walked right off with a 16-inch plow, pulling it eight inches deep in decomposed granite soil, according to L. M. Anderson.

Measure an Engine's Worth By Its Years of Service

NOT FIRST COST ALONE, but the years of service it gives you determines whether or not an engine is expensive or economical.

YOU CAN BUY AN ENGINE that costs less than the Alpha, but long years after the low priced engine is consigned to the scrap heap, your Alpha engine will be giving you as dependable service as the day you bought it.

BECAUSE OF THIS DURABILITY and absolute dependability

ALPHA ENGINES

GASOLINE—KEROSENE—OR—DISTILLATE
are recognized as the World's Standard.

THERE ARE MORE DROP FORGED PARTS on Alpha engines than any other. This means an engine as accurate in adjustment, and therefore as economical after five or more years' constant use as when new.

PAYING FOR QUALITY at the start is far cheaper than paying for repairs and losses through delay every little while.

ALPHA ENGINES ARE DESIGNED to give the user real engine service. They are built up to a high standard, not down to a low price, yet **cost and service considered,** Alpha engines are the cheapest and most economical in the world.

DON'T TAKE OUR WORD for it, but ask any user of an Alpha engine anywhere, and he will tell you as he tells us that the Alpha engine always satisfies.

CONTAGIOUS DISEASES.

[Written for Pacific Rural Press by Susan Swaysgood, Pomona.]

This is the season of the year when contagious diseases come to rob the poultryman of all his leisure hours and perhaps his winter profits.

Roup, canker, and all diseases of the throat and lungs are very easily contracted by hens that have been highly fed during the winter months.

The safest thing to do is to ease up a little on all mash foods, feed more dry grain, and alfalfa, or other green food, and give the whole flock a physic of Epsom salts or coal oil. If convenient, clover or alfalfa should be cut in short lengths and if fed in a mash, let the greens predominate.

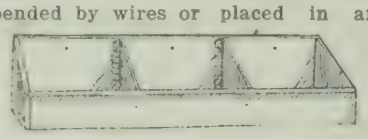
First Signs.—Sneezing is always the first sign of colds in hens and if caught in that stage it is easily controlled, while if allowed to run until roup is developed, the whole flock may be affected. If the cold is neglected until the eyes are affected, there will have to be individual treatment with an antiseptic solution. Don't expect a roupy fowl to get well without treatment, for they will not get well; but simply develop into a chronic condition and the disease or germ is always there to spread, like a fire that has been left smoldering. The germs are spread through the excretions, so the first thing is to clean up and disinfect the houses, feed, and water troughs, and keep the dropping boards clean.

Boracic acid and chamomile flowers make a good wash for the eyes, and when these things are not on hand, use permanganate of potash, or coal oil. In using the last mentioned articles it is best to dip the fowls in a can containing enough liquid; hold the head under until the fowl fights for breath, then wipe off the extra oil, and let it go. Usually about two treatments with a physic will put the hen on the road to recovery.

The Canker Stage.—When the disease attacks the air pipes or the tongue, it has reached the canker stage and is much more difficult to cure. However, with persistence it can be cured and the quickest remedy is powdered bluestone. Take a little stick and make a swab with cotton. Dip this into the powdered bluestone, and put on the canker. scrape off the cheesy substance and put more dry bluestone on. Two treatments will usually cure if the bird is not too far gone.

Give the whole flock a tonic by mixing a tablespoonful of sulphate of iron and one teaspoonful of carbonate of iron into a small amount of mash that will be quickly eaten up. Do this twice or three times a week and feed plenty of good, sound grain, green feed, and good clean beef scrap, and the flock will soon be in condition again.

Spring winds are hard on poultry, and every one should see that their birds are properly sheltered and not allowed to sleep in draughts.



About Preserving Eggs. — Mrs. W. C. D. asks: "How can one tell when the water glass used for preserving eggs is exhausted? I have some now that looks somewhat like starch. Would it be safe to use? If so, should it be boiled or strained?"

If it looks like starch, it would appear to me as if the water had evaporated, leaving the water glass in its natural condition, or nearly so, which is a thin syrup. I have never tried to use it more than one season without adding some fresh water glass to the liquid. A druggist ought to be able to advise you as to the length of time it will act effectually, but to thin out ready for use, boiled water should always be used after cooling.

METAL NESTS FOR POULTRY AND GAME BIRDS.

[By Geo. H. Croley.]

The accompanying illustration represents a set of 11x11 inch nests, made of galvanized iron that may be hung by hooks or nails on the wall of a poultry house or suspended by wires or placed in an aviary for the use of game birds. In addition to the durability and cheapness of these metal nests, they greatly insure against vermin. Lice and mites do not thrive in them, and the few that might find lodgment in the nest material may be instantly killed by taking the nests to a safe place, sprinkling with kerosene and setting them on fire.

A set of galvanized iron nests that greatly insure against lice, mites, and ticks.

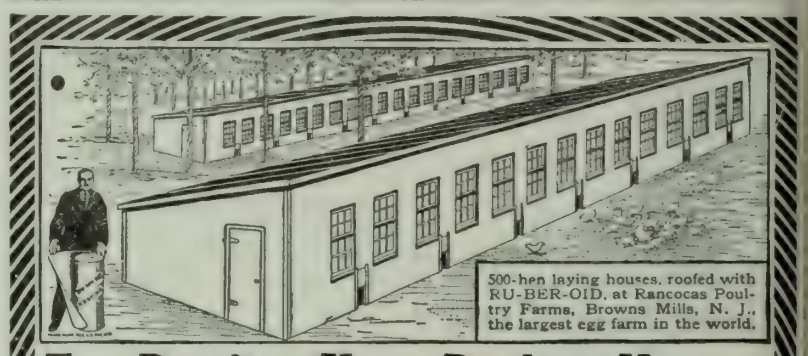
By the exercise of a little ingenity in placing them in an aviary, one may gain remarkable advantages. A fender or various shaped hoods made of green cloth to obstruct the view please and attract game birds to these nests. When these birds nest on the ground under brush they are often the prey of ticks, lice, and mites, as well as burrowing animals. Any shape or size nesting bowl may be formed in these nests by partly filling them with excelsior, leaves, or straw that have been well soaked with lice-killing liquids; over this material pack moist earth to the thickness of one or two inches. Another plan to obstruct ticks is as follows: Solder a 20 or 40 penny nail by the head under each corner; punch holes in the lids of four baking powder cans or other metal cups and slip one on each nail and solder it firmly about two inches from the bottom of the nests; keep these cups filled with liquid lice killer.

The College of Agriculture has agreed to give a short course in poultry husbandry at Riverside from June 5 to 9, inclusive. There will be lectures every morning from 9:30 to 11:30, and demonstration periods from 1 to 3 each afternoon during the five days. Among the subjects to be dealt with will be incubation, brooding, housing, yarding, breeding, and feeding.

TURKEYS WITH SPOTTED LIVERS.

To the Editor: I am losing young turkeys. Their livers are full of white spots. What is the cause and remedy?—Mrs. B., Gridley.

[Answered by Geo. H. Croley.]



[There are four fatal and practically incurable diseases that cause spots to appear on the livers of turkeys: **Avian Tuberculosis.** — This, comparatively a rare disease, produces whitish or grayish points or nodules the size of a pea. **Spotted Liver (cercomoniasis).**—This causes yellowish white spots on the liver that are somewhat depressed—not prominent or raised as in tuberculosis. Clean premises and disinfect thoroughly. Give a purgative every ten days. Epsom salts are good for this. **Aspergillosis.**—This disease is created by dust from moldy straw or other litter and from damaged grain. In addition to the whitish yellow spots on the liver, these spots usually appear also in the throat and lungs and are often mistaken for tuberculosis. It has been claimed that very small doses of iodide of potassium in water will sometimes cure this disease. **Black Head** (infectious entero-hepatitis). — This is caused by a germ that is taken into the system with the food or drink. The liver is usually greatly enlarged and on the surface are yellowish spots varying from ⅛ to ¾ inch in diameter. In issue of Dec. 25, 1915, page 666, we answered an inquiry in regard to black head in which is suggested means of checking the spread of this disease in its early stages.

FOWLS POISONED BY COPPER

To the Editor: My fowls are droopy, eat little, and droppings are watery and greenish color. Last summer fowls on the same ground were affected the same way; pens and houses have been vacant since last fall and recently were thoroughly cleaned.—A. C. M., Coutolenc.

[Answered by Geo. H. Croley.]

[Th watery, greenish droppings are a symptom of cholera; but during more than thirty years we have never seen a case of real poultry cholera in California. The description also indicates copper poisoning, the symptoms of which are: Diarrhoea, blue or green droppings, violent pain and convulsions; this poison sometimes acts as an emetic, causing fowls to make an effort to

For Roofing Your Poultry Houses

You cannot afford to experiment with cheap roofings. Keep your fowls warm and dry. They will pay you better when protected with

Pronounced "RU" as in RUBY

RU-BER-OID ROOFING

COSTS MORE - WEARS LONGER

"We used RU-BER-OID Roofing at Rancocas Poultry Farms," writes Reese V. Hicks, General Manager, "because we knew that it had given many years of continuous service without repairs. Roofing that we put on ten years ago is still practically as good as new. It keeps our 15,000 White Leghorns warm in winter and cool in summer and helps us to secure more than one million eggs annually."

RU-BER-OID is *permanently* waterproofed and will not crack, run, warp or leak. It is the *original* smooth-surfaced ready-to-lay roofing, uniform in quality for 23 years.

Colored RU-BER-OID (Ka-lor-oid), made in beautiful permanent Tile Red and Copper Green, possesses all the enduring qualities of gray RU-BER-OID.

Look for the RU-BER-OID Man (shown above) on every roll of the genuine. RU-BER-OID has been widely counterfeited. The U. S. Appellate Court has enjoined imitators from using the word "Rubberoid or any similar name as the trade name or brand" of their roofing.

omit. The source of poison may be Bordeaux or other spraying mixture, containing blue vitrol or copper sulphate, or the fowls may be forced to eat grit containing native copper or some copper compound. As remedies, give large quantities of milk or white of egg or mucilage. Supply grit that is free from harmful minerals.]

OLIVES PREVENT LAYING.

To the Editor: Our 200 hens have laid no eggs for five months. We have two olive trees that were loaded and these hens have been picking up the olives all winter. Would this prevent laying?—F. P., Buckeye.

[Answered by Geo. H. Croley.]

[The great amount of oil in olives would prevent laying, because it makes the ration too wide. One unit of fat is as rich as 2.4 units of starch. Usually the acid in fruit is what prevents laying, but the olive is an exception for the reason that there is very little acid in olives. Prof. Wickson states that even the bitterness of the olive is not an acid, but a glucoside which is capable of breaking up into glucose which is of a sugary nature and, therefore, also a fat-former. A ration containing a good percentage of bran, shorts, and meat scrap will quickly bring these hens into laying condition.]

WHY KALE GETS BITTER.

To the Editor: In your publication of Feb'y 19, C. E. B. of Petaluma wanted advice about preventing bitter kale. If the cause was not the hardpan or sub-drainage I suggest that he might have broken the tap roots of the plants when he set them out. If there is plenty of water near the surface or the plants are mulched well this will not hurt them so much, but if the plants have to go far for water the young plants must have a good long tap root when they are transplanted and these roots must be put in the soil carefully and straight up and down, or they will not go down deep in the ground. If they are broken or bent they never draw the water so well even if they do get down to water. If the seed is sown in boxes the dirt must be ten or twelve inches deep, and if sown in the open ground the plants must be taken up carefully. **Reader.**

A CURE FOR SPARROWS.

To the Editor: Since writing to you about exterminating rats, sparrows and gophers I have discovered that sparrows can be fooled into eating poisoned wheat, if a teasponful of New Orleans molasses is added to each gill of wheat (soaked) and well mixed with it and powdered strychnine added in sufficient quantities to coat each grain. They destroyed beets and lettuce as fast as they grew and also attacked the young apricots.

Knowing that canaries are fond of sugar I thought that the sparrows might have a "sweet tooth" also. Apparently they have, as I have about cleaned them out. Where there were hundreds of them before there are very few to be seen now. Neighbors report finding dead sparrows all around us.

San Jose. **Sam'l Haigh.**

POULTRY NEWS NOTES.

[By Geo. H. Croley.]

The Fresno Co-operative Poultry Association was organized on March 3 by the poultry keepers of Fresno county. The following officers were elected: President, J. M Hacock; Secretary, F. N. Howard; other directors, A. W. Gearhart, J. S. Mitchell and T. Hall. It will be conducted similar to the Danish Creamery Association; the object is to lower the cost of production and to guarantee to the consumer a first-class product.

The Schilling farm near Newark, Alameda county, is to be transformed into a private game farm by A. Schilling of San Francisco and a group of friends. This enterprise has been incorporated under the name of the Arden Game Farm. The State Fish and Game Commission has granted them permission to raise and market wild ducks and other game.

A Dept. of Agri. report states that fully 30 per cent of the dressed poultry sent to market by poultry keepers is incompletely bled. This reduces the value 2 to 5 cents per pound because the appearance is inferior, the flavor is not so good, the flesh loses its firmness sooner, and the keeping qualities are greatly impaired.

Feeding red millet seeds to baby chicks is injurious, but soft shelled white or yellow millet seeds are excellent. The red variety is a hay producer while the soft white and yellow sorts are used for human food in Asia and southern Europe.

The soft long chicken fleas which frequently infest nest boxes, may be killed with a spray made of one gallon of salt in four gallons of water.

STATEMENT OF THE OWNERSHIP, MANAGEMENT, CIRCULATION, ETC., REQUIRED BY THE ACT OF CONGRESS OF AUGUST 24, 1912,

Of PACIFIC RURAL PRESS, published weekly, at San Francisco, Cal., for April 1, 1916.

State of California (
County of San Francisco(ss.

Before me, a notary public, in and for the State and county aforesaid, personally appeared Frank Honeywell, who, having been duly sworn according to law, deposes and says that he is the owner of the PACIFIC RURAL PRESS, and that the following is, to the best of his knowledge and belief, a true statement of the ownership, management (and if a daily paper, the circulation), etc., of the aforesaid publication for the date shown in the above caption, required by the Act of August 24, 1912, embodied in section 443, Postal Laws and Regulations, printed on the reverse of this form, to wit: 1. That the names and addresses of the publisher, editor, managing editor and business managers are: Publisher, Frank Honeywell, Berkeley, Cal.; Editor, E. J. Wickson, Berkeley, Cal.; Managing Editor, E. J. Wickson, Berkeley, Cal.; Business Manager, Frank Honeywell, Berkeley, Cal. 2. That the owner is Frank Honeywell, Berkeley, Cal. 3. That the known bondholders, mortgagees, and other security holders owning or holding 1 per cent or more of total amount of bonds, mortgages, or other securities are: None. 4. That the two paragraphs next above, giving the names of the owners, stockholders, and security holders, if any, contain not only the list of stockholders and security holders as they appear upon the books of the company but also, in cases where the stockholder or security holder appears upon the books of the company as trustee or in any other fiduciary relation, the name of the person or corporation for whom such trustee is acting, is given; also that the said two paragraphs contain statements embracing affiant's full knowledge and belief as to the circumstances and conditions under which stockholders and security holders who do not appear upon the books of the company as trustees, hold stock and securities in a capacity other than that of a bona fide owner; and this affiant has no reason to believe that any other person, association, or corporation has any interest, direct or indirect, in the said stock, bonds, or other securities than as so stated by him.

FRANK HONEYWELL.

Sworn to and subscribed before me this 24th day of March, 1916.

C. B. SESSIONS,
Notary Public in and for the City and County of San Francisco, State of California.

My commission expires May 26, 1917.

Poultry Breeders Directory

Rates in this directory, 3c per word each issue; or if carried weekly for one year, 2½c per word.

SOME BABY CHICKS!— Roofden Poultry Ranch announcement. Old customers and new crowded us with business during March, but with added capacity can care for more orders now. We specialize on R. I. Reds, Barred Rocks, Black Minorcas, Brown and White Leghorns—the best utility breeds for meat and eggs. Breeding stock well mated, eggs well hatched, and we know how to pack them for safe delivery. Write for particulars and prices (express paid when requested); any quantity from a dozen to thousands. Price and quality will suit you. Roofden Poultry Ranch and Hatchery, Campbell, Cal.

PEKIN DUCK EGGS for hatching, $1.00 per dozen. L. D. Collins, R. F. D., 54G, Denair, Cal.

PHEASANTS—Golden and Ringneck. Eggs from April on. T. D. Morris, Agua Caliente, Cal.

HARES AND RABBITS.

LEADING RABBITRY IN AMERICA—Flemish Giants and New Zealands. Cut your living expenses. Catalogue free. Empire Rabbitry, Empire, Cal.

BELGIAN HARES—Young stock for sale. Hurd Bros., St. Helena, Cal.

The Home Circle Page of the Pacific Rural Press

MRS. BEST'S LETTER.

My dear Friends:

The change of seasons brings new things for children as well as for their mothers. The stores are showing many pretty wash dresses for little girls in combinations of plaids or stripes with plain materials of harmonizing tint.

The middy suit is one of the most popular garments—it is seen in all white, or with a skirt of striped material and a white middy with trimmings of the same stripe. A very pleasing effect is gained by having the hair robbon (if the child's hair is dressed that way) of the same color as the stripe of the material. For small girls, these striped skirts are just straight, pleated skirts, but for girls from ten upward, they are either gored, or made in a two-piece, semi-circular pattern, with the stripes meeting diagonally in a seam both front and back.

For a daintier, lighter weight dress, the striped dimity, made with a smocked yoke and hanging free below the yoke, makes an attractive garment for the tiny girl; and sheer white material, trimmed with lace and a touch of embroidery is good style and suitable for all ages.

There is so much talk about inferior dyes that care needs to be exercised in the purchase of any colored wash goods.

For the small boy from four to eight, the shops are full of attractive Norfolk wash suits, developed in striped coat with collar, cuffs, belt and trousers of plain material, or of all plain material with white collar, cuffs and belt. With these are worn the bright, Windsor tie, and they have almost entirely replaced the "Buddy Tucker" suit of last year. With these suits the little men wear half hose and low shoes or sandals and they are well dressed enough to go anywhere.

For the older boy up to fourteen, the wool Norfolk suit still holds its popularity, but the coat is not always developed with the regulation pleats, but it always has the belt and patch pockets and full knickerbockers. For dressy wear with these suits, there is nothing better than the Eton collar, which is broad enough to extend over the coat collar and finished with a bright Windsor tie. But many boys of twelve and over prefer the collar like "father wears" and a four-in-hand tie.

As long as boys wear short trousers, their stockings are a good deal in evidence, and I wonder how many of you mothers know about and use the guaranteed hosiery. They cost a little more than the ordinary hose to begin with, but you are entitled to return them if they develop holes before a given time (and they always do), which really gives you two pairs for the price of one.

The jocky caps are having a run of popularity now; the cap itself is small, fitting closely on to the head and having a long visor. The straw hats for the little people are rather high-crowned and worn with the brim turned down. Devotedly,

Rosabella Best.

A WHOLESOME DRINK.

Cocoa or chocolate ground or shaved from the cake, unsweetened, sweet or milk, all make a good drink. Add sugar and mix it to a paste with warm water. About one tablespoon of both together will make a medium strong drink. Add water to make one-half cup for each cup desired and boil for a couple of minutes. Then add hot milk and serve with whipped cream if possible. A marshmallow is a delicious addition, or a dash of vanilla or ground cinnamon. If egg is used, beat thoroughly and blend carefully just before serving. For delicious iced cocoa make the syrup stronger and add a pinch of salt. When ready to use, pour over cracked ice (if possible) and fill up with all milk or part milk and part water and top with whipped cream.

EMERGENCY EQUIPMENT.

In too many households, when an accident occurs, there is nothing at hand to work with and the result is that wounds that were trifling at first become serious. It is a fact that home accidents are more apt to be followed by blood poisoning than those which happen in workshops where equipment is ready. An emergency case should have in it, plain gauze for padding for wounds, absorbent lint for compress pads, absorbent cotton, roller bandages to hold dressings in place and adhesive plaster for closing small wounds. There should also be at hand an antiseptic wash for cleansing wounds and a carbolized paste for use in burns and scalds. Aromatic spirits of ammonia are valuable in case of fainting or shock—do not hold the bottle to the fact, but place liquid on a cloth to be inhaled.

LUNCHEON SETS.

At the Woman's Exchange (a specialty shop for the sale of home-made articles by women), a new idea in luncheon sets was displayed in the window. Each set consisted of a square for the table and small napkins to match—one set being developed in tan linen with picot edge of blue embroidery silk and a small cross-stitch design in one corner of the same color. Another set was of white linen with crocheted corner set in. This crocheted section had an initial worked in it.

TRAVELING BAGS.

One of the best stores had a window display this week of traveling cases and traveling bags for both men and women. These were all fitted up with all the necessities of travel and included brushes, manicure articles, soap, mirror, etc. The toilet articles were in silver, ivory and tortoise and the bags of leather, lined in silk or fine leather.

PLAY FORMS HABITS.

A very celebrated worker with children gives as his opinion that practically all habits of children are formed at play. Honesty is developed by games like croquet, while a sense of justice is formed by children in swings. The positive habits are formed in occupation while the vices flourish in idleness.

A bit of brisk rubbing with kerosene will remove finger marks from doors.

CHRYSANTHEMUMS.

[Written for Pacific Rural Press by Geo. N. Tyler.]

Chrysanthemums can be grown in almost any kind of soil, but do best in a clay loam that has been thoroughly enriched with rotted manure and they also like a little leaf mold in the soil, and by all means give them a liberal dose of bone meal, well worked in, as they require phosphoric acid to do their best. They should be grown in a sunny location, sheltered from strong winds, and if they are shaded from the hot afternoon sun, so much the better. I will give my method of growing the single stem flowers. Make your cuttings now, from tips, or take what are called two-eye cuttings. Cut off just above an eye with a sharp knife (leave the leaf on), and then cut off just below the next eye, cutting off the leaf. They should be planted in three inches of sharp sand, and should be shaded and sprayed once a day, towards evening. Never let your cuttings get wilted or you cannot grow large flowers, for the cutting gets hard-wooded, and takes longer to root. The wood is in the right condition for making cuttings when it breaks clean across when bent, but if it knees, it is too hard. They will root in from three to four weeks. Never by any means take divisions of old plants if you want to grow large flowers, and never grow them in the same location two years running. After your cuttings have rooted never let them remain long in the sand or they will run up spindling.

Plant them in the beds where they are to bloom. The beds should be four feet wide so you can work from both sides of them. Give them a thorough watering when you set the rooted cuttings out, and shade for a few days till they get established. Plant in rows ten inches apart and six inches between plants. After they have made a growth of six inches scratch in a liberal coating of bone meal, one-half pound to the square yard, and then stake them. The cheapest and best stakes are made from split shakes; a bundle of shakes costs 35 cents and one shake makes twelve stakes; there are twenty-five shakes in a bundle. Tie the plants when about eight inches high with soft twine or raffia, not too tight. When mums are in strong growing condition, they require a great deal of water, both on the foliage and at the root; spray in the evening after the sun has left them, and on very warm days in the middle of the day. After they have made a growth of about one foot, give them a mulch of cow manure about one and one-half inches.

If your plants develop a bud before the right time for taking same, three shoots will start out. Select the strongest and rub off the other two; also keep all side growth rubbed off as fast as it forms. The first bud that forms is called the first crown, and if it comes within a week of the time that you wish to take the bud to make your flower, rub off all the side shoots but that one. Most of the varieties of mums that are sold by specialists give the bud to take and the time of taking, and if you know the name of the variety, you can tell from their catalogue when and what bud to take. When varieties are propagated late they make what is called the terminal bud—the last cluster of buds that is formed. You can always get a good flower from a terminal bud. After you have taken your bud and the bud begins to swell, give liquid manure every other watering, one pound of sulphate of ammonia to fifty gallons of water makes a fine fertilizer for mums.

After your buds show color, do not give any fertilizer but tend carefully to the spraying and watering; but by no means wet the bud, or all your work will be for nothing. Remember that the main thing is to keep your plants soft wooded and in a growing condition all the time. If you let them get wilting dry they will become hard-wooded and an inferior bloom will be the result. By following these directions you can get flowers up to twelve inches in diameter, according to the variety.

Pompons and singles are all the go in the east. They are very easy to grow, as they do not require any disbudding. Plant them one foot apart both ways. When the plants are six inches high pinch them out, so they will branch. Fertilize and feed as with the single-stem mums. All mums are greatly benefited by a shading of cheese cloth after you take the bud, or after the buds form. Pink varieties should not be fed much as it causes them to bleach.

Green and black aphis are the insect pests that greatly infest the mums. By spraying every night with a strong spray of water you can keep them down. Otherwise get the nicotine extract of tobacco, and use a two-inch pot full to five gallons of water, once a week. Diabroticas, or the yellow-spotted beetle, eats the flowers. These will have to be hand picked before they do much damage.

You can plant out the exhibition show and commercial varieties of mums up to the middle of July, but the singles and pompons should be planted as soon as you can procure the plants.

In staking and tying up, work from the center of the bed out. In disbudding work from the center out and from the top down so if by accident you should break off the bud you will have a lower bud to make a flower. Do not let any underground suckers form; lift them up and cut them off close to the main plant. If you follow these directions carefully you can grow as good mums as any professional.

LOST HOURS.

"I say good-night and go upstairs
And then undress and say my prayers
Beside my bed, and then jump in it;
And then—the very nextest minute—
The morning sun comes in to peep
At me. I s'pose I've been to sleep,
But seems to me," said little Ted,
"It's not worth while to go to bed."

—Sidney Dayre.

THE LITTLE WOODEN FLAT-IRON.

Long, long ago there lived a little girl who had never seen a toy-shop. Her home was a wee brown house in a village many miles from any big city. Her name was Molly Ann.

One Monday morning when Molly Ann's mother was washing clothes in the kitchen, the little girl undressed her dolls and washed their clothes in the tin wash-basin. She had neither soap nor water, but that made no difference, because Molly Ann played that the basin was a wash-tub full of water, and she played rub soap on the dolls' clothes.

Molly Ann's mother stopped washing, rubedy-rub, rubedy-rub, on the big washboard when she noticed what her little girl was doing. She stopped washing long enough to smile and get the ball of string.

"Wouldn't you like to have a clothes-line to hang your dolls' clothes on, to dry after they are clean?" asked mother.

"Oh, yes!" answered Molly Ann. "Will you make me a clothes-line?"

"To be sure," answered Molly Ann's mother; and she straightway broke off a long piece of string. One end of the string she tied to the table-leg, the other to the arm of the straight kitchen rocker, and there was a clothes-line upon which Molly Ann hung a big washing.

Next day when Molly Ann's mother was doing the ironing, and stepping from the kitchen stove to the ironing-board, singing as she worked, Molly Ann played ironing her dolls' clothes. Her ironing-board was the bottom of a wooden chair, while a corner of the wood-box was her stove. She was busily ironing dolls' clothes, singing as she worked, when her father walked through the kitchen.

"Let us see your flat-iron, Miss Molly Ann," said he.

"It isn't a really one," explained Miss Molly Ann. "It is only a big hickory nut. I play it is a flat-iron. You can play 'most anything!"

"So you can, so you can!" agreed her father. "Daddy will make you a little wooden flat-iron like your mother's big one."

That very evening the little girl's father began whittling out a wee flat-iron from a bit of wood. He whittled and he whittled and he carved until at last he finished a tiny wooden flat-iron, smooth and white. The little girl was so pleased with that flat-iron she carried it to bed with her, and smiled in her sleep. She may have been dreaming about the new toy.

Next day and the next and the next, Molly Ann played wash and iron; truth to tell, she was so happy with the little flat-iron it is a wonder the dolls' clothes didn't wear out before Monday came again.

On Tuesday, when Molly Ann's mother was ironing big clothes with the big irons, singing as she worked, and Molly Ann was ironing little clothes with a little wooden iron, singing as she worked, Mrs. Peterson rapped at the front door. Molly Ann's mother put her flat-iron on the hot stove and went to the door. Immediately Molly Ann did exactly what her mother did. She put her little wooden flat-iron on the hot stove and went to the door.

"I came to borrow your log-cabin quilt pattern," said Mrs. Peterson, when Molly Ann's mother had said, "Do come in and have a chair."

Not many minutes passed before Mrs. Peterson stopped talking about quilts to say:

"Dear me, I smell something burning! It smells like wood! I do hope your house isn't on fire!"

To the kitchen rushed Molly Ann's mother, followed by Molly Ann and Mrs. Peterson.

"It is only Molly Ann's flat-iron!" exclaimed Molly Ann's mother. "It is smoking hot!"

"Oh, my little flat-iron is spoiled!" wailed Molly Ann, when mother lifted her treasure from the hot stove with the stove-poker. "Oh, my little iron is spoiled!" No wonder Molly Ann cried.

Fortunately the little flat-iron wasn't spoiled. That very evening Molly Ann's father whittled off the scorched places and smoothed the little flat-iron with sandpaper until it was good as new. But Molly Ann never put that little flat-iron on the stove again.—Frances Margaret Fox, in The Churchman.

To destroy the slugs that infest the gardens, make a strong brine in an empty tin can and drop the slugs in—this is a much better method for children than crushing them.

Proper Feeding War Started by Women

NEW YORK, February 27.—Prominent women representing all parts of the country have been appointed members of a special committee to organize the campaign undertaken by the National Housewives' League to build up the health of the nation through proper feeding as its contribution to the preparedness movement, it was announced here tonight. Every woman's organization in the country will be urged to take up the propaganda.

FIGURES GIVEN ARE INDEPENDENT AND RELIABLE

Pacific Rural Press Market Report

PRICES QUOTED AS PAID TO PRODUCERS.

San Francisco, April 5, 1916.

WHEAT.

Indications of a light crop have caused a further advance in the East, and the Portland market also shows a slight advance. As local buyers are now getting much of their supplies from the north, Bluestem has been marked up a little, and other grades are very firm. The more distant future, however, is very uncertain, depending to a large extent upon war developments.

Cal. Club, ctl	$1.65@1.70
Northern Bluestem	1.90@1.92½
Northern Red	1.85@1.95

BARLEY.

The speculative market is a little easy, but the spot grain shows increasing firmness, with a fair consuming demand, and holders generally demanding the top figures.

Shipping, ctl..	$1.40@1.42½
Choice Feed, ctl.	1.35@1.37½

OATS.

Everything under this head is very dull, with no consuming demand of any consequence in this market. Values are weak, but not quotably lower.

Red Feed	$1.35@1.37½
Red Seed	1.45@1.65
White	1.45@1.50

CORN.

Eastern and California Yellow remain steady on the former basis. Egyptian, etc., find a fair demand, and considerable offerings move readily at the prices quoted.

Egyptian Yellow, ctl.	$1.80@1.85
Milo Maize	1.40@1.45
Kaffir	1.60@1.65
Egyptian	1.50@1.57½

BEANS.

There has been a gradually increasing inquiry for white beans for shipment, in consequence of which this variety has again been marked up a little. Colored beans, however, still receive very little attention, and in some varieties there is still a good deal of stock on hand for this time of year. Holders for the most part are maintaining prices pretty well, but the tendency is still downward, and slight declines are noted this week in pink and cranberry beans.

(On wharf, San Francisco.)

Bayos, per ctl.	$4.50@4.60
Blackeyes	3.00@3.10
Cranberry Beans	4.65@4.75
Horse Beans	3.00@3.25
Small Whites (south)	5.90@6.00
Large Whites	5.75@5.90
Pinks	4.20@4.30
Limas (south)	4.35@4.45
Red Kidney	6.50@.675
Mexican Reds	4.50@.465
Tepary Beans	4.00

SEEDS.

No further change is noted in prices, and the market is rather quiet in all the varieties quoted.

Melilotus Alba, lb	23 c
Melilotus Indica	6 c
Bur Clover	11 c
Oregon Vetch	5 c
Soy Beans	6 c
Canada Peas	5¼@6 c
Alfalfa, per lb.	22@24 c
Sudan Grass	40 c

HEAVY SHIPMENTS OF STRAWBERRIES START.

Strawberries are now coming forward in fairly large quantities from several districts, and prices will drop considerably in the next few weeks if weather continues favorable. Los Angeles stock is plentiful and much lower. Watsonville stock is showing up well, and while the acreage has decreased the crop is said to be large. The acreage at Sunnyvale has been considerably increased. Some fine berries are coming from Fresno, where a large crop is also expected; and the Sacramento district will soon start carload shipments north. Dealers look for a generally large crop if there is no heavy rain; but if the canning demand holds up prices should be up to normal.

HAY.

The weakness of the last few weeks, with the diminishing supplies at shipping points, have led dealers to curtail their shipments to this market, and the arrivals have contrasted sharply. Prices stand about the same, except on stock hay, which has declined abruptly owing to the cessation of active demand; but all the medium grades are somewhat easy, as this market is still overloaded. Fancy wheat and red oat hay, however, are very firm. There is still a fair but not heavy movement to coastwise and interior points, with no export demand. Several districts are beginning to need more rain. Little new alfalfa has appeared, and values are steady as last quoted.

No. 1 Wheat	$13.00@16.50
No. 2	12.00@14.50
Tame Oats	12.00@18.00
Wild Oats	12.00@14.00
Alfalfa	12.00@15.00
Stock Hay	6.50@ 8.50
Straw, per bale	.25@ 40

FEEDSTUFFS.

The demand for concentrated feeds continues to decrease, owing to the abundance of green feed in most places, and prices are easing up a little. Bran is quoted slightly lower.

(Wholesale prices per ton, carload lots, San Francisco.)

Beet Pulp, per ton	$22.50@23.50
Alfalfa Meal, per ton	20.00@21.00
Alfalfa Molasses Meal per ton	21.00@22.00
Bran, per ton	24.50@25.50
Oil Cake	Nominal
Cocoanut Cake or Meal	23.00@25.00
Cracked Corn	40.50@41.50
Middlings	33.00@34.00
Rolled Barley	29.00@30.00
Tankage	45.00
Rolled Oats	29.50@31.00

VEGETABLES.

The asparagus market so far has been exceptionally firm. There is a large crop, and as much as 8,000 boxes came in the first of this week; but Eastern shipments have been heavy, and the canners are buying eagerly at better prices than they usually pay. Offerings are lighter now, and unless they increase materially local dealers do not look for much lower prices. Rhubarb is weak and so is lettuce, with heavy offerings, though prices are unchanged. Cabbage is scarce, and cauliflower about cleaned up. Celery also is stiffening up. Peppers and eggplant are higher, while supplies of peas and artichokes are excessive.

Cabbage, ctl.	70@80 c
String Beans	10@15 c
Peppers, bell, lb.	20@25 c
Rhubarb, box, Bay	50@90 c
Peas	3@ 4½c
Tomatoes, Mex., box	1.50
Eggplant, lb.	15@20 c
Celery, crate	2.50@3.50
Artichokes, doz.	20@40 c
Lettuce, small, crate	.75@1.25
Asparagus, box	1.50@2.00

POTATOES AND ONIONS.

Old potatoes are pretty well cleaned up, but new potatoes are beginning to appear. So far there are few, and much of the stock is too wormy for shipment, but some shipping business is expected later. Some Australian onions are offered at $4 per ctl., but move slowly.

New Potatoes, lb.	4c
Oregon Burbanks	$1.75@2.10
Salinas Burbanks	2.10@2.25
Delta Burbanks	1.25@1.85
Sweet Potatoes, ctl.	2.30@2.50
Onions, Delta, ctl.	1.85@2.25
Onions, Oregon	1.30@1.50
Australian	4.00
Garlic, per lb	8@10 c

POULTRY.

Very few turkeys are appearing. The general market is decidedly easy, with little demand and plenty of Eastern stock offered. Small broilers and hens are lower.

Turkeys, dressed	27@30c
Live Turkeys, lb	20@22c
Broilers, 15 lbs. to doz. and less, lb.	32@35c
do, over 15 lbs. to doz.	38@40c
Fryers	30@35c
Hens, extra, per lb.	19c
Small	19c
Smooth Young Roosters, per lb.	23@24c
Squabs, per doz.	2.00@4.00
Geese, per pair	2.25@3.00
Ducks, young, lb.	18@19c
Old	17@18c
Belgian Hares	10@11½c

BUTTER.

Extras show a further advance, being about 5c higher than last year. This is due to the heavy shipping movement, and the market is still lower here than in most other markets, as supplies are coming forward from nearby producing points very freely. Eastern prices are still maintained on a very high level, probably owing to foreign demands, and several more cars have gone East from California in the past week. There has also been quite a large movement to Seattle, partly for Alaska and some for Mountain states.

	Thu.	Fri.	Sat.	Mon.	Tu.	Wed.
Extras	28½	28½	28	28	28½	29½
Prime Firsts	28	28	28½	27½	27½	28½
Firsts	27½	27½	27	27	27	28

EGGS.

The demand continues very active, and the movement includes a good deal of stock for shipment, some going to Seattle and Alaska, and some to the Islands. Storage buyers are also operating freely, and the low prices have brought the usual heavy consuming demand locally. However, production has been quite heavy, and prices hang around the same level as last week.

	Thu.	Fri.	Sat.	Mon.	Tu.	Wed.
Extras	22	21½	21½	21½	22	22
Sel. Pullets	19½	19½	19½	19½	20	19½

CHEESE.

Offerings are large, but a little more demand has added ½c to fancy flats. Monterey cheese is lower, with large offerings.

Y. A.'s, fancy	18½c
Fancy Calif. Flats, per lb	18 c
Monterey Cheese	15@16½c

LOS ANGELES DAIRY PRICES.

	Wed.	Thu.	Fri.	Sat.	Mon.	Tu

DECIDUOUS FRUITS.

Loquats are a little higher, while apples are moving slowly, with little stock bringing over $1 per box.

Strawberries, S'n, crate	$1.00@1.25
Fresno	2.00@2.50
Watsonville, drawer	60@90c
Apples:	
Pearmain	.85@1.00
Baldwin	.75@1.00
Loquats, crate	2.50@2.75

DRIED FRUITS.

The dried fruit market remains about steady, as there has been comparatively little pressure to sell in most quarters, and while nobody is buying much beyond immediate needs, values are well maintained. Peaches, in fact, are quoted slightly

Special Live Stock Market Report.

A few grass cattle arrived at this market during the past week, but there has been very little buying transacted and the market is not as yet established. There is no apparent change in the market, but there is an easier feeling among packers as to the season's supply of grass cattle, which are expected in larger quantities about the first of May.

A shipment of live lambs was made to eastern points during the week which sets a record for early lamb shipments. There is more or less speculation as to how the shippers will come out in the deal, owing to the age of the lambs shipped. Locally there are enough lambs to supply the present demand, which is to be expected at this time of the year. What will be the condition later, nobody knows.

While we are able to quote last weeks prices on hogs, the supply is more plentiful than it has been in recent weeks and fractional cuts could possibly be made, if the buyers were at all bearish, which they are not. Lightweights continue to arrive in excess of the demand and a severe cutting in price continues with that class of stock.

WOOL.

Some country buying at fractional reductions is reported, one large clip in the Bakersfield district having been contracted for 21½ cents. No contracting is reported from Tehama or Nevada. The Eastern market is fractionally lower, holders making concessions of one-quarter to one-half cent. Good wools are more salable than defective ones, in fact defective wools are not wanted at all except at very much reduced prices. London sales were postponed a week and the forecast is that they will be lower all around. Australian market is also lower.

THE TRACTOR
OF GENERAL UTILITY

BULLOCK CREEPING GRIP TRACTOR
KNAPP & BLACK, Gen'l Ag'ts
157-59 N. Los Angeles Street, Los Angeles, Cal.

higher, as the amount of spot goods in sight is getting low, and there has been a little inquiry in consuming quarters. Nothing whatever has been done in futures at this end, according to local packers, but some have been offering future prunes in the East at a 3½c basis. Such sales at this time, however, can have little effect in establishing values. A chain store corporation has lately made the heaviest purchase of raisins that has occurred in a long time, absorbing all low-priced seed raisins in the principal Eastern markets. The general demand also is increasing, causing a strong feeling in the market; and the general movement of dried fruits into consumption is satisfactory. The New York Journal of Commerce says:

"A little more prompt shipment business in California prunes, held on the Coast, is noted, sales covering a number of carload lots of forties to sixties, in equal quantities, being reported yesterday on a 3¾c f. o. b. four-size bulk basis. There is a more satisfactory movement in prunes out of store, and spot peaches as well as apricots are reported to be getting more attention. None of these goods, however, appears to be wanted in a large way, and while the tone of the spot New York market has hardened somewhat, there has been no appreciable improvement in quotations."

Apples	5 @5½c
Apricots, per lb	6 @10 c
Figs, white	Nominal
Black	Nominal
Calimyrna	Nominal
Prunes, 4-size basis	3½ @4 c
Peaches	3½ @4 c
Pears	4 @7 c

(Associated Raisin Co. Prices.)

Fancy Seeded, 16 oz.	7 c
Choice Seeded, 16 oz.	6¾c
London Layers, 3-crown, 20-lb. box	1.25
Imperial Clusters, 6-crown, 20-lb. box	2.50
Bulk, layers, 50-lb. box	2.75

CITRUS FRUITS.

Notwithstanding the upward prices reported last week, they are still better this week with strong, steady demand for both oranges and lemons. Bloods, seedlings, and St. Michaels are averaging slightly better than Navels, largely on account of the predominating large sizes of the latter. Ventilated cars as a rule went lower than those shipped under ice.

On the New York auctions navels averaged $2.35 to $3.55 per box, mostly going over $3, on Apr. 3. Lemons averaged $2.50 to $3. Philadelphia, only, reported lower prices on oranges, where all sales were under $3, as was also true in Cleveland with one exception. Chicago averaged $2 to $2.50 for large navels and $2.75 to $3.25 for medium to small. Lemons $2.50 to $3.25. Total shipments of oranges to Apr. 3 from southern California lagged 1,461 cars behind last season; lemons have excelled last season's shipments to date by 364 cars, yet they are stronger on the auctions than oranges.

Both navel oranges and tangerines have been marked down a little on the San Francisco market, and the demand locally is fairly active at the new level, with some business for northern markets. Grapefruit is a little firmer, as cheap stock is less plentiful.

Oranges, Navels	$1.50@2.75
Tangerines	1.25@1.75
Grapefruit	1.50@2.50
Lemons, box	1.75@3.50
Lemonettes, box	1.25@1.75

HONEY.

Spot values are largely nominal, as there is not enough coming in to establish prices; but it is believed that a small amount of fancy stock should be worth more than has been offered lately, as there is little on hand in this market, and a very fair consuming demand is noted. New honey, however, is expected very shortly, and with a large crop in sight there is no disposition to buy any large quantity now.

Water White, comb	13@15 c
Amber	8@12 c
Water White, extracted	7@ 8 c
Light Amber	3@ 4 c
Dark	2@ 2½c

NUTS.

Almonds are moving slowly now, as the only demand of any consequence is from shellers, and most of them are well supplied so far. The bulk of the crop is cleaned up, but a few scattered lots are still held in the country, and could hardly be sold at the prices recently quoted. Walnuts are scarce and firm.

(Prices f. o. b. San Francisco.)

Almonds (1915)	Nominal
Walnuts (1915):	
Budded; per lb.	17½c
No. 1	14 c
No. 2	11 c
Jumbo	17 c

HORSES.

Local dealers are rather disappointed at the course of the San Francisco market this spring, and no new stock has come forward for the last two weeks. The effects of the increasing use of motor trucks are being felt to an increasing extent, having caused a perceptible curtailment in the local demand, even for heavy drafters, which will hardly bring the top prices that have been quoted. The higher prices of gasoline, etc., may change this before long, especially if hay is plentiful this year. There is no demand whatever locally for light horses, but horses from 1100 to 1200 lbs. are in strong demand for military purposes. Speculative buyers have practically cleaned up such stock from northern California. Local dealers have made some purchases lately for the United States Army, but the number involved was very small.

(Approximate values in San Francisco, based on auction sales.)

Publisher's Department

The demand for our new book "Second Thousand Answered Questions in California Agriculture" (Wickson), is very brisk, and notably from those who secured a copy of "One Thousand Questions Answered." The latter is entirely sold out, but the new book is immensely valuable to the California farmer and immediately solves knotty problems he is constantly running up against in his business. The price is $1.50 postpaid, but our subscribers should write for our special offer to them on this useful little volume.

We added 168 new names to our subscription list during the past week.

POULTRY ADVERTISING PAYS.

"At this time I wish to say that I am more than pleased with the results coming from my ad in the Pacific Rural Press, as scarcely a day passes without an inquiry coming and I have made some good sales through parties writing me on account of it. While my poultry business is small, yet the ad has brought me enough to take all the eggs and stock I can possibly supply.

"Maurice S. Woodhams.

"San Mateo."

A. B. Shoemaker of Stanislaus county, who has 600 acres of vineyard, reports that the cut worms are starting to work, and that vineyardists should lose no time to put poison out. He gets best results by using a mixture of 4 gallons water, 16 pounds brown sugar, 1 pound Paris green, and 1 sack bran. The sugar, water, and Paris green are mixed first and then worked in the bran until a mash is found. A teaspoonful placed in the crotch of the vine and one at the roots is the best way.

A campaign against gophers is to be started at once in Stanislaus county by the Stanislaus County Farm Bureau. Poison will be distributed free of charge by Adviser Connor to farmers who will use it.

We would get far better results in olive growing, according to A. S. Clover of Terra Bella, if we would make basins around the trees, fill them with a mulch except a couple of inches around the tree, and irrigate that way, keeping the ground cool and moist and encouraging fine roots where plant food is most plentiful.

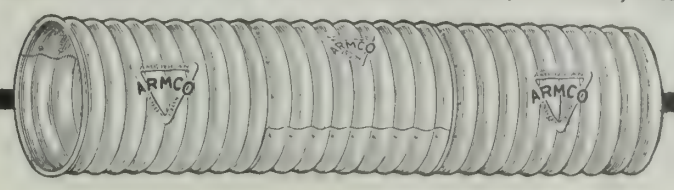
THE BULL TRACTOR — THE BULL WITH THE PULL — THE BULL TRACTOR

No Danger There!



THE weighty tractor, the heaviest threshing outfit—the kind of traffic that does not dare to venture across the ordinary bridge, but is compelled to go a long way round—all these can pass without risk and without loss of time over the road on which are used

"ARMCO" IRON CORRUGATED CULVERTS

In every State "Armco" Iron Culverts have been installed to take the place of dangerous bridges. Years of service have proved them safe. Thousands of installations have also been made on the road-beds of the great railway and traction lines. "Armco" (American Ingot) Iron Culverts are also economical in the long run. Being *pure* iron (never less than 99.84% pure) they resist rust and defy the forces that cause ordinary culverts to deteriorate. They are easily hauled to the job, and quickly installed.

Look for the triangle trade-mark on every section. If you do not find it, the culvert is not genuine "Armco" Iron.

ARMCO IRON CULVERT MFRS. ASSOCIATION, Cincinnati, Ohio

FISK

Non-Skids

—On Your Front Wheels, Too

FISK Tires, with their strong and reliable Non-Skid tread, cost no more than plain tread styles of many other standard makes.

When all four wheels are equipped with Fisk Non-Skids you can drive over rough or wet or muddy or sandy roads with confidence and safety—and the cost is no more than when you use plain tread tires of many other makes.

Back of Fisk Tires is a reputation of seventeen years of leadership—seventeen years of high quality and satisfactory mileage—**you can't buy greater tire value.**

A Special Advantage In Going To A FISK Dealer

More than ***one hundred Fisk Branches,*** covering the entire country, make Fisk Service quickly available to 35,000 dealers. When you go to a Fisk dealer, you can be sure of getting not only value in tire mileage, but through him the prompt attention of the Fisk Branch in your vicinity.

If you are handy to a Fisk Branch you should take advantage of the FREE SERVICE you can get there—changes, inflation, inspection, advice, instruction, and so on—all free to motorists, whatever tire is used.

Send to the nearest Fisk Branch for a price list—compare Fisk prices with the prices of other makes.

Why the Hog Looks Like a Good Bet.

Showing the Hog in His Past, Present and Future Aspects, with Respect to California. How the California Hog Compares in Quality with Corn-fed Pork and Why the Consumer has had a Joke Played on Him.

[Written for Pacific Rural Press.]

CALIFORNIA'S batting average in the pork producing league is about 50 per cent. That is to say, though we consume about $30,000,000 worth of pork and pork products, we produce only about half that amount. Two years ago our average was down to 35 per cent, thus showing a gain of seven and a half per cent annually, roughly speaking, in what we produce over what we consume.

In a business that amounts to $30,000,000 to the State as a whole, a seven and a half per cent gain annually assumes almost boom proportions, yet the rapid increase in hogs has not been a boom. It has been a natural growth which was only to be expected with colonization and which may be expected to follow closely in the wake of all future colonization. The settler on new land requires something that will bring quick financial returns from a small outlay of cash and in this connection the hog is IT.

Of course, the hog-growing army needs more recruits to counterbalance our appetite for pork and to keep at home some $15,000,000 which is now spent on the outside.

Why We Will Grow.—But we cannot afford to be satisfied with an outlook in pork production which is limited to our home consumption. Already we have enough developed land and enough people on it to bring production up to consumption, once they get started, and they're starting and will continue to start for the following good reasons:

In the past few years we have been adding cog after cog to an immense machine, capable of doing hog promotion work on a large scale. We have swine breeders' associations in various counties, hundreds of purebred breeders instead of tens, who are always good distributors of the hog germ, a State central organization which has just begun to get accustomed to working clothes, farm advisers, representatives of the University, packing house interests and the general agricultural press. All are preaching the hog faith and have been and will continue to be factors in more and better hogs.

What is the significant thing about this movement? Simply this. Fruit raisers, alfalfa growers and general agriculturalists are getting into hogs. And they are going to get in faster, with all of the above named forces concertedly driving home stories of profitable production, than was possible a few years ago with a few professors, a few breeders and a few agricultural papers preaching at them.

Railroad men and others familiar with immigration problems maintain that there is a larger background to this hog movement than most of us see. They believe that with a more general recognition of the California hog by Californians there will be a more general recognition of California as a place to grow hogs by Easterners who are prospective developers of our undeveloped lands.

So far we have endeavored to present the hog from the producer's standpoint, showing his desirability on the farm and why we believe his numbers will be greatly increased in the next few years. Surely there is no disputing the fact that at the present time he is in excellent repute with the farmer.

The strongest claim for the quality of the barley-fed hog lies in the fact that when sold under a corn-fed brand the consumer lauds his superior merits.

Consumers Balk. — Curiously enough, the same condition does not hold true with the consumer. The hog in his most finished stage, cured meat, is one home product that Californians are not loyal to. You can get them to demand a box of crackers carrying the "Home Products" seal, in order that their nickel may be kept at home, but try to sell them California bacon or ham and they balk.

Is this then the serious fault with our hog industry? Are they so poorly bred or are feeds so badly at fault that our own consumer will not eat them in the cured stage? This is the question for the California hog man to answer, for no such expansion as above outlined can occur unless our packing house industry is greatly increased. We can raise hogs but only to the extent of our fresh meat consumption if the charge be true. If, on the other hand, our consumers are under a misapprehension, then our opportunities for marketing pork and pork products are unlimited.

The charge that California-fed hogs do not make good cured meat is not a new one. It originated a great many years ago and at that time was partially correct. Since then it has been a tradition handed down from one generation to the next in such a consistent manner that even many of those who want to think well of the local product are dubious.

The Original Kick.—One of the State's oldest retailers recalls the condition in this wise: "Years ago the only kind of pork we handled in a cured or pickled state was a soft, salty product, so full of brine that you could scrape it off with your finger nail, and taste salt pork for a week after eating a piece of it. Then a few shipments of Eastern-cured hams and bacon reached here by mail. The comparison was too great. The best trade soon came to demand an Eastern ham or bacon and we were glad of it, because it's a lot

Grapewild Farms Berkshires

GRAND LEADER 2ND, No. 190,377.
Winner of the Grand Championship at the Panama-Pacific International Exposition.

SIRE OF STAR LEADER, who won **Junior Championship** and **Reserve Grand Championship** at the same show.. **STAR LEADER** is now at the head of the **CALIFORNIA UNIVERSITY FARM HERD** at Davis.

GRAND LEADER 2ND is also sire of **MAYHEWS LEADER 6th,** a prize-winner at the P. P. I. E., of whom L. E. Frost, Editor of THE BERKSHIRE WORLD, said: "He is one of the best to be found in America and will, without question, make a great sire." This young boar now heads the herd of **BUTTE CITY RANCH,** one of the largest and best selected Berkshire herds on the Coast.

GRAND LEADER 2ND also won first and second with six of his daughters for Sire and his Get. This is the most highly valued of all the trophies to most breeders, and is particularly so where the sire wins Grand Championship honors. In this connection, Judge Scott, who judged the Berkshires, said: "The real test of a breeding boar is in the kind of off-spring he produces, and here are a lot of animals (speaking of the Get of Grand Leader 2nd) that are superior individuals, as like as peas and a wonderful demonstration of the ability of a great individual to reproduce himself."

After six years of careful breeding, during which time steady improvement in quality has been our aim, we now have 75 Brood Sows, rich in the blood of every famous Berkshire strain. With Grand Leader 2nd at the head of this herd, not only himself a **Champion,** but the sire of **Champions,** and with several other Boars of prize-winning strain, we believe we are in a position to give you the best to be had in Berkshires. Satisfaction guaranteed. Stock of all ages for sale.

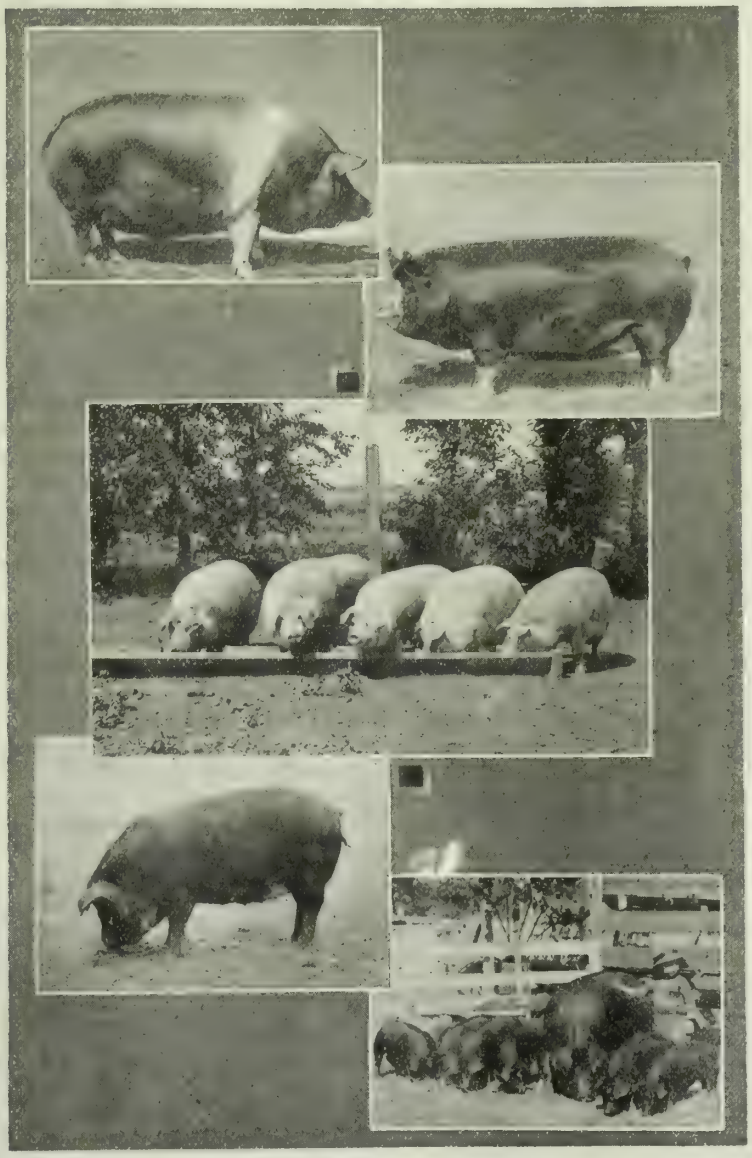
A New Dawn for the Purebred Hog.

Some Sidelights on the Purebred Hog Drama in California, as Presented by Some Thousand Breeders and Recorded by an Onlooker. California is coming to be a Leader in Purebreds.



[Written for Pacific Rural Press.]

CONDITIONS change. To everyone at all familiar with the purebred hog industry in California this must be apparent. The history of purebred hogs here dates back a good many years. It was about that time that the industry began to be concrete in nature, to the point where you could go into almost any community and find some advocate of the registered hog.

The vision of most breeders in those days was not very large. It was recognized that the business of raising hogs for breeding purposes was a growing one and it was generally conceded that it paid better than raising grade animals for market. The farmer's trade in service boars for grade herds kept the available supply so low at all times that no difficulty was experienced in selling, and no one thought of making it his business to expand the market to outside States or territories. Thirty dollars was a good fair price and the average one for a service boar to both breeder and customer, so why worry?

A National Happening.—The condition continued till a show of national importance loomed up right at home. It was expected that our hogs must compete with the best in the country, and older breeders as well as younger ones pricked up their ears and began a still hunt for something out of the ordinary.

And after months of preparation the whole flock and posse came down to San Francisco. not, as it transpired, to compete with the middle westerner in person, but with an astonishingly large number of hogs bred in the middle west. The result, as we all know, was that a good show was put up, some characterizing it as the best in the history of the whole country. Over-night, so to speak, the situation changed. The slow plodding work of previous years was shown to be constructive. While breeders had been growing hogs for the farmer, at farmers' prices, they had also been breeding the type that would command respect in the most fashionable company anywhere.

"The hog-grower must be helped to realize the importance of producing the largest amount of marketable pork at the least cost, and then work to get the highest price for it."

Although the Easterners lauded our efforts before the judging, it was after the awarding of prizes that prices pyramided. The day before the judging a hog might be worth a hundred dollars at the very most. The next day his value ran up to $1,000 in at least two instances, and when nearly 50 animals sold at an average of $150 a head in the public auction ring, the old order changed forever.

The New Order Enters.—Here was the parting of the ways. The game immediately expanded to unthought of proportions. You could play it whichever way you liked; to the farmer trade with its steady demand for good serviceable animals at a good fair price, with an outstanding animal sandwiched in now and then at a fancier price to some other breeder here or elsewhere, or, you could sit into the game where the ante was higher and where the stakes meant the selling of your best stock to breeders all over the country, the more ordinary ones finding an outlet at lower prices to the pork producer on the farm.

On the one side you could continue to be of service to the State by placing more purebred sires at the head of grade herds. On the other you could be of service by promoting the California bred and raised hog among breeders of other states as well as at home. With approximately one thousand breeders in the State, the transformation of ideals was necessary and very desirable. At the rate we have been growing in this business the time is approaching when there would not be room for everybody if everybody was playing to the home crowd. Developers of outside markets were necessary and now that we have them we can continue to grow without fear of a reaction setting in.

Work to Do.—But it would seem a mistake for either division to lie back in peaceful slumber and let the boat rock at will. She is well built to weather storms, but the rudder must be held steady.

The work of the contestants in the higher ante game seems to be well cut out for them. They must not only lend support at home but develop and maintain markets abroad. They must make the California purebred hog known in distant states and countries by breeding and selling better hogs than are produced elsewhere.

This is all possible, for the Exposition demonstrated, what many have long maintained, that our feeds and long growing season combine in making a superior hog and this is particularly true of young animals, the kind that are most useful for exporting purposes. It was common comment of Eastern breeders and judges that the California hog is supreme in the matter of maturity. California must show the world, in a constructive way, that we produce a supreme hog in every respect and members of this division of the breeding craft are the ones who must do it.

But how to steer the course at home is, after all, the big question. In comparison, the above-named gentry are almost inconsequential in numbers. The great majority of breeders are dependent upon the farmers' trade, the trade that is after all the real backbone of the entire industry.

The Home Trade.—He may, at times, get one foot into the higher division, with some outstanding animal, and that is what makes the game interesting, but in the main he must cultivate his home trade, at least for the present. And the sooner he accepts the condition the sooner he will be successful. If he has learned his lesson he

(Continued on Page 494.)

Valuing Young Orchards.

A Suggested Method of Estimating Value of Orchard, Year by Year, from Planting to Maturity.

[Written for Pacific Rural Press by Prof. R. L. Adams, University of California.]

"In your farm valuation work have you arrived at figures for determining increment of value of young fruit trees up to bearing? That is, how much is a two-year-old worth more than a yearling just planted, a three-year than two-year, etc.?"

In offering an answer to such as the above, which you submit to me, one needs a good deal of courage in view of present land values. The matter is open to a good deal of discussion and I for one should be glad to hear from those who feel qualified to pass judgment. The following is offered as the result of personal investigations, and is not necessarily final. It will, however, serve as a basis for dissection by all interested.

It seems to me that four things enter into the increasing value of land year by year.

First, one should secure the market value of the undeveloped land plus all expenditures of time and capital to clearing, leveling, grading, preparing for planting, providing irrigation facilities, and all other improvements pertinent to the care of the orchard.

Second, as year succeeds year, the owner is entitled to actual expenditure of all labor and cost of cultivating, pruning, spraying, irrigating and the like, including a reasonable sum for management.

Third, a sum sufficient to cover interest and depreciation of capital at a fair rate should be included.

Lastly, the owner should receive a sum for his initiative in starting and carrying on the work.

Since something in the way of receipts will be secured from intercropping and the early yields of fruits, these returns should be deducted from the cost of the orchard during the current year in which they occur.

The sum which shall be paid for initiative is the most difficult of determination. Perhaps the best possible method is to pro-rate the difference between the point when maximum cost occurs and the value of well-established mature orchards over the number of years required to bring the orchard to maturity.

An example will indicate the line of reasoning:

The life of an assumed apple orchard is divided into three periods.

(1) Period from purchase of raw land until trees begin to bear.

(2) Period from commencement of bearing to maturity.

(3) Period from maturity to old age.

In the absence of specific data figures are assumed for purposes of illustration. They are not to be taken as absolute guides.

The cost the first year is:

Apple orchard	Per acre
Raw land	$100
Clearing, grading and leveling	40
Irrigation	(Not required)
Trees, setting out and replanting misses	15
Care, 1st year	12
Management	12
Taxes	2
Total	$181
Interest on money at 7 per cent	13
Total cost 1st year	$194
Less profits from intercrop	25
Net cost 1st year	$169

In the same way the costs are added year by year, including costs for management and interest and reduced by receipts from intercrops and fruits, resulting in about as follows up to the twelfth year, when maturity is assumed. The trees bear a few apples at five years, and are producing enough to pay operating costs by the eighth year.

At the end of each year, including the first, the cost per acre may be assumed to be respectively, $169, $184, $206, $247, $293, $332, $365, $386, $400, $391, $358, $300, and $238.

The investment at the end of the eleventh year—when the trees are in bearing is $358. Yet the market value for orchards of this kind is, let us say, $600. The difference between $600 and the point of highest cost (reached when interest and operating costs have piled up to the highest point and receipts not increasing proportionately) of $400, is practically $200.

This $200 may be considered as payment for one's initiative in setting out the orchard, caring for it, and keeping it free from insects and disease. By prorating this $200 over the eleven years passing from planting out until maturity, the real worth of the orchard per acre, in round numbers will be at the end of each year respectively, beginning with the first: $190, $220, $260, $320, $385, $440, $490, $530, $560, $580, $600, $600, and $600.

Berkeley, Apr. 8.

Planted Apricots in Johnson Grass.

[Written for Pacific Rural Press.]

One man can kill 40 acres of luxuriant Johnson and Bermuda grass in three months. Only the seed will grow afterward; and they may be kept down with ordinary cultivation if they are not allowed to grow large enough to make the underground stems.

This is the experience of "Dave" Porter of Kings county.

A five-acre patch of old alfalfa was badly infested with Johnson grass and a few small areas of Bermuda. He plowed it under, in 1908-09. Barley was sown and cut for hay in May or June. The field was irrigated, and pumpkins planted. Johnson grass grew so high that travelers on the road did not know Mr. Porter was in it and hearing them talk about his shiftlessness. He mowed the grass in the fall. Next spring he dug holes for apricot trees. The holes were made three feet in diameter and two feet deep to get below Johnson grass root stocks.

In planting the trees, instructions were given to keep all Johnson root stocks out of the holes, no matter how long it might take. It cost a lot, but was worth while.

Then the field was plowed 12 inches deep, "rolling up the sod to beat the band." After cross-plowing he tried to keep it worked down with a 6-foot straight-blade weed cutter. This clogged up so that he got a Planet Junior cultivator. This consists of seven V-shaped "sweeps" 10 inches wide but alternately behind each other and overlapping so the machine works a strip four feet wide. This would let the sods and roots slip by, but kept them stirred.

The new orchard was cultivated in opposite directions every four days through three spring months while Johnson grass wanted to grow. The five acres required half a day each cultivation.

It was a lot of work, and Mr. Porter became discouraged after a couple of months. But one day he picked up and broke a rootstock. The color inside had changed to brown.

"I knew I had it going then, and didn't let up."

At the end of three months all the root stocks were dead. Since then, seeds sown previously have been coming up every year, but so long as they have developed only the fibrous roots, they yield to cultivation like other weeds. The Bermuda also was killed.

CONTROL SAP TO AVOID COULURE.

[Written for Pacific Rural Press.]

"Control sap flow in order to set your crop of grapes," is the slogan of Frank Henry of Fresno, whose success in producing fruit instead of wood, with less strain on the vine, is still doubted by some; though everything promises well for this, his second year in public notice.

Dropping of blossoms without setting fruit is perplexing all who work with grapes. This is unnecessary, according to Mr. Henry. Excess of sap at blooming time causes it. To reduce sap flow at this time, dry out the roots. Let sap start the shoots, cultivating lightly if necessary, to save moisture enough to plow when they are well started.

Then plow, as A. B. Cates is doing in the same county, 10 to 12 inches deep with about three furrows through the center, then throwing dirt away from vines by two rounds with a single plow. This cuts surface roots and dries out the crown. They may be cross cultivated before blooming, but no irrigation will be applied until June. The late plowing permits growth of vegetation, too, which is sorely needed in Fresno county for humus. This also helps to dry the surface soil.

"Few buds start, if you weaken the vine by cutting surface roots with a plow just before the buds open. When the roots which were cut off have made their second start, the few buds that open will have made such growth that they draw all the sap; and the other buds remain dormant so you lose the crop.

"By letting the vines make an even start with many buds, then plowing deep to cut the surface roots, assist the vine to set a crop, by light sap flow at blooming season. After blooming the second growth of the roots will support the crop."

Stanislaus peaches promise a normal crop of most varieties.

Ancient Farming

Herodotus, in the year 450 B. C., said that good cultivation yielded two-hundredfold in the Valley of the Euphrates. Even in that land of Eden, poor cultivation yielded but fiftyfold.

In 1898, the average Wheat yield per acre in New York State was 21.2 bushels; in 1907, 17.3 bushels per acre; in 1912, but 16 bushels. This does not speak very highly for our Fertilizers.

Average American yield per acre of Agricultural Produce is at present about Eleven Dollars. European yields are more than double.

Isn't it time for our farmers to get down to business methods? Home Mixed Fertilizers will help.

Past Walnut Season Gratifying.

[Written for Pacific Rural Press.]

Total shipments of walnuts from alifornia the past season were 14,-00 tons, of which the California Valnut Growers' Ass'n shipped 9,200 ons besides 1,250,000 pounds of uts which were cracked and sold in he form of 500,000 pounds of meats, cording to Ass't Mgr. H. Zander of he Association. All of the crop has een sold.

Walnut Meats Introduced. — The alifornia walnut meat business is st beginning in Eastern U. S. where rench meats have heretofore held ractical control. Our shipments the ast season have been of amber eats, because they could be sold at lower price than the French white eats. Our white meats will prob-bly be sold in the East next year, hough our cost of production, espe-ially labor, is far greater than that n France. The percentage of Cali-ornia white meats last year was mall, anyway, on account of the hot pell which darkened them.

Carload shipments of amber meats ere made to the Middle West this eason, and the quality was equal to that of the French nuts; while the Eastern representative of the Ass'n said the flavor was better.

Cartons Continued.—The 14-oz. Diamond brand cartons for unshelled nuts will be continued, though re-tailers have been slow to take hold of them. They have to be shown that their profit on cartons is greater because their loss is less. The car-tons contain guaranteed nuts, so they bring steady demand after being introduced to patrons.

With nuts displayed in bulk, the store keeper cannot object when his customers take two or three casually, yet two or three make an ounce. At the holiday season, when the clerks feel happy, they often add two or three to the pound, so the shrinkage on a sack is very appreciable. The time used in sacking and weighing small orders during the rush holiday season is also a point in favor of the cartons. The response of retailers who have seriously undertaken to handle the cartons has been most gratifying to the Walnut Growers' Association.

Lime-Sulphur Grapes in Spring.

[Written for Pacific Rural Press.]

Lime sulphur spray on Muscat rape shoots up to 8 or 10 inches ong has been practiced two years y G. A. Ritchie of Hanford; and his year about April 10 to 15 he ill spray all of his own 75 acres nd about 225 acres of his neigh-ors' who have already ordered it. he lime-sulphur is diluted 1 to 75. n his first experiments, damage re-ulted from too strong a mixture. he 1 to 75 dilution has never in-ured the vines except as he wanted hem injured.

As already explained in Pacific ural Press, pinching off the tips f shoots soon after the forms of unches appear, throws the sap into hem and makes bigger bunches of igger berries, besides starting lat-rals for a very early second crop. Mr. Ritchie claims to accomplish the ame result by the spraying, besides iving mildew its first preventive ttack. This strength of the Or-hard Brand spray, which he pre-ers, kills the tips of shoots and the mallest two leaves. It would not urt the forms of bunches, says Mr. Ritchie, if they were dipped in it, or they have a felty covering.

Prevents Mildew.—Spraying thus arly is also done to prevent mil-dew, not to cure it. The same trength is applied again about May 0. From May 15 to June 10, the rapes are blooming for the first rop and must not be sprayed. As oon as blooming is over they are sprayed again. Then the second crop is blooming for about two weeks and everything is sprayed again in July—always using 1 to 75 strength and a power sprayer.

As the effect of dry sulphur is best when it is spread so evenly, thinly, and uniformly that it cannot be seen at a little distance, the lime-sul-phur coating the leaves, canes, and fruit, produces the same effect more surely and permanently. Mr. Ritchie is experimenting with the soluble atomic sulphur for mildew on a block of 600 vines this season.

POINTS ON PROCESSED PRUNES.

To the Editor: In your issue of April 1 Mr. Shelley comments on the present unsatisfactory method of processing prunes.

Unfortunately Mr. Shelley doesn't differentiate between a dry pack and a wet one. It is nonsense to say that the processing cooks them. Passing a prune through water at about 212 degrees Fahrenheit, for three minutes, doesn't cook it.

At our local Farmers' Union pack-ing house we put out a dry pack. This is accomplished by not allow-ing the prunes to remain in the water too long, and by passing them over a long draining board. Our last year's pack is in perfect condi-tion.

It is true that the sugar in dried prunes will deliquesce in tropical climates. This can be overcome by special containers.

It is true that some packers put out a wet and consequently a perish-able pack. But this fact does not justify Mr. Shelley in classifying all packs as such and impressing the people with the idea that all proc-essed prunes are alike.

Gilroy. **W. Ralph Thomas.**

California Fruits and How to Grow Them

EDWARD J. WICKSON.

Seventh Edition, Extended and Revised.

Contains over 500 pages of text with many illustrations. Goes thoroughly into every phase of that immense industry, Califor-nia Fruit Growing.

In the preliminary chapters, the important subjects of Cli-mate and Soils are handled in a masterly manner, with the neces-sary modifications called for by the immense latitude, the topog-raphy of the country and the different regions with their relation to coast, valley and mountain.

The book then goes into the subject of Fruit-Growing from the nursery, on through budding and grafting, preparation for planting; planting, pruning the trees and thinning fruit; cultiva-tion, fertilization and irrigaton right along to picking, canning and preserving, with chapters on injurous insects, tree diseases and the protection of the trees therefrom. Every fruit and nut which can be grown commercially in California or countries pos-sessing a similar climate, has received the attention which the forty years' experience of the author makes of incomparable value to the fruit grower.

Price, $3.00, Postpaid.

Growers Pack and Market Own Olives.

[Written for Pacific Rural Press.]

The growers were up against it. They had a 300-ton crop of olives coming on, and no one would buy them. That was last fall and around Hemet.

The California Growers' Ass'n was one of the few California olive packers which had more orders than olives. It is a non-profit organization of the growers of canning fruit with locals at several fruit-growing centers in the southern half of the State.

The Hemet growers asked to be organized as one of the locals so that their olives might be processed and marketed. Those controlling 1200 acres of canning fruits got together and organized the Hemet-San Jacinto Growers' Ass'n last September. They began to build an olive pickling and canning plant Nov. 20. This cost $5,000 for plant and equipment. It was built next to a laundry, from which they now get steam and power. The veteran ripe olive canner of the State, J. A. Campbell, installed and supervised the running of the plant during its first season.

When the plant was visited Feb. 22, there were 80 tons of ripe olives in process. Some 60 or 65 people were being employed. Plans were already made for a $40,000 separate plant to be built in March, 1916, when they would dismantle the present one. They expected to have 2000 acres in the Association by the time the plant should be completed.

In whatever direction one would ride into the country, it seemed like nearly every house had the big sign on a tree or post in front, reading "Member Hemet-San Jacinto Growers' Ass'n." That system of advertising the organization, invented by R. G. Spencer of the San Antonio Growers' Ass'n, has a good effect on the members, as well as on their wavering neighbors.

Continuous Canning. — Olives are canned from early November to early April. Honey will be put up during April and May, then apricots and peaches until nearly time to start olives again.

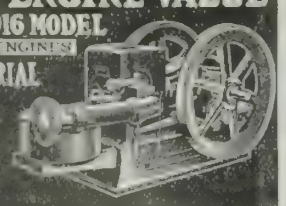
Only ripe olive pickles and olive oil are produced—probably 3,000 gallons of the latter during this season. Missions and some Manzanillos only are canned. Ascolanos would be harder to handle; make soft ripe pickles which lack flavor.

All pickles are graded into the standardized grades of the California Growers' Ass'n. This is done under supervision of Mr. Campbell for the central organization, so that all goods put up under their label may be uniform in each grade.

They are sized by a machine, graded for softness by hand, and for flavor by experienced tasters. All of this is done, not before they have gone through the lye process as was originally done, but afterward. It has been found that size makes no practical difference in the time required for the lye to penetrate barely to the pits, when they are taken out. Light grade caustic is used, to avoid mushy olives.

There are only three size graders in the State like this one, according to Mr. Campbell. It does not bruise the fruit. A rotary toothed cylinder lifts them over from a hopper into a tank of water. Under the surface of the water is a slat bottomed tray with the slats farther apart at one end than the other. This is lifted just out of the water and forward at the same time by a rotating arm, so that the larger olives are carried easily forward away from the others.

The standardized pack of only ripe olives, and the efficient marketing through the central organization bid fair to greatly increase the demand for a brand which is fully as good as the highest priced, yet designedly sold at a lower price. The lower price is made with the idea of increasing consumption, to furnish a market for ever-increasing crops, at good prices to the grower.



One of the members, M. B. Moulton, is responsible for the statement that for the six different sizes, the growers are getting $60 to over $200 per ton.

To Effectively Control Grape Mildew.

The increasing prevalence of powdery mildew on grape vines is yearly causing greater loss to California grape growers. As the vines grow older and larger with a greater amount of thick foliage and more fruit, control of this disease by past methods of practice does not, in all cases, give satisfaction or economical results.

Several hundred acres of grape vines, both table grapes and wine grapes, in irrigated and non-irrigated vineyards, including old vines and young vines in San Joaquin, Sacramento, Solano, Tulare and Fresno counties have been sprayed during the last two years by practical grape-growers, who are successful and who obtained economical and profitable results by the use of Atomic sulphur.

The sulphur in this preparation is not in chemical solution, but is in very finely divided state in thin paste form, which dilutes readily in water, giving an effective adhesive spray that will remain active and give protection to fruit and foliage for the greatest possible length of time. It should be applied with a spray machine giving good pressure, preferably a power outfit or the best grade of large hand pumps capable of maintaining at least 150-pound pressure—preferably 200 pounds. Use large chamber type angle nozzles on the ends of suitable rods so that the underside of all leaves and young canes as well as the crown of the vine can be thoroughly covered.

DIRECTIONS.—Dilute and thoroughly mix Atomic sulphur with water at the rate of 12 pounds for each 100 gallons of spray. Make first application on grape vines well before blooming, that is, when the first young shoots are from 9 to 18 inches long, and thoroughly wet the entire vine, leaves and leaf buds with the spray. The second application should be put on as soon as the grapes are through blooming and the berries have set (if vine hoppers are present add Black leaf "40" at the rate of 1 pint for each 200 gallons of spray.) Carefully cover the under surface of all the leaves, the entire surface of all the canes and new shoots, and particularly all berries and stems in the grape cluster.

One acre of vines will require from 150 to 300 gallons of dilute spray per acre for the first application, and 200 to 400 gallons for the second application, depending on the size and number of vines per acre.

Full information furnished on request.

IRRIGATES VALENCIAS BI-MONTHLY.

[Written for Pacific Rural Press.]

"We irrigate our Valencias only once every 8 or 10 weeks," says C. C. Chapman of Fullerton, who has probably done as much as any one man to boost Valencia oranges. "We don't like to irrigate as much as most people do. It ruins trees to water so frequently. It leaches, bakes, and kills the soil."

Mr. Chapman's soil is a more or less heavy sandy loam, deep, and far down to the watertable so the latter has no effect.

"Don't the trees suffer and the leaves curl up?"

"No."

"Why?"

"Cultivation — that's our hobby. Here we are plowing this block (March 11) crosswise, having already plowed it once lengthwise of the checks. We will let it lie a while rough (but mellow) because we always have some more rain. It will catch and hold the rain. Then we will spring-tooth it—maybe before. We like the spring-tooth best. We plow deep, and we never cultivate with less than four mules on a harrow 8 or 9 feet wide."

"Doesn't such deep cultivation tear up a lot of roots?"

"We don't think so. If we were irrigating all the time the roots would come to the surface as they do in most orchards, and some of them would bake between times. We get our roots deep down and keep them there by deep cultivation, and keep the ground moist underneath by the same means.

"We wait until after the fruit is set, if possible, before applying the first irrigation."

A rice experiment is being fostered on 22 acres by farmers around Millar Station, 20 miles south of Sacramento. A man has been placed in charge who will take care of the land at all times, writes L. H. Rodebaugh of the Oakland, Antioch & Eastern Ry. J. W. Mills, Solano County Farm Adviser, will have charge of the scientific part of the experiment. The Oakland, Antioch & Eastern Ry. has donated a large pump; and a well 81 feet deep with water 4 feet from the surface has been sunk. It is expected that rice will do very well in this part of the country. Planting will commence in a very short time under the jurisdiction of Mr. Mills and other farm experts and the results of the experiment are being looked forward to with great interest.

THE "BOSS" TREE PROTECTOR

Made of Yucca Palm. Is cheap, durable and quickly put on the tree. It prevents rabbits from destroying your trees. A sure protection against frosts, sunburn, grasshoppers, or dry winds. Can be easily removed, will last for years. Send for samples.

A Shot at Home Rule on the Sacramento.

To the Editor: Colonel Irish has come out with a diatribe against the proposed act of Congress known as the "Newlands" act. The statements made by him are so far from being correct and the provisions of the proposed bill are so grossly misrepresented that it is but meet and proper that the facts should be fairly stated lest your readers be influenced improperly by the erroneous statements of Colonel Irish.

To take up the misleading statements of the Colonel seriatim would be too tedious as it would involve practically every statement made in his article. To mention a few of the most grossly misleading will suffice to classify the remainder. The Newlands law does not propose to do away with the work of improvement now going on, nor to interfere with it in any way if it has any merit, and I challenge Col. Irish to find a word or a line in the proposed act to justify his statement. The Newlands law does not propose to reservoir any specified quantity of flood waters of the Sacramento valley, and when it is stated that any specific thing was to be done under the Newlands law, that statement is wholly untrue for the simple reason that the act has not been made a law yet and no one has a right to say what will be done when it becomes a law.

Colonel Irish's statement that this is the first attempt to improve the Sacramento river is fully as misleading as his other statements. It is, however, the first attempt to hitch a private reclamation scheme onto a plan for assisting the improvement of the navigable character of the Sacramento river and it is this feature of the plan which has commended it so highly to the eminent editorial engineers who are so vehement in its behalf and so bitterly opopsed to the Newlands law because it proposes to take this whole vast question out of the domain of petty politics and private interest and turn it over for solution to a body of men chosen to solve it because of their ability to do so and because of their being entirely disinterested.

To those of your readers who may be unfamiliar with the provisions of the Newlands act I wish to explain what it really proposes. It is a proposed national law to take the rivers and harbors of the country out of politics; to destroy the pork barrel; to substitute for the present system of securing appropriations for ponds, creeks, and non-existent harbors a system by which this government will only spend money upon prospects that have merit and are of general use. It proposes to have all the various prospects considered as units. Every man who has studied our local problems knows that in order to secure the best results many things must be considered at the same time. The improvement of our navigable streams demands the consideration of questions of storage, reclamation, irrigation power development and conservation of forests. This the Newlands act proposes to place in a position to be handled by the same men at the same time. It should be enacted. Our river work should be taken out of the hands of the editorial and political engineers and placed in charge of real engineers of established reputation and acknowledged ability.

The writer has had a more active part in the work of improving the great waterways of California than any other civilian. It has been my observation that the greatest obstacle to the improvement of the Sacramento and San Joaquin rivers has been the constant efforts made by representatives of private interests to so shape the work as to lead to their personal aggrandizement rather than to the common good.

Every man in California who has at heart the best interests of our rivers and harbors will lend his influence to assist in having the Newlands act made the law of the land, Col. Irish and the corps of editorial engineers, and the various beneficiaries of existing projects to the contrary notwithstanding.

Esparto. **H. J. Corcoran.**

[We prefer not to have discussion of this subject continued at this time. We have allowed each side to call the other "politics"—and that is about the limit of the vocabulary. Even if we acknowledge that Mr. Corcoran is supporting a perfectly rational academic scheme for the control of all American rivers, from the Maumee to the Yukon, it is not necessary to urge it now. It may have a thousand years to run and Sacramento might get in the first century and it might not. On the other hand there is a way to have something dong on the Sacramento at once, as this dispatch indicates:

WASHINGTON, April 6.—Flood conditions on the Sacramento river will be cared for in the general bill being drawn to cover conditions on the Mississippi. The new flood control committee of the House of Representatives will vote on the bill within the next few days. The measure proposes an expenditure of $45,000,000 for the Mississippi and $5,800,000 for the Sacramento.

The latter appropriation will be spent in co-operation with California state and district reclamation appropriations. Both appropriations will cover continuing work over five or six years.

Mr. Corcoran claims that the bill does not intend to interfere with any project now under way. Granting that to be true, what guaranty is there that some preparedness bunch may not use the Newlands bill as a side-track to shunt the Sacramento project upon and spend the money, which it is now arranged to appropriate for this improvement, on the building of a little battleship? The proposition is too dangerous to monkey with just now.—Eds.]

Curl leaf is prevalent in Elbertas wherever they were not sprayed with lime-sulphur when buds were swelling but none opened.

—Six feet through at base, 4 feet 6 inches through at top, five feet above ground.

Giant Stumping Powder did a clean job, taking out roots and all without tearing a big hole in the ground. Farmers who have used them know that

GIANT FARM POWDERS
STUMPING — AGRICULTURAL

always save them money, time and work. They save money because they lift and heave as well as shatter, and go further than high explosives that merely split the stumps. They save time and work because they get out the stumps—big or little, green or dead, in a condition easy to handle. "I get better results from Giant Powders than from any other powder I have used," says A. E. Adkins, Woodburn, Ore.

There are two Giant Farm Powders, both made especially for Pacific Coast farmers. Eureka Stumping Powder is most economical for dry work and Giant Stumping Powder saves money in stump blasting in wet soil. Try these two. Compare them with the powder you have been using, and you will always use Giant in future. Write us and we will have our nearest distributor supply a trial case at the lowest market price.

Mail the Coupon for Free Books

Better ways of removing stumps and boulders, making ditches, planting trees, and breaking up the subsoil are described in our five illustrated books. They were written for western farmers, to meet the conditions that *you* have. Choose the books that you prefer and mark and mail the coupon today—before you forget it.

University Farm's 8th Annual Picnic Day

[Written for Pacific Rural Press by Tom Judkins, University Farm, Davis.]

Founded in 1906 and celebrating its tenth anniversary on April 22, 1916, the University Farm Experiment Station and Farm School at Davis has come to be regarded as the greatest general agricultural experiment station on the Pacific Coast. The recent investigative work in irrigation, soils, horticulture, poultry and animal husbandry has been the means of saving thousands of dollars to farmers along these lines.

Annual Visitors' Day.—The present enrollment at Davis is 250 Farm school students and over 100 from the University at Berkeley, who are completing their course with a term's work along strictly practical lines—as the curriculum at Davis essentially is. One day in the year is set aside on which all farmers of the State, their families, and all city-folk interested in a closer study, on its native heath, of the much-heralded "scientific agriculture" may come, be instructed and entertained.

The day is intended to be one on which that ideal combination of practical instruction and informal entertainment is practised. The interested farmer or stock man is shown through all the phases of the investigational work being carried on at this great experiment station. Fifty-five acres devoted to study of the orchardist's problems will interest the horticulturist. Special attention is being devoted by this division to the rejuvenation of California's "worn-out" orchards whose former high yields have been in some sections materially lessened through improper methods of cultivation and lack of knowledge of pruning, pollenization and grafting questions.

On Saturday, April 22nd, will be held the 8th annual Farmers' Picnic Day, and the slogan adopted is "Worth-while demonstrations and loads of informal outdoor fun for the farmers of California and their families." Because of the vastly improved condition of the automobile roads in this part of the Sacramento Valley, last year's record of 400 visitors is certain to be greatly exceeded.

Besides the festival side of the day's program, the visitor will have opportunity of viewing the activity of the various departments on the Farm.

In the poultry department he will find a new laboratory where disease investigation work is being extensively carried on. A flock of over 2,000 fowls is usually maintained at this "farm" for experiment and student instruction purposes. Research work is now being done in moulting, relative effects of soy bean meal and meatscrap as protein feeds for laying and breeding hens, etc. An attempt is being made to find means of making the laying season of California hens a more regular and higher egg-producing period.

The irrigation division is specializing on dobe-soil work in that field of agriculture and also endeavoring to prove to the farmer that he is annually wasting large sums of money through over-irrigation and causing the partial prevention of desirable bacteria growth. Eleven types of head-gates are at present being tried out in the irrigation of this great 780-acre tract of Sacramento Valley alluvial soil.

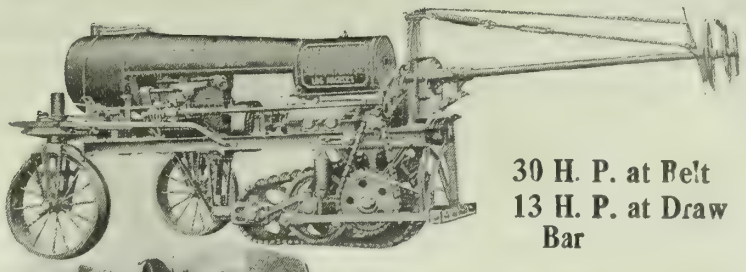
The Agronomy division is kept busy with research work on field and forage and is especially concentrating on the growing of corn, sorghums, and Sudan grass under local conditions.

Many Champions.—The animal husbandry division is on an especially high plane, and is probably the most important of the departments. Herds of beef and dairy cattle are maintained that compare most favorably with those at any station in the country. The beef barn is the home of "University Jock," one of the greatest steers ever raised in this State. Others of the herd have earned the titles of Champion Hereford at both the San Francisco and Portland International fat-stock shows, Reserve Champion Cross-bred at both, Champion Aberdeen-Angus at both, and numerous other honors that prove that the breeding and feeding methods practised at this adjunct of the University of California College of Agriculture are correct and to be emulated by enterprising breeders. Five Farm steers sold last fall at an average of over 13c per pound on foot, and one dressed out at 71.6. The Shorthorn herd is at present small, but will soon come into prominence with a grandson of "Whitehall Sultan" as herd bull.

A small flock of milch goats have lately been installed and one of these will soon reach a mark of 1,400 pounds of milk for her first lactation period. High-producing Holstein-Freisians, Jerseys, Guernseys, and Ayrshires are among the 120 head of dairy cattle in the dairy department. One star individual has a year milk record of over 23,000 pounds.

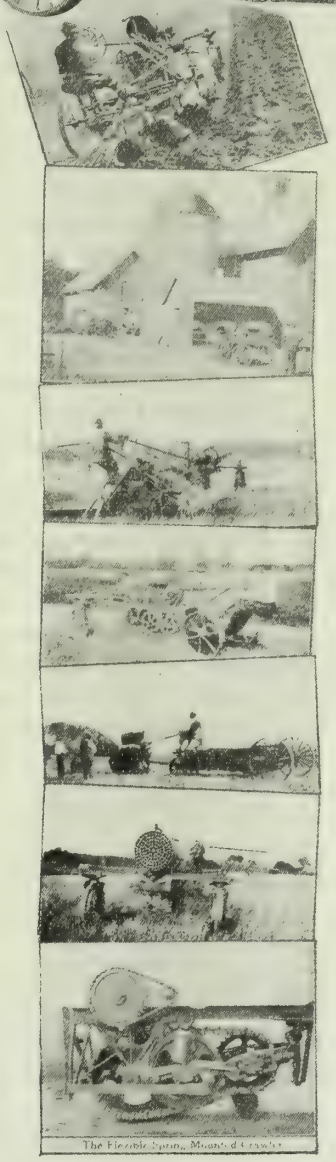
In the sheep department may be found representatives of the Shropshire, Hampshire, Southdown, Rambouillet, Cotswold, and Romney-March breeds. One of these, a Southdown wether, was adjudged Champion of his breed at the San Francisco show and Grand Champion at the Portland International.

The swine herd averages 500, and contains members of the Berkshire, Poland-China, Duroc-Jersey, Chester-White, Yorkshire, Tamworth and Hampshire breeds.



CHAIN SMOOTHS SEED-BED.

[Written for Pacific Rural Press.]



A spiketooth harrow leaves a seed bed in small ridges which dry out sooner than if level, and may prevent germination of some broadcasted alfalfa.

F. E. Handel of Covina wanted some alfalfa planted in his family orchard, to feed the goats. A good seed bed was worked up and borders made beside the tree rows. The alfalfa was sowed and harrowed in twice with a spike harrow from which dragged a heavy chain in the shape of a semi-circle, its ends being hung to opposite ends of the harrow. This dragged along just under the surface, leveling the ridges and filling hollows in fine shape.

BATES STEEL MULE

30 H. P. at Belt
13 H. P. at Draw Bar

ONE MAN AND THE MULE for every operation. There is no "guess work" about the **Bates Steel Mule.** It was built to take the place of horses on the farm—to do all farm work quickly and thoroughly, such as plowing, discking, drilling, harvesting, pulling fertilizer spreaders, filling silos, hauling crops to market, runs irrigation machinery and for every work where power on the farm is needed.

NO NEW IMPLEMENTS NEEDED when you buy the **Bates Steel Mule.** Use the ones you have when you buy the "Mule" for they are good enough and will do the work cheaper, quicker and better. The "Mule" works 30 per cent more days per year than an ordinary tractor and works on **any soil, wet or dry,** and this feature is important to the man who buys a tractor.

IS EASY TO OPERATE. There's one thing about the **Bates Steel Mule** that strikes everyone, and that is how easy it is to operate. All the control wheels are located on the column extending from the rear of the tractor within easy reach of the operator. The steering is as easy as an automobile—while the clutch is even easier, if possible. So gradually can the clutch be engaged that you can crack a nut with the wheel rims and not crush it. The "Mule" is used by thousands of satisfied owners all over the world, and is the **only real one man tractor built.** If you are going to buy a tractor for your work, go one step further, buy a **Bates Steel Mule.** "It's the way to better farming, bigger and better crops."

GUIDES ITSELF WHEN PLOWING. One of the greatest labor-saving features of the **Bates Steel Mule** is the self-guiding feature when plowing. One front wheel runs in the furrow, and as this wheel has a beveled flange on the inside rim, it hugs the furrow wall with practically no attention of the operator.

THE "CRAWLER" is hinged at its rear end, making it flexible for working on rough ground. In the middle of the side-frames are heavy coil springs, enclosed in a steel shell. These springs take all jar and vibration from the tractor machinery, making the **Bates Steel Mule** peculiarly adapted for road work. Taking away all vibration, the springs greatly increase the life of the entire machine under every kind of service. The "Crawler" touches every inch of the soil. **No slipping and sliding,** but a **straight, hard, steady pull.** Packs the ground less than a man. Just like laying a big broad platform on the ground and putting the weight on the platform instead of on the ground itself.

San Diego	0	12.53	9.11	78	50

THE WEEK

WE ARE giving this issue largely to the the pig, because he seems to think that his friends should be encouraged a little and because we believe it is possible to spell the long word "opportunity" with three letters—and it does not matter whether you begin with a "p" or with an "h." But to be conscientiously frank with our friend, the pig, we must remind him that unless he wishes to be lathering around the State in a few years, to find out what he can do with himself, as the peach and the prune are now doing, he must begin at once to study the arts of foreseeing and foretelling. Unless he does this he may be rushing down the steep bluffs into the Pacific with the devil in his tummy—just as his progenitors did in Palestine so many years ago. For we cannot find anything to relieve ourselves from the impression that there is no difference in opportunities which come to pigs and to people; that all opportunities are not opportunities at all unless the opportunities are ready to lay hold on the hind-legs of opportunities and hold on. And so, while we thoroughly enjoy the word-pictures of opportunities which our pig pen-artists are portraying for other pages of this issue, we must add the conviction that to realize these opportunities the California-grown pig must begin right away to study manufacture, commerce and economics, and not fill himself wholly with pride of ancestry and the joy of good living. For though it is truly a shame that the population of so good a pig-paradise as California should think they are eating distant pigs and admiring distant labels, the condition probably cannot be changed much until the local pigs are more fully standardized to meet packers' requirements of size, style and quality, and California-packed pig products are popularized to a recognition of how good they are. This cannot be all done by simply growing more pigs, though that is a necessary condition—providing they be good pigs and well grown. Therefore, we call upon every California pig who loves his country to get his snout under his owner and keep boosting and rolling him over until he joins some kind of a pig club or society—the declared purpose of the organization being not only to grow more and better pigs, but to inaugurate a co-operative purpose to find out how California pig products can be given proper commercial standing at home and abroad.

THE PIGS THAT WENT TO MARKET.

IF WE remember correctly we made reference some time ago to our observation in England and Ireland of the operation of "Live Pig Societies" and "Bacon Societies." These societies were all very much alive, though the pigs were dead and smoked in one group. There was one very living purpose in all of them, and that was to displace Danish pork and pork products, and to get for British pig growers a fair show in the British markets, and they were doing so much that the printed reports of their transactions and membership lists made a book as thick as a slab of bacon. We attended one of the Live Pig Society's market days at Leicester, where we saw the Society's headquarters and its corrals filled with pigs so uniform in every way that a butcher or packer could buy a score or a thousand and not be able to tell individual pigs apart except by reference to their visiting cards. When the buyers for the markets or packing houses did not offer a fair market, the growers had their "Bacon Societies," which went to smoking. This was chiefly in Ireland, where packers were small and few. It is for the California growers' societies to look into such matters as these. We do not know how far it may be necessary to go in this State. That is for the growers to determine by investigation. Two of their attainments are apparently desirable here: first, an ample supply of uniform pigs of exactly the size and style the packers need; second, district or community sales' points where the right kind of stuff will be placed in open market to the fullest requirements of the packers. What the growers can do to advantage in finishing their product and developing distribution and publicity for it, they should be busy trying to find out. They should probably use existing packing and distributing arrangements just as long as growers get a fair deal, and they should join with packers in popularizing the California grown products and in making California hams and bacon smell just as sweet under a California label as they do now under imported coverings. Every California grower should join a pig society and learn how to squeal to some purpose.

ANOTHER CALIFORNIA CONSOLATION.

NOW that we have done the proper thing toward getting smoke into good California bacon, it is interesting to note that good California smoke will come after bacon. For it is a piece of trade information that the war has knocked the pipe from the face of mankind, and California has to replace it. It seems that French briar-wood, which has been held to be the best pipe-stuff in the world, cannot now be had, and the director of the forest-products laboratory at the University of Wisconsin reports that "after a number of experiments, the California mountain mahogany has been designated as the best substitute yet found for French briar wood used in pipe-making." This result was attained through the shipment from the California division of the U. S. Bureau of Forestry of various California woods, including specimens of mountain mahogany. This wood is reported as being plentiful in California, and is available in many parts of the State. The reports at hand leave us in doubt as to which of two species of cercocarpus has won the tubular award, but it is probably parvifolius, which has the larger range through our Sierra Nevada and Coast ranges, and goes abroad into other parts of the Pacific slope also. There would seem to be enough of it to smoke up the world. It cannot be doubted that the wood fully justifies the new eminence which comes to it. Long ago our pioneer botanist, Dr. Kellogg, wrote of it: "The wood is dark colored, with very little sap, hard and prodigiously heavy; of exceeding slow growth, trees of the largest size being about one thousand years old, perfectly sound, without infirmity, journeying on with eons unnumbered crowning their venerable brow and yet others in store; still the beautiful tressed seeds come and go as of yore, prettily spiraling as in juvenile grace, merrily trilling to the breeze, silky softening into mellow haze her curly head, lest the unbecoming twig seem too strict and stiff, or formal and bare, to please the eye or satisfy the taste."

As the indulgence in pipe-smoking is itself largely promotive of the play of the imagination, soothing and at the same time setting fancy free, how a pipe made of such a tree must bring consolation to a disrupted world! And to think that quaint old Dr. Kellogg, sitting in his workship of forty years ago, in his shirt-sleeves and red-flannel waistcoast, slowly pulling on his old black dudeen, and writing the poetry of botany, should really have been prophesying advertisements for the world-beating pipe of the twentieth century! But even this would not have displeased the genial, devoted pioneer; he always longed for the time when something good about California should be in everyone's mouth.

AND THIS IS EVEN WORSE.

AS WE have been, in a way, apologizing for the unbeastly vice of pipe-smoking, we may as well perhaps finish the chapter of crime and write of beer, for close observers always hold that smoking leads to drink, and sure enough, for here we go to it. It is an interesting fact for California barley growers that the malt-houses of the belligerent countries are not the only refuges for export barley. So far as we have observed no embargo has struck barley yet, but one does not know. Every time Britain sees a flock of Zeppelins she shoots off a volley of embargoes, and both are alike in the fact that they hit only those who are not fighting. In the matter of barley it is very interesting that the malt trade of the world seems to be rapidly coming to the United States. According to figures made public by the bureau of foreign and domestic commerce, of the Department of Commerce, the value of malt exports jumped from 330,000 bushels for the twelve months preceding the war to 2,153,000 bushels for the first twelve months of the war.

The value of such exports increased from $270,000 to $2,301,535. Italy, Sweden, Argentina, Brazil and the Philippnes imported malt from the United States for the first time during the fiscal year 1915. Brazil was much the largest customer of the year, taking 600,000 bushels; Argentina was next with 336,000 bushels. The only country to which exports fell off was Canada, to which 83,000 bushels were consigned, as compared with 161,000 bushels in the year previous. Possibly this suggests that California ought to be shipping malt through the canal instead of raw barley, but the more immediate suggestion is that we can sell barley in this country if there is any trouble about it abroad.

IN SACK OR IN BULK.

SPEAKING of grain and embargoes, it should be mentioned that one of the embargoes has struck us below the grain belt, because we have no public elevators to run a grain belt in. We have a few private elevators recently constructed which are doing well, and we may speak of them at another time, but the present trouble comes through the British embargo on the shipments of jute from Calcutta. Probably Britain counts on needing all the jute to sack up the prisoners she expects to be taking pretty soon, but that does not make it any less hard on us to be short of bags when we have a great crop coming on. We hope the committee recently appointed by the Sacramento Development Association, consisting of B. F. Walton of Yuba City, State Senator Benjamin F. Rush of Suisun, and G. W. Hendry of the University Farm, will soon have some pertinent suggestions for us on the desirability of elevators in our grain districts. Practically all the burlap used in the manufacture of grain sacks on the Pacific Coast comes from Calcutta and China. The bags are all made in the states prisons and in these no orders have been taken for a long time, all the output having been contracted for. The shortage of burlap has considerably reduced the output already. Current gossip is that second-hand bags are now worth considerably more than new bags were a year ago, and the apparent shortage of bags is very great. Of course, such things are not usually as bad as they seem in the distance, and there may be some substance available for containers not now thought of, because advance in price always brings new things to light, but surely everything possible should be done to escape the cost and danger of trusting to bags, and it should be done forthwith.

OUT OF TIME WITH THE WORLD.

AS WE find it practically impossible to say nice things about all the warring nations, because their policies hurt us so much in basket and in store, probably the best way to be neutral is to slam both sides. We have been sufficiently cross about British embargoes, which the Anglo and London-Paris National bank very neutrally says, in its recent circular, "is a serious loss but not a calamity, and will be partly offset by the unusual purchasing power of our own people." It is a good hint for all our embargoed producers to begin at once and see how much they can sell to more prosperous Americans, and that should never be lost sight of in our many marketing assemblies which are being held. Still, if Britain forces us to be thus out of time in our world trading it is a match for the foolishness of Germany in trying to gain time by monkeying with the clock. The report is that the German Federal Council has passed a measure providing that on May 1st all clocks shall be set ahead one hour. The measure was proposed for hygienic and economic reasons as lengthening working time during daylight and decreasing the necessity for artificial light. Of course, one can readily see that if the work day begins an hour earlier and stops an hour earlier, it gives a pleasant late afternoon for beer and pretzels, and may get the people to bed earlier. That is all rational enough perhaps—except the beer. But what kind of stupidity is it which requires the clock to be knocked out of time to do that? Why not change the shop rules or the blowing of the whistles, or the ringing of the bells. It may all be very wise for the people it is evidently intended to benefit, but we can not understand what kind of people they have to be thus benefited. It looks to us like the enactment of an imperial falsehood, the influence of which for immorality is hard to measure. And if the advantage of getting more working time in daylight is an offset for that impeachement of the truth, why not do more of it by turning the clock one hour forward at midnight, two hours backward at noonday, two hours forward at midnight, and so on? What time is it?

Queries and Replies.

Querists must give name and address.

What Is the "French Improved Prune"?

To the Editor: Kindly advise me what you know about the French Improved Prune, and whether you consider it a desirable prune to plant for commercial purposes. I am advised by reliable nurseries that it is in the experimental stage and they advise sticking to the varieties that have proven merit.—E. H. S., Delevan.

We have never seen the "French Improved prune" and cannot give an opinion about it. It is reasonable that improvement should be reached by selecting buds from the best bearing trees having the largest fruit and if you can be sure that this is the method of improvement, we should plant a few for trial. But, as we have previously intimated, any one who claims an improvement on the French prune (prune d'Agen) by getting away from the established type, is engaged in a very risky business.

Growing Castor Beans.

To the Editor: I wish information about the culture of castor bean as a commercial crop. What is the best sort to produce oil?—E. T. C., Ripon.

The castor bean grows luxuriantly in California and bears abundantly, but it is not a safe crop to grow unless you have a contract with an oil maker at a profitable price and unless you get the seed from him so as to be sure to get the kind of castor he wants. There are ornamental castors the seed of which is worthless for oil. As the beans are not edible either by man or stock your only chance is with the oil man. The soil must hold moisture enough to keep the plant growing late in the summer, for the crop ripens by succession of clusters and this requires much hand labor in gathering the clusters, and drying them so the beans will pop out on a floor where they will not be lost. Castor beans were first grown in California over forty years ago without profit and they have never been profitable since that time. Beans grown in India or in the middle west have always undersold our product because of cheaper labor.

What Will Celery Shoots Do?

To the Editor: I have some last year's celery roots which are sending out little, new plants from the old stumps. I wish to know if I can reset these shoots, and will they make celery, or will they go to seed? I set the plants from the seed last year. They grew up and were not pulled, so went through the winter and are now sprouting thickly. Each of the little shoots has plenty of roots. Some stumps have as many as 15 shoots and are farther along than plants from seeds would be.—C. V. J., Le Grand.

We never have grown plants from such shoots and therefore cannot speak from observation, but we are reasonably sure that even if the shoots did not soon send up seed stems they would not make such foliage and leaf-stems as a new plant from the seed would do. Therefore, practically, they are of little if any value—except possibly for seed growing. It is usual to grow seed from seedlings set out late and held over to produce seed the second summer. Presumably these shoots would share in the advanced experience of the hold-over roots from which they are taken; but, though they had the sentiment they would not have the force of the old root in bringing forth—that, however, we are guessing at. Who knows from observation?

Nuts in Lower California.

To the Editor: I am a new subscriber and am very much pleased with your publication. I will recommend it to my friends so they may share the benefits of it I intend to plant several hundred walnut trees next season. I have land, part of which is level and part of which is sloping, but not steep. I can plow up and down it with ease. The soil is very rich, but only from 18 to 22 inches deep as an average, being a little deeper on the lower part. The land lies about three miles from the coast, and between the ocean and the land there is a small range of hills that checks the sea breeze. For the past ten years, a crop of hay and a crop of beans have been raised on it, alternatively, each year, with success. Would this land be suitable for walnut trees, or is it desirable to secure other land?—R. R., Ensenada.

Unless you can find bearing trees which have behaved well your planting must be largely experimental. We do not know enough about your local conditions to warrant definite prescription. As the land comes through with a crop of beans it has presumbably enough summer moisture and moderated heat to favor the walnut. In Southern California beans and walnuts have been good pals for a third of a century. The soil is rather shallow and its capacity depends much on the character of the subsoil, which you do not mention. If the subsoil is permeable but not too loose or gravelly, it will help you out considerably. On the flatter land we would plant walnuts on California black walnut roots. On the slope we should try almonds—planting mixed varieties. You will see that we are only making suggestions for an experiment. In a few years you will be wiser and you can have the satisfaction of adding to the wisdom of the community also. Meantime we should scurry around and see if some earlier planter has not already rendered such public service.

Mechanical Power on the Farm.

EMPTIES FROST POTS ECONOMICALLY.

[Written for Pacific Rural Press.]

Frost pots have been emptied this spring by an economical system for the Corona Lemon Co., and will be made more economical and satisfactory next season by installation of a small gas engine.

F. A. Steele, who has charge of the orchards comprising some 245 acres of lemons, had observed the men lifting the heavy pots, many of them containing about nine gallons of oil, at arm's length above their heads, to the man on the tank wagon who would empty them. It was hard, wearing work, slow and uneconomical. They used to spill oil over the ground—a quart average per pot.

"Oil Kills the Ground and Trees."—To make the work easy and avoid spilling oil, Mr. Steele put a 300-gallon open-topped galvanized iron tank on timbers slung under a low-wheeled, broad-tired truck, hitched the truck on behind the tank wagon, fitted a pump to lift the oil, and then had the men dump the pots into the low-sided tank. They can now dump 1,500 nine-gallon pots from 20 acres per day.

Where the pots are entirely full, one man dips out a little from each. One man drives the tank wagon, two men work the double action Myer's force pump steadily, and three men carry pots from trees on each side of the outfit. They do not lift them more than 4 to 4½ feet high and have the whole open tank to pour into.. They do not spill oil as the man used to in trying to pour it into the small hole on top of a closed tank wagon.. A chicken wire and another fine screen prevent excelsior and newspapers, which were originally used to light the oil, from going into the tank—for these would clog the pipes by which oil is distributed on part of the place. About 21,000 of the pots were put in three years ago and have never been taken out—5,000 have been there still longer.

This year's experience suggests several improvements. It now costs about 3½ cents each to empty the 9-gallon pots, haul them to the barn, and stack them. Mr. Steele hopes to reduce this to 2 cents, and to take pots out of 35 acres per day.

A gas engine will take the place of the two men at the pump. Instead of the open tank resting on 6x6 timbers, it will rest on T rails or channel irons, so it can be lowered several inches. Now, the pots must be lifted a foot higher than the surface of the oil in the tank, which cannot be filled nearer than a foot from the top on account of splashing out. Next year's tank will have lower sides curved or flanged to prevent splashing.

ELECTRIC RATES REDUCED.

[Written for Pacific Rural Press.]

Reduced rates for electricity for 2582 agricultural power consumers in the San Joaquin valley from Merced county south have been ordered by the State Railroad Commission.

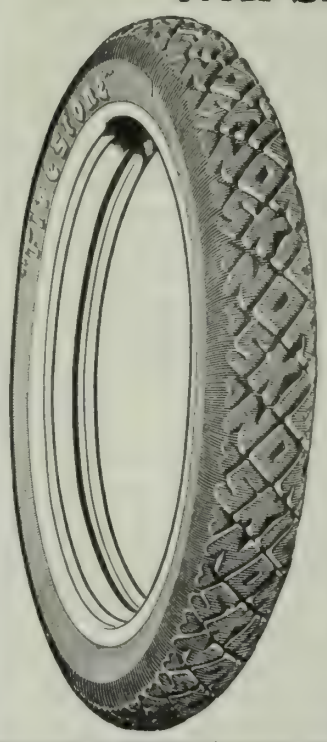
A flat rate of $50 per horsepower year has been charged, not allowing current to be used for other purposes when not in use for irrigation. The new rate is $42.30, and an equitable scale made for all uses of electricity. Farmers have been compelled to pay $65 each for a transformer: the power companies must furnish transformers free of charge hereafter. Instead of having to agree to use the current five years, the contract term is reduced to three years and annually thereafter. As pumping is not needed more than 8 or 9 months, flexible seasonal rates are made. One corporation has been compelling consumers to pay the cost of extensions, but will hereafter pay that cost itself. The maximum demand system has been abolished.

Both corporations are commended for efficient service.

The basis for the fixing of rates was a valuation of the property of each company, used and useful, allowing 8 per cent dividends. It was found that earnings have repaid early deficits with interest at 8 per cent; and depreciation funds have been provided.

ELECTRIC MILK HOUSE.

[Written for Pacific Rural Press.]



Electric power runs a dozen machines about the city milk-producing plant of the Elliott-Brant Rancho in San Fernando valley. As the strong features in producing the very best milk are breed, cleanliness, and coolness, perhaps the fundamental motor of the outfit is the one which pumps ammonia to cool the brine which makes several 50-pound blocks of ice at once. This ice is left in the tanks in which it is made until needed, with the brine around them. The brine is pumped through a milk cooler over which the milk runs after having the natural slime taken out in a motor-driven clarifier. A little motor runs the machine by which ornamental lead caps are put onto the bottles.

When the bottles come back empty and more or less clean, they are pushed two at a time over wet brushes rotating by motor power to

The Last Word "MILEAGE"

OPINIONS may differ on what constitutes a good tire until the mileage record speaks. Then Firestone mileage settles the argument. Firestone mileage talks convincingly. It has talked motorists into demanding twice as many Firestone Tires this year as last. It has talked many thousands of new dealers into joining the Firestone forces. It will talk you into insisting upon Firestones on every wheel and on the spare.

Firestone
Non-Skid Tires

now have Red Side Wall and Black Tread, a handsome color combination, the trademark of Firestone. It adds a touch of elegant "difference" to any car without showy effect.

The Firestone Non-Skid Tread means big economy of extra mileage while affording the greatest possible security against skid or slide.

Firestone Accessories give that help at the critical moment which the farmer—of all busy men—so much appreciates.

Firestone Cementless Patch FREE

Let us send you a Firestone Cementless Patch Free—also copy of book, "Mileage Talks," No. 64 Write today. Meantime, see your dealer.

Firestone Tire & Rubber Co.

"America's Largest Exclusive Tire and Rim Makers"

AKRON, OHIO

Branches and Dealers Everywhere

P. & O. No. 40 Combined Corn and Bean Planter

Furnished with open center or solid concave tires.

The Combined Corn and Bean Planter here illustrated is a machine built by one of the largest manufacturers of planters in the world, particularly to meet the requirements of the Pacific coast trade.

It is not a made-over machine, but is built from the ground up for Coast needs. This fact, together with the reputation of the P. & O. Company for building tools right in every detail, insures absolute satisfaction to every user of this planter.

It's the Way They are Built

FEATURES:

Equipped with a full set of plates for planting any of the different kinds of corn or beans commonly planted in California, including Egyptian and Kaffir corn.
Adjustable to any width rows from 28 to 44 inch. The check-rower machine is adjustable for checking rows 3 ft. 4 in., 3 ft. 6 in., and 3 ft. 8 in.
Accurate planting insured by the sight feed. Sight feed has a large opening, and the seed is visible at all times to the operator as it drops from the hopper to the upper valve.
Quick, detachable runners held on the shank by one bolt. Easily removed for sharpening.

Write for descriptive circular and address of nearest agent.

clean out the insides while a brush above and between them scrubs the outsides of both bottles at once.

When butter is to be made, the cream is pasteurized, and cooled by pumped brine after being separated by electricity. It is churned and worked by electricity.

The official tester has a 24-bottle Babcock tester run by electricity to tell the efficiency of the butter-makers, both animal and human.

PLOWS STICKY ADOBE.

[Written for Pacific Rural Press.]

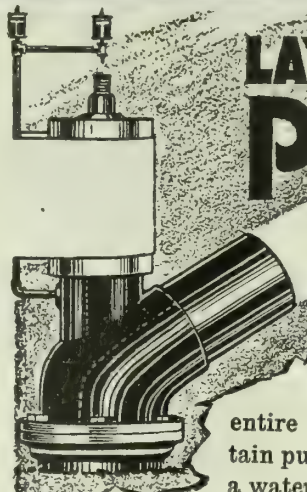
The moist adobe soil was not scouring very well, but the 70 h.p. Best tractor was rolling along with three gangs of four ten-inch plows each, hung by independent cables from the tractor and pulling back like game fish on a line. Behind each gang was a section of spike-tooth drag, attached to a timber across the front of the gang. One or two men kept fairly busy cleaning off the plows, which were going 5 or 6 inches deep.

Volunteer grain had grown eight or ten inches deep when the plowing was done late in March by A. J. Hunsaker and Son for H. G. Hutchins of Terra Bella. It was to be planted to beans, which would make their crop from the winter rains without irrigation. These are to be harvested in July and wheat sowed about December 1.

The tractor would plow 160 inches instead of 120 if the ground were drier, according to Mr. Hutchins, and would plow and harrow 80 acres per day.

ALFALFA FOR RED SPIDER.

[Written for Pacific Rural Press.]



About half of A. L. Hardaway's six-acre peach orchard in Fresno county was sowed solid to alfalfa in mid-March, 1915. During the season following, red spider infested the cultivated trees right up to the first row with alfalfa around it. Here they stopped and the trees among alfalfa were not only free from spiders but made three times the growth that the others made, according to Mr. Hardaway. The fruit was larger and there was more of it.

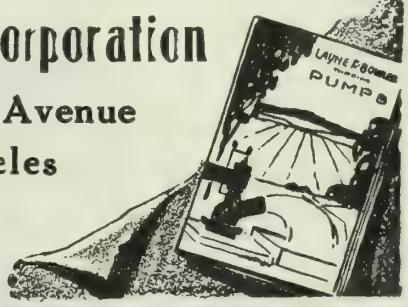
He has sowed some more of the orchard to alfalfa this spring, and if no ill results follow, the whole orchard will get it and the alfalfa will be left as long as the trees seem to thrive.

There is no hardpan here. The sandy soil is deep as the roots go, and probably more.

But perhaps the increased vigor and immunity from red spider would be accounted for by more frequent irrigation. The alfalfa was watered four times—the rest was and always had been watered twice.

Irrigation is accomplished with a 10 h.p. engine and a four-inch Fresno pump throwing 450 gallons per minute. The first irrigation was applied light when the alfalfa was a month old and two or three inches tall. The rest is applied as the alfalfa and trees need it.

LAYNE & BOWLER PUMPS



You cannot afford to gamble an entire season's crop against an uncertain pump. You must be insured against a water shortage—keep things growing by using a dependable pumping system.

Layne & Bowler Pumps

can be depended upon the entire year. They have stood the test. They have proven their superiority. Simple to install, simple to operate and, simple in construction, they require little or no attention. They are rigidly adjusted and compact—all bearings are enclosed, and unaffected by grit or sand. The old style well pit eliminated. Lower your water-producing cost and insure a continual supply by installing a Layne & Bowler Pump.

"Jackson MADE"

Write for Catalog No. 47 F

A Better Maker Not Made

For Water Deep Under The Ground

Jackson Deep Well Turbine Pumps give continuous and efficient service. They do not get out of order as they have no valves or plunger rods. Very little care or attention needed as they are oiled from the surface. Are much lower in cost than other types of deep well pumps when the expense of dug pits, cribbing and timbering is reckoned. They raise water from the very bottom of the well, thus eliminating heavy vacuums and delivering all the water the well yields. They develop slow wells and increase their flow.

Like all Jackson Made Pumps These Deep Well Turbine Pumps Are the Very Best Pumps Made for the Purpose—They are Dividend Earners, Not Expense Makers

Whatever your water problems may be our Expert Pumping Engineers will help you out free of charge—write

General Agricultural Review.

CITRUS AND SEMI-TROPICAL FRUITS.

Orange Cove citrus growers have formed a local association.

Imperial county imported nearly 30,000 grapefruit trees in March.

Seventeen fig trees set out by B. R. Saccett in 1851 on the August Brinck ranch near Winters produced a second crop of 5 tons dried last year.

The semi-annual meeting of the California Avocado Ass'n will be held at Blanchard Hall, Los Angeles, April 29 instead of April 20, as previously reported.

Caprifigs of Merced and Fresno counties froze last winter so the blastophaga are scarce. Prof. I. J. Condit suggests the planting of caprifig trees in the thermal belt of the foothills.

Valencia shipments from Tulare and Orange counties started the first week in April, the earliest in years. The quality seems better than usual and the crop heavier.

A Japanese orange peddler in Los Angeles is carrying Sunkist oranges because so many of his customers demanded them. The national advertising campaign of the Exchange is getting in its work at home.

All movement of trees, flowers, or plants infected with disease or insects is prohibited by the Florida State Plant Board, to prevent spread of white fly, canker, etc., by means of orange blossoms, etc.

Citrus blast, a new disease, has been observed in Butte county through the past year by Prof. J. Eliot Coit of the University. It is active in winter weather. It kills the leaves and travels down to the twigs which it often girdles. It does not hurt the wood of the twigs.

Architect's drawings for buildings on the new Citrus Experiment Station were recently submitted to the city planning commission of Riverside. They will be located beautifully high on the hillside overlooking the entire valley to Redlands, San Bernardino, and westward.

DECIDUOUS FRUITS.

Over 20,000 fruit trees have been set out in the Cuyama valley this season.

Butte county orchardists have had good results with vetch winter cover crops.

Ninety-two per cent of the Stanislaus freestone peach acreage is signed up in the Association.

Over 10,000 almond trees were imported Mar. 1 to 25 to be planted in the Paso Robles district.

Muir peaches are reported to have set a heavy crop around Dinuba, with Elbertas and Lovells doing well.

A 750-acre apple orchard is being set out at Berry Creek, just off from Feather River canyon, by the Sierra Orchards Co.

Little leaf and peach blight are getting in their deadly work early this season and are reducing the crop, especially in the San Joaquin Valley.

Nearly 3,000 acres of orchards and vineyards have been set out in Sutter county this spring. Grapes lead with 1120 acres and prunes follow with 1079.

About 80 per cent of Napa prune growers have subscribed to the Information Bureau according to Henry Wheatley, who has been consistently boosting for it.

The Mendocino Farmers' and Apple Growers' Ass'n have elected Joshua Grindle president and A. A Heeser secretary. Mr. Grindle will be general manager of the next apple show.

Apricots around Winters are reported as a half crop owing to rains during and after blooming. Those remaining are clean and promise well for early eastern shipment. Peach crop is well set.

A Watsonville Apple Show is proposed for this year if the $2,000 debt can be wiped out. It is suggested that a full report of receipts and expenditures of the last Show (held in San Francisco) be made before proceeding farther.

The Santa Clara Growers' Information Committee advises that no prunes be sold at present prices of 4 to 5 cents. Nine cents is offered for 1916 apricots and $30 for pits, but the Committee advises that no sales be made. Prune crop is not so heavy as it previously looked; apricots worse.

OilPull Means This

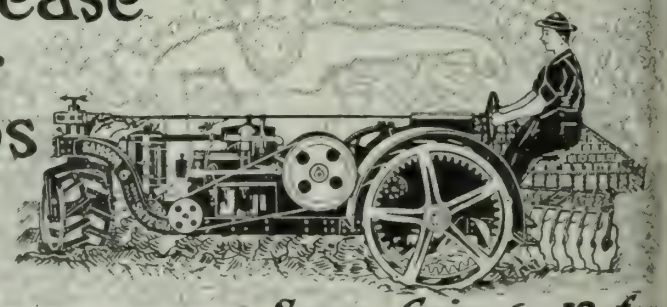
—lower operating costs, smaller upkeep expenses and *bigger profits.*

This strong statement is based first upon the ability of the OilPull to burn "stove tops" and the cheapest oil fuels *at all loads, under all conditions —all the time.*

Now figure the strong construction of the OilPull and the work it will do. It is built to give long service and will do all your belt work as well as handle your draw-bar jobs.

The OilPull is throttle governed, the power is steady and uniform. The air intake on the carburetor is high up out of the dust. All working parts are well protected and perfectly lubricated. It is oil cooled —the radiator can't freeze and there's no bother with cooling water.

The OilPull made good on the Coast from the start, and we can refer you to many satisfied owners.



Two sizes—15-30 and 30-60 horsepower. Ask for OilPull catalog.

Advance-Rumely lines include Rumely traction plows, the light weight GasPull tractor and the new All Purpose small farm tractor, threshers, steam engines, hullers and huskers—all dependable machines and backed by Advance-Rumely service.

RANDALL BROS. NURSERIES CO.

WRITE US. R. F. D. 1, WHITTIER, CAL.

The State clearing house plan for distributing deciduous fruits in eastern markets was presented to a large meeting of shippers and growers at Sacramento recently. F. B. McKevitt is reported to have said that while it would do much good, it would probably not be possible to prevent gluts of the market. The same proposition was previously questioned by G. Harold Powell as presenting legal difficulties, and by others as likely to stifle initiative in developing markets to get increased consumption.

OLIVES AND NUTS.

Stanislaus almonds are fair to light crop in general.

Arizona permits no importation of olive nursery stock except unrooted cuttings.

The Wyandotte Olive Growers' Ass'n has filed articles of incorporation. It is a co-operative non-profit organization.

John Glynn of eastern Contra Costa county sent in the names of 10 new members for the Cal. Almond Growers' Exchange on Mar. 21.

Olive packing by the Tulare Growers' Ass'n of Porterville is completed for the season. Manager R. A. Powell reports most encouraging sales.

A light almond crop is reported by M. P. Stein of Stockton, due to rain and frost. Nonpareils and Ne Plus are especially light. IXL's are nearly normal.

The Rumsey District Almond Growers' Ass'n filed articles of incorporation April 10. The new Association is composed of the minority of the Guinda Ass'n with others, and is affiliated with the Cal. Almond Growers' Exchange.

The net gain in membership of the Cal. Almond Growers' Exchange during the past year has been 109. J. B. Wrangham of the Exchange reports that never before have old members been so active in securing new members as this spring.

The Guinda Almond Growers' Ass'n, having become prosperous through the raising of almond prices and steadying of the market by the Cal. Almond Growers' Exchange, recently voted, by a majority of 1, to withdraw support from the Exchange which nourished it; and started on its independent way to bring chaos on the industry again. They doubtless hope that most others will not follow their example.

GRAPES AND SMALL FRUITS.

For raisin day celebration in Fresno, $1591 had been raised up to April 7; $6,000 is desired.

The earliest strawberries of the Woodland district were produced by J. Koebel. He made a commercial picking Mar. 31.

Table grapes brought the growers $4,714,000 more than all the wine grapes last year, according to the State Viticultural Commission.

Imperial Valley strawberries dropped out of the Stockton market the first week of April because local berries made too strong competition.

Sweet wine production in 1915 was 20 per cent of normal; dry wines were 3,500,000 gallons short of normal, according to Sec. E. M. Sheehan of the State Viticultural Commission. "There was little or no profit to the grower unless he made his own wine," says Mr. Sheehan.

Only 500 tons of raisins were made from wine grapes last year in spite of the fears proclaimed because of the excessive tax on fortification brandy. There were 124,000 tons of raisins, which gave the growers a net profit of $2,000,000, according to the State Viticultural Commission.

California strawberries are barred from Utah because the Utah sealer of weights and measures will not permit a variation of ½ cubic inch or ½ a strawberry in the size of boxes imported. The California sealer allows ½ cubic inch variation from the standard of 33.6 cubic inches per basket.

Spraying grapes for mildew with atomic sulphur, 10 pounds per 100 gallons spray, applying the first time when the young shoots are 6 or 8 inches long, is recommended by horticultural commissioner J. J. Fox of Napa. He estimates the cost at $3 per acre or less. Every part of leaf and vine must be covered with the spray.

GRAIN AND FIELD CROPS.

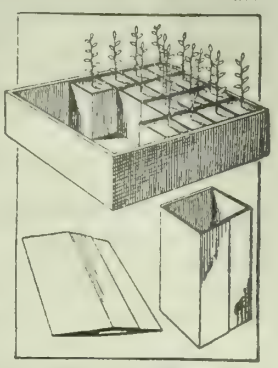
Hop growers of Sacramento county are reported to be pulling up their vines.

The Alameda Farm Bureau is distributing samples of sorghum corns and sudan seed.

Nearly 8,000 acres are being prepared for rice in Yolo county, mostly to be sown this season.

Summer squash from Imperial Valley appeared in Stockton markets Apr. 7, retailing at 15 cents per pound.

There were 61,811 tons of grain in San Francisco, Port Costa, and Stockton warehouses Apr. 1, according to Chief Inspector H. C. Bunker of the San Francisco Chamber of Commerce.



Perforated Tree Protectors

that will keep Squirrels and Rabbits and Gophers from barking your trees. Also perfect protection from hot sun, sand storms, barking in cultivation, etc. Tell us your pest and we will tell you what kind of a Wrap to use. Ca make a number of kinds and can save every tree for you from pests.

COLLAPSIBLE PLANTING POTS.

These pots are bottomless. This allows you to plant the pot and plant, never disturbing your plant in transplanting it or checking its growth a single hour. Now is the time to start early Vegetables in them such as Tomatoes, Cabbage, Egg Plant, Cauliflower, Cucumbers, Cantaloupes and Squash. Also for propagating Rose cuttings, Geraniums, Eucalyptus and Conifers of all kinds. It's the only practical pot for propagating work. Write us for samples of either pots or protectors. where construction counts

CATERPILLAR

Reg. U.S. Pat. Off.

Don't say Caterpillar unless you mean Holt!

Keeping at it, twice around the clock when necessary, without stop for mechanical troubles—that's where Caterpillar construction shows its worth.

Keeping everlastingly at it—turning up the miles of furrow without hitch or breakdown—that's what makes the Caterpillar such a money-maker for its owners.

It's the "know-how" points—big and little—that 30 years' manufacturing experience has taught us, that give the Caterpillar its "stand-up-iveness."

Rigid standards of construction, careful tests, thorough inspection, service after the sale—these bring results in satisfied customers. There are 3,000 Caterpillar owners in 25 countries, more than 1200 in California alone.

The Caterpillar is built in several sizes—there's a size just right for your work. We'd like to send you Folder C 336 which shows the different size Caterpillars built and gives further details of Caterpillar construction.

SPOKANE, WASH. PORTLAND, ORE.

California Livestock Industry is the Empire Builder.

[Written for Pacific Rural Press by A. B. Humphrey, Escalon.]

Escalon is a Spanish word meaning "The Door Step." The town bearing this name is not only the door-step to the great San Joaquin Valley stretching for 200 miles to the south, but it might properly be called the Front Door Step, since it lies in the center of the valley at its widest part, and within 20 miles of where that valley meets tidewater. Where the valley and these waters meet, the city of Stockton was wisely located—on the shores of an ocean-connected waterway and in the mouth of an enormous inland valley. So Escalon is rightly named the Door Step, and he who named it saw a great valley through an imaginary open door.

Being so favorably situated, the quick changes that are taking place are rapid, wonderful, and impressive, and have ceased to excite comment. Natural resources and ceaseless ambition are working changes overnight.

The new South San Joaquin Irrigation District centers around this point and what a few years back (less than might be counted on the fingers of one hand) was a grain field is now fast becoming a checkerboard of small farms and produce plants. So fast is it changing and being brought under water's wonderful influence, that it is surpassing the most liberal predictions. This is not so surprising when the broad plan under which the district was laid out and developed is considered. Something was done in the South San Joaquin Irrigation District that was never done before in a district of large proportions.

Many of the large irrigation districts of the State boast of having brought the water over the lands at a low cost, and many such have now been inaugurated for two decades with the result that comparatively small areas are as yet making use of the great privilege of water for irrigation. And why? Such a thing would seem strange—but no,—the very thing boasted of erected a barrier against the progress which should have followed; and hindered the development which should have returned double and treble the original expenditure. The water was brought out over these large expanses in canals and laterals miles apart and today, 20 years after the initial effort, much of the land is miles away from its water supply.

Not so the South San Joaquin Irrigation District. You hear no talk of the cheapest irrigation district ever inaugurated. On the contrary, nothing was spared to produce practical, permanent results and bring quick development. Something was done never before undertaken in the State on so large a scale. The initial effort not only included the building of the great masonry dam in the Stanislaus river and the construction of the main canals and laterals equipped generally with permanent concrete structures, but it also included the delivery of water to the corner of every Government forty-acre tract in the entire district of 70,000 acres. This could be productive of only one result: the quick development of a territory so bountifully favored. The record substantiates it.

In the Pacific Rural Press—issue of July 26, 1913—a description in detail of this work appears. Among other things are these statements: "This spring the dam was formally opened. Early in August, if not before, the main canal will be completed. . . . . In the spring of 1914 the system will be completed to the last 40 acres, and in 1915 in all probabilities the storage dam will be ready also. Then the northern part of the San Joaquin Valley will be a garden," etc., etc.

Is it any wonder since these statements in the main came to pass that sudden changes should take place? Predictions as to what would happen, how much and how fast the water would be called into use have been surpassed. The first year 15,000 acres were served, last year 25,000 acres and this year the estimate is 35,000 acres will call for water. It looks as if the Door Step to the San Joaquin Valley will be colored in an agreeable green without delay.

But what of all this effort? Where does it lead and what the results? And if any, how practical to bring about permanent prosperity, to produce self-sustaining, happy homes for the small family—the backbone of all national welfare? Ride through the country and notice. Do you know what a silo is? A few years ago no one would answer this question.

A silo means only one thing. It means a dairy. A dairy means milk. Milk means butter. Butter means weekly cash returns. Weekly cash returns means savings banks in every district. Savings banks mean more dairies with better cows to make them up. Silos and dairies mean more and better swine, because dairies and swine intimately and naturally go hand in hand on the farm. Swine also mean continuous cash returns at all seasons.

MODERN DAIRY AND HOG EQUIPMENT.

Livestock is becoming recognized as necessary to bring impoverished land back to productive fertility. This plant was erected within five months by A. B. Humphrey of Escalon.

The Farm a Savings Bank.—And that is the combination that changes the appearance of the country seemingly without effort and before we are aware of the change. At last the right combination to make the farm a savings bank is reached after years of exploiting and soil robbery. Correct principles come because there is no choice other than bankruptcy.

First the cattle barons crowded the ranges to extinction and drove the produce off and sold it. Next the wheat farmer came and exacted the last pound, restoring nothing, feverishly burning up the stubble in haste to raise more. Then the alfalfa farmer who cut the hay and sold it off as the easiest way to get cash returns. Even the orchard and vineyard, usually considered to be a light load and rather a concession to the over-worked land, proved, because it took from and returned nothing, that it also led to poorer crops and down poverty's path, until at last forced to accept the inevitable we turn to first methods, the systems prevailing in the old and crowded countries, and return to the soil its due, taking from it such as is necessary to keep up the intense system of rotation, but returning what enriches the land and builds up an invisible but staple deposit of soil wealth,—to be drawn upon intelligently—always as reachable as a savings bank account.

And so this building process goes on and live stock takes its place—because it fits and because it belongs in the system necessary to the increased population to which California's generous resources entitle it.

[Everywhere in the interior valleys where good land and water are brought together in desirable quantities, the transformation which Mr. Humphrey describes in the above is apparent, although it is true that one does not find such rapid colonization as in the South San Joaquin Irrigation, in most districts. Certainly not on such a large scale.

Year after year livestock is gradually tightening its hold on these interior valley farms, first because it offers a means of securing quick financial returns and latterly, as Mr. Humphrey outlines, to re-establish fertility. But livestock is doing more than the establishing of farm animals on the farms. It is making for a more diversified state of farming than that, although ultimately it is all for livestock.

This is apparent in the Modesto and Turlock districts which adjoin the South San Joaquin district. There you find livestock has come to be the established occupation of the large majority of farmers and there also you find an ever-increasing amount of grain, sorghums, and other field crops being grown. Most of these were not possible before livestock added to the fertility of the soil, but now grow in abundance. Most of them were not profitable until the increase of livestock made a nearby and steady market for them.

Thus we find that instead of the grain farmer of years ago, with his two or three choices of cereal crops, the possibilities of the new settler as well as old are now almost unlimited in this respect. This has incidentally enlarged the outlook for future livestock development in all interior valley situations. Many feeds such as corn, which was considered almost an impossibility on anything but river bottom lands a few years ago, now hold promise of profitable culture under a great variety of conditions.—Editors.]

The Goodwin dam, which has a capacity sufficiently large to supply 140,000 acres, 70,000 of which are in the South San Joaquin Irrigation District. It is estimated that 50 per cent of this will be called for in 1916.

The new world's champion two-year-old Ayrshire, Willowmoor Etta 3rd, bred and owned by J. W. Clise, Redmond, Wash., has just completed her official record of 16,621 pounds milk 4.01 per cent fat, making 666.06 pounds fat.

DAIRYMEN MUST COOL CREAM.

We are advised by F. W. Andreason, Sect'y of the State Dairy Bureau, that the State dairy law pertaining to the cooling of cream within one hour after milking will be more rigidly enforced this year than in the past and that already four dairymen in the San Joaquin Valley have been convicted and fined on this charge.

The law says that cooling must be done within one hour after milking to as low a temperature as is practicable. By allowing the cream to run from the separator over a water cooler, instead of directly into the can from the separator, the intent of that section of the law will have been complied with and for that reason all subscribers who are selling cream to creameries should secure a water cooler at once, and in this manner insure themselves against possible arrest.

Southern California Hog Opportunities.

[Written for Pacific Rural Press.]

With Southern California drawing 80 per cent of its pork supply from Idaho and Utah, something is wrong. With Los Angeles ranking close to Chicago in size; with hundreds of thousands of acres adapted to alfalfa, milo, kafir corn, etc.; and with a climate suitable twelve months every year for thrifty hog growth at very little cost for buildings, there seems every reason why Southern California should compete successfully, in its own great market, with Idaho. The $140 to $175 per car freight on hogs through hundreds of miles of mountains, for a distance totaling 2000 miles, added to the cost of production in a country that is snowbound several months each year, and added to the cost of getting the porkers out of the more or less inaccessible valleys in which they are grown, would seem to give Southern California hog producers a considerably greater profit if hogs from both districts brought the same price in Los Angeles. It is said that the present (Mar. 22) nine-cent price on live hogs here is due to the Idaho hogs being still snowed in. Last spring prices were lower because a mild Idaho winter permitted early movement of hogs. Can't we raise hogs as cheaply in Southern California as in Idaho?

Now What is Wrong? — We give some pointed remarks of various Los Angeles packers.

"California hogs have been a side issue; they have had to shift largely for themselves."

"Dairy-fed hogs are sloppy."

"Hogs grown and fattened on alfalfa have meat of greenish yellow tinge, 'fishy' flavor, moist and shrinky."

"Acorn-fed hogs cause us lots of trouble."

"The only way to raise hogs is to immunize them. We have 800 hogs immunized on our own ranch. George Long in Imperial Valley fattens 5000 or 6000 hogs a year, and he vaccinates all of them."

"Idaho hogs are as good as Eastern hogs on account of their breeding. Ten years ago you couldn't get anything in California except razor-back relatives; but now Californians are beginning to breed up."

"Even a California hog raiser will sell his hogs and buy eastern hams and bacon."

"To make hog raising for pork most profitable, get high-grade sows and registered boars."

"Eastern hogs dress out 5 to 6 per cent more pork than ours."

"Californians as a rule haven't gone into hog raising on a business basis. They sell out their breeding stock when prices are down and can't supply porkers when prices are high. You can't succeed in any business unless you stick to it through thick and thin."

"We bought 50 or 60 runts from a farmer a while ago, weighing around 75 pounds. We are feeding them alfalfa meal, ground milo, and tankage. They are gaining 1½ to 1¾ pounds per day at a cost of 4 cents per pound. If they hadn't been stunted by starvation from the start, we would be getting two pounds daily gain easy. As hogs are worth 9 cents now we are making 5 cents a pound or 125 per cent on the feeding of these runts. The farmer should be making that."

What about the Future?—Terse statements, obviously true, are quoted:

"People are going to keep on eating."

"This is a growing country."

"Southern California population is increasing."

"There will be more profit when California hogs are marketed at full weight when 8 or 9 months old than there is now when the average age is 15 months."

"We are running the packing house to full capacity."

"When we have increased our production to supply the 80 per cent now shipped in, the population will have increased to take a good bit more than that."

"Our business is increasing every year."

"We are even now shipping to Honolulu. If we had a merchant marine we would be shipping to the Far East."

"When California produces pork of quality equal to Idaho or eastern pork, and enough of it, she will drive eastern pork out of our markets."

"Californians, with climate, feed, and freight advantages, ought to make money competing in California markets with northern or eastern hogs and pork."

Purebreds Needed. — Southern California purebred hog raisers now are pioneering. Their scattered location in all parts proves the adaptability of the country to purebreds. The increasing use of purebred boars acknowledges that the proportion of improvement in desirable characteristics is due to the pure blood of the boar. Then why not go a step farther and use purebred sows? There are a number of southern breeders with herds already acclimated and handy to investigate. Compare your hogs with theirs."

RIVER BEND FARM DUROCS

ARE MAKING GOOD.

Our Herd Boar is "River Bend High Model"—sire, "High Model" (No. 3300), and Dam, "Lady Top Notcher 6th (No. 1100). He is producing large litters and these will become high-class foundation stock.

Our 20 Brood Sows are of equally good stock so that buyers will secure just what they want when they order.

Our weanlings of both sexes, which have our guarantee and must satisfy our customers. We sell only our own stock and are in the Duroc business to stay. For prices,

SOME OPTIMISTIC REASONS FOR PORK.

The best estimates place the cured and fresh pork consumption in California right around $30,000,000 annually. This represents more than 2,000,000 live hogs. We now produce about $15,000,000 worth annually. Two-thirds of this pork is cured or pickled. Our present capacity for packing cured meats is approximately 1,450,000 hogs, more than all the cured meat at present consumed in the State. Yet we are only packing 20 per cent, or approximately $4,000,000 worth, of the $20,000,000 worth of cured pork we consume.

Central and Individual Farrowing Pens.

[Written for Pacific Rural Press.]

Two types of hog houses are shown in the accompanying illustrations, the Corsa central farrowing house in the top view and the individual house and driveway in the lower picture.

The house in the upper picture is situated on the Steybrae Farm, owned by E. B. McFarland in San Mateo county; and as the illustration shows, is well lighted and ventilated, two very essential factors in houses of this type.

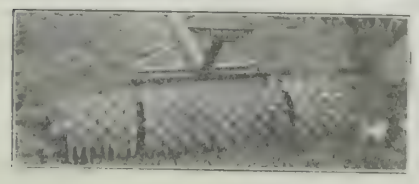
It faces the south, allowing the maximum of sunlight inside the building. A central feeding alley eight feet wide runs from end to end, dividing the pens on either side which are nine by ten feet in size.

The floor is of wood, having a gradual slope from the east end to the west, the floors in the pens also having a gradual slope toward the alleyway where a six-inch gutter on either side carries away all liquids.

Provision is made for a feed and litter carrier that runs the entire length of the building and may be extended outside the building. A feed room is located in the east end. While somewhat expensive to build, this is a most desirable house as it reduces labor to the minimum with large numbers of hogs.

The lower view shows a system of housing as used by Geo. V. Beckman at his ranch in San Joaquin county. The houses in this case are each large enough for a sow and her litter, both sides of the roof being hinged at the lower edge, so that one or both sides may be spread open at the gable, allowing both sun and ventilation in clear weather. In rainy weather they are drawn together as shown in the picture.

Corsa type, central farrowing house.



Individual type hog houses used on Geo. V. Beckman ranch, Lodi.

These houses are set in small pastures, feed troughs being placed next the driveway, and drinking water being supplied at troughs located at the division fence between each two pastures. While not compact, this system is favored by many because less work is required in keeping the quarters sanitary and more room is provided for grazing.

The P. P. I. E. reserve champion Shorthorn bull calf, Pacheco Lad, has been sold by the Pacheco Cattle Co. to E. N. Casares and Sons of Buenos Ayres. The calf is 13 months old, weighs 1150 pounds, and sold for $750.

Farrowing Pens at Vina Ranch.

[Written for Pacific Rural Press by F. W. Holbert, Supt. Hog Dep't.]

At the Stanford University's ranch at Vina we have two farrowing houses. The buildings are of shed type, 13 feet high in front and seven feet at the rear. Each one is 250 feet in length and 16 feet from front to back. The floors are concrete. In each house are 25 pens 10 by 11 feet with a five-foot alley along the front. Over a part of the alley is a floor for storing baled hay.

The pens are equipped with fenders and at the rear of each pen there is a window two feet square and five feet above the floor. There is a horizontal sliding panel (g) at the back of each pen for closing the small door into the runs on the south side of the building. A vertical sliding panel made of one by six inch slats, closes the opening into the alleyway. This panel (h) can be fastened at different heights to allow the sow to enter, or to allow the pigs to pass under it into the creep.

When the pigs are old enough to eat grain, a creep for each pen is formed in the alley by swinging back the front gate (d) to a position across the alley (a) and placing a portable panel at (c). This portable panel will fit at (c) or in the doorway (d), and when not in use can instantly be fixed against the wall as at (f).

With this arrangement each litter is kept separate and there is no robbing. The pigs learn to eat grain and to drink skim milk in the creeps and when ready to wean, the sows are quietly and quickly taken away. The pigs are not disturbed and receive no setback. After a few days three or four pens are turned together so that the pigs can be fed in bunches of about 25.

The pigs of course have access to the outside runs, and as soon as they are large enough to rustle they are turned out on pasture in herds of about 100 head.

Before the creeps are placed, we have a clear alley the entire length of the building, and the feed is wheeled along the alley. After the creeps are in position we wheel the feed along the outside of the building. Water is supplied by hose, attached to hydrants along the front of the farrowing houses.

The arrangement is such that one man, by manipulating the panels and gates, can move animals through the alley, from one end to the other, without trouble. This is a convenience at all times and also makes the buildings quite suitable for breeding.

We have reduced the mortality of pigs from farrowing to weaning time about four per cent. Last season our mortality after weaning amounted to one-half of one per cent.

The Flaggler ranch of Corona is starting purebred Holsteins.

TUBERCULOSIS TESTING MUST BE OFFICIAL.

State Veterinarian Chas. Keane again advises us that tuberculosis tests made on or before October 1, by private practitioners, will not be recognized as official, in the enforcement of the new dairy laws which go into effect on that date.

He states that many dairymen are under the impression that these private tests will insure compliance with the law, but that such is not the case. After October 1, official testing of dairy cows may be secured free of charge, by applying to the State Veterinarian at Sacramento.

Questions About Pig Feeding.

To the Editor: I have 45 pigs between six and eight weeks old that are still with their mothers. I have just finished feeding old corn and shorts in shop, but will have to buy all feed from now on till the corn that I have planted gets ripe. Have been thinking that I would use milo to take place of corn. How would that do, also how should I feed it, as I have no concrete space that could be kept clean? Is there a preparation that should be kept before hogs to keep them healthy—copperas, salt, etc.—and how should one start with this so the hogs wouldn't get too much, or is there danger? Would like bulletins from the State Agricultural College. What is the address? Also, can there be any profit in fattening these hogs for market when feed is so high; milo $1.45 to $1.60 and shorts $1.85 per cwt? Would this be a balanced ration?—W. R. P., Hynes.

[Answered by Prof. J. I. Thompson, University Farm, Davis.]

[Milo maize at $1.45 to $1.60 per 100 lbs. is quite high in price to feed to hogs. If no pasture is available would suggest that some rape be sowed at once in order to provide pasture, which will lessen the cost of the grain part of the ration. If milo is to be fed it should be ground and may as well be soaked and fed in troughs. The amount of trough room to feed 45 head would not be enormous. In case barley can be bought for a lower price than milo it should be used. If the pigs are healthy and a reasonable amount of pasture such as rape or clover can be supplied, the gains even with barley at $1.40 should show some profit at the present price of hogs. However these pigs will just about be ready for market at the time the most of the stubble hogs are shipped in so that the price will undoubtedly be lower than now. The better chance of making a profit on these would, therefore, seem to be by hurrying them along.

Instead of buying shorts at $1.85 per 100 lbs., would suggest that tankage be secured, which will cost probably $2.00 to $2.25 per 100 lbs. This would seem to be higher, but it contains about 55 per cent protein, the material needed, where shorts contains about 15 per cent, so that it is much cheaper at the above mentioned price than shorts. If the pigs are fed a reasonable ration of barley or milo maize daily, allowed tankage in a box where they can eat it at will, and have plenty of pasture, they ought to make satisfactory gains.

Concerning the material to be kept before the hogs at all times, would suggest that instead of mixing a lot of things together, a box divided into several compartments be built with a cover above it, and in the separate compartments the following things be placed:

Air-slaked lime
Salt
Charcoal
Wood ashes
Bone meal, and perhaps
Copperas and sulphur.

There is a difference of opinion as to the value of the last two. The hogs will eat but little of any of these, and yet should have as much as they want whenever they seem to need it.

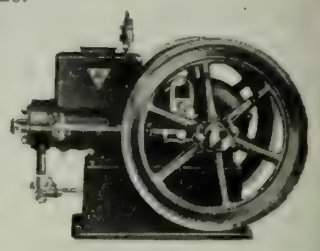
The experiment station work in Animal Husbandry is done at Davis, California. Available circulars and bulletins can be secured by addressing the station there or the Dean's office at Berkeley, Cal.]

Fast Hog Fattening.

[Written for Pacific Rural Press.]

Five to six thousand hogs per year are fattened by Geo. A. Long in Imperial Valley. About 3,000 per year are killed in his own packing house at Imperial. They are all vaccinated against cholera. They are raised on one of several big ranches and fattened mostly at the slaughter house. They average two pounds a day gain for about 50 days, according to Mr. Long.

When the hogs to be fattened are four to six months old they are graded according to size and put into the fattening pens. About six pounds of feed per day is given per 100 pounds live hog in three feeds. Two men do all the feeding, cleaning, loading, and unloading for the 1000 hogs generally being fattened.



The ration is composed of about 5 parts whole milo corn mixed with 3 parts tankage, meats, waste from slaughtered animals, "soup," etc. This is steamed all together three or four hours and run out in two iron tank carts along a track to the fattening shed.

The shed contains 22 pens about 20 by 35 feet with an aisle along center and a track for the feed tank cars. The concrete floors slope rather steeply toward the outside and drain into a wide gutter outside the pens. Manure is scraped and flushed into this gutter, whence it is ricked with a Fresno scraper. The sides of the fattening shed are open, the roof is of corrugated iron high enough to work under conveniently. Fences between pens and along the outside ends are of woven wire. Fresh water is piped to a tank under the partition fence so that each tank supplies two pens. A trough is fastened in the center of each pen for the hot feed. Thirty-six to 45 shoats are kept in each pen. Self-feeders are constantly supplied with dry "rolled" corn run through a mill nearby so the corn is also distributed from cars on the same

Dependable Power

Can You Afford An Engine That Balks?

More Butter and Better Butter

YOUR HERD should average at least 500 lbs. of butter per year. A good Jersey herd will do even better—600 lbs. per year, and the butter will be of the finest flavor, texture, and color. There are many individuals of this breed producing 1100 lbs. They make good use of every ounce of feed, do not require fancy feeding, mature early, thrive in any climate, are steady producers, are beautiful and gentle. They pay big dividends on the highest priced land.

Our latest free book, "About Jersey Cattle," tells all about the development of this hardy breed. Send for it—*now*. You'll be glad you did.

track. Filling these feeders takes about 15 minutes three times a day.

When feeding time comes, one man shovels it into buckets while the other distributes it in the troughs. This requires about an hour, two cars of hot corn and tankage being given at each feed.

PURPOSES AND AIMS OF SWINE BREEDERS' ASS'N.

[Written for Pacific Rural Press.]

The California Swine Breeders' Ass'n was organized at the University Farm at Davis, three years ago, adopting at that time the slogan "More and Better Hogs."

Like any young organization, it has taken time to secure a large membership and to work out a constructive plan for the advancement of the industry it represents. Unlike most livestock organizations, it is not entirely a purebred breeders' organization. A farmer who breeds for the market is considered as desirable a member as a breeder of registered stock.

At a meeting held in January of this year, C. B. Cunningham was elected president for the succeeding year and in order that readers may have a clear understanding of the contemplated future work, we quote Mr. Cunningham.

"The first thing as I see it," he states, "is to increase the following of the association from one end of the State to the other till it includes every raiser of hogs, whether he be large or small, near or far. It is not necessary, as I see it, that each one become a member of the State central association, but he should be a supporter of that association.

"To accomplish this we expect to appoint vice-presidents in each county, from our present membership, and through them organize county associations. We will endeavor to supply these local associations with literature and possibly at times with speakers, all tending to grow more hogs with the minimum of waste and the maximum amount of high-priced meat.

"And besides helping the producer to produce good hogs at the least cost, we are going to help him get a fair price for them. In other words, we will support anything that will advance 'More and Better Hogs' in California.

"Among other things that we hope to do for the breeder of purebred hogs is to secure better accommodations for him at the State and County fairs and inaugurate better selling methods."

At the present time the association has several hundred members, the annual dues being but one dollar, and according to Prof. J. I. Thompson, secretary of the association, with offices at the University Farm, Davis, the effect of past work is being noticed in the increasing numbers of swine growers who have been sending in their dues since the first of the year.

If you are a hog grower and have not as yet become a member of this organization, do so at once as it is only through strong organization that the above outlined program can be most effectually carried out.

A new Essex boar is being brought in to head the purebred herd of S. W. Millsap of Yolo.

"Remco" Air-Dried Redwood

PIPE For irrigation water, supply-power. Cheaper than any other pipe of equal size, capacity and endurance.

TANKS For all uses, in all sizes from 500 gallons to 500,000 gallons, and with towers if wanted.

SILOS For dairymen, stockmen, farmers. In sizes from 25 tons to 300 tons. The best silo made today.

All Remco products are built to your order. Only clear, air-dried redwood is used. Write us your needs and we will send you full information.

A NEW DAWN FOR THE PURE-BRED HOG.

(Continued from page 475.)

will have forgotten the fancier's prices of last fall for that game isn't his game. He hopes to sell to the farmer, the real producer of market pork, and that customer isn't paying $1,000, $500 or even two hundred dollars for boars. He has, it is true, raised his limit, but it still sounds more like $40 to $50 when he acquaints you with it.

As we have shown on another page, the possibilities of this customer and his market are unlimited, but he must be helped to realize the importance of producing the largest amount of marketable pork at the least cost and then work to get the highest price for his product.

To establish any right to offer it such help, breeders must sell right. Whether it be at private or public sale, the cull seed must not be offered. It may be all right for the butcher, but it is not going to further the purebred in the mind of the utility breeder. When he buys his first purebred he expects better results than he has been securing with the mongrel. If he is not disappointed he comes back for more.

Breeders, generally speaking, recognize this to be a cardinal principle in selling at private sale. Now that the auction sale holds out hope of a better method of distribution they must recognize the same condition. The auction method of selling livestock is undoubtedly a forward move and holds out many possibilities, but it needs a guiding hand to insure uniformly high quality, else the goose that lays the golden egg will stand a good chance of being prematurely cooked. The breeders alone hold the trump card in this matter. They can kill or cure.

An Education Campaign. — Producing the largest amount of pork at the least possible cost can not all be accomplished in breeding. C. B. Cunningham, president of the California Swine Breeders' Ass'n, is so strongly convinced of this that he has pledged his administration to carry on an educational campaign, centered principally on the two factors, feeds and marketing, that he hopes will reach every hog raiser in California.

This will be done in a constructive manner. Vice-presidents in each county will co-operate with the State central organization in distributing knowledge, first how to breed hogs, then how to feed them, and, above all, how to market them.

With due respect to all past attempts at hog promotion work in the State this is the most fundamental proposition that has ever been advanced by the breeding fraternity. It savors of the same principle as the national manufacturer who long ago recognized the need of developing his customers' field in order to develop his own. It gets to the very core of the whole situation, in that it builds, first and foremost, the utility end of the hog game. It recognizes the fact that when the producer is prosperous and expanding, the purebred industry is prosperous and may expand.

Never has the future of the man who breeds good registered hogs been brighter.

With the Live Stock Men.

DAIRYING.

A cow-testing association is practically organized in Glenn county.

Jas. B. Irwin, Holstein breeder of Minneapolis, visited R. F. Guerin of Visalia recently.

Butter shipments are being made from San Francisco to northern as well as eastern points.

The American Jersey Cattle Club has endorsed rigid enforcement of laws regarding oleomargarine.

A sale of Holsteins on the State Fair grounds Oct. 6 is planned by the Cal. Pedigree and Sales Co.

A Cleveland milk producers' strike was averted by agreement with city dealers, who yielded a better price.

Butter must be retailed in California in one- or two-pound squares hereafter rather than in fractional parts of pounds.

Chas. Bonaficio of Monterey county is to move his 100 high grade Holstein cows to the David Jacks Corporation ranch.

Southern Illinois milk producers struck April for an advance of 10 cents per hundred pounds to $1.40, which the dealers had refused.

Thirty-one Holstein heifers bred to King Pontiac Mayflower were brought to Sacramento recently from New York by Dr. E. J. Weldon for himself and F. W. Kiesel.

The 48th annual meeting of the American Jersey Cattle Club will be held at the Club House, 324 W. 23rd St., New York, Wed., May 3, at 11 a. m., writes Secretary R. M. Gow.

The Holstein, Sir Veeman Korndyke Pontiac, newly owned by R. F. Guerin of Tulare, is out of a 30-pound daughter of a 29-pound cow, and he has many 30-pound daughters.

F. M. Johnson of Napa will begin at once to test the five Jersey cows recently bought from the Sheldon Estate. His herd bull, bought in the East, is sired by Mary Maiden's 3rd Son.

Shipping butter from San Francisco to Chicago in boxes rather than tubs was the only criticism of a carload recently, which scored over 92 on arrival. An alfalfa flavor was noticed but not criticised.

W. E. King of Imperial Valley has engineered two deals in which 163 cows sold for $16,300, says the El Centro Progress. L. Oudries bought 70 cows for use in Imperial Valley and H. Bloemsma of Meloland sold 93 head to Reese Snowden of Lancaster.

Th Oakdale Creamery is having trouble to handle the increasing quantity of milk from that section, though the plant capacity was doubled a few months ago and has lately been putting out 2500 pounds of butter per day.

Another 1000-pound-butter Jersey, Sadie Crown Princess, has completed a record of 16,578.4 pounds milk, 876.7 pounds fat or 1031.5 pounds butter. She ranks tenth in the breed for butter fat, and ninth for milk. She is owned by H. F. Probert, Jackson, Mich.

A new herd of highly purebred Ayrshire heifers has been established by the Sullivan Investment Co. at Grass Valley, most of them having come from eastern Canada. The bull, Saladin of Steybrae, is out of May of Kelso which gave over 7,000 pounds of 4.3 per cent milk during her first lactation.

The second carload of butter shipped to Chicago by the Visalia Co-operative Creamery left Apr. 5 according to Mgr. N. J. Beck. The Lucerne creamery of Hanford helped make up the shipment. It will be remembered that the cream grading policy is what makes this butter keep after long distance shipment.

The J. H. Harlan Co. of Woodland have nine more Holstein cows in A. R. O. The Jr. 2-year Modjeska Crane 3rd made 19.14 pounds butter from 372 pounds milk in 7 days. The 4-year Margie Moori 2nd made 22.7 pounds butter in 7 days, and 90 pounds in 30 days. Tidessa Marjorain, 10 years old, made 25.44 pounds butter in 7 days and 104 pounds in 30 days.

BEEF CATTLE.

A. B. Hammond has bought 6 purebred Shorthorn cows for his Chico herd.

All states have removed all restrictions from the movement of feeding cattle into or out of Chicago.

What is said to be a new disease has recently killed 23 head of Kern county stock on two ranches. Is it anthrax?

The highest price of the year for baby beeves at Kansas City was $9.85 per cwt. paid April 3 for 50 heifers averaging 622 pounds.

Two fat steers prepared by Thornton Glide of Davis for the P. P. I. E., but not exhibited, were recently sold to the local butcher, above 1700 pounds at 16 and 20 months old.

Cattle losses for the past year are estimated by the U. S. Dept. Ag. at 2.2 per cent and 1.96 per cent from disease for California and the U. S. respectively. The 10-year averages are 2.4 per cent and 2.01 per cent. California must have been lagging, but is improving.

The Northern California Stockmen's Association met at Redding March 22 and elected the following officers: President, William Junkans; secretary, M. D. Lack; treasurer, George A. Grotefend; vice-presidents, Mrs. Rhoda M. Menzel, for Shasta county; William Forster for Trinity county; James Long for Tehama county, and J. B. Parker for Siskiyou county.

SWINE.

Bruce Cornwall of San Francisco has sold the O. I. C. boar, Pattern Maker, to H. S. Yates of Holt.

The Swineland Farm of Woodland reports hog sales excellent and a new crop of pigs coming along in fine shape.

Swine breeders of Imperial Valley will hold a hog show at El Centro May 26 and 27 under the auspices of the Farm Bureau.

Nate Hauck of Alton, Humboldt county, will have pigs the last of April, sired by his big type Poland China boar, Cantrall's Ideal, which is a son of the famous Big Joe.

A. M. Henry's big type Poland China herd is nominated in the Cal. Poland China futurity which will be held in connection with the next State Fair.

A. M. Henry of Farmington has recently bought two Poland China sows and a fine boar from W. J. Hather of Neb. and a boar from Peter Mouw of Iowa.

The Flaggler Ranch of Corona has purchased Duroc foundation stock from Peters, Lamson & Walker, a boar by P. & L.'s Defender and one by Ames Boy; also ten gilts.

Peters, Lamson & Walker of Devore have sold the Fontana Land Co. two yearling boars. Also fifty gilts to Mr. Thompson of Holtville and ten sows to Mr. Haag of Holtville.

Losses of hogs from disease the past year are estimated by the U. S. Dept. Ag. at 4.1 per cent for California as against 3.7 per cent for a 10-year average; for the U. S. the losses the past year were 6.63 per cent as against a 10-year average of 6.62 per cent.

The Tulare County Hog Raisers' Ass'n has drafted a county ordinance to help in controlling their two cholera outbreaks, and presented it to the supervisors, who passed it April 6, to become effective at once. It provides that every hog found dead must be cremated or buried three feet deep before sundown.

LIVESTOCK DIRECTORY.

Rates in this directory, 3c per word each issue; or if carried weekly for one year, 2½c per word.

SWINE.

BIG-TYPE POLAND CHINAS—One to a carload. Any age, either sex. 600 on hand. They have plenty of size, extra good hams and shoulders, strong arched backs, great length, depth and thickness of body, with good looks as well. Many are sired by IOWA WONDER, a 1000-poundsr in show condition. I believe his pigs are the best in California. Visitors say they are the best they have ever seen. He sires the kind that grow faster and larger, have more, better and stronger pigs, and are more practicable and profitable—the kind that are highly satisfactory. Extra special prices on account of being overstocked. I have hogs galore. Prices will surprise you. Satisfaction guaranteed. Write Geo. A Smith, Corcoran, Cal

BILLIKEN HERD OF IMPROVED CHESTER WHITES—The Money Makers. Everything registered and cholera immune. Nothing to offer for immediate delivery. Sows now farrowing. The pigs from these sows will be ready to ship during late May and June. Am booking orders now for these. The offering represents the very best and most popular blood lines the breed produces. Sires and dams by Champions and Grand Champions. Let me have your orders early. C. B. Cunningham, Mills, Sacramento County, California.

REGISTERED DUROC-JERSEYS—ALL AGES—We are booking orders for Spring pigs out of sows sired by full brothers of "I Am Perfection Wonder," sire of Grand Champion sow at Panama-Pacific, and from others equally well bred. Also offering about 30 exceptionally choice fall boars and gilts. This stock is in first-class condition, breeding guaranteed, and of the finest blood in existence. Prices reasonable. For particulars, write Haden Smith, Route 1, Box 97A, Woodland, Cal.

HAMPSHIRE SWINE—Both males and females from Grand Champion 700-lb. boar and Grand and Junior Champion sow. Also Guernsey bull calves from Grand Champion bull. BELLA VISTA HERD, J. W. Henderson, 1st National Bank Bldg., Berkeley, Cal.

REGISTERED BERKSHIRES — World's Fair Grand Champion at the head of the herd. Also winners of Senior, Junior and Reserve Grand Champions. Stock of all ages for sale. Grapewild Farms, A. B. Humphrey, Prop., Escalon, San Joaquin Co., Cal.

BERKSHIRES—I have one of the best herds on the Pacific Coast, including Grand Champion Sow, Reserve Grand Champion Boar under one year, Third Aged Boar, etc. Frank A. Brush, Santa Rosa, Cal.

BIG TYPE POLAND CHINAS—My hogs are sired by California Wonder and Big Chief, imported direct from Iowa. There is no better blood. All hogs eligible to registration. C. A. Cooley, Durham, Cal.

BLATCHFORD'S PIG MEAL weans easily and safely; no trouble; no milk. Write for free folder, "The Safety Route from Pighood to Porkage." Coulson Co., Petaluma.

CROLEY'S BALANCED PIG FEED for growing youngsters; also cheaper hog feeds for big hogs. Geo H. Croley Co., Inc., 631-637 Brannan St., San Francisco.

REGISTERED PUREBRED BERKSHIRE PIGS — Weanlings—both sexes. Reasonable prices. Write for full information. J. E. Hall, Sebastopol, Cal.

LARGE, QUICK MATURING registered Berkshires. Both sexes, $10 each for weanings. Older ones at farmer's prices. J. M. Bomberger, Modesto, Cal.

LITTLE BLACK ESSEX—Service boars and weanlings. Only herd in the State. Limied supply. Yolo Essex Herd, L. W. Millsap, Yolo, Cal.

RANCHO RUBIUS—Duroes all sold except one service boar and a few October pigs. Spring litters will be "best ever." Elmer Lamb, Ceres, Cal.

REGISTERED DUROCS—All ages. One yearling boar. Satisfaction guaranteed. Frederick M. Johnson, Napa.

REGISTERED BERKSHIRES — Prize-winning stock. Sunnyside Stock Farm, Perkins, Cal.

Humboldt sheep men are holding their wool on account of rising prices.

At the Napa County Livestock Ass'n meeting at St. Helena Apr. 1, Dr. B. J. Cady told the members that two things are necessary to eradicate cholera: information and co-operation.

The River Bend Farm, of St. Helena, has recently purchased a daughter of the great "Defender," recognized as one of the best of Duroc boars. This sow has been bred to "Orion's Pal." Napa county is certainly getting on the Duroc map with its twenty herds of these popular purebred hogs.

A. D. McCarty of the Riverina Farms, Modesto, writes: "Out of 44 Yorkshire sows that we have to farrow, eight litters so far have averaged 10½ pigs. One sow, Nema 8th, farrowed and is raising 12 sow and 2 boar pigs, making 57 pigs farrowed by her in four litters. One of her gilts farrowed a few days under a year old, 13 pigs, and is raising 12. Pearl 4th farrowed 11 and is raising 9."

J. P. Daggs of Modesto writes, "I just got a young Gold Model boar from Prof. H. W. Mumford of Urbana, Ill. Sales made in March, 1916: 10 sow pigs weaned and a boar, to Ed Dunbar, Manila, P. I.; 3 gilts and boar to W. W. Perkins, McFarland, $270; 1 boar to Wm. McIntyre, McFarland; 1 boar to J. F. Martin, Yuma, Ariz.; 3 gilts bred to the new boar, to S. H. McKenny, Long Beach, $300.

SWINE.

50 HEAD OF SOWS bred to IOWA WONDER for spring litters. 60 head of gilts bred to JOKER for spring litters. 50 head of open gilts. 300 head of young pigs three to four months old, both sexes. These pigs are sired by IOWA WONDER, a son of A Wonder. JOKER is the First Prize boar, in the UNDER SIX MONTHS CLASS at the Wisconsin State Fair of 1915, and is a son of JUMBO HADLEY the FIRST PRIZE, CHAMPION and GRAND CHAMPION TWO-YEAR-OLD at the same Fair. BIG TYPE. I am offering this stock at extremely low prices. The Book, "The Poland China, the Hog Supreme," free for the asking. Write Geo. A. Smith, Corcoran, Cal.

YOUNG'S POLAND CHINAS—Large type Boar, I. B. A. Wonder won first and reserve champion P. P. I. E., weighing 730 lbs. under 2 years in breeding condition. Weanling pigs, either sex—none better—$15 up. Satisfaction or money refunded. W. A. Young, Lodi, Cal.

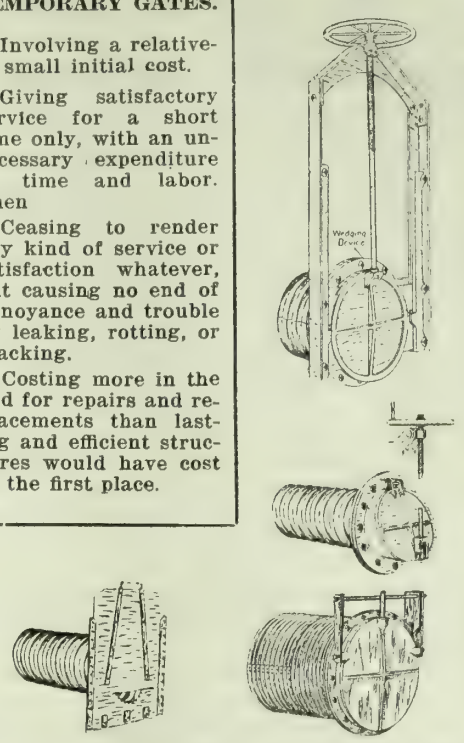
WHICH?

TEMPORARY GATES.



Involving a relatively small initial cost.

Giving satisfactory service for a short time only, with an unnecessary expenditure of time and labor. Then

Ceasing to render any kind of service or satisfaction whatever, but causing no end of annoyance and trouble by leaking, rotting, or cracking.

Costing more in the end for repairs and replacements than lasting and efficient structures would have cost in the first place.

or

PERMANENT GATES.

Involving a slightly greater purchase price.

Rendering excellent service at all times, season after season, with a minimum expenditure of time and labor.

Remaining at all times absolutely watertight, in first-class condition, and a source of satisfaction and proof of good judgment on behalf of the purchaser.

Proving that in Permanence there is Real Economy. First cost—total cost.

Hogs Grind Grain

THE HOG MOTOR is both a grinder and feeder. With it your hogs will grind their own grain, saving you money and labor. This machine will care for 30 hogs on full feed at a saving of 25% of the grain, and a pig of 40 pounds can operate the grinder. Grinds all kinds of grain, coarse or fine, separate or mixed. No waste—grain always dry, clean, fresh.

Grain and Concentrates for the Horse.

[Answered by Professor F. W. Woll, University Farm, Davis, Cal.]

The concentrates used in feeding horses in different parts of the country are: **Among the cereals,** oats, Indian corn, barley rye, low-grade wheat; **of other seeds,** Kaffir and other sorghum varieties, beans, peas, cow peas, cotton seed; **of factory by-products,** wheat bran and middlings, linseed meal, cottonseed meal, peanut cake meal, cocoanut meal, dried distillers' and dried brewers' grains, malt sprouts, dried beet pulp, and molasses.

Among the concentrates, oats are, in general, considered of a higher value in feeding horses than any other grain feed. They are eminently adapted for this purpose, and are relished better by horses than other cereals. Oats can be fed safely to horses, since the digestive tract of these animals does not hold a sufficient quantity to produce serious disorders. Owing to the presence of the hull, oats form a light and loose mass in the stomach, which makes it easy for the digestive fluids to permeate the mass and insure a more complete digestion. Oats should be fed whole to horses, or at least crushed or rolled, except in the case of old horses with poor teeth. If corn and oats are fed, the grain should be coarsely ground, as it may otherwise give rise to colic and indigestion when swallowed fast by hungry animals.

While oats form the common cereal fed to horses in most parts of the country, other grains are used in different sections and countries: Indian corn largely in the corn belt and the southern States, barley on the Pacific coast, in European countries, and North Africa. Barley is the common horse feed in Arabia, which is world-famous for its fine breed of horses.

In this State barley, or barley and oats, are more generally fed than oats, largely as a matter of economy, since oats are at least $5.00 to $6.00 per ton higher than barley, on the average. Both cereals make excellent horse feeds and may be considered of similar feeding value. Oats have an advantage in their higher protein content, while barley is higher in starchy components and, therefore, is a better supplementary feed for alfalfa hay than oats.

Indian corn is the main substitute for oats in the horse's ration in corn-growing states. Numerous trials have shown that it is a safe and satisfactory horse feed and that the best method of feeding it is to give a mixture of the two grains. Immense quantities of "ground feed" or chop (corn and oats) are sold every year in central and eastern States and fed to horses and dairy cattle, the proportion of each being dependent on the market prices of the grains.

All the other concentrates than those referred to above—**oats, corn and barley**—are of minor importance as horse feeds, being fed only in exceptional cases and as a part of the grain ration.

To the farmer or horse owner in this State only a couple of these miscellaneous feeds are of sufficient interest to be discussed here. The question of substitutes for barley is of no special interest so long as this is the cheapest available concentrate for horses on our market, as is generally the case. The only feeds of those mentioned that are likely to be lower in price are dried beet pulp, cocoanut meal and molasses. These cannot be fed as sole concentrates for horses, but may be fed in mixture with grain. Dried beet pulp will be rendered palatable to horses by adding an equal part of molasses: Two to three pounds of each will take the place of an equal amount of grain. Molasses has nearly a similar feeding value to grain, but must be fed in moderate quantities only on account of its laxative properties. Fed as suggested it serves both as an appetizer and a tonic for horses out of condition, and improves the palatability of the rations fed.

The other feeds mentioned may make up a part of the horse's grain ration when they are produced on the farm or can be obtained at a reasonable price, but they will never become general or important horse feeds under the conditions prevailing in this State, unless radical changes occur in the system of agriculture and the market conditions in the State. Farmers who are in position to try any of them should bear in mind that the horse is a creature of habit, and only gradual changes can be safely introduced in his ration. The results obtained in feeding horses, perhaps more than with other farm animals, depend largely on the feeder and the care and intelligence which he exercises in handling them. By a study of market quotations and of available feed supplies he may, however, at times be in a position to considerably cheapen the concentrate part of the ration without detracting from its efficiency.

As to the proportion of the concentrates for horses, the general rule is to increase the grain feed with the amount of work the horse has to do. Idle horses can get along with only a few pounds of the concentrates daily if a supply of good hay or other forage is available. The ration for hard-worked horses, on the other hand, must include a larger amount of concentrates than of hay. The simplest ration for common work horses in this State is about ten pounds of alfalfa hay and twelve pounds of barley, or its equivalent of other concentrates. In the case of horses doing very heavy work, it is often necessary to feed considerably more grain than this to prevent their losing flesh, but the quality of hay fed determines, to a large extent, the amount of grain that will be required.

Remarkable IHC Mower Record

LAST spring when Lester Brown, of Ottawa, cut his 40-acre alfalfa field with an I H C mower, he completed just about one-millionth of the total work done by I H C mowers during 1915. That interesting fact presents in a striking way the popularity of the reliable mowers and rakes sold under the old trade names—**Champion, Deering, McCormick, Milwaukee, Osborne** and **Plano.**

I H C mowers and rakes were the first ever made. Their sales have grown larger steadily, year by year, showing plainly what the farmers who use them think of them. They cut clean and close in all kinds of grass, clover, alfalfa, or other hay crops. With reasonable care they do good work for many years. It is always easy to secure repairs, new parts, or special service. They are sold by local dealers whose business it is to see that you are satisfied.

If you are already using I H C haying machines, we need say nothing except to remind you to look over your machines before you take them to the field and order now any repairs they may require. If you have not yet used any of them, see your local dealers, or write us for catalogues and other information about **International Harvester** haying machines.

Pedigreed Holstein Bull $250

I am now offering a very fine bull out of a high-testing dam, who was sired by King Pontiac Premier, one of the best sons of King of the Pontiacs, 165 A. R. O daughters. His dam's present record is 21.09 pounds, average test, 4.11%, made at four years old. This record was made under verw unfavorable circumstances, and she will make around 25 pounds with next calf. On the sire's side the bull has the blood of Pietertje Hengerveld Count De Kol, 99 A. R. O. daughters; and dam Deutschland Creamelle, is out of Creamelle Vale, the former world's championship milk cow. This young bull is almost white in color and is ready for service. His high test breeding will count in your herd.

Write or come and see him.

A CHANCE TO BUY TUBERCULIN-TESTED COWS.

[Written for Pacific Rural Press.]

The supply of tuberculin-tested dairy cows has been limited for several years and dairymen who maintained tuberculin-tested herds have found it exceedingly difficult to secure good producing and tested animals at prices within reason.

With the enforcement of the new dairy laws which go into effect October 1, this condition promises to become more acute as the demand will be greatly increased and prices correspondingly higher.

For these reasons the owners of the Rancho Dos Rios herd of Jerseys at Modesto expect a large gathering of buyers at their sale of registered and unregistered cattle, to be held at their ranch May 6, as most auction sales, especially of unregistered animals do not contain tested animals.

All of the 125 head to be offered in this sale have been tuberculin tested during the past month, thus insuring the buyers against possible loss from this source.

As producers at the pail the animals in this sale are out of the ordinary as they represent years of culling, and were it not for the fact that a large number of heifers are about to freshen, in the herd of over 400 head on the ranch, together with a shortage of feed, these cows would be kept in the milking herd as at present.

Mr. Mailliard, owner of the herd, advises us that by the time this appears the catalog will be ready for mailing, in which pedigrees and full descriptions of each animal to be sold will be given.

NOT AFRAID OF CHOLERA.

[Written for Pacific Rural Press.]

There was hog cholera within half a mile on both sides of Peters, Lamson, and Walker's purebred Duroc herd of 600 hogs near Holtville last January, and big flocks of blackbirds were flying back and forth. L. L. Lamson, who has charge of the ranch, didn't wait for the hogs to get sick. He cleaned them out thoroughly with sulphur, charcoal, and condition powders to prepare them for vaccination. He finished immunizing the last of the 600 on Jan. 7. No grain was fed for 10 days after vaccination. The hogs were run only on their usual green alfalfa pasture "to prevent overtaxing their digestion."

The few suckling pigs were not vaccinated, as, according to Dr. R. W. Ritter who did the work, they resist cholera while suckling. They are better vaccinated with serum alone when ready to wean, and again 60 to 90 days later with the double treatment. He used over 30 bottles of 500 c.c each of serum from Kansas City, on the Peters, Lamson, and Walker herd.

None of the pigs became much sick on account of vaccination; and all are now free from danger.

An additional precaution of Mr. Lamson, that should be on every hog farm, is the box in which a gunny sack is kept soaked with a disinfectant. Visitors are expected to carefully wipe their shoes on this sacking before entering the pens. It takes only a minute, and should be invariably insisted upon.

Rancho Dos Rios

SALE OF

Jerseys at Auction

Modesto, Cal., Sat. May 6, '16

REMEMBER, THIS IS A FOUNDATION SALE. The animals in this sale have been selected for our own dairy and are the result of years of careful breeding and selection.
THEY ARE HEAVY AND CONSISTENT MILKERS, and we would not part with them if it were not for the large number of heifers on our ranch, which will soon freshen. **Most of them are fresh or in calf to our herd sires.**
40 HEAD OF REGISTERED ANIMALS ARE INCLUDED in the offering, only four or five of that number being bulls, and each male we offer is a **REAL HERD HEADER.** Among the lot is our great proven sire, Dos Rios Pogis, a great grandson of Hood Farm Toreno, who has 34 daughters in the list of test cows with records up to 1047 pounds butter.
85 HEAD OF UNREGISTERED COWS will be sold. This is the finest opportunity ever offered dairymen in California as the breeding of most of this lot is the same as that of the registered animals in the sale. They are of pure breeding, but not eligible to registration in A. J. C. C..
For full pedigree and description of each animal to be sold,

Poultry for Profit---Producing and Marketing.

HOW BEST TO MARKET SMALL BROILERS.

[Written for Pacific Rural Press by Susan Swaysgood, Pomona.]

During the early spring months, there is a big demand for small broilers. The small broiler should weigh 1 to 1¼ pounds; but when the quantity is scarce they are acceptable if a little under one pound. This year prices and demand have been very good.

For those who live far from the city, commission charges and express have very much reduced the profit. So to get the full price for the product of your toil, it is far better to take the time to make a business trip to the city and look up a market of your own. Get closer to the consumer than is possible by passing your broiler through several hands.

Open Markets.—In all large towns or cities there are what are termed "markets." This means a place that handles first-class meats, poultry, game, etc., direct to the consumer They are both wholesale and retail dealers, and when possible they always buy from producers who are not so far away. Usually they pay a little higher than market price, besides paying the express charges and returning coops.

Possibly, also, there are a few pounds less in shrinkage, for we all know that if an animal or bird is kept without food or water while it is passed along and weighed on several scales, it will lose more than if weighed just once and the figures put down.

Advertising. — The next best method is to advertise for bids from clubs, high-class restaurants and hotels for a certain number of small broilers per week.

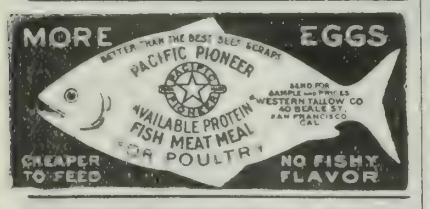
Have some neat letter-heads printed and envelopes with the name of your farm and your own name in the left hand corner. This is businesslike and will make a good impression on those who receive it. In your letter state what variety of fowls you keep; give color of skin, legs, etc.; and ask whether they desire the broilers alive or dressed. If you contract to furnish a club, restaurant, hotel, or hospital with a certain quantity and quality of broiler and get your price right—and unless you do get right prices don't contract—you have a steady, profitable business as long as you keep up your standard, for if one man happens to go out of business another will take his place and he will want your broilers because his customers will call for them.

Parcel Post.—I don't really believe that there could be any sort of trade in small broilers through parcel post. During the rainy season, our mails are too uncertain, rural routes are too long for carriers with heavy vehicles, and light ones would not carry much weight. Outside of the first zone the parcel post offers no inducements to the producer who wishes to reach the consumer with poultry products, except eggs.

DO PIGEONS HARM TREES?

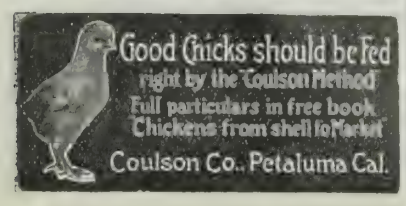
To the Editor: Can you give me some information as to the habits of pigeons and the amount of feed required for squab raising; what is the composition of the "squab feed" sold by dealers; and would the pigeons harm the trees in my 40-acre orchard?—G. W. J., Halleck.

[Answered by Geo. H. Croley.]



[They breed in pairs; and for squab raising pay best when confined in a small wire enclosure or aviary at one end of which is a shed or house that is completely closed and draft proof except in front, which is often entirely open; some breeders partially close this front. Pigeons require an abundance of fresh air, but quickly sicken and die from the effects of drafts. It is roughly estimated that each pigeon eats 35 pounds of feed each year. The commercial pigeon and squab food is a balanced ration composed of 15 or 20 sorts of peas, grains, and seeds; to successfully produce squabs, the parents must be furnished with a great variety of properly assorted food stuff including some peas. We never heard of pigeons injuring orchards.]

POULTRY NEWS NOTES.



[Answered by Geo. H. Croley.]

A number of small hatcheries that have recently started near Turlock and Ceres report a ready sale for all the chicks they can hatch.

It is worth going miles to see the flocks of fowl belonging to D. E. Terrill of Denair; so says Mr. F. L. Hall. Mr. Terrill says he feeds no waste products, but uses only dry mash, scratch feed, and greens, with

BELGIAN HARES—Young stock for sale. Hurd Bros., St. Helena, Cal.

10 inches graduated in mesh from ½ inch to 1½ inches then 20 inches of 2½ inch mesh, topped by 4½ inch mesh for the height of the fence.

The Fence Without a Sky Line

It is the most economical as well as the most practical of all poultry fences. It costs no more to buy than the old style poultry netting and costs much less to put up.

It is the only fence made with a bottom mesh smaller than one inch. It will turn the smallest chickens. Because of the straight line, continuous weave of "CALMADE GRADUATED" Fence, baby chicks won't hang in it, large fowls can't climb it.

"CALMADE GRADUATED" Fence will not slip at the joints nor unravel when cut. Uniform in weave and width. It unrolls flat as a board—it is easily put up and stretches without bulge, kink or band on posts 16 feet apart. Learn all about these advantages and let your next fence be a "CALMADE GRADUATED." Write at once for free samples of wire used, free illustrated folder and name of nearest dealer.

E. H. EDWARDS COMPANY 535 Howard Street, San Francisco

remarkable results. He regularly sprays the houses and cultivates the yards. His fowls are in beautiful condition and paying remarkably well.

E. W. Kelly reports that the percentage of egg fertility this season has been a record breaker in the Hollister district.

The poultry industry in the vicinity of Oroville is growing rapidly. At Bentz, Earl McClain reports extensive sales of baby chicks, and Frank Park has added 1600 White Leghorn chicks to his outfit.

In the small back yard of her home in Los Angeles, Mrs. Helen Maxwell is making a success of raising pheasants and thereby secures a good part of her living.

The hatcheries in the Santa Clara valley report that it is difficult to obtain enough suitable eggs for hatching to keep up with the demand for baby chicks. Many shipments of chicks have been made to Utah, Idaho, Nevada, and Arizona. There is an increasing local demand for the larger breeds.

WHY THE HOG LOOKS LIKE A GOOD BET.

(Continued from page 473.)

more satisfactory to sell good goods. In those days packing was only incidental to block hog butchering.

"Since then the prejudice has grown, notwithstanding the change in methods of pork curing here on the Coast. In face of this do you blame us for displaying Eastern cured meats? It's far easier to drift with the tide than to swim up stream and you certainly have to swim against a strong tide of public approval when you try to push California cured bacon or ham."

What the Women Think.—To illustrate his point, ask the housewife why she buys Eastern cured pork. The answer 99 times out of a hundred will be, "Why, because you can't make good bacon or ham from a California hog. In the East, you know, they feed corn and that's what makes good pork." Seems strange that she knows so much about it when she probably never saw a California hog fed, doesn't it?

But does she know all about it? If she doesn't buy California bacon or ham, who does eat the $4,000,000 worth which is annually packed in this State? Surely there is some outlet for it or millions of dollars would never have been spent in constructing large, modern plants.

The Pork Joke.—What is the answer? Go to the packer. Is he in a frenzied state of mind over the situation? Not so you could notice it! He even laughs when you broach the subject, and you do, too, when he explains that the staunch supporter of the corn-fed hog is a poor deluded creature who has been buying California bacon and ham without knowing it.

Oh, no, you are not a victim! You don't buy California-cured meats. Haven't you repeatedly watched the retailer tear an Eastern wrapper off the bacon, and didn't your last ham have an eastern brand on it? Of course it did, and it was fine eating for breakfast, too. Just as good as any you ever tasted. Is it a shock, then, to tell you that you're mistaken? That it is very probable that the hog from which it was cut was raised in your own county, or mayhap on your own alfalfa patch.

Seems like a far-fetched story, it is true, but that is the situation here today. The packer doesn't feel at all excited as to whether California-cured meats are as good as corn-fed ones or not. He knows that a good barley-fed hog is just as tasty as a corn-fed one, because he has your assurance for it in the amount you consume and the way you unconsciously laud its merits.

Is it necessary to quote cured-meat authorities as to the standing of the Danish, barley-fed hog or to dig up a lot of distant data to establish the fact that barley makes just as good pork as corn? We think not. But it is necessary to acquaint the consuming public with these facts and this is a work that our hog promotion interests must take up. If a product has a black eye at home, expansion of outside markets is necessarily more difficult.

Pork for the World.—As soon as the public is apprised of the true situation, through the public print and by publicity campaigns, their loyalty to home-cured pork will not be a questionable matter. Neither will it be longer necessary for the packer to clothe his barley-fed hog in a corn-fed sack or wrapper.

And when his product goes to other states or countries, as it inevitably will, it will advertise California as a hog State just as Sunkist oranges now advertise us as a citrus-growing State.

Like the Sunkist orange though, a certain responsibility rests upon the producer's shoulders. His product must be properly bred and properly fed to meet the requirements of the packer. Also as with oranges, the man who grows this high quality product will be rewarded for it in an advanced quotation for his pork. That hog is grain-fed, and carries more weight than the block hog which has been most in demand in the past. But he is coming and the farmer who first realizes it will be the first to profit by the new order.

Pull Out Stumps With the Famous Hercules!

Triple-Power

Pull an acre or more of stumps a day. Pull any stump in 5 minutes or less. Don't have loafer land when it's so easy and cheap to *pull the stumps out!* Make 1000% profit by using the Hercules. $1281.00 the *first year* on 40 acres! $750.00 every year after. Let us *prove* it.

Low Price and Book Free!

Get the facts. Read our book. Tells what all steel, triple power means. Shows many features of the Hercules. Shows many photos and letters from owners. Postal will do.

The Home Circle Page of the Pacific Rural Press

MRS. BEST'S LETTER.

My dear Friends:

Until after Easter, all the stores seem to vie with each other in showing new, attractive spring garments. Silk coats are very much in style again and they range from the practical black in conservative cut to gay colored evening garments that are almost like a circular cape with an apology for a sleeve. These are trimmed with heavy silk fringe and ostrich feather bands and make one feel festive just to look at them.

Georgette crepe is proving to be a strong rival of taffeta for popularity. Some of the exclusive shops are showing entire dresses of this material in shades of white, blue, rose and gray, with bead trimmings. These are made in very simple styles—full skirts with bands of the same material or tucks and soft blousy waists with long sleeves.

It is astonishing how the vogue for long sleeves continues—practically the only dresses you see for women that have short sleeves are the house dresses made of gingham or percale. I saw some very good looking ones of striped materials, as low as $1.95.

For girls from fifteen to twenty, one-piece dresses are shown of linen or crash in many different shades. Many of these are in solid colors—the plaids seem to be used more for the younger girls. Petticoats of thin muslin with flouncings of either embroidery or rows of fine lace are plentiful for dress-up occasions, but the practical garment for common use is made of corded pique, with a circular flounce on the bottom finished in a buttonholed edge. These sell as low as $1.50 and are very durable.

Ostrich feather fans are on display in many of the stores and at one very good shop a combination of silk party bag and ostrich fan is displayed as a Paris novelty.

Corduroy seems to be holding its own in popularity—at this time of year, the white is so pretty and if handled correctly they can be washed very satisfactorily, and, best of all, if the quality is good, they dye beautifully and for a small amount, you have practically a new skirt. Devotedly, **Rosabella Best.**

VACATIONS.

The vacation season is almost here and how fortunate all city dwellers are who can spend that period in the country, far away from the routine of their daily life.

What we all need for vacation is change from our ordinary manner of living—so what better could country people plan than to come to the cities, especially those that have the ideal summer climate—like San Francisco.

The theatres, the large stores, the parks, the fine churches all furnish either entertainment or recreation and the cost of such a trip is small compared with the benefit derived from it. Why not spend your vacation this summer in the city? Make double use of your time — see the sights and do some shopping. Many of the largest stores run special sales during June, July and August.

ENGLISH PORK PIE.

Make a pie crust, not very rich, and put around the sides of a deep pie-dish. In the bottom and above put layers of thin-sliced bacon, thin-sliced potatoes, onions chopped or sliced very fine, lean fresh pork cut into small pieces. Season with pepper, salt and sage. Fill the dish with any good gravy left from waste, or with water thickened for the occasion with some butter added. Cover with crust and bake about 1½ hours. Cover the pie with thick brown paper, if it gets too brown.

WASHING WHITE CORDUROY SKIRTS.

Take a generous amount of lukewarm water in a large receptacle—a bath tub is ideal except for the stooping, and in this, place your garment to be washed. Use Ivory soap and a clean, stiff brush. Go over the entire skirt with the brush well covered with lather, being careful to brush downwards with the nap—never against it. Do not rub between the hands nor on a board. You can get the dirt out that way, of course, but you ruin the appearance of the corduroy. After the skirt seems clean, rinse in two waters, but do not wring. Hang the skirt up perfectly straight and let it drip. At the same time, dry your brush and when both articles are perfectly dry, brush vigorously with the nap of the goods.

This method keeps the garment looking more like new than the ordinary way of washing.

EASTER EGG DECORATION.

All the drug stores carry dyes that can be used to color eggs for Easter—some of them on transfer paper while others are in powder form. But if you want to have something different, try working out an original design in relief on the shell. Draw only the outline of the figure or letter desired and keep the design simple. Melt candle wax and spread over the design, being careful that you keep your outline clear. Then soak in vinegar for an hour and peel the wax and the design will stand out in relief against the rest of the shell.

FLASH LIGHTS.

For use in a household where there are little people who need attention at night, the flash lights are a great convenience. They come in several shapes, one being narrow and flat, intended to be kept under the pillow, and a still newer design in the shape of a candlestick with the bulb at the top. With any of them a slight pressure on the slide produces a ray of light that is very valuable in a dark room.

HOUSEHOLD HELPS.

The food scrapers that can be bought for ten cents that are made of a piece of rubber set into a wire handle should be in every household. They are almost a necessity on fine china, and even on ordinary ware their use is recommended.

Soap shakers made of heavy wire and with a long handle solve the problem of how to use up small and broken pieces of soap. They are fine for dishwashing.

SUMMER SCHOOL.

The Bulletin of the Summer Session of the University of California is about ready and will be sent to any address upon application to the Recorder of the Faculties, Berkeley, Calif. The school lasts from June 26 to August 5, and tuition is $15.00 with no entrance examinations required.

The usual courses will be offered, with particularly interesting programs in Chemistry, Physical Education, Public Speaking, English, Graphic Art, Music, Manual Training, Home Economics, Education, Public Health, Agricultural Education, German and History.

Strangers wishing assistance in search for suitable boarding places will have all inquiries answered by the Dean of the Summer Session, California Hall, Berkeley, Calif.

LAUNDRY SETS.

The leather stores are showing a novelty in pocket-book form of laundry sets, consisting of half a dozen tiny clothespins, not more than two inches long, and a card of linen cord with two glass push tacks. This is put up in a small leather case and is for use in your own room for dainty articles. It sells for fifty cents.

GLASS COOKING DISHES.

Pyrex is the name of a new, clear, transparent substance of which baking dishes are made. It will stand the heat of a very hot oven and enables one to see how the contents of the dish are progressing toward completion. It comes in many sizes and shapes and is recommended very highly.

HIS NUMBER.

Teacher—I'm surprised at you, Sammy Wicks, that you cannot tell me when Christopher Columbus discovered America! What does the chapter heading of the week's lesson read?

Sammy—"Columbus—1492."

Teacher—Well, isn't that plain enough? Did you never see it before?

Sammy—Yes'm, yes'm; but I always thought it was his telephone number.

Two men were once talking over their respective sons' careers at college, and one remarked, "Well, I sometimes feel like saying as did Aaron in the wilderness, 'Behold, I poured in the gold and there came out this calf.'"

White of egg applied to burns gives great relief from pain.

FLORAL DEPARTMENT.

[By Gorge N. Tyler, Los Gatos.]

The Rural Press has made arrangements with Mr. Tyler, formerly of Alameda, but of late years living at Los Gatos, to conduct a floricultural column weekly in this department. Mr. Tyler will give cultural directions covering plants, bulbs, and shrubs, also will answer questions germane to the department. As Mr. Tyler has been for a long time a recognized authority in this line we believe our readers will secure many valuable hints by following his teachings.—Publisher.

Asters.—It is now time to plant out asters. Get the young plants from the florist. The comet and branching asters give the best results. The bed should have been prepared last fall, with a heavy application of manure,—horse manure for heavy clay soils and cow manure for light sandy soils. Before planting give a good application of hydrated lime—do not under any consideration use green manure for asters. Lime in itself is not a fertilizer, but it puts the soil in a good mechanical condition for working and releases all available plant food, so the plants can take it up; it also sweetens sour soil, and puts it in condition so that the denitrifying microbes can work, and release all available nitrogen, etc. In setting out the young plants, firm the soil around them and leave a little hollow, so that you can water as soon as planted out, afterwards filling this hollow with dry soil which acts as a mulch. Always water any plant as soon as set out, as the water settles the earth around the roots. After the plants have become established, water freely and cultivate after every watering. In about a month or six weeks, give a liberal application of bone meal and work it in with the rake or hoe. Do not use any kind of manure for a mulch, as this causes yellows and bull-headed flowers. Further directions for feeding will be given later.

Pelargoniums, in pots, are coming into flower now. Give them lots of air, full sun and also work a level teaspoonful of bone meal into the soil at the top of the pots. This increases the size of the flowers, the plants make a vigorous short-jointed growth. Do not under any consideration wet the flowers or foliage.

Pansies should have an application of an inch to one and a half inches of cow manure, so as to keep the roots cool and moist. The size of the flowers can be greatly increased by using the liquid manure, as described in my last article on mums.

Roses should be thoroughly enriched with bone meal, and then a good dressing of manure applied. The foliage should be sprayed in the forenoon of bright days, but never in the late afternoon, for moisture on the foliage causes mildew. Mildew is caused by sudden changes of temperature. Dust the plants with flowers of sulphur early in the morning, while they are moist with dew as a preventive. Use a piece of cheese-cloth, making a bag; put the sulphur in this and strike it with a stick which makes the sulphur sift gently down over the plants. For green aphis use a strong spray of water and wash them off, or use soapy water, or any of the tobacco extracts according to directions.

DOUBLE VISION.

My grandma's spectacles are queer—
  It's almost like a game;
She says she has two pairs of them,
  Although they look the same.
One pair makes tiny things seem big,
  "Enlarged," she says it's called;
The other makes big things seem small—
  I s'pose they are ensmalled.

I never see her change them,
  But she always seems to know
Just when to see things pretty small—
  And when to make 'em grow!

Some days folks think I'm 'quisitive,
  And bother 'round a lot;
Her specs just twinkle as she 'splains,
  "She's such a little tot!"
But when she gives me gingerbread,
  Or cookies, for a treat,
She says, "A great big girl like you
  Needs lots and lots to eat!"

I saved some choc'lates for her once—
  Some teeny little ones—
She said I was "an angel" an'
  They looked "as big as buns"!
But when I dropped my mug, and made
  A big spot on the mat,
She said, "It won't be seen at all,
  A little thing like that!"

I'm saving all my pennies,
  And I'm going to buy two pairs
Of spectacles for father—
  The kind my grandma wears.

—St. Nicholas.

WHY THE HORSE WHINNIED.

Adelaide was tired of shopping. Stores are so large, and there are so few places where a little girl can sit down to rest! If mother had been shopping in the toy department it would have been different; but sheets and pillow-cases are stupid though necessary. So mother left Adelaide at father's office while she went back to the shops and sheets and pillow-cases.

Father is an editor, and he sits at his desk writing, writing, always writing. When Adelaide was younger she supposed he was doing his writing lesson, as she did twice a week; but now she knows that he writes down all that happens the world over, so that the printers may know what to print in the columns of the evening paper.

When one calls on father, one must sit very quietly by the window, looking at pictures in papers and magazines or cutting them out for paper dolls. One must not interrupt father unless it is absolutely necessary,—like a cut finger, or a pin that hurts,—and one must never, never fret, not even if it is a quarter of an hour past luncheon-time.

This morning Adelaide seated herself with the mucilage-bottle and the big desk shears and some lovely tissue paper rescued from the waste-basket, to make a dress for a lady doll cut out of a magazine. As she sat there working she heard a horse whinny in the street below. Some whinnies mean, "Please, master, I'm tired of waiting here."Others are "How-de-do's" to passing horse acquaintances. Adelaide wondered what this one meant.

She colored the lady doll's eyes blue and her cheeks red with her father's colored pencils. Then she heard the horse talking again. The window was so high and the sill so broad that she could not see down to the street below. She wished she knew what the horse wanted. All the time Adelaide was making the lady doll's gown—blue with a white yoke—that horse whinnied.

The dress was just finished — it was lovely!—when father laid down his work, got up from his chair, and asked, "How about luncheon?"

The nicest part of visiting father is going out to luncheon with him. One goes to a funny little restaurant where instead of pictures on the wall are framed signs reading "Oysters," "Chicken Salad," "Coffee Rolls," and names of other delicious dishes. One sits at a little round table with father and orders either from these sign-pctures or from the bill-of-fare, which is fine print and harder to read.

So when father laid down his work, got up from his chair, and said, "How about luncheon?" Adelaide quickly laid down her work, slipped out of her chair, and replied, "Oh, yes."

They went down in the elevator and through the large hall. As they reached the sidewalk that same horse whinnied again, and this time Adelaide knew what he was talking about, for she could see him. Just out from under his nose a fruit-vender had set up a stand of pears, large and yellow and fragrant.

"Oh, father," cried Adelaide, "he has been teasing for a pear for the longest time, and I heard him; but I didn't know what he wanted because I couldn't see him or the pears either. Your poor horsey, how dreadful to have all that smell and not a single taste!"

"What would we better do about it?" asked father, smiling.

"You know, father," she said, "that while you drink your little cup of coffee that is just like my doll's cups, I have a glass of milk and a banana or an orange or a peach."

Father remembered.

"Now I think I will have a pear today, and, if you would just as lief, I will have it now and give it to horsey because he wants it so badly."

Father said he was feeling rather rich today and perhaps he might afford to treat both the horse and Adelaide to dessert. He bought two pears of the fruit-seller,—they were two for five cents,—and Adelaide took one by the stem and held it up to the horse. He pushed out his lips, as horses do, and seized the fruit in them. While he ate he blinked at Adelaide in a contented fashion. After he had eaten the second pear and Adelaide and her father were walking on he whinnied again, but this time the whinny said, "Thank you."

"Didn't he enjoy them!" said Adelaide. "I guess, if you really feel rich enough to afford it, I will have a pear myself while you drink your doll's cup of coffee, instead of a banana or an orange or a peach."—Mary Alden Hopkins, in Congregationalist.

Do It Electrically

PACIFIC GAS AND ELECTRIC COMPANY — PACIFIC COURTEOUS CONTINUOUS SERVICE

ELECTRIC APPLIANCES in the household not only add to the convenience of all members of the family, but they are economical and time-savers. ELECTRIC APPLIANCES include CHAFING DISHES, COFFEE PERCOLATORS, VACUUM CLEANERS, ELECTRIC IRONS and every other appliance that is needed in the modern home, not forgetting ELECTRIC FANS.

We carry these appliances in many of our branch offices, and will be glad to have you call and inspect them. Where we do not carry them we will be just as glad to give you our expert advice.

"PACIFIC SERVICE" is always "At Your Service."

Pacific Gas and Electric Company
HEAD OFFICE, 445 SUTTER ST., SAN FRANCISCO.
Branches in all principal cities and towns of North Central California.

Endurance

"How long a run for my money?" That is the vital question.

10,000 mile Savages are common. 20,000 mile Savages are not unusual. All Savage Tires give maximum service.

Ask any Savage user for his opinion of Savage endurance and Savage mileage.

Be sure to get our interesting Tire Book, No. 1438.

Pacific Rural Press Market Report

PRICES QUOTED AS PAID TO PRODUCERS.

San Francisco, April 12, 1916.

WHEAT.

Unfavorable crop indications in the East have caused a firmer tone there, but the war situation is not encouraging for heavy speculative buying, and values show little change in either local or outside markets. Trading here is very dull.

Cal. Club, ctl.	$1.62½ @ 1.67½
Northern Bluestem.	1.90 @ 1.92½
Northern Red	1.85 @ 1.95

BARLEY.

The spot movement here is limited to current needs, with buyers taking very little interest. However, offerings are pretty firmly held at the former level, the supply being of moderate proportions.

Shipping, ctl.	$1.40 @ 1.42½
Choice Feed, ctl.	1.35 @ 1.37½

OATS.

Local consuming requirements are light, and as most buyers are amply supplied for current needs there is little interest in the market. Considerable stock is offered, and the market shows a tendency to weakness.

Red Feed	$1.35 @ 1.37½
Red Seed	1.45 @ 1.65
White	1.45 @ 1.50

CORN.

Yellow, either Eastern or California, is in fair demand as last quoted, though inferior grain, either of this or the Egyptian type, is not readily salable. Good Egyptian and Kaffir corn is moving well in the country.

Egyptian Yellow, ctl.	$1.80 @ 1.85
Milo Maize	1.40 @ 1.45
Kaffir	1.60 @ 1.65
Egyptian	1.50 @ 1.57½

BEANS.

(On wharf, San Francisco.)

Bayos, per ctl.	$4.50 @ 4.60
Blackeyes	2.90 @ 3.00
Cranberry Beans	4.65 @ 4.75
Horse Beans	3.00 @ 3.25
Small Whites (south)	6.00 @ 6.10
Large Whites	5.75 @ 5.90
Pinks	4.20 @ 4.30
Limas (south)	4.35 @ 4.45
Red Kidney	6.50 @ .675
Mexican Reds	4.50 @ .465
Tepary Beans	4.00

SEEDS.

Melilotus Alba, lb	23 c
Melilotus Indica	6 c
Bur Clover	11 c
Oregon Vetch	5 c
Soy Beans	6 c
Canada Peas	5¼ @ 6 c
Alfalfa, per lb.	22 @ 24 c
Sudan Grass	40 c

HAY.

The first carload of the first cutting alfalfa arrived in this market a few days ago, and arrivals are expected to increase rapidly from now on. Buyers are still holding off a little, fearing that the new hay may be imperfectly cured; but those who receive it say the quality is much better than usual for first cutting, and with good curing weather an excellent lot of alfalfa is expected from the San Joaquin. Conditions for the grain hay crop have been bad, as there is great need of rain in most districts. There is said to be a great shortage of hay in the Portland market, and shipments up the coast have cleaned up the local surplus, causing a much better feeling in this maket.

HEAVY GRAIN FED HOGS IN FAVOR.

Hog arrivals have been of such a mixed nature locally that packers could not come out with the nine-cent top and as a result a shaving of prices is noted this week. A large number of lightweights have been slipped through, making it difficult to profitably handle the large volume killing from a packer's standpoint. The demand for good, heavy, grain-fed hogs is still good and will probably continue to be, but a nine-cent top must not be expected. Lightweights continue in bad repute, and find little, if any, demand from the packing sources.

No. 1 Wheat	$13.00 @ 16.50
No. 2	12.00 @ 14.50
Tame Oats	12.00 @ 18.00
Wild Oats	12.00 @ 14.00
Alfalfa	12.00 @ 15.00
Stock Hay	6.50 @ 8.50
Straw, per bale	.25 @ 40

FEEDSTUFFS.

(Wholesale prices per ton, carload lots, San Francisco.)

Beet Pulp, per ton	$22.50 @ 23.50
Alfalfa Meal, per ton	20.00 @ 21.00
Alfalfa Molasses Meal per ton	21.00 @ 22.00
Bran, per ton	24.50 @ 25.50
Oil Cake	Nominal
Cocoanut Cake or Meal	23.00 @ 25.00
Cracked Corn	40.50 @ 41.50
Middlings	33.00 @ 34.00
Rolled Barley	29.00 @ 30.00
Tankage	45.00
Rolled Oats	29.50 @ 31.00

VEGETABLES.

A decidedly firm feeling is noted in several lines of vegetables, owing to a large movement to the Eastern markets. This is true in part of asparagus, though the cannery price has been as low as $1.25 on heavy receipts; and string beans and green peas are higher on account of the shipping demand.

Cabbage, ctl.	70 @ 80 c
String Beans	20 @ 22½ c
Peppers, bell, lb.	20 @ 25 c
Rhubarb, box, Bay	50 @ 65 c

POTATOES AND ONIONS.

New potatoes are now coming forward in considerable quantities, causing a very sharp drop in prices. Old stock also is a little higher, but on the whole the market for good old potatoes is in fair shape.

Asparagus, box	1.50 @ 2.00
Artichokes, doz.	20 @ 40 c
Celery, crate	2.50
Lettuce, small, crate	.75 @ 1.25
Eggplant, lb.	15 @ 20 c
Peas	3½ @ 5 c
New Potatoes, ctl.	$2.50 @ 2.75
Oregon Burbanks	1.75 @ 2.00
Delta Burbanks	1.25 @ 1.75
Sweet Potatoes, ctl.	2.50 @ 2.75
Onions, Delta, ctl.	1.25 @ 1.50
Onions, Oregon	1.30 @ 1.50
Australian	3.25 @ 3.50
Garlic, per lb.	8 @ 9 c
Tomatoes, Mex., box	3.00

POULTRY.

Really good turkeys would bring a premium, but practically no attractive stock is offered. Arrivals of Eastern chickens have been very light this week, and with a good demand the market is very firm on everything but small young stock, which is coming freely from local points. Broilers have dropped a little, but fryers are steady, and both hens and roosters show a sharp advance. Ducks also are a little firmer, and Belgian hares are in demand.

Turkeys, dressed	27 @ 28c
Live Turkeys, lb.	20 @ 22c
Broilers, 15 lbs. to doz. and less, lb.	30 @ 33c
do, over 15 lbs. to doz.	35 @ 36c
Fryers	30 @ 35c
Hens, extra, per lb.	21 @ 22c
Small	20 @ 21c
Smooth Young Roosters, per lb.	25 @ 30c
Squabs, per doz.	2.00 @ 4.00
Geese, per pair	2.25 @ 3.00
Ducks, young, lb.	20c
Old	18c
Belgian Hares	10 @ 11½ c

BUTTER.

Local prices have rather suddenly taken a 1½c. drop, owing to increasing arrivals and an easier feeling in Eastern markets. The shipping movement has continued until very recently, however, large quantities going to Seattle, while occasional carloads are still going East. The difference in values now is too small to offer much inducement for Eastern shipments, but the goods are moving on buying orders from New York and Chicago.

	Thu.	Fri.	Sat.	Mon.	Tu.	Wed.
Extras	29	29½	30½	29	29½	28
Prime Firsts	28½	29	30	28½	28½	27½
Firsts	28	29	29½	28	28	27

EGGS.

The market is rather uninteresting, as prices have been maintained steadily on extras, with only a slight advance on pullets. There is still considerable outside demand, which with the movement into storage is taking up all surplus offerings.

	Thu.	Fri.	Sat.	Mon.	Tu.	Wed.
Extras	22	22	22	22	22	22
Sel. Pullets	19½	19½	20	20	20	20

CHEESE.

Flats have been coming in quite freely for some days past, causing a sharp decline, while the other grades remain as last quoted.

Y. A.'s, fancy	18½c
Fancy Calif. Flats, per lb.	14½ c
Monterey Cheese	15 @ 16½ c

LOS ANGELES DAIRY PRICES.

	Wed.	Thu.	Fri.	Sat.	Mon.	Tu
Butter	28	28	28	28	28	28
Eggs	21	21	21	21	21	21

DECIDUOUS FRIUTS.

There is nothing new in the market as yet, though some cherries are said to have been shipped from early growing districts. Strawberries have declined rapidly, as arrivals from all three districts mentioned are growing fairly large. Most of the berries so far have been of attractive quality, and find quite an active demand in the local market. Loquats are easier, and apples stand about as before.

Strawberries, S'n, crate.	$ .75 @ 1.00
Fresno	1.25 @ 1.50
Watsonville, chest	8.00 @ 12.00
Apples:	
Pearmain	.85 @ 1.00
Baldwin	.75 @ 1.00
Loquats, crate	2. @ 2.25

DRIED FRUITS.

The dried fruit market is decidedly in the doldrums at present. What may be taken as a somewhat favorable indication is an advance in spot pears, which would seem to reflect a shortage in some other lines. Spot prunes also show a little more firmness, and peaches have been marked up about ½c, as the spring consuming demand is making itself felt, and the trade in distributing centers is recovering from its scare. There are still some peaches left in the country, and some good-sized lots of prunes, but these are expected to move off in good shape before the new crop comes in. Values for futures are still very uncertain. Some of the packers have had buyers in the field the last few days, but report that the growers generally are refusing to sell, partly on account of the prospect of short crops in several lines, and partly from expectations of better marketing conditions later on. The present attitude of the growers is having some effect on Eastern markets, apparently, and it is expected that short sellers will have trouble in making deliveries.

Apples	5 @ 5½c
Apricots, per lb	6 @ 10 c
Figs, white	Nominal
Black	Nominal
Calimyrna	Nominal
Prunes, 4-size basis	4 c
Peaches	4 @ 4½c
Pears	5½ @ 7½c

(Associated Raisin Co. Prices.)

Imperial Clusters, 6-crown, 20-lb. box	2.50
Bulk, layers, 50-lb. box	2.75

CITRUS FRUITS.

The shipments of oranges to the east have been very heavy for some time, averaging nearly 300 cars daily. It is expected that the navel crop will be nearly all shipped by

Special Livestock Market Report.

There is very little buying activity in cattle, only a very few of the choicest lots of grassers being contracted for. Some of these are bringing as high as 6¾ for early delivery. Cattle for immediate shipment are in strong demand, there being a scarctiy of light cattle at the present time.

The market on sheep is about the same. The southern districts report an exceptionally early drying up of feed, but it does not seem probable that many will have to be carried over. In view of the prices which lambs were contracted for they are not carrying near the weight they should. Practically all of the lambs in the country are contracted, and the same condition applies to sheep, although not in such a broad sense.

WOOL.

There is a little buying in the country, but hardly reportable. The London sales opened five per cent off April 11, but it is too early at this writing to say what the ultimate condition will be. Boston reports a fair volume of business at old prices. It looks to be a waiting market.

BULLOCK CREEPING GRIP TRACTOR

the middle of May. Prices are ruling good on acceptable fruit, but large sizes are holding down the average. At New York on Monday, April 10th, the auctions averaged from $1.80 to $3.65 per box for navels, and from $2.25 to $2.60 for lemons. At Chicago the same day prices averaged $2.25 to $3.75 for navels, and lemons from $2.75 to $3.50 per box.

Oranges, Navels	$1.50@2.75
Tangerines	1.25@1.75

HORSES.

Little stock has come in for several weeks past, but a small lot of heavy drafters appeared a few days ago. They were disposed of at about the range quoted, but there appears to be no very great interest in any class of horses locally, and it is hard to dispose of anything except first-class stock of the types most in demand at anything like satisfactory prices. A recent country sale is said to have shown poor results.

(Approximate values in San Francisco, based on auction sales.)

Drafters, 1700 lbs and up	$ 250
Drafters, 1550 to 1650	150@200
Chunks, 1350 to 1500 lbs.	150@175
Wagon horses, 1050 to 1350 lbs	110@150
Green Mountain range horses, 950 to 1200 lbs.	20@75
Farm Workers	50@100

HIDES.

Buyers are still taking an active interest, and local offerings are kept pretty well cleaned up, values being well maintained.

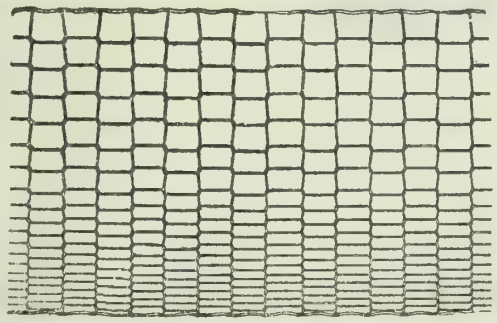
Publisher's Department

Number of new subscribers added to our list the past week was 149. While we are all working to increase the subscription list, it would seem as though the eastern paper manufacturers were the ones who were reaping the rewards at this time. In common with other material the price on paper has steadily advanced for the past three months till now it is nearly 50 per cent higher than last year. This office was lucky in having several carloads on hand before the prices commenced shooting skyward, so we welcome every new subscriber.

This issue is given largely to Swine in California. After reading it you may want more information. In case you do, send for our California Hog Book, price $2. Our next issue will print a lot about the Hay Crop.

Chrysanthemums!



20 rooted cuttings, my selection, for $1.00 postpaid. 12 from 2½ inch pots, my selection, for $1.00 by express. This special offer includes both singles and pompons. Send for price list of latest novelties in show, commercial, exhibition, pompons and single Mums.

GEO. N. TYLER,
Brookdale Nursery, Los Gatos, Cal.

Save Money on Wire Fencing!
-send for WHITING-MEAD'S Free 1916 catalog showing how to save money on Building Material

HOG FENCING, 50c ROD

4 FOOT HIGH—LIKE PICTURE.

—With the rapid advance in price of all kinds of fencing, this is an even more important offer than might seem at first reading.

—We are fortunate in being able to secure an unusually large amount of this fencing, so can fill large orders promptly.

—Picture to the right shows just how it looks However, there is a heavy barbed wire at top and bottom not shown in picture. This prevents cattle from pushing **down** and hogs from **lifting up** this fencing when in use.

—Only best Number 9 and 12 gauge wire used, fully galvanized. This price applies in 20 rod rolls.

WHITE ENAMELLED ROLL RIM SINKS $1

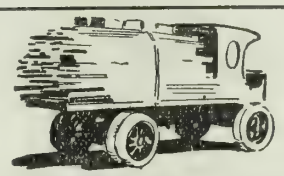
—Another evidence of buying in quantities impossible to small dealers. Roll rim sinks, just like the picture, white enamelled inside and deep blue enamelled outside. Made of best pressed steel. We've sold thousands and despite the war are able to quote the low price of $1.00

Enameled Steel Bath Tub. Our Famous Special. $8

—For years this has been our most talked-of bargain, in fact, we have reason to believe we are the only people on the Pacific Coast selling these tubs.

—Made of finest 24-gauge galvanized steel. Inside white enamelled, outside finished in rich sky blue enamel with handsome bronze trimmings and hardwood rim. Price, ... $8.00
larger sizes, $8.50, $9 and $10.

Low Down Enamel Steel Toilet Combination..... $11.50
Complete to floor—wonderful value.



Low Down Vitreous China Closet Combination..... $15.50
Special value—worth $22.50

Big value in High Tank Toilet Combination $11.50
Complete to floor—a bargain.

Special Bankrupt Stock of Kitchen Sinks. All sizes— from..... up $1.00

Best Quality Porcelain Lavatories; every one guaranteed— $10 down to..... $3.75

About Our Lumber

—Just as we have been telling you for some time we now have one of the finest lumber stocks in Southern California open for your selection.
—Do not let anyone mislead you. We can prove our lumber to be all we claim it. It is all new and strictly up to grade. Get our prices before you build.

Standard House Paint $1.50

—Regardless of the increased price on paints we are still able to quote you our old prices on the famous Standard and other paints.

—Standard House and Floor Paints, $1.50 per gal.

—Standard makes of varnishes at 25% off regular prices.

Everything in Paints, Wall Tints. Brushes, etc., at big savings to you.

Dutch Kalsomine, 4½c per lb.
Black Graphite Roof.— per gal.*..... 50c
Standard Roof Paints— red, green, gray — per gal.* 85c
Shingle Stain, made from pure ground colors per gal 50c

*In 5 gal. lots only at this price.

Ready Roofing $1

—Roofing like this is being sold by many firms for 20% to 40% more. The European War demand is sending the price of all roofing up by leaps and bounds, but by reason of our large stocks we can quote these low prices:

1-ply, double-sanded, per roll of 108 square feet	$1.00
2-ply, double-sanded, per roll of 108 square feet	1.55
3-ply, double-sanded, per roll of 108 square feet	1.80
1-ply, "King" smooth, per roll of 108 square feet	1.40

CHALMERS · MOTOR · CO
Detroit, Mich., U.S.A.

Quality First

A SENSIBLE CAR THAT ECONOMIZES AND ENDURES—3400 r. p. m. CHALMERS

The back-bone and mettle of a motor car, after all, can only be shown up on country roads.

The new 3400 r. p. m. Chalmers, by facing all kinds of conditions on all kinds of roads without whimper, apology, or flinching, has proved that she's got the stuff in her.

She has proved that she is no mere citified, boulevard performer; for no car on earth of her price or size has ever gone about its business everywhere with her energy, endurance, strength and spirit.

Her conquest of hills and rut-riven roads is the talk of every county seat. She has climbed hills on high gear and pulled through country roads on "high," where conditions were so bad that the running boards dragged.

These are two of the reasons why the 3400 r. p. m. Chalmers is such a sensible car for the farmer to buy. She does not boast of fantastic records of performance made by a tuned-up, doctored-up, professional-driven car on the race-track. Her achievements have all been recorded with ordinary drivers at the wheel and ordinary roads beneath her tires.

Owners throughout the country have driven her over roads on which they admitted it was a shame to drive any car, and she has made amazingly good.

The 3400 revolutions per minute of her engine, recorded without skipping and with absolute safety, prove tremendous engine-strength and precision.

Long engine-life and high engine-speed have always been twin features of the most successful engines of all kinds. 3400 r. p. m. means long life because it reduces side-thrust of the crankshaft to the minimum, and side-thrust means wear and tear.

The 3400 r. p. m. Chalmers is a sturdy, long-lived piece of machinery, built not only to endure, but to economize.

You get 18 miles of light-footed going out of every gallon of gas. You add many miles to the life of your tires because of the smooth velocity with which her engine delivers might.

The same throbless, fretless engine-action, whether you travel at the rate of 3 or 60 miles an hour, whether one or five are aboard, means riding comfort that springs, good leather and 9-inch cushions only partially explain—riding comfort that has never been dreamed of before in a $1050 car.

Her pick-up responds with the same velvety obedience in the Dakotas as on Michigan boulevard. She economizes with fuel over Kansas gumbo, just as on Fifth Avenue.

From every angle, you'll find the 3400 r. p. m. Chalmers a sensible, practical, value-delivering car to own and drive.

Drop in and see her at your Chalmers dealer's the next time you go to town.

One look—one ride—and you'll realize why she's cast her spell over 100,000,000 Americans.

Rotation; Driving-Wheel of Prosperity.

Rational sequence of crops and fertilization will make open land continuously profitable and enable it to help sustain fertility in land permanently planted.

[By J. W. Gilmore, Professor of Agronomy, University of California.]

THE writer once listened to a Japanese agriculturist relate some of the differences that existed between the agriculture of Japan and that of America. Among other things he stated that in Japan they cultivated soils, while in America it appeared to him that we cultivate crops. In view of the fact that the agriculture of Japan is old, while that of America is young, and in view of the fact that Japan has supported her dense population on an area of arable land amounting to less than 15 per cent of the total, this statement has some significance. Its significance is in the fact that permanent agriculture is wrought with the problem of treating, husbanding, or cultivating the soil in such a way as will at least maintain its crop-producing power.

When a complete survey of the methods of maintaining crop-producing power of the land is made from the records of experience as well as from experiments, it will be found that among other factors the diversification of crops and the keeping of domestic animals are two that stand out prominently, and that in addition to this there must be a correlation between the weight of live animals fed on the land and area of land cultivated.

The problem in California is complicated by the fact that there is a demand not only in other parts of our own country, but also abroad, for the products of the soil in the form of grain seeds and forage. Hence, we are of apparent necessity selling away from our lands elements of plant food large in amount as well as in value. If it may be granted that half of our barley crop is sold from our lands and all of our wheat crop, then we are removing each year more than one million dollars' worth of fertility in the wheat crop (at the rate of $3.43 per 1000 lbs.) and more than two million dollars' worth in the barley crop (at the rate of $2.60 per 1000 lbs.) This is sufficient illustration without mentioning a large number of other crops by which plant food elements are removed.

The future of California agriculture therefore involves a consideration of the problems relating to the maintenance of the crop-producing power of our soils. It is believed from all the experiments and experiences that can be assembled that this may be accomplished by the use of a variety of good crops, by the feeding upon the land of farm animals in a ratio of numbers suitable to the area cropped and the kinds of crops produced and the placing upon the land from time to time such mineral and organic fertilizers as are required. In this enumeration it is assumed that the land is not charged with excessive amounts of water or alkalis and that no organic matter is burned or wasted.

General farm crops are fundamental to permanent agricultural prosperity, because they provide rotation of cash crops, remove competition from fruit growers, and supply feed for live stock, which supply fertility for the fruit and general crops.

Why Rotation is Rational.—The demand for rotations and diversifications are usually brought about by depleted yields or qualities, and these arise out of deficiencies in the soil or from the presence or infestation of insect enemies or fungous diseases. The purposes to be attained through a diversification or rotation of crops may be briefly enumerated as follows:

I. Reasons bearing upon the crop-producing power of the land:

a. Cultivated crops, cover crops, and forage crops should alternate in order to maintain an optimum humus content in the soil.

b. A legume crop should appear on the land one year in four in order to maintain as nearly as possible the supply of nitrogen.

c. Alternate crops of different culture methods in order to maintain good physical condition. This also includes crops of different food requirements.

d. Under some conditions a summer fallow must be included in order to conserve moisture and to augment available food supply.

II. Reasons bearing on the control of enemies:

a. Employ crops having different culture methods, seasons, and structural characteristics, for the control of weeds, insects, and fungous diseases.

III. Reasons bearing upon economy in farm management:

a. Crops should be varied in order to insure continuous returns in time as well as amount.

b. A succession of crops should be planned so as to distribute as equally as possible both man and horse labor throughout the year.

Instances of Depletion.—One does not have to travel very far in California to see the evil effects of continuous cropping. At the University Farm, Davis, continuous cropping to wheat since 1908 has resulted in the following figures.

(Continued on page 516.)

Cave Life or Civilization

Civilized man is distinguished from the cave man by his habit of co-operation.

The cave man lived for and by himself; independent of others, but always in danger from natural laws.

To the extent that we assist one another, dividing up the tasks, we increase our capacity for production, and attain the advantages of civilization.

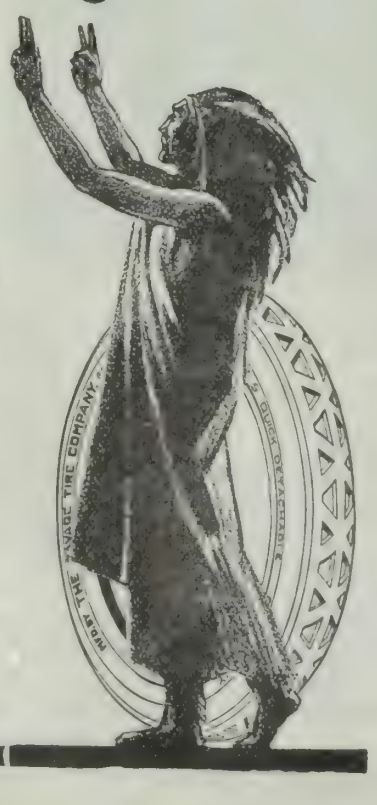
We may sometimes disregard our dependence on others. But suppose the farmer, for example, undertook to live strictly by his own efforts. He might eke out an existence, but it would not be a civilized existence nor would it satisfy him.

He needs better food and clothes and shelter and implements than he could provide unassisted. He requires a market for his surplus products, and the means of transportation and exchange.

He should not forget who makes his clothes, his shoes, his tools, his vehicles and his tableware, or who mines his metals, or who provides his pepper and salt, his books and papers, or who furnishes the ready means of transportation and exchange whereby his myriad wants are supplied.

Neither should he forget that the more he assists others the more they can assist him.

Take the telephone specialists of the Bell System: the more efficient they are, the more effectively the farmer and every other human factor of civilization can provide for their own needs and comforts.



Or take our government, entrusted with the task of regulating, controlling and protecting a hundred million people. It is to the advantage of everyone that the government shall be so efficient in its special task that all of us may perform our duties under the most favorable conditions. Interdependence means civilized existence.

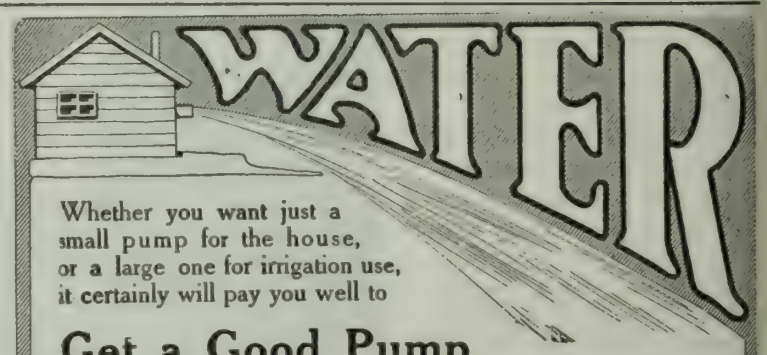
Why Take A Chance?

WHEN you buy your grain binder this spring, do not make the mistake of experimenting with an untried or cheap machine. You cannot make money that way. A binder is useful for one purpose only—to get all the grain cut and bound in the short time allowed for the harvest. That is no time to risk experiments, especially when you do not have to. Choose your binder from one of the old reliable, yet up-to-date in every way, **International Harvester** binders sold under the trade names—



Champion Deering McCormick
Milwaukee Osborne Plano

You will find practical farmers, who know what particular harvesting difficulties they must overcome each year, urging the use of some binder with an **IHC** name. Years of building and betterment have resulted in these machines that insure as complete a harvest as it is possible ever to get, even under worst field and grain conditions.

Look for the same high-grade workmanship, the same famous **IHC** quality in **IHC** twine. Make the most of your crops. Your local dealer can furnish you with **IHC** binder repairs and twine. See him or write to us for information.

The Uniqueness of California Hay.

Seventh of a series of sketches in which the Editor presents suggestions drawn from long experience, of what Californians should think and do for the advancement of California Agriculture.

SIGHT.—Perhaps the rudest shock which early American entrants to California received was from their discovery that it was a land devoid of greensward. Most plains-crossers received this shock in aggravated form, because the breaking up of winter was usually the signal for a start overland from the eastern states and spring migration resulted in summer and fall arrival in California—the pilgrims being the more deeply impressed because they first hailed verdant mountain meadows of California as the joyful ending to weeks of dusty distress in plains-crossing and hastened onward toward the heart of the new paradise to find that organ feebly welcoming them to palpitating heat-waves amid bare, rounded foothills and then to a tawny ocean of arid plains, islanded by scattering oaks which cast naught but dry and dusty shade. All this they saw and felt—keenly remembering, too, that at the very time of their arrival in California the fields whence they came were verdure-clad with growing grains and clovers and the air redolent of new-mown hay.

"Alfalfa is in a winning race with 'grains cut green' for they are in the last decade of their leadership, probably."

And there came others by ship and ocean, arriving as the rains were falling and they saw the valley plains park-like—illimitable lawns, flower-spread and tree-set. Theirs it was to be joyful over the contrast between this sight and memory of home-fields drear and snow-mantled until, to gather flowers, they stepped out upon the naked soil uncushioned with turf even where grew the thickest grass.

And so, to those who arrived in summer, and in winter also, the conviction came that this land of mines could never be a land of farms, for what they saw offended the traditions of all humid countries—"no sod, no grass; no grass, no cattle; no cattle, no manure; no manure, no grains; no grains, no life for civilized man."

Insight.—There is no space to outline the awakening to insight which came to nearly all whose mistaken conclusions gave to California a bad name for agriculture in the very early years of American occupation, nor to record the expressions of it at any length. Much of the new truth which was learned pertains to pasturage, and of that we are not writing now. And to those who did gain some early insight, conviction was slow: it was conversion—with doubts. A few words from the distinguished Horace Greeley written in 1859 in his "Overland Journey to California," give us the hay connection which we desire:

"Such a thing as an honest, straight-out barn has not blessed my eyes in connection with any farm since I left civilized Kansas—if even there. A Californian would as soon think of cutting hay for the sustenance of his family as for that of his herd. In fact winter is, after spring, his cattle's best season—that in which they can best take care of themselves with regard to food. From August to November is their hardest time. But the herbage which rendered the hills and plains one vast flower garden in spring is, though dead and dry as tinder, still nutritious; its myriad flowers have given place to seeds which have the qualities of grain; and, if the range be broad enough, cattle which have naught to do but forage, contrive to eke out a pretty fair living. But it were absurd to suppose that a single crop of dead herbage can afford, acre for acre, equal nourishment with the constantly renewed grasses of an eastern pasture."

But Mr. Greeley runs out of the meadow into the pasture and we cannot follow him, even to dispute the accuracy of his conclusion—for we are not shelling that cathedral now. Suffice it to say that most early Californians began to think about it that way and naturally they went from lamentations to somewhat systematic efforts to make turf grasses grow in California that they might have something like the eastern Timothy meadows from which to cut hay. They failed everywhere except in valleys in the extreme north of the State and in more strictly mountain valleys high up in the Sierra on the eastern border of the State where one finds many eastern grasses now established and thriving as they possibly have thrived ever since the first seed was shaken from immigrants' hay at camping places near the overland trails. Turf grasses are also to be found on some low lands in the valleys where continued summer moisture comes from below as a substitute for the summer showers which the clouds deny. But this also refers more to grazing than to hay making and interesting facts concerning such establishment of exotic grasses must be reserved for another occasion.

What, then, for Hay?—Oh, well, it was not so hard to take a hint. After the lamentations over the loss of eastern meadows were forgotten in the anger over the cussedness of eastern grasses which would not show delight at being brought to California, the wise ones fell into the Mexican way of taking things as they found them and soon found that they could cut wild-oat hay, of which there was more than they could use, whenever there was a decent annual rainfall. The pioneers soon found that wild oats were just as hard to get out as eastern meadow grasses were hard to get in, and there was therefore no lack of hay and why worry over the fate of Timothy and the other foragic apostles? Cronise in his Natural Wealth of California (1868) gives this picture to illustrate the way a botanical providence provided for the California pioneers when they consented to take a hint from the Mexican pre-occupiers:

"When California became first known to Americans the face of the country was nearly everywhere covered with wild oats. Though parched, in the long summer, the grain held firmly in its capsule, giving good pasture. The wild oat has bearded projections with bended joints like the legs of a grasshopper. The first rains limber out the

The Latest About Citrus Scaly Bark.

[Written for Pacific Rural Press by Prof. H. S. Fawcett, Whittier.]

The cause of scaly bark, also known as Psorosis, of orange trees, is as yet not definitely known. Until we have been able to determine the cause of this disease, the treatment will also remain in an unsatisfactory condition. We have been investigating this disease and had hoped before this to be able to find out as definitely as we have for lemon gummosis the cause of the trouble.

First Stage.—The first evidence of the disease is a roughening of the bark over a small area on which the outer bark is broken up into scales and pushed off with formation of a new bark underneath. These areas at first are only a few inches in diameter and do not cause any noticeable effect on the foliage of the tree.

Second Stage.—This cracking and loosening of the outer bark goes on from year to year, usually very slowly, only an inch or so each year, before an area of any importance is formed. It finally, however, entirely surrounds the trunk or limb, and small drops of gum begin to form, especially at the advancing edges of the areas. The disease usually advances to the second stage in which a band or zone of affected bark completely surrounds the trunk or limb before it begins to make any appreciable effect on the growth of the tree.

Third Stage.—In the first and second stage, there is often no particular injury to the wood underneath the bark, except the formation of little pockets or rings of gum. As the disease continues on the tree, however, for five to ten years or more, the third stage is reached, in which the wood underneath shows a dark discoloration which may finally involve a greater portion of the wood directly under the affected areas. During all this time, the new bark tends to form under the old. This new bark is not normal, but is filled with small gum pockets and presents an irregular, roughened exterior.

Treatment.—If the disease is take in the first stage, or when the outer bark only is affected not more than a third the distance around the trunk or large limb, it may be cured by entirely dissecting out the affected bark and treating the area with Bordeaux paste or other good fungicide that is not injurious to the remaining bark. After the edges begin to heal, the exposed wood should be covered with asphalt paint or other good covering.

If the disease has gone to the second stage, or so far that the trunk is entirely encircled, the affected bark cannot be entirely cut off, since this would result in girdling the tree so treated and cause its death. If the wood underneath is not yet discolored, the disease may often be checked, but not always cured, by carefully rubbing off or scraping off the cracked, outer bark without taking off the live cambium underneath, and treating with a fungicide. To cut enough without cutting too deep requires a careful workman. The results that have been obtained in the treatment of the disease at this stage have varied and seem to have depended largely on the care with which the advancing edges were attended to before the application of the fungicide.

Third Stage Hopeless.—If the disease has advanced to the third stage, or so far that the wood underneath is beginning to be discolored and to die, there is, as far as I know, no way of getting rid of the trouble, unless the affected part is pruned out. If the trunk is in the first or second stage of the disease, it may be practical to treat it in accordance with the suggestions above. If it is in the third stage, it will usually be best to look towards finally taking out the tree. Sometimes a severe pruning back of the tree will seem to give it new vigor for a while, but I do not believe it will ever entirely cure a tree, the trunk of which has gotten to the third stage.

Active in Late Spring.—It is well to keep in mind that the scaly bark, or Psorosis, disease is most active, as a rule, in the late spring and summer when the tree is growing rapidly, and that it seems to be inactive in late fall and winter when the tree is more dormant. No matter what treatment you give it, therefore, the disease appears to be cured in the dormant period of late fall and winter, and this often accounts for there being so many reported cures for the trouble. Any remedy that is used must stand the test of a year or a year and a half before definite conclusions can be drawn.

This description of the progress of the disease and suggestions for the treatment, based on the best information we now have regarding the trouble, should be considered as only tentative. We are now carrying on a line of investigations and experiments which we hope will lead, before long, to a better understanding of the disease.

Preventive.—As a preventive measure, it would seem that the orchards subject to this disease should be given frequent tree-to-tree inspections, so that the trouble could be detected in its first stage, when it may be cured. The fungicide we are suggesting for use in the first and second stages of the disease, is Bordeaux paste made as follows:

Dissolve 1 pound bluestone (copper sulphate) in three quarts water in a wooden or earthen vessel. This can best be done by hanging it in a sack at the surface of the water. Slake 2 pounds unslaked lime in about three quarts of water. Stir together when cool, making a light blue mixture the consistency of whitewash. Mix up fresh each day or two as the mixed paste tends to deteriorate. It may be applied with a large brush like whitewash. This may also be used on healthy bark as an additional preventive.

The Durham district, not including the Chico district, produced 370 tons of almonds from 500 acres last year, reports F. L. Martinette. Some 5000 acres there are rapidly coming into bearing and it is estimated that the crop will be 1000 tons in two years and 2000 tons in four years. Considerable sentiment is being worked up there in favor of marketing through the State Exchange.

THE "BOSS" TREE PROTECTOR

Made of Yucca Palm. Is cheap, durable and quickly put on the tree. It prevents rabbits from destroying your trees. A sure protection against frosts, sunburn, grasshoppers, or dry winds. Can be easily removed, will last for years. Send for samples.

Tehachapi Apples and Pears.

[Written for Pacific Rural Press.]

An apple and pear district about isolated from danger of insects nd diseases as the Imperial Valley, Tehachapi Valley and its three anches, known as Bear, Bright's, nd Cummings Valleys.

Standing in Tehachapi, you seem be in a grand basin surrounded lofty old mountains, over which ehachapi peak stands guard, 7800 et high and clothed in white snow om November to May.

For 50 years the 3500-acre basin as been farmed to grain. A few the farmers planted family orhards long ago, of which only pears nd apples have survived in conderable numbers. C. T. McKinnie stimates 200 acres of trees 20 to 0 years old scattered over the four alleys in small lots. Horticultural nspector L. J. Kanstein mentions he 10-acre Kiser orchard 40 years ld, from which 1000 boxes of mixed ngraded, unwrapped, and unsprayed pples were sold last year in Bakerseld at $1.50 per box.

Some 2500 acres of commercial orhards half apples and half pears, ave been planted on the floor and lopes of the valley in the past eight ears, mostly five years old. Only artlett pears and red apples are lanted, with a few sour cherries. ome Beauties, Jonathans, Winesaps, Ganos, and Delicious, in the orer mentioned, are the favorites. bout 125 acres of currants will ruit this year unless frozen.

Nursery stock undergoes drastic nspection which surprises some peole who are accustomed to lax enorcement of the quarantine laws nd consequently get careless about nspection before shipment.

"We have no pests or diseases here ow that worry us," says Mr. Kanstein. "While we dislike to inconvenience the nurserymen, they know the law; and our duty is to keep this valley clean, since we have such a wonderful opportunity.

"We turned down a shipment of 2200 currants and gooseberries day before yesterday because they were badly infested with greedy scale. Wolly aphis, which anyone could see, is holding up 125 apple trees received today. We inspect and handle every tree."

A little pear blight was found last fall by a tree-to-tree inspection in which all of it was cut out and a few old trees pulled out under direction of County Horticultural Commissioner K. S. Knowlton.

Until last year very little damage had been done by frost, though snow is expected until late March. The damage done last year and this suggests the need of cultural methods to delay spring growth or else the usual frost-fighting equipment to be used when danger comes. The late spring cold spells are making people think more of planting on the slopes rather than in the trough of the valley whither the cold air drains.

As the valley was originally a lakebed, and as the surrounding mountains are made of limestone and granite, the soil is a deep mixture of decomposed granite and sediment from weathered limerock. The east end of the valley is more clayey, while Cummings valley near the west end is of looser texture.

Irrigation is necessary for fruit. There are about 25 pumping plants in the district and the Tehachapi Fruit & Land Co. figures the cost of one irrigation at $1 per acre for pumping and distribution, using ¼ inch per acre. Their outfit supplies 1600 acres. Two irrigations and occasionally three are applied. The lift is about 100 feet—more, higher on the slope; less, below. The natural reservoir of snow on Tehachapi peak drains mostly into the valley, but is not much available for summer irrigation.

Most of the growers are taking good care of their orchards according to Mr. Kanstein, old trees receiving renewed attention. They are alive to suggestions for improvement of cultural practices. They believe in maintenance of their present practical immunity from pests and diseases; and they support the horticultural inspector in his determination to allow none of them to be imported.

ALFALFA IN YOUNG TREES.

[Written for Pacific Rural Press.]

It is a great mistake to let alfalfa grow close up to young walnut trees after the third year, thinks W. S. Herring who has a 25-acre orchard 9 years old in the Covina district of Los Angeles county. On ten acres where alfalfa was left four or five years, some of the trees got too dry and were killed, while others suffered.

Yet this soil four years later takes and retains moisture better than any of the rest. Judging from this and from the experience of a neighbor whose orchard was planted a year later, he thinks the neighbor's way was best, and that alfalfa three years is the best thing that can be done for a young orchard, especially where planted on land previously farmed to grain for 30 years as this was.

The neighbor threw up a ridge about two feet from each side of the young tree rows at planting, and sowed alfalfa in the open space.

Thus, the alfalfa and the trees could be irrigated independently. The trees needed water about every three weeks; but if alfalfa had to be watered at the same time, it would interfere with hay cutting.

KILLING REDWOOD SPROUTS

To the Editor: I have read an item in the Press concerning the killing redwood sprouts by F. L. L., Bethany. Let him bore three or four 1½-inch holes pointing downward a foot deep and tamp them full of saltpetre, then plug just above the ground. I have known this to be done in case of Redwood stumps and in killing timber and afterwards burning. The roots burn for months and I have dug out good charcoal from the burned roots.

Oakley. M. F. Lockwood.

Cucumbers grown under 100,000 square feet of glass at Hollywood are selling at $2.25 per dozen, according to Louis Derocher who manages the outfit. He was in Imperial Valley recently looking up the prospects.

USE NATURAL FERTILIZERS --- DON'T ROB THE SOIL.

Put back into the ground at least a portion of the natural elements you take out of it.

California Fruits and How to Grow Them

EDWARD J. WICKSON.

Seventh Edition, Extended and Revised.

Contains over 500 pages of text with many illustrations. Goes thoroughly into every phase of that immense industry, California Fruit Growing.

In the preliminary chapters, the important subjects of Climate and Soils are handled in a masterly manner, with the necessary modifications called for by the immense latitude, the topography of the country and the different regions with their relation to coast, valley and mountain.

The book then goes into the subject of Fruit-Growing from the nursery, on through budding and grafting, preparation for planting; planting, pruning the trees and thinning fruit; cultivation, fertilization and irrigaton right along to picking, canning and preserving, with chapters on injurous insects, tree diseases and the protection of the trees therefrom. Every fruit and nut which can be grown commercially in California or countries possessing a similar climate, has received the attention which the forty years' experience of the author makes of incomparable value to the fruit grower.

Price, $3.00, Postpaid.

Prune and Apricot Growers on Their Way

The mass meeting of prune and apricot growers in San Jose April 14 was an exceptionally alert and interested assembly and notably unanimous in its transactions. Its purpose was to demonstrate to the growers of these fruits that they should be on their way and to show them the way to go.

President J. H. Bone, of the recently organized "Information Bureau," occupied the chair; Secretary G. E. Merrill was demonstrator of the way, as affirmed by the Bureau; Col. Weinstock and James Madison were chief advocates of its adoption as a working plan and about 600 growers constituted the participating body.

In a general way, the purposes and powers of the organization are expected to be as follows:

"To buy, pack and sell dried and green prunes and apricots and other fruits both for its own account and on commission for others; to operate warehouses and packing-houses wherever necessary or expedient in order to store or dispose of green and dried prunes, apricots and other fruits; to purchase, acquire, own, hold, lease and control real and personal property necessary for the transaction of the business of the corporation; to loan money upon and to negotiate loans upon green and dried prunes and apricots and other fruits and to establish domestic and foreign agencies to carry on the general purposes of the corporation."

The association shall agree to pay its members such minimum price per pound for their crop as may be equitable, less a certain percentage to cover the cost of operations; and the association shall further agree to pay, upon the delivery of the crop, such proportion of the agreed minimum price as may be determined upon, making the balance payable by interest-bearing notes. The price actually secured for the prunes in excess of the minimum price per pound, less the cost of operations, shall be remitted to each grower at the end of the fiscal year. Failure of a grower to deliver shall be covered by a definitely fixed penalty, as liquidated damages to the association.

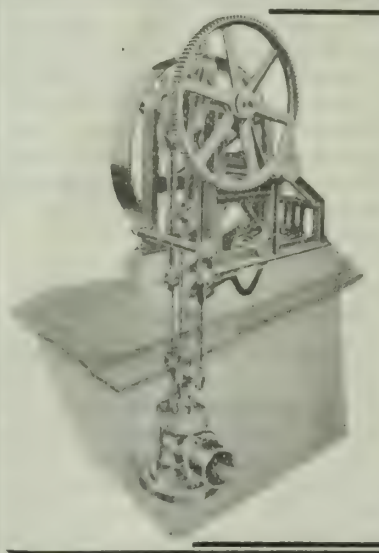
Members of the association are to subscribe for the capital stock at the rate of, perhaps, $10 per acre; ¼ of said amount to be payable at the call of the association, the balance in three annual installments, to be covered by interest-bearing notes of the subscribers, and the payment of such to be annually deducted from crop returns. The members of the association shall receive interest or advances from the association on their paid-up capital. The capital of the association is to be used, as far as possible, in making advances to growers for purposes of cultivation and harvesting. The stock of the corporation will be divided into 25,000 shares of a par value of $100, 10,000 shares of which will be preferred and 15,000 common stock shares.

The agreement which will be put forth to be signed by the growers stipulates that unless subscriptions to the common stock amounting to $750,000 are made by March 1, 1917, and contracts for the sale of at least 75 per cent of the prunes and apricots grown in California for a period of three years, are entered into, then the agreement shall terminate.

California will be divided into seven districts, two members of the board of trustees to be chosen from the growers of each district except the district including Santa Clara county and the neighboring counties, which, on account of its predominance in the industry, will have 12 members on the board. These trustees will be elected by the membership of the different districts voting by mailed ballots. The trustees shall elect seven directors to conduct the association.

The Bureau of Information Ordered to Proceed.—When the exposition of the general plan of organization was complete, a motion was promptly made to adopt it. An amendment was submitted that the State Market Director instead of the Information Bureau should undertake the promotion of the corporation. Col. Weinstock explained that with nearly a dozen groups of producers pressing for organization it was impossible for him to do this. His position is advisory. By his appointment the State did not intend to displace initiative on the part of producers but to assist its development. The motion was withdrawn. Before the vote was taken another amendment was submitted that the mass meeting name fifteen members who should assemble at once as a nominating committee and name three who should undertake the promotion of the new organization. Being put to a vote this amendment was unanimously negatived. It was clearly the purpose of the mass meeting that the Information Committee should proceed to organize the controlling corporation.

The Bureau will undertake this work and without interfering with the function for which it was created, it will give definite details to the plan of organization and submit a complete organic act for the incorporation, a subscription sheet for stock-takers, a pledge for crop-signing and a soliciting force to submit the propositions to individual growers. The conditions which will make these signings forceful on March 1, 1917, have already been stated. Thus the plan goes to those who can give it the breath of life.



WHITE BERRY GROWERS QUIT.

The berry business has gone mostly to the Japanese in Los Angeles county. One of the last white men to give up was Judge T. B. Cannon, whose remarkable work with Crandall blackberries was described in Pacific Rural Press about August, 1913.

"I came here six years ago," said the Judge recently. "The first year, I sold 700 crates of blackberries and Loganberries. I had a little over $400 after all bills were paid. During the last few years I've been making less and less from the berries. Last summer the figures on one shipment of 24½ crates stood like this: Picking, per 30-basket crate, 30 cents; boxes 11 cents per crate; freight 3 cents per crate; commission for selling, 10 per cent of gross sales. This made the picking and marketing of the 24½ crates cost either $12.40 or $12.60. The returns were $10.40. The next 8 crates brought losses at the same rate and I quit shipping. I advertised that anyone could have my berries at 50 cents per crate on the vines, and sold $50 or $60 worth that way.

"This Gardena country is the greatest place for berries in California, but white men can't live and work like the Japanese do. However, they attend to their own business."

Secretary G. E. Harvey of the Pacific Rice Growers' Ass'n says that the crop in hands of growers will be cleaned up by April 26 and advises all holdings to be sold by about that time. The price for paddy is above what the price on cleaned rice justifies, owing to a strong demand from Louisiana. The California mills are buying for the season's needs at the advanced prices. The sales report April 12 shows prices up to $1.92 per cwt. W. H. Gilstrap sold 5,000 bags to the Gridley mill at $2.00.

WORLD'S TRADE IN CALIFORNIA FRUITS.

By George Robertson, State Statistician.

The following is a brief summary of U. S. Exports of cured fruits almost exclusively produced in California, and imports of fruits with which our products are in competition:

	EXPORTS		IMPORTS.	
	Raisins.		Raisins.	
Year	Pounds	Value	Pounds	Value
1913	16,594,394	$1,006,509	3,564,298	$ 288,338
1914	21,688,429	1,485,417	3,873,784	267,329
1915	58,497,249	4,240,068	1,604,803	167,516
	Prunes.		Figs.	
1913	94,344,157	$5,551,208	19,162,494	$ 948,460
1914	35,228,737	2,582,560	20,506,563	968,448
1915	50,775,637	3,592,541	8,327,870	390,327
	Apricots, dried.		Olives.	
1913	21,325,523	$2,308,779	3,517,899	$1,589,090
1914	16,541,222	1,598,405	5,743,130	2,528,390
1915	25,747,600	2,323,001	3,713,315	1,551,152
	Peaches, dried.		Olive Oil (edible)	
1913	5,152,147	$ 341,215	5,179,209	$6,776,842
1914	7,387,161	458,983	6,780,936	8,421,499
1915	18,720,272	1,120,534	6,368,872	8,105,834

Exports of figs, olives and olive oil being small, are not shown separately in the custom returns, but included in "all others." Imports of prunes, dried apricots and peaches are not given.

Most of the edible olive oil comes from Italy, the quantity in 1915 being 4,654,761 gallons, France, 803,674 gallons, and other countries, 910,437 gallons. The value of imported olive oil for manufacturing purposes is $438,628 for 1915.

Of dried fruits in 1915 the bulk went to the United Kingdom. Of apricots 7,000,000 pounds went to the United Kingdom, 2,900,000 pounds to France, 2,000,000 pounds to the Netherlands and the balance to other countries.

Of prunes, in 1915, 15,000,000 pounds went to the United Kingdom, 10,000,000 pounds to Canada, 1,800,000 pounds to France and 18,000,000 pounds to other European countries.

STATE-WIDE OLIVE GROWERS' MEETING.

[Written for Pacific Rural Press.]

An all-day meeting of ripe olive growers is called for 10 a. m. April 24, at the assembly room, Sheldon Building, 461 Market St., San Francisco, by the Cal. Ripe Olive Ass'n. It will be a meeting of directors and representatives from the local associations and all olive growers are urged to attend. Market Director Weinstock will address the growers at 2 p. m. It cannot be a complete growers' organization unless growers come and ask all the questions they want to, and get acquainted with the State Association whose object is to work out state-wide standards for olive packing and to market the standardized goods.

In olive districts, where no associations are yet formed, it is urged that growers have a meeting and appoint delegates with power to act on important matters. The membership fee of $10 is suspended and may be changed, along with other provisions of the by-laws.

CALIFORNIA CURED FRUIT EXCHANGE DOING BUSINESS.

[Written for Pacific Rural Press.]

The Cal. Cured Fruit Exchange, whose cashier was recently jailed, held a meeting of directors and representatives from locals of the Exchange, April 11. All directors and all but one representative were present. Their recent financial difficulties caused by what is charged as criminal defaulting of the cashier, were investigated, the special auditor's report considered, and satisfactory arrangements made to carry on the business to close the 1915 crop. The attachments made by the late cashier on the fruit still held by the Exchange, have all been lifted.

Greatest harmony prevailed and the new Secretary-Cashier, W. J. Hill, is working in perfect accord with President A. E. Ogden. Mr. Hill is a fruit grower and has been president of the Shasta county Fruit Ass'n. since it was organized. He was one of the directors of the State Exchange from its organization until the late cashier succeeded in removing him last spring, when the defalcations are charged to have begun.

WINTER TOMATOES.

[Written for Pacific Rural Press.]

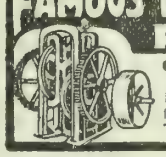
Sixty acres of tomatoes on North Whittier Heights supplied the Los Angeles and Pasadena markets until mid-January, long after most other districts had dropped out. These were grown among young orchard trees.

Among the growers is G. C. Smith, who planted four acres among lemon trees about Oct. 1, 1915. A crop of White Rose potatoes had already netted him $200 from this same piece in the summer of 1915 after all shipping expenses were paid.

Two rows of tomatoes were planted six feet apart in each center, and furrow irrigated once right after planting. They were cultivated and allowed to run flat on the ground.

The one light frost did not greatly injure the vines, but heavy rains in January stopped shipment on account of rot.

Elevators to handle grain in bulk to save the expense of sacks and sacking are being proposed pretty generally over the State. J. W. Jennings of the Ramina Ranch, Tehachapi, put one into very satisfactory operation for last year's crop. The Sacramento Valley Development Ass'n heard exhaustive reports on all phases of the subject April 15. Prof. B. H. Crocheron of the University has made a thorough investigation of doing away with grain sacks; and reports that the only hindrance is a lack of elevators such as dot the prairies of the Middle West.



Late sown grain in Sacramento Valley needs a rain. Some of it is not yet sprouted. Half the usual crop is expected.

The Uniqueness of California Hay.

(Continued from page 507.)

joints which, being again dried by the sun, shrink, causing the berry to jump about giving it wide distribution over the land—and falling into cracks in the soil is preserved in these natural receptacles from birds, squirrels and other animals."

And if hay could be made of wild oats which the Lord had endowed with such particular ability to hold on from year to year without perennial roots, why not sow barley and wheat to cut for hay when continued haying of wild oats took away the seed and reduced the yield too low? Evidently it was proper enough to help the Lord and one's self by sowing grain for hay and so the question of how to get hay in California was settled, and remained settled for a long time, and is now only disturbed by the growing greatness of alfalfa. And yet there were for a long time some twinges of the agricultural conscience. It seemed so unnatural a thing to cut in its youth a plant which seemed destined to hold aloof the golden grain. And did it hold to reason that such an immature thing could be fully nutritious and satisfying to the stock? Was it not something like serving a veal chop to a man with a mouth watering for a tenderloin steak? Men who had a chance to see their animals performing on such a diet soon lost their doubts of the desirability of grain hay, but the quidnuncs who specify army supplies were different. It required nearly half a century to convince these wise men that grain hay was good enough for a government mule!

The steps of hay development and the increase since the census crop of 1909 are shown in this way:

	Tons	Acres.
1850	2,038	.....
1860	305,655	.....
1870	551,773	.....
1880	1,045,119	758,024
1890	2,218,285	1,431,574
1900	3,035,266	1,431,574
1910	4,327,130	2,533,347
1914	5,265,000	2,700,000

What Our Hay Is Now Made of.—Before saying more of kinds of hay it will be well to note what our present considerable hay product is made of. The following classification of kinds, production and value is from the U. S. Census of 1910:

Hay Plants	Tons	Value
Timothy	20,001	$ 185,579
Timothy & Clover	73,183	629,575
Clover	20,380	212,289
Alfalfa 1,639,707		13,088,530
Millets	2,688	27,483
Other tame grasses	119,415	1,253,428
Wild grasses	281,033	2,028,494
Grains cut green..2,019,526		24,056,727
Coarse forage	60,611	438,095
Root forage	90,586	266,015
Totals 4,327,130		$42,187,215

One cannot be quite sure of the accuracy of this classification, because the schedule is the same as used in all parts of the country and enumerators may have had to throw figures somewhat to get them in. The product of "Timothy and clover" and of "other tame grasses" seems too large and "coarse forage" is too small to include fresh-fed and siloed corn and sorghum, bean straw, etc. The chiefly interesting thing in the table is the relative standing of hay from alfalfa and from "grains cut green" and their total compared with the total product, of which it is, roughly, five-sixths—which shows that the pioneers were strictly "agin nature" when they dreamed of installing eastern hay-meadows in California. For even the spread of irrigation has given us little more to speak of of humid region grasses—except in suburban lawns: Irrigation has simply magnified alfalfa, a plant as strange to the early easterners when it was brought from Chile in 1851 as was any plant they found growing here. It is now in a winning race against "grains cut green," for they are in the last decade of their leadership probably.

The Hard Row of Alfalfa Hay.—Without going into a discussion of the relative nutritive value and availability of these two hays for feeding purposes (a matter which belongs of right to the specialists on nutrition and feeding practice) a few things may be said about their standing in the public mind which has affected commercial value at different times. The present popularity and wide use of alfalfa hay is in sharp contrast to its disfavor thirty or forty years ago. During the latter seventies the writer remembers the arrival in San Francisco of a committee of dairymen from the Sacramento river region sent down to overcome the discrimination against their butter by city receivers who charged that its ill flavor made it impossible to sell it at anything like the price of coast butter and intimated that the cream must be "doped" in some way. As that was the time of the first wave of anger against bogus butter the intimation became, by inference, rather specific—especially as some city people claimed that they had seen casks of too fragrant oil going up the river to the dairy districts. This committee proved that they were feeding nothing but alfalfa and alfalfa hay and succeeded in shifting the indictment from themselves to the plant. The trouble was corrected by changes in feeding materials and methods and in handling the milk and cream and was no longer heard of. During the decade following 1880 there was great trouble over bad butter in the then new alfalfa district around Fresno. "Country butter" was declared too bad for good axle-grease and "city butter," sent through San Francisco from the coast dairy districts, was declared to be indispensable to good house-keeping. Here again alfalfa and alfalfa hay came under indictment which endured for a time, until the large, well-equipped creameries were opened to the alfalfa districts and began their conflict with the coast establishments for standing both in quantity and quality of product—and thus the prejudice against interior valley butter faded away.

Then alfalfa hay for horses came under indictment and city teamsters would not use it. Not only did it make the horses washy and prone to undue perspiration, but the public objected to have the pavements splotched and sprayed with ill-smelling green paint instead of being dotted with neat round balls, which long familiarity had rendered inoffensive. But though alfalfa hay can be advisedly used in a proper way even for horses at hard-hauling in the city streets, its unwise use has created a lasting prejudice against it—which it is hard for horse feeders in the alfalfa districts to consider reasonable because they rely upon it largely for their country work horses. However, as city motors are now so largely fed on gasoline the city hay supply is a diminishing quantity, both in use and in public interest. On the whole, alfalfa hay may be said to have made good for all purposes, to a degree far beyond early expectations.

Unique Popularity of Grain Hay.—The fact has been noted that the only enduring opposition to hay made from "grains cut green" was put up by the supply experts of the U. S. Army, and this existed until very recently. When the Spanish war and the occupation of the Philippines made it necessary to ship hay across the Pacific it took some effort by our congressmen to get Pacific Coast contractors a chance to file bids and longer still to admit the "grains cut green" to the place occupied by the sainted Timothy on the army schedules and we understand that oat and even barley hay are now admissible to the government mule menu. We mention this fact to emphasize the contrast between the conservatism of the army and the ready acceptance of grain hay by the California pioneers. They saw what the Mexicans did with horses and the "grain cut green" which they used for hay and had no doubt of their quality. But the more specific demonstration came later when the race-horse magnates put a test on the "efficiency" of California grain hay and stopped at no expenditure to secure the advantage of it. Joseph Cairn Simpson, who was probably the greatest equine-philosopher of the last century, was firmly convinced that the supremacy of California horses, which was so clearly demonstrated a few decades ago, was due in good part to the climate and the feed, and he used to like to point to the practice of expert horse men as supporting his contention. In one of a series of articles for the Sunset Magazine in 1901 Mr. Simpson gave these facts:

"A test between Timothy hay imported from Oregon and wheat hay of California resulted in a decided preference for the latter. That estimate has been endorsed by many trainers from the east. Hickok, Marvin, Goldsmith and Salisbury, after one trip east with trotters, when eastern hay had to be used, became so well satisfied of the superiority of California hay that in subsequent eastern trips they took a season's supply with them. There were differences of opinion as to which kind was best: wheat, oats, wheat and oats, and wild oats each had its advocates. The crowning testimony of its excellence was when

The Fallacy of Paraffine base: Eastern oil manufacturers have long extolled the superior virtues of paraffine-base motor oils But Pacific Coast motorists have proved that Zerolene, made from selected California crude *asphalt-base*, gave best results Their experience is now supported by the testimony of international experts. Lieut Bryan stated before the Am Soc. of Naval Engineers: "Oils made from the asphalt-base crudes have shown themselves better adapted to motor cylinders, as far as their carbon-forming proclivities are concerned, than are paraffine-base Pennsylvania oils." Zerolene received highest competitive awards San Francisco and San Diego Expositions. Dealers everywhere and at service stations and agencies of the Standard Oil Company.

dward Corrigan, known all over the nited States as one of the most uccessful managers and trainers of ace horses (which achieved many otable victories on every prominent ace course from San Francisco to ew York and from Chicago to New rleans) shipped a detachment of is horses from California to Eng- nd. Accompanying the horses ent several carloads of California ay—enough to last his large stable or a year. This was because his orses did not do as well in distant arts as they did when trained in alifornia, and this he could only scribe to the superiority of the hay, s all the other conditions in distant arts were favorable."

And farther comment seems unecessary to establish the quality of alifornia "grains cut green" for ay. These famous horsemen staked illions on it, before Uncle Sam ared officially spend a few thouands for it as meals for his mules!

A Bogus Timothy.—But though he recognition of value in "grains ut green" came early and with such mphasis as the above quotation rom Simpson shows, there was still longing for hay-meadows and for true grasses" instead of grasses ommonly called "grains." When he old eastern Timothy failed it was oped that a new Timothy might be ound. With much delight, therefore, the committee on awards at the State Fair of 1857 "called attention to a fine sample of California Timothy, grown on the farm of M. Williams, San Joaquin county, with heads large, heavy and plump and stalks sweet: full evidence that the grasses indigenous to the country have only to be noticed and cared for to fill a want in California agriculture becoming each year more imperative." Contemporary writers do not support this claim that hay grasses were increasingly called for. Pasture grasses of summer verdure were and the committee probably jumbled the two—but that is another story. The fact is that this "California Timothy" deserved neither the praise nor the prophecy based upon it. For, as Dr. H. M. Hall of the University kindly advises us, the reference is to Phalaris angusta, of which Thurber, in the Botany of California (1880), says: "Its better name is canary grass and it has some resemblance to a coarse, large-headed Timothy."

And yet wild grasses are of some hay value in California, of course, particularly on low, wet lands where they do make a coarse turf. But, as our table of kinds of hay shows, the area of such grasses is only one-tenth of the area or one-twentieth of the value of the total hay production. They do sometimes serve a very good purpose. Cronise wrote in 1868:

"Natural meadows of great extent are found interspersed among the watery tule lands. The grass is heavy, wiry, coarse and of inferior nutriment, but at times it is of priceless value. The year 1864 was one of famine to cattle; the rains were scant and the natural feeding grounds barren. Some enterprising men cut 50,000 tons of this coarse grass—saving a large number of cattle and yielding great profit to the adventurers."

These low lands serve a similar purpose whenever there is a very dry year and in 1898 cattle were driven and hauled even from the south coast district to the tule lands to save their lives—but that is largely a grazing proposition and out of place here.

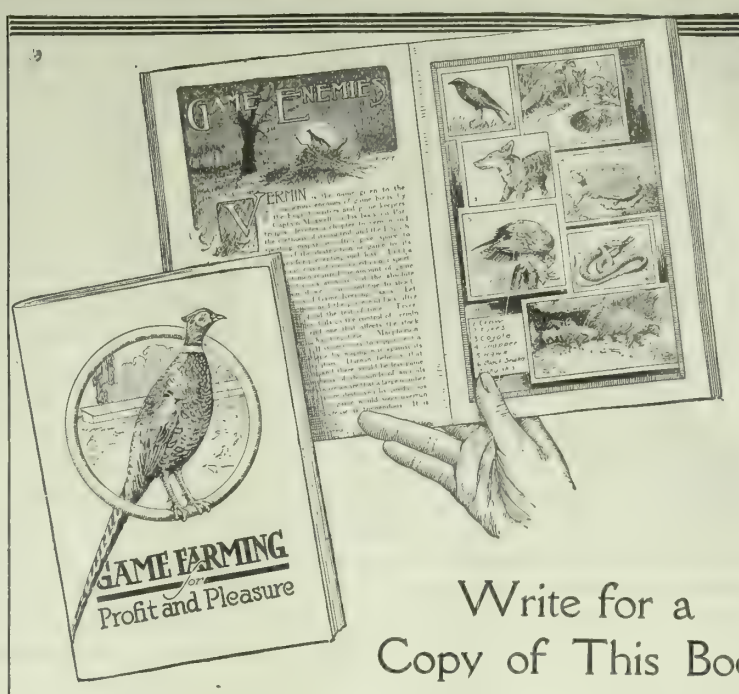
More Anon.—But space limitations compel us to make hay of this article by cutting it between the milk and the dough. We have room neither to complete our "observations" nor to set forth the great moral and agricultural lessons which they justify; so we shall expect to finish at another time. And even that is a reflection of California hay conditions: if you fail to cut and cure all your hay horizontally, it will cure itself standing up!

HAY-MAKING WITH LITTLE SUNSHINE.

Notwithestanding the old saying, "Make hay while the sun shines," the best quality of hay would result if the hay could be cured without the sunshine, according to Professor J. E. Larsen of the Oregon Agricultural College. "It is easy to overdo the sunshine business, and the best green hay product is often ruined by too much sunshine in the curing. The quality of the hay depends very much upon the making, the best quality undergoing a certain degree of fermentation. Extreme light and sunshine prevent this and also destroy the natural green color, which should be kept in the cured hay as largely as possible. Good color and good quality are closely associated. Hay, especially grain and vetch, allowed to lie in small bunches until completely burned out, is low in value. It looks about like excelsior and is worth about as much for feed."

NATURAL RE-SEEDING OF COVER CROPS.

[Written for Pacific Rural Press.]



Leaving the middle of every other row in the orchard uncultivated during the entire spring and summer seasons, in order to allow the growing and reseeding of green forage crops is being practiced by some of the fruit growers in the Newcastle district of Placer county.

In order to irrigate, a strip five feet wide is plowed on each side, close to the trees. The water is run in furrows made in this strip of plowed ground. The following year the strip left unplowed is handled in the same manner.

The advantages of this system, as claimed by those following it, are: that the green crop is much larger than ordinarily obtained; that it insures the reseeding of that crop and that it prevents erosion on the hill side by heavy rains.

Mr. Jerilson of Newcastle, the originator of this system, has been following it for the last seven years. Several other fruit growers in the district have also taken it up and claim that a difference is noted in the health of the trees and as a result larger crops are being harvested.

A lime experiment on peas by Ernest Peters of the Carneros Farm Center shows that the liberal application increased growth over the plot receiving a light application, which in turn beat the plot having no lime added at all, according to Farm Adviser H. J. Baade of Napa.

Write for a Copy of This Book

AS a practical farmer you are interested in any subject which has to do with increasing the productiveness of your farm. For this reason we ask you to write for a copy of "Game Farming for Profit and Pleasure." You will find that this book contains a mine of information that will be both of interest and value to you.

"Game Farming for Profit and Pleasure" is a carefully edited and profusely illustrated manual on the breeding of game birds. It describes in detail the habits, foods and enemies of wild turkeys, pheasants, grouse, quail, wild ducks, and related species. It tells of the best methods for rearing. It discusses the questions of marketing and hunting.

Game Farming Pays Well

The breeding of game birds should prove profitable to you from many standpoints. The demand for birds is much greater than the supply both from city markets and from those who wish to raise game. There is also a continuous call for eggs by breeders.

Pheasants, wild turkeys, quail, grouse, etc., are valuable as destroyers of insect pests and weed seeds. Furthermore the birds you raise will afford you good sport in hunting, and also food for your table. If you own large acreage, or can control it by combining and co-operating with your neighbor you may lease the privilege of shooting birds produced through your investment of money and labor. You may be able to get a sportsmen's club to furnish the money for stock and pay you for the birds raised.

The breeding of game birds either for the market or for sport is more profitable in many ways than the raising of domestic poultry. It is always far more interesting.

Write today for the book, "Game Farming for Profit and Pleasure." It will be sent without cost to you. Use the coupon below.

California Weather Record.

The following rainfall and temperature record is furnished the PACIFIC RURAL PRESS by the United States Department of Agriculture Weather Bureau, at San Francisco, for the week ending at 5 p. m., April 18, 1916.

STATIONS	Rainfall Data: Past Week	Seasonal To Date	Normal To Date	Temperature Data: Max'm	Min'm
Eureka	.84	36.93	41.15	60	40
Red Bluff	.02	19.73	22.57	84	44
Sacramento	0	18.16	18.28	80	42
San Francisco	0	27.05	20.77	78	46
San Jose	0	16.30	15.63	80	36
Fresno	0	11.73	8.52	78	42
Independence	.20	10.32	8.43	78	—
San Luis Obispo	0	26.85	8.65	76	38
Los Angeles	0	19.89	14.79	72	48
San Diego	.01	12.54	9.32	70	50

THE WEEK

THE most conspicuous event of the week is certainly the mass meeting of prune and apricot growers and the forward march toward a growers' selling organization of which the general direction is sketched elsewhere in this issue. Two things were conspicuous in the transactions of that popular assembly: first, that a selling organization be undertaken; second, that the Information Bureau, established by the mass meeting of January 19, undertake the initiative in determining whether the selling organization can be realized or not. As this fact will be determined by the attitude of the growers on March 1, 1917, it is evident that the Bureau is expected to maintain promotive effort for nearly a year. Some growers have communicated to us an apprehension that the Bureau, which they thoroughly approve, and for the outlay of which they have enthusiastically contributed, may neglect or decrease the effort for timely and exact trade information, which will help each grower to do his own selling while they are working for the more potent and complete organization, which, perhaps, they are not yet convinced should be undertaken at this time. They are also apprehensive lest the funds which they contribute for information be expended for promotion. In the nature of things we cannot give any guaranty that such apprehensions are unnecessary because we have neither voice nor influence in the conduct of the Information Bureau, but we can perhaps administer this sort of assurance: first, that we have faith that men of standing and acuteness like those composing the Central Committee of the Information Bureau will not be diverted from the main purpose entrusted to them, viz.: to ransack the universe for facts which will affect the wise marketing of the crop of 1916; second, there are, among these men, those who are so staunch and conservative that they can always distinguish between direct sunlight and a rainbow, and will never agree that funds given for a present purpose shall be expended for a prospect, be it never so bright and promising. This is, of course, a matter of great importance, because if the Bureau dims the victory which we expect it to attain in its own line this year, it will thereby lessen the chances of growers signing up for the greater effort of 1917. From this point of view the Bureau now holds not only the chance of its own achievement, but the erection of the superstructure for which its achievement would be the foundation. For this reason it does not seem to us necessary to apprehend that the Bureau will relax its primary purpose, nor that it will divert funds from that purpose. Promoting the future organization will make the officers of the Bureau work harder and longer, but that, we believe, they are willing to do for the good of the industry which trusts and honors them. As for the funds to be expended, we have no doubt they will be separately provided by patriotic people and institutions, just as they have been most recently for the promotive work of the peach-growers' organization. Our advice to enquiring friends therefore would be :trust the men of the Information Bureau to do their work right loyally, and do not think they will be false to their little old sweetheart because their duty calls them to kiss the hand of a queen.

AMONG THE FUNDAMENTALS.

WE ARE excavating toward the economic and historic foundations of California's "general agriculture" this week, as we previously declared it to be our intention to do. Professor Gilmore leads us down into the subterranean chambers of agricultural policy that we may see the need of making our policies align with the requirements of soil productivity and crop success. The underlying ideas and demonstrative facts which Professor Gilmore sets forth are of course primarily suggestive of what every individual owner of land should consider for his own greater reward, but beyond that they cast illuminating glances upon California agriculture as a whole. Because, though there is most direct suggestion of policy with annual crops as they succeed each other, there is also in rational rotation on annually cropped lands, most direct connection with the maintenance of fertility on lands which may be held for decades without change in surface vegetation. Rotation sequence, diversification, the golden tread of the stock, the trenching and aeroplaning of the legumes, yes, even the shattering dynamite and the gas-bombs of fertilization—all these have a bearing not alone upon common staple food crops, but upon the most elegant and unique products for which we bring back to California the gold, which from more than half a century ago until this day, California is sending abroad throughout the world. Let no reader think for a moment that a rational general agriculture for California has only to do with things common to the earth all over the world, for upon it rests the future of the things in which we take so much pride because they are characteristic and different.

We set beside Professor Gilmore's philosophic dissertation a gossipy sketch of our own on the subject of hay in California, because, of all crops gathered and marketed in natural form, hay is nearest to the soil most fundamental in its relation to the power which gives industrial service to our more highly developed products. Of course, from the point of view of agriculture, it is regrettable that a product from the firmament under the earth should be largely displacing hay, because gasoline makes no manure, feeds no higher crops, and therefore serves no rotations, save those of trucking, tractoring and joy riding. And yet our hay product is very important and twice in value the gold output of the State. Besides, this product is so unique in its source and characters that knowledge of its origin, its humanistic relations, and its distinctive qualities, as popularly demonstrated, must be important—particularly to younger or newer comers who are apt not to know the pathways by which present things were attained.

IRISH STEW FOR MUNITIONS.

WE WERE quite puzzled the other day over the receipt of an inquiry from a canner in Wisconsin asking that we send immediate information as to whether "a large quantity of carrots could be bought in California," and "what part of the State carrots were largely grown, either for feeding live stock or for other purpose." We had to answer that we did not know of any large supply left from last year's crop and that, though carrots are grown in many parts of the State in moderate amount, we did not know of any particular carrot-belt—but we had that carrot in our neck for several days, wondering about it. On Friday last there came in the press dispatches one from Eau Claire, Wisconsin, stating that the cannery in that town was "being remodeled to turn out twenty-six million quarts of good old Irish stew, at the rate of half a million cans a week, for the Canadian soldiers on the European fronts." "The contract was awarded by the Canadian government, and it was expected that the first half-million cans would be ready by the middle of May to go abroad via Halifax. But that is not all of it, for Irish stew seems to be a great munition, and the Wisconsin canners have only one end of the contract. It is announced from Seattle that all the available onions and carrots in Western Washington had been shipped to the canning plant at Ladner, B. C., and that 8,500 tons from Oregon and California had gone to Ladner. Under the circumstances we presume we shall soon be short on hold-over carrots; but that one contract, at the rate of half a million cans a week, will take a year to fill, and it might not be a bad idea for Californians, who will have new onions and carrots ready before any one else can, to see how badly the Eau Claire cannery wants them. It may be that old-fashioned, yellow French carrots may be required, but, under the circumstances, White Belgians ought to be accepted without question.

WHAT TO DO WITH THE OLD WORLD?

IF WE understand aright all the financial figures which are now afloat, it really seems that we should frame some reasonable conclusion as to what we should do with the "old world" when we get it. It looks as though we might have to foreclose our mortgage, and a mortgagee is always credited with prophetic figuring as to what he should do with your property when he gets it. Have we loaned all the money we should to those riotous, wasteful

wners across the Atlantic, or should we give hem more to hasten the reversion of the prop- rty to us? They are not treating us as benefi- ent and benign capitalists ought to be treated. They are nosing their thumb-ends and wiggling heir fingers at us. They are making us empty f carrots and full of prunes. They are mock- ng at us in all the ways they can think of, and et we are making them continually able to in- dulge in their destructive prodigality at home nd their insolence abroad. Should we not foreclose on the property and run them off the world? This question adheres to the report of new French loan of two hundred million, which raises another question as to how long his country can continue to finance Europe. Comptroller of the Treasury Williams says: "The surplus reserve held by national banks would give a further loaning power of three o four billion dollars. Despite loans of sev- ral hundred millions, there is no sign of dverse effect, for the banks of this coun- ry were never stronger." He says farther hat the mere increase in reserves of national banks during the last year exceeds the total resources of the Bank of England, the Bank of France, the Bank of Russia, the Reichbank of Berlin, the Bank of The Netherlands, the Bank of Switzerland, and the Bank of Japan. And this seems to mean that our national banks have gained, over and above their normal re- serves, $3,000,000,000, which is more than the aggregate resources of the great banks of Europe on which exact figures are obtainable, and this country holds the balance of power. We have to confess that we do not know ex- actly what these immense figures mean, but timid people, who are shivering over the fear that after the present war each of the belliger- erents will proceed to invade the United States, either abreast or in tandem, should re- member that they would have to borrow more money from us to pay their fare!

"HER BREATH CAME IN SHORT PANTS."

WE ARE probably quoting from the text of some long-forgotten novel in which this memorable passage welcomes the hero who has arrived along the ridge just in time to balk the villain who is trying to throw the heroine over the cliff into the boiling brine. We have always refused to accept the words as merely descriptive. We have felt that they concealed some portentous prophecy. We thought we saw the fulfillment of it over forty years ago when Dr. Mary Walker was facing a crowd of persecutors in her characteristic garb on Washington street. We are now convinced that Doctor Mary was only an omen, and that the principle of women's right in personal adornment, for which she contended, has but just reached its great victory, and the idea of a woman's capable defense against ruffianism is still dominant. We read in a Washington dispatch that Mrs. J. Hungerford Millbank, head of the "American Women's League for Self-Defence," which has been holding weekly drills all winter, recently asserted that the clothing worn by women was not suited for self-defense. Others denounced dresses as a "curse and burden" to women. "When your husbands go to the front," said one speaker, "you will have to guard your home against marauders. It will be man's work and you cannot do it in dresses." The question came then on the adoption of a proper costume for endangered women and the vote for trousers was carried by an overwhelming majority. This decision will be hailed as reasonable by many California farming women, who have already acted on their own experience that to do a man's work one must have the freedom of man-like clothing. The report from Washington, however, does have one feminine touch, for one of the speakers "objected to trousers on the ground that such a uniform would be opposed by husbands." But that apprehension does not seem to us well placed. Current fashions make it impossible for a man to tell whether a lady is encased in a skirt or in pantaloons. It is the psychological moment to make reforms, for a man cannot detect the necessary changes and will not growl about it.

Queries and Replies.

Querists must give name and address.

Sour-Sap in Apricots.

To the Editor: Among our apricots planted last year, a considerable number failed to start this season. All did exceptionally last season and those which started are doing remarkably well now. We are told that the cause of the trees failing is "sour sap." Will you enlighten us on causes and methods of control?—N. L. C., Nuevo.

We have frequently discussed this trouble, but perhaps newer subscribers may like a re-statement. Sour sap results from interference with normal circulation and induces fermentation of the cell contents and injures or destroys the tissue. The most frequent cause is the rotting of the root hairs by water standing in the soil. If this condition is partial or transient, the tree may lose part of the top-growth by die-back and recover vigor by the restoration of normal root function. If the injury is greater, it may kill the tree outright. There is no treatment except cutting back the top, which may lessen the burden on the roots until they recover sufficiently to push out good new growth. The preventive is under-drainage to rid the soil of surplus water or, rather, to prevent its accumulation. Another preventive is to have apricots on myrobolan which is able to survive considerable soil saturation. The reason why some trees are injured and others not is because the safe trees are in places naturally free from standing water. This of course does not mean water standing on the surface, but in the soil. Soggy places will cause the trouble whether on hillside or on flat land.

Young Trees Not Fruiting.

To the Editor: We have in our garden a couple of fig trees—a Brown Turkey and a Black Mission. The trees are four years old and have borne very few figs. The figs on the Brown Turkey set but have never matured. The black fig has matured a very few. We have also several strawberry guavas four years old. They are large, healthy shrubs and blossom profusely, but only two have borne and those very little. Can you suggest the cause? —Suburban, Los Angeles.

If your trees have a healthy aspect, clean large leaves and good new wood-growth, the probability is that they will fruit better as they get older. The stronger the growth of a young tree the less likely it is to hold on to its fruit, because its vegetative activity is too great. If you increase this activity by too generous fertilizing and watering you are not helping the plant to fruit but you are postponing the fruiting. If so, stop fertilizing and use less water and do not prune at all. If you help a plant to realize that its mission is not riotous living, it will give you more fruit. An old tree usually makes better use of generous treatment than a young one.

Oil and Gasoline Under Oak.

To the Editor: I am worried about one of my fine oak trees. I have discovered that gasoline and oils have been dripping from tanks kept under the tree, and I fear this has been going on for a long time. My attention has just been attracted to the condition, and I am wondering whether I could apply anything to the soil that would have a tendency to overcome the injurious effects that might be produced by the oils. I cannot guess as to the quantity of oil that has been absorbed by the soil; it may be that the quantity is negligible but on the other hand the dripping may have been considerable.—Suburban, Santa Clara.

We should first prospect the situation by digging to ascertain by feel and smell whether any considerable amount of soil had been saturated—removing all such as far as feasible without too much interference with roots, and refill with clean earth. You probably will not find any considerable amount, for heavy oil spreads very slowly and getting out all you can this way would probably head off injury. If you do find earth which should be removed treat the excavation freely with wood ashes and water before filling with fresh earth. This will saponify whatever oil it catches up with Whatever may be present could be disposed of by digging up and exposing the soil to the air. Unless the tree shows signs of sickness we would not be apprehensive of trouble.

As for the gasoline, although it is very destructive of roots, its tendency to vaporization will limit its extent and duration of injury. and tend to render it inocuous.

Spring-Sowing of Alfalfa.

To the Editor: I have red loam with a little red clay or adobe mixed with it. Is it too late this year to plant alfalfa and would it be advisable to plant a light crop of oats or barley with the alfalfa? I irrigate from wells.—F. H., East Nicolaus.

It depends upon the land and what shape it is now in. If it is low, moist land, it could be surface worked now and a good catch might result if we have some late showers to bring up the seed. If it is upland, plowed last fall or winter and harrowed after plowing, there might be moisture high enough to hold a good stand with late showers until the plant is high enough to irrigate to advantage. If it is plain land not yet broken and dried out badly by this long dry spell, it would be too late to begin now to get it into shape. In any case do not sow any grain with the alfalfa seed: it would only help to dry it out.

Peach Moth on Almond.

To the Editor: I send you almond buds which have some little worms in them. Kindly tell me what they are and what to spray with to kill them and also when to spray.—G. W. S., Brentwood.

They are the larvae of the "peach moth." They work in the buds and new growth twigs causing them to die. Later they tackle the fruit. They are killed by spraying with winter-strength lime-sulphur, just as the buds are beginning to swell, for the worms are then coming out of burrows in rough bark. If this spraying is well done the killing is large enough to make summer treatment unnecessary.

Rotation; Driving-Wheel of Prosperity.

(Continued from page 505.)

	Bushels	Rainfall inches
1908	48	13.5
1909	37	23
1910	22	11
1911	11	23
1912	9	9.5
1913	4	9
1914	11	29

It will thus be noted that the yield has gradually diminished irrespective of the rainfall except for the two dry years of 1912 and 1913.

The classic experiments of continuous cropping at the Rothamsted Station in England and covering a period of more than sixty years, yielded these results:

	Wheat alone per acre (bus.)	Wheat with manure per acre (bus.)
1844-53	15.89	27.11
1854-63	16.66	37.40
1864-73	12.88	35.20
1874-83	10.45	29.73
1884-93	12.15	38.66
1894-03	12.27	39.53

From these results and from my experiences in travel and study in other countries it is pertinent to state that permanent and consequently profitable agriculture cannot be maintained by continuous cropping when nothing is returned to the land. It behooves all who are interested in the welfare of agriculture and the State to see to it that the lands are not ruined before steps are taken to maintain their fertility.

Available Crops for Rotations.—California agriculture suffers to a certain extent because of the relatively small number of crops that will do well during the summer months. The climatic conditions especially as related to moisture supply, are such that the latter part of the summer finds the country barren of crops except where irrigation water is available. The summer crops that do best, therefore, are those of short growing period that can be planted early and that will mature a crop before the moisture supply is exhausted. Three very promising crops that have these characteristics and which find a place in our farm economy at the present time, are beans, Sudan grass, and the grain sorghums. The value of these crops is being more fully recognized from year to year, for California is rapidly striding towards leadership in bean and sorghum grain production.

Among the varieties of beans that are especially well adapted to the summer growing conditions of San Joaquin Valley, are the blackeye, pinks, and red Mexicans. The teparies are well adapted, but they are not of the best quality.

Among the grain sorghums that are suitable may be mentioned dwarf milo, feterita, brown durra, and shallu. All of these are short season crops and if well cultivated should leave the soil in good condition.

Other crops that lend themselves to rotations according to uses and adaptations are alfalfa, cotton, corn, sugar beets, potatoes, Sudan grass, small grains, flax, buckwheat, sunflowers, and hemp. It is worthy of note that all of these have not only a money value in their production, but aid in general agriculture, rendering communities more permanently established as well as prosperous.

Importance of Organic Matter.—Organic matter is the heart of the land; without it the land becomes dead. It fluctuates widely in both temperature and moisture relations and becomes gritty and of impossible physical condition. An optimum amount of organic matter in the soil results in a soil of good tilth, of good moisture-holding capacity, and there is usually an available supply of plant foods for reasonable crops.

While it is evident that organic matter is important, yet under our climatic and soil conditions the maintaining of a suitable supply is not easy; and with diminishing yields, whatever means may be adopted may not prove profitable. In many parts of the interior valley where biennial cropping is necessary it is difficult to secure sufficient moisture in the soil to rot the stubble and straw that is grown upon it. Consequently, the practice of burning straw is so largely followed on the grain lands. While this practice is conducive to profitable crops for a while, yet in time it must stop, for under it the soils are gradually losing their supply of organic matter and are consequently diminishing in yields.

A few years ago some experiments in grain production were conducted at Ceres, Stanislaus county, in the course of which the influence of organic matter on wheat yields was demonstrated over a period of two years that both the kind and quantity of organic matter had a decided influence on the yield of wheat. In the last six entries the crops were plowed under and not harvested as crops:

Crop or Treatment	Bu. per Acre.
Wheat after wheat	32.7
Wheat after fallow	41.6
Wheat after horsebeans	43.1
Wheat after field peas	43.3
Wheat after wheat	38.6
Wheat after horsebeans	42.3
Wheat after rye and vetch	44.4
Wheat after burr clover	48.2

Storage of Nitrogen by Leguminous Crops.—The benefits of legumes in rotation are two-fold. In the first place leguminous plants usually carry a larger amount of nitrogen in their substance than most other plants and when they, or any of their parts are returned in a rotted condition to the soil, the soil is enriched not only by the organic matter, but also by the nitrogen thus added. In the second place, by bacterial growths upon their roots, these plants restore a considerable amount of nitrogen to the soil by the rotting of these parts. The species of this family of plants, however, differ widely in the amounts of nitrogen that they contain and return to the soil. The sweet clovers, alfalfa, vetch, bur clover, and the cowpeas excel most of the others as soil renovators. When a crop is grown to be turned under some choice should be exercised. Usually the considerations of cheapness of seed, season of growth, and value as a renovating crop are considered.

A classical experiment showing the amount of nitrogen stored up by legumes is that reported by the Rothamsted Station in England. After a period of twelve years, sweet clover had stored up 702 pounds of nitrogen per acre valued at more than 105 dollars. Alfalfa had stored at the expiration of the same period 1916 pounds valued at 287 dollars, while vetch had stored 911 pounds

Maximum Power, Efficiency, Economy

valued at more than 136 dollars. Another experiment shows the enrichment of a soil by 303 pounds of nitrogen in a period of five years by the growing of clover.

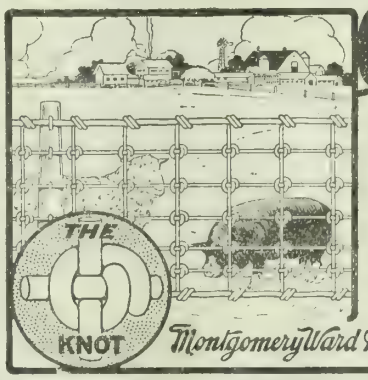
When it is remembered that alfalfa is a perennial crop and has to be reseeded only once in a number of years, while the others are annual crops, it will be recognized that alfalfa has a high value in addition to its value as a forage crop. In fact alfalfa in California should be employed both as a forage producing crop as well as a rotation crop. When the crop reaches a stand of less than 75 per cent it should be plowed under and followed by several annual crops, such as grain, potatoes, and sugar beets, then restored to alfalfa. For short rotations, vetches, cowpeas, or beans are more adaptable.

Crops of Different Habits.—The desirability of growing sugar beets, from the point of view of soil betterment, cannot be denied. It was at first supposed that the beet would impoverish the soil but the fallacy of the statement was disproved in the course of time. Although granting that the beet draws heavily on the plant foods in the soil, the beneficial results more than compensate for this. Summed up they are: The opening up of lower layers of soil by the rootlets, the bringing to the surface soil of plant foods from deeper down in the ground, the humus value of the rootlets and the tops, the aeration and better wetting of the soil, the deep plowing and thorough cultivation, and the deep subsoiling given when harvesting.

In Montana Agricultural Experiment Station Report for 1903, F. B. Linfield reports that a series of 1-acre plats which were used for a 6-year rotation experiment during six successive years were sown to oats. After wheat the yield was 1,590 lbs. of grain per acre, after peas 3,405 lbs., after clover 2,760 lbs., after barley 1,335 lbs., after oats 1,952 lbs., and after sugar beets 2,620 lbs. of grain per acre. From this it can be seen that the yield of oats after sugar beets was only surpassed by the yield of oats after leguminous crops, viz: peas and clover.

Varied Crops and the Distribution of Labor.—Although the tractor is competing strongly with horse labor on the level lands of the valley, yet in either case the continuity of employment for these forces on the farm is an important factor of success. The great decrease in the acreage in wheat during recent years is due not only to the unprofitableness of small yields, but also because on many of the large grain farms, a relatively large number of horses are kept throughout the year for a relatively short period of service. This system entails a loss not only in the investment in the animals themselves, but in the keep of the extra horses while they are idle.

By investigations conducted both in New York and in Minnesota it has been shown that by arranging a rotation of crops so that both man and horse labor might be employed nearly continuously throughout the year, not only was the number of horses reduced, but the crop yields increased, and there was a considerable saving in the keep of the animals relative to the work they did. This saving is even more noticeable where dairying is included in the farm operations. An idle horse on the farm should be looked on in the same light as a hired man asleep in the shade of a tree. Where a cropping system is arranged in such a way as to continue the land preparation and planting season throughout the fall, winter, and spring months, and the cultivating and harvesting season throughout the summer and fall, this arrangement along with the care of livestock will insure a more even distribution of labor throughout the year.



The Influence of Livestock.—The best system of diversified farming is one which includes both crops for sale as well as forage crops for live stock, and the greatest economy comes from feeding the livestock on the farm rather than in selling the forage crops from the land. Thus in the production of alfalfa, sorghums, and the coarser fodder crops, the farmer is compelled to keep livestock on the land. The investigations of the United States Dept. of Agriculture, as well as several experiment stations, indicate that the largest labor income, that is, the net proceeds, are paid from those farms where there is a rational balance between crops produced for sale and those produced to feed to livestock on the land.

Another point of importance in the relation of livestock to general farming is the prevention of waste. The one crop farm is unusually subject to wastes owing to the urgency of work at particular times, such especially as harvest. Thus the sugar beet farmer can make no use of the crowns and tops, except at best to plow them under. The potato farmer can make no use of the culls, but has to leave them in the fields where they perpetuate disease. In the bean harvests there are shattered beans as well as large quantities of straw which if used with economy must be fed on the place.

Perhaps one of the greatest benefits to be derived from crop rotation is that it teaches system and efficiency in organization to the farmer. A crop rotating system when worked out successfully requires the closest study of all the factors involved in crop production. Cost accounting and the balancing of farm operations are the outcome of this study and these large factors in the success of farming.

SOIL-COLOR NOT SPICE.

Cinnamon Hill is the (copyrighted) name adopted by County Horticultural Commissioner G. W. Harney of Yuba county for a new ranch located on the State Highway between Marysville and Wheatland in Yuba County. The buildings, wide-porched bungalow, tower, etc., recently completed, occupy a commanding site on a high knoll overlooking the highway and the countryside. The ranch consists of about forty acres and is planted to almonds, Bosc and Comice pears and berries. The name is taken from the color of the soil.

ONLY 23½¢ PER ROD

THIS hard, tough, springy sheep and hog fence—26 in. high—only 23½c per rod. Stock fence—42 in. high—only 24½c per rod. Wires are of basic open hearth steel. Heavily galvanized. A real stiff, stay fence. Does not rust nor get out of shape. Hogs can't root through, nor cattle trample it down.

General Agricultural Review.

GRAIN AND FIELD CROPS.

The San Joaquin county potato acreage is smaller than usual.

Sudan grass may be planted till June according to Farm Adviser Rubel of Alameda county.

The Salinas Journal prints the statement that California consumes $25,000,000 pounds of rice per year.

Alfalfa hay in Yolo county is normal in quantity and quality. Some of it is being sold for $6 in the shock.

The Sperry Milling Co. have heartily endorsed the grain elevator idea and are planning a system of local elevators for their own grain.

On Dixon ridge fall sown grain looks fine. It would have to be made into hay if a hot wind should come, though very little grain hay is usually made.

The Turlock Merchants and Growers' Ass'n has leased the land and let contracts for a warehouse and loading platforms 400 feet frontage on the S. P. Ry. at Turlock and 200 feet at Keyes. They are also building a warehouse at Denair.

Eastern mustard manufacturing companies have contracted for most of the mustard seed to be grown in Santa Barbara county. The Lompoc district supplies the world, having an annual output of about 1,500,000 pounds.

The average condition of winter wheat in U. S. on Apr. 1 was estimated by the U. S. Dept. Agr. at 78.3 per cent of normal as against 88.8 a year ago, 95.6 per cent two years ago and 87.3 average for the past 10 years on Apr. 1.

Arakelian Bros. of Fresno, who expect to handle $5,000,000 worth of cantaloupes this season, plan to put a sticker on each one. They are said to control ¼ of the 3500 acres planted to cantaloupes in Cal. A publicity campaign is to help stimulate consumption.

The general opinion of grain men about Woodland, Arbuckle, and the adobe land south and east of Dixon is that unless it rains pretty soon there won't be ¼ of a normal crop. If it rains and everything is favorable, there will be chance for ½ or ⅔ of a crop.

The Fresno Broom Factory is to put in 1,000 acres of Standard Glory broom corn on John Decker's ranch at Lemoore this spring. This variety produces a fiber of better quality than is ordinarily used for brooms and will be used exclusively if no unforeseen disadvantage arises.

The Turlock Merchants and Growers' Ass'n estimates that there will be 5542 acres of watermelons and cantaloupes in that district this season, of which they have 51 per cent or 2700 acres under contract. The district output is expected to be 3,000 cars as against 1370 cars last year.

Some alfalfa growers of Fresno county were recently reported busy with their first cutting. Some of them are said to have forgotten since last year that it takes a little longer for the first cutting to dry. There is no more danger of losing the leaves after a couple days of drying the first crop than after ½ or ¾ of a day with the other cuttings.

DECIDUOUS AND GRAPES.

The cherry crop in San Joaquin county is very light.

Dropping of apricot foliage is bothering growers in Kings county.

A half crop or less of prunes and apricots is reported from the Hollister district.

A New York firm shipped Dinuba grapes last season from New York to Buenos Ayres, South America.

John Lawton of Fillmore contracted 200 tons of green apricots last week at $35 per ton f. o. b.

The Sonoma prune crop is reported less than half that of last year, which was 20,000,000 pounds.

Eastern peaches have been hurt by extremely warm and extremely cold weather.

Offers of 9 cents for apricots and $30 for pits were reported to the San Jose Grange meeting Saturday.

A. W. Rechel reports the prune crop light in the Geyserville section. Many young trees died of sour sap.

The Ventura apricot crop is reported better than the other southern counties but considerably lighter than usual.

A half box of Purple Guigne cherries was shipped from Vacaville Apr. 10 from the T. L. Gates ranch. They sold for $25 in Chicago.

Many of the larger speculators have sold short at low prices and to date have not covered ⅓ of their sales, according to the Information Bureau.

Peach growers on the west side of Yolo county are very enthusiastic about the prospects of the new peach association and are unanimously for it.

A 5-cent basis price is now offered for 1916 prunes and the Information Bureau believes that no grower should take less than 5½ cents for spot or future goods.

The Humboldt Farm Bureau is well along toward buying the cannery of the Humboldt Fruit Canners' Ass'n. at Arcata to put up fruit, berries, and vegetables this season.

A surplus of money in the East and workmen busy at higher wages than ever before, are pointed to as evidence that more California fresh fruit will be consumed than ever before, if we can furnish it.

The Feather River Growers' Ass'n, a local of the Cal. Growers' Ass'n, is said to be assured of sufficient support in the fruit territory from Chico to Tudor to justify operation of a co-operative cannery.

A heavy pack of peaches is expected by both Visalia canneries. Their holdover is about 20,000 cases, which is less than for many seasons. War orders have already reduced the stock to less than they had on hand last July.

Napa County Horticultural Commissioner J. J. Fox estimates the prune crop in Napa Valley at less than half of last year's yield. Apricots will be negligible. Pears and apples generally well set. Most of the peaches will be full crop.

Secretary G. E. Merrill of the Prune and Apricot Information Bureau credits Col. Weinstock and the British embargo with causing events to move faster than was anticipated last spring, toward a capitalized prune growers' organization.

Almost everyone in the Fresno district is reported to have been sulphuring their vines this year, but most of the peach orchards are neglected. Most of the peach men used all the sulphur they had last year and would not buy any more at the advanced prices this spring.

Apple growers and shippers of Pajaro Valley are to have a general mass meeting at the Auditorium, Watsonville, April 22, p. m., to discuss the packing and marketing of the crop next fall, to hear announcements of the policy of the Watsonville Apple Distributors, and to elect its officers. Harris Weinstock will be there.

CITRUS AND SEMI-TROPICAL.

The first full carload of Valencias from Lindsay were shipped April 6.

The Black Mission fig crop of the State is mostly bought up by brokers at 3½ cents.

Eighteen acres of Marsh Seedless grapefruits are being planted by C. A. Reves near El Centro. The ranch already has 13 acres of fine Valencia and Navel trees.

Pomona Valley expects to ship 600 carloads of Valencias, the crop being the biggest ever, and of fine quality.

NUTS AND OLIVES.

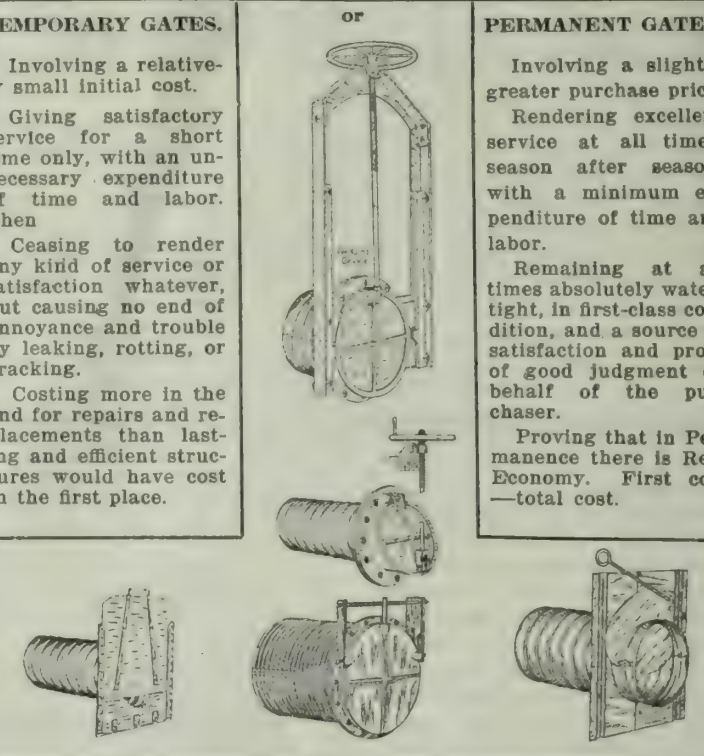
The almond crop in San Joaquin county is especially light on the old trees.

The campaign is on for state-wide celebration of California Ripe Olive day May 16.

The hot drying east wind knocked

WHICH?

TEMPORARY GATES.



Involving a relatively small initial cost.

Giving satisfactory service for a short time only, with an unnecessary expenditure of time and labor. Then

Ceasing to render any kind of service or satisfaction whatever, but causing no end of annoyance and trouble by leaking, rotting, or cracking.

Costing more in the end for repairs and replacements than lasting and efficient structures would have cost in the first place.

or

PERMANENT GATES.

Involving a slightly greater purchase price.

Rendering excellent service at all times, season after season, with a minimum expenditure of time and labor.

Remaining at all times absolutely watertight, in first-class condition, and a source of satisfaction and proof of good judgment on behalf of the purchaser.

Proving that in Permanence there is Real Economy. First cost —total cost.

California Poultry Practice

Every poultry raiser of California should have this book. It is very practical and will help make your business profitable. In the preface of the book the author says:

"This book is not an accident; it is born of a desire to help others to avoid the stumbling-blocks in the poultry business, and at the request of many readers of The Pacific Rural Press, and other papers.

"With forty-two years of experience with poultry it is expected that I have learned a few things about it; it's a poor business that does not teach lessons in that length of time. Don't you think so?

"There are books, yes, books without number, on poultry matters, but many of them are mostly theory. This book tells you just what I have done and how I would do it.

"It is a book of action, and it is action that counts these days. We have to act in the living present if we want to live. I want to live and I want others to live, too, and as I have learned these things by experience it is fitting that I should tell others how to obtain results without paying such a big price for the experience.

"The things told you in this book are original, unorthodox, but strictly practical; and if you will read and then heed, you will be well satisfied that the author has given you your money's worth. California is an empire in itself, and I am sure there are enough men and women engaged in the poultry business, or wanting to get into it, to call for a million copies of this book, though its only claim is that it is needed."

The book contains 157 pages, besides illustrations. The 45 chapters cover every phase of poultry culture from eggs to hens, and from hens to market. Feeding, housing and parasites.

Pacific Rural Press, Publishers

525 Market Street San Francisco, California

quite a proportion of Ventura county walnuts last week.

A 20-year Chico almond orchard recently sold at $400 per acre or $11,000 for 26.34 acres to R. L. Douglas of Red Bluff.

The Sutter County Almond Growers' Ass'n is to elect officers April 22. They have no intention of withdrawing from the State Ass'n as has been reported.

Pres't G. M. Williams of the Goleta Walnut Growers' Ass'n reports a fine and even setting of walnuts in his district and around Carpinteria, but blight is already showing.

We have a report of the following olive plantings in Browns Valley, Yuba county: E. M. Eddy, 20 acres last spring and 20 this; S. V. Smith Jr. has 4,000 olives in nursery rows to plant next year as a part of 200 acres all told; J. S. Wardell, 100 acres, mostly Missions and Manzanillos; W. R. Hendricks, 100 trees; and Mr. and Mrs. Worthington Ames, about 15 acres of the same varieties.

MISCELLANEOUS.

The great rabbit drive at Arbuckle resulted in the killing of about 100 rabbits.

March exports from San Francisco were worth $2,704,032 more than for the same month a year ago which was $6,398,380.

Rice growers have begun irrigation of several thousand acres around Gridley through the main canal of the Sutter-Butte Canal Co.

Two lines of the Tulare Lake levees have broken and destroyed 90,000 acres of beautiful grain nearly ready to harvest.

Eleven freight ships of 5,000 to 10,000 tons are soon to be run from San Francisco to Asiatic ports with white crews under the American flag.

Grain alcohol bought for mechanical purposes in Washington caused so many drunks that one judge ordered gum camphor to be put into each flask when sold.

The Butte County Spring Exposition is to be held at Chico May 22-28. It will be a show of agricultural, livestock, and poultry resources of the district.

The value of farm lands without improvements is estimated by the U. S. Dept. Agr. at $45.55 per acre; $40.85 a year ago; $40.31 two years ago and $38.10 three years ago.

Santa Barbara County Bee Inspector W. J. Oates, reports that a tremendous honey crop is in the making, as showers have opened up the mountain flowers in great shape.

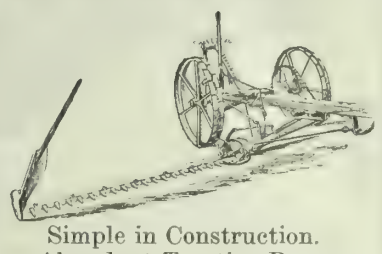
Boundaries of the district which will have to pay $1,095,000 toward the construction of the Sacramento by-pass for flood waters were designated recently by the State Reclamation Board.

Free recent bulletins of the U. S. Dept. Agr. treat of sweet potato diseases, food for young children, road building, cherry by-products, brown rot of prunes, the raisin industry, and milk and cream contests.

American exports for February were valued at nearly $410,000,000, the highest point ever reached. Imports were nearly $216,000,000 less. The East ought to have some money to buy California fruits at a good price.

The increase in demand for potash has resulted in inquiries of government officials concerning the amount of this chemical contained in wood ashes which may be available at saw mills operating on the National forests.

Farewell, Imperial county grasshoppers! The Farm Bureau is after you with 1350 pounds of white arsenic to be mixed with 67,500 pounds bran, 5400 quarts of molasses, and 1350 dozen lemons to entice you. Five acres of this mixture is being sold for 68 cents.



The waste product of sawmills in the United States, including that fed to the furnaces as fuel is estimated to be 36,000,000 cords per year, and the equivalent of 2,880,000,000 cubic feet of solid wood substance. About half of it has no use whatever but is usually burned to get rid of it.

The 1915 Yearbook of the U. S. Dept. Agr. is being distributed. It contains articles on co-operative purchasing of farm supplies, a co-operative laundry, water systems for farm houses and buildings, seed testing, boys' agricultural club work, and a general summary of American agriculture with maps.

The high cost of retailing food products is the biggest leak between producer and consumer. The Watsonville retailers are cutting it by dividing the city into four delivery districts. Members of the delivery association will send goods for their customers to a central station whence each driver will deliver on his own certain route four times a day, thus avoiding duplication of routes.

Fresno county held an Agricultural Assembly at Kearny Park April 19, 10 a. m., writes S. P. Friselle, manager of the Kearney Vineyard. Leaders in agriculture and University men spoke. The Farm Adviser plan was presented. Livestock judging, etc., was part of the program.

P. & O. No. 40 Combined Corn and Bean Planter

Furnished with open center or solid concave tires.

The Combined Corn and Bean Planter here illustrated is a machine built by one of the largest manufacturers of planters in the world, particularly to meet the requirements of the Pacific coast trade.

It is not a made-over machine, but is built from the ground up for Coast needs. This fact, together with the reputation of the P. & O. Company for building tools right in every detail, insures absolute satisfaction to every user of this planter.

It's the Way They are Built

FEATURES:

Equipped with a full set of plates for planting any of the different kinds of corn or beans commonly planted in California, including Egyptian and Kaffir corn.
Adjustable to any width rows from 28 to 44 inch. The check-rower machine is adjustable for checking rows 3 ft. 4 in., 3 ft. 6 in., and 3 ft. 8 in.
Accurate planting insured by the sight feed. Sight feed has a large opening, and the seed is visible at all times to the operator as it drops from the hopper to the upper valve.
Quick, detachable runners held on the shank by one bolt. Easily removed for sharpening.

Mechanical Power on the Farm.

PRUNES TRAVEL THROUGH DIP.

[Written for Pacific Rural Press.]

A new prune dipper and grader is being put on the market by F. J. Yandel of Santa Rosa, its inventor and manufacturer. As will be seen by the accompanying cut, this machine has a rotary attachment that keeps the prunes moving through the liquid and lifts them onto the grading screens. It is very carefully adjusted and will not bruise the fruit.

Continuous Movements of Prunes Through Dip and Grader Gives Uniform Results.

An oil burner furnishes uniform heat and a 1 h.p. gas engine or electric motor furnishes more than ample motive power. It is called the "Perfection Dipper and Grader." It is made in two sizes, one with a capacity of 3 or 4 tons per hour, the other with a capacity of 7 or 8 tons per hour.

Ellert Weerts used one on his prune ranch on Sebastopol Avenue last season, and says it has the following advantages:

1. Efficiency and economy. The day's picking was easily put through in three hours by three men, at a cost of 9 cents per ton for fuel. The rotary attachment keeps the liquid constantly stirred, so no sediment forms in bottom of vat, retarding the heat.

2. Uniform dipping. As the heat of the liquid and the speed of the machine are both automatically controlled, there is no guesswork.

3. Superior grading in three grades. The vibration of the screens can be adjusted for soft or hard prunes.

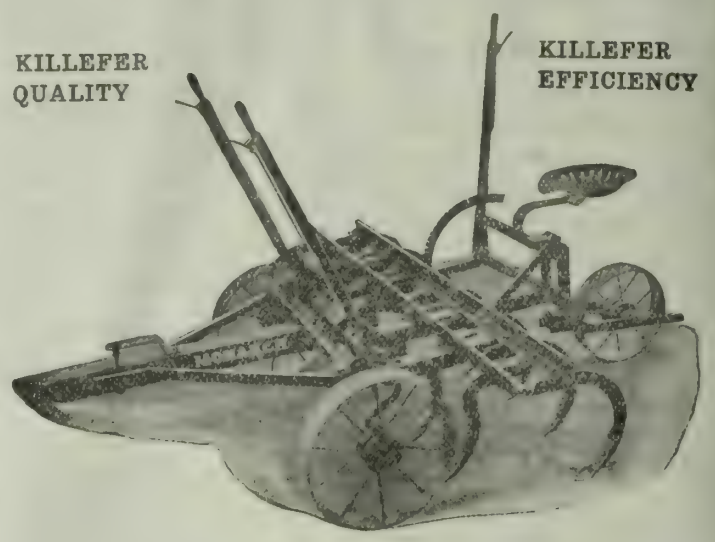
BALES HAY WHILE CUTTING.

[Written for Pacific Rural Press.]

When hay is to be stored or shipped, it is usually most economical to bale it, because space in storage or on trains costs money. Woodward and Sons of Perris Valley have 80 acres of alfalfa which yields about 11 tons per acre. They ship practically all of it. But if prices are low, they store hundreds of tons, as much as two years at a time. They have an 8 h.p. gas engine baler which puts up about 12 tons per 9 hour day. With it, their cost of cutting, raking, hauling, and baling last year just about equaled the cost of hiring the baling the year before, not figuring interest and depreciation.

The machine kept eight wagons busy last year, though the field is across the road from the baler, which worked only afternoons while one man would be cutting. The partially cured hay would be loaded onto the eight wagons. Beginning at the upper end of each check, one team could haul two loads to the lower end. Then one load at a time would be hauled to the baler, left until afternoon, and baled from the wagons.

Owing to what Mr. Woodward thinks will be superior convenience of an electric motor, he expects to either get a new electric baler, or fit a motor onto the old one. That can be done by removing the engine and piston, and fitting the motor to the fly-wheels which are already cog-geared.



SCREWS PUMP PACKING TOO TIGHT.

To the Editor: The packing around the shaft of my Layne and Bowler pump wears out each irrigation run and it costs $1.50 to renew it. This packing ought to last all season. There is much fine sand in

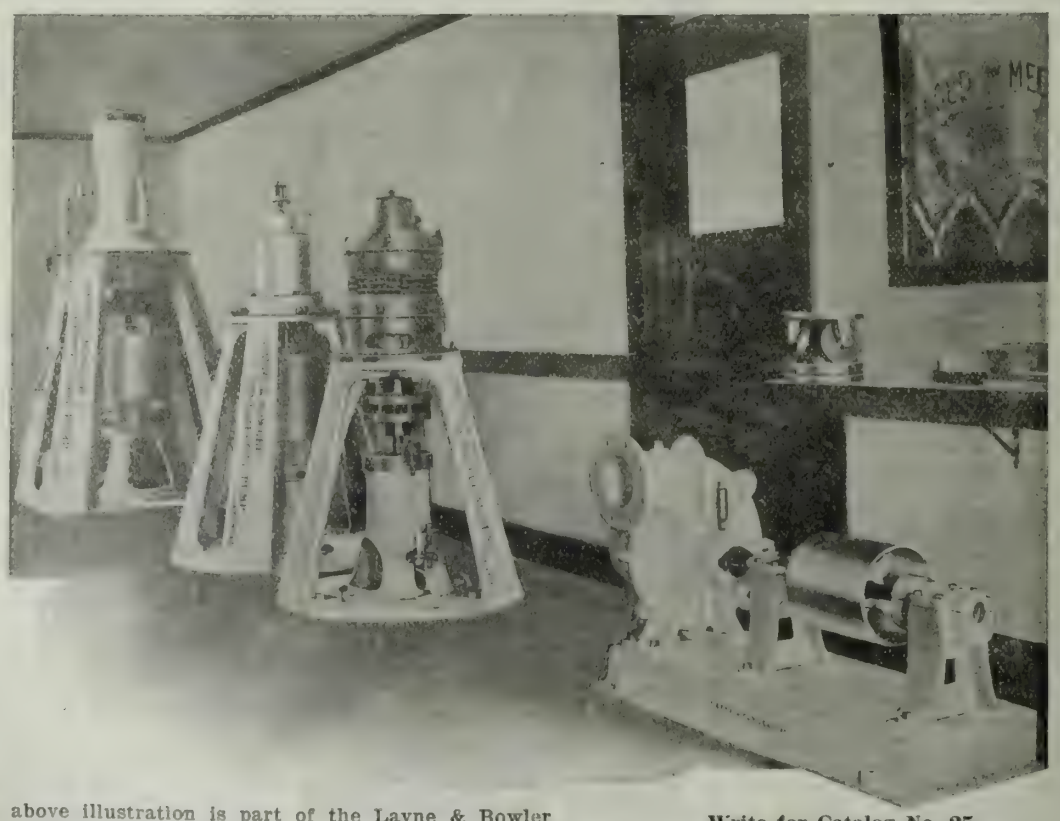
Monarch Cultivator (K)

KILLEFER QUALITY

KILLEFER EFFICIENCY

The Killefer Monarch Cultivator has more varied uses on the ranch than any other tool we manufacture. As a Chisel for bean and beet ground before planting, it has no equal. As an Orchard Cultivator, where deep cultivation is desired, it gives perfect satisfaction.

As an Alfalfa Cultivator, when fitted with our Special Alfalfa Tooth, it does excellent work, loosening the ground to a depth of from six to eight inches without injuring the stand. This deep cultivation enables the water to percolate to a greater depth than any cultivator on the market. Made in 5, 6 and 8-foot sizes.



Corvallis, Ore., April 3, 1916.

THE KILLEFER MFG. CO.,
2209 Santa Fe Ave.,
Los Angeles, Calif.

Gentlemen:—
The Monarch Cultivator did us a good job in our Alalfa field, taking out a tough grass sod which nearly had the Alfalfa whipped out. Am pleased with its performance. We are handling it with a 30 H. P. Motor.

Yours,
J. B. CORRIE.

Layne & Bowler Corporation

900 SANTA FE AVE., LOS ANGELES.

the water. Also perhaps we screw down too much pressure on the packing so it wears out sooner. What is wrong?—H. L. C. W., Corona.

This pump consists of several centrifugals arranged in a casing so that they may be let down into a well casing about a foot in diameter so that a section of pipe below them is always well under water. The centrifugals are run by a vertical shaft which is held in place by brass boxings at regular intervals, and is entirely incased in a pipe of larger diameter which screws onto the centrifugal casing and is water-tight to the surface. It is filled with oil to keep the brass bearings lubricated. This pipe enlarges just under the belt-wheel above the ground, large enough to permit a packing ⅜ inch square to be inserted around the shaft. The packing is held from going too far down, by a bearing around the shaft.

It is made of rubber surrounded by asbestos preparation, all soaked in graphite, "the most perfect lubricant known." It is made in the shape of a spiral spring.

When a shaft is to be repacked, plates are taken from the side of the frame which protects the enlarged end of the pipe. An oval "gland" is unscrewed. This is a flat piece of iron which fits around the shaft and has a circular projection to fit into the enlarged pipe. It is tightened into place by screws through its ends.

Packing is cut from the spiral in circles, each of which is inserted separately into the enlarged end of the pipe around the shaft. When the space is filled, the gland is screwed down to hold the packing in place.

It should be adjusted slightly every day, according to shop superintendent John Wintrooth, just enough to prevent the oil in the pipe from squeezing out. If it is screwed down too hard, it cannot absorb enough oil to prevent its becoming dry and hard. This will make the shaft hot and will wear it more than the bearings do.

It will be seen that as the pipe is water-tight sand in the water could not affect it. Mr. Wintrooth says that trouble must be due either to using poor grade of packing, or an unsuitable high grade packing, or to screwing the packing down too tightly.

AVOIDING CHAMOIS SKIN DANGER.

To the Editor: How can we avoid the danger of straining gasoline through chamois skin and still have its advantages?—Sub.

[Answered by Prof. J. B. Davidson, University Farm, Davis.]

[The danger from static electricity in connection with the use of a chamois skin strainer for gasoline might be obviated in several ways: If the strainer should be grounded or connected by a metallic conductor to the ground or to some metallic object embedded in the ground, there would be little or no danger. Again, the danger should be guarded against by the use of a strainer in the feed line to the carbureter in which the water, if any should be in the gasoline, is allowed to accumulate in a pocket from where it may be drained off occasionally. The inspection of a can of gasoline will often reveal the presence of water. The water usually has a rusty appearance and of course settles to the bottom. This is not practical in large tanks.]

About 10,000 acres of sugar beets are planted in San Fernando Valley this season.

Belting That Must Make Good

When you buy a rubber belt you should know what service it will give you or have the belt service guaranteed by a responsible firm who will make good in case the belt falls down. Every belt-buyer should know how to judge a rubber belt, and we would like to send you a **free sample** of **Test Special** together with our folder that will tell you just how to judge a rubber belt so that you may know just what service you will get from any belt you buy.

Fill out the coupon and mail it to us and we will recommend a belt that we will unqualifiedly guarantee to do your work satisfactorily. We have had seventy years' manufacturing and selling experience.

LET·THIS·ENGINE·REDUCE YOUR·HIGH·COST·OF·LABOR

The only way for a farmer to keep up with the always increasing cost of doing business, is to take advantage of the many MECHANICAL AIDS now provided for his benefit. In fact, no farmer who wants to do the most work in the most economical way can afford to be without a

FULLER & JOHNSON
TYPE "N" GASOLINE ENGINE

To supply CHEAP POWER for operating an Alfalfa Cutter, Cream Separator Churn, Corn Sheller, Electric Dynamo, Feed Grinder, Grind Stone, Ice Ice Cream Freezer, PUMP, Spray Pump, Washing Machine, Wood Saw, or ANY FARM MACHINE equipped for power-drive this engine is a NECESSITY.

THE FULLER & JOHNSON TYPE "N" ENGINE is different from most engines. 1st—it is the product of 13 years of business and manufacturing experience, backed up with a world-wide reputation for QUALITY; 2nd—It is made in modern shops equipped with the finest machinery, by unusually high-class mechanics; 3rd—IT COMBINES THE GOOD POINTS OF HIGH PRICE ENGINES IN DESIGN, MATERIALS AND WORKMANSHIP—all the latest improvements—yet sells for a surprisingly low price; 4th—It is very, very simple, has few parts, is easy to start and run—by anyone; 5th—It has only one-fourth the weight of engines made from antiquated patterns—an . is more easily portable; 6th—It has "make-and-break" ignition, a "hit-and-miss" governor that keeps its speed constant and permits it to use very little fuel; 7th—It operates on the superior 4 cycle principle and cools itself perfectly; 8th—It runs equally well on gasoline or engine distillate.

The work the different sizes of this wonderful engine will do for you and the amount of money it will save will surprise you. You CAN'T AFFORD to be without it.

For Water Deep Under The Ground

Jackson Deep Well Turbine Pumps give continuous and efficient service. They do not get out of order as they have no valves or plunger rods. Very little care or attention needed as they are oiled from the surface. Are much lower in cost than other types of deep well pumps when the expense of dug pits, cribbing and timbering is reckoned. They raise water from the very bottom of the well, thus eliminating heavy vacuums and delivering all the water the well yields. They develop slow wells and increase their flow.

Like all Jackson Made Pumps These Deep Well Turbine Pumps Are the Very Best Pumps Made for the Purpose—They are Dividend Earners, Not Expense Makers

Whatever your water problems may be our Expert Pumping Engineers will help you out free of charge—write

MADEWELL SURFACE PIPE
ROBINSON HARDWARE CO.
GILROY, CAL.

Smooth Lock Seam Sleeve

Here is an exclusive Madewell feature that appeals to every user of Surface Pipe. Seamed inside with perfectly smooth surface. Much stronger than the old-fashioned lapped and riveted seam used by others.

Madewell Surface Pipe

is recognized in established surface pipe districts as having the strongest, smoothest, and most practical construction.

Our Long Lock Seam is the best seam possible to make—and in addition is carefully soldered the entire length so that it stays water-tight. **Strength and Smooth Finish** are the big things to consider when you invest in surface pipe.

Send for Free Booklet—which tells just how Madewell Pipe is constructed

Robinson Hardware Co. Box B Gilroy, Cal.

Southern California Guernsey Pioneering.

[Written for Pacific Rural Press.]

Against the hills, beyond a mile of gently rising green, nestle the white silos and the village of white buildings on the Elliott-Brant Rancho, a landmark for the fertile empire of the San Fernando valley, and an inspiration to all the countryside to share the delights of growing purebred Tamworths, Berkshires, and Guernseys.

Butternut Queen (30478), possessing, perhaps, the best dairy type of this herd. Her 2-year-old A. R. record was 532 pounds. On re-test she is greatly exceeding this.

The inspiration is increased when one visits the well-nigh faultless dairy yards and barns and accepts a drink of the cold, rich, distinctively flavored Guernsey milk, guaranteed over 5 per cent fat.

Of the Tamworths and Berkshires, more may be said later; this writing will deal with the Guernseys, all of which are tuberculin tested and free of the disease.

With the characteristic pride of the purebred breeder, D. O. Brant was ready with the names and records of most of the cows—really the most important part of dairying; for the records indicate great yields of high-priced milk, and ability to transmit great production to offspring of great value.

Twenty-one of the cows are already in the Advanced Register—fifteen are being milked three times a day on official test — a number have recently made high records. We give a few.

Record-Making Stock. Princess of Meadowbrook has the highest Guernsey record on the Pacific Coast, having finished the first of March an official record of 725 pounds fat from 14,600 pounds milk. Her dam Teddy's Pet, dropped her fourteenth heifer calf last March. Her sister, Pet's Pansy of Pine Grove, will finish a year's record as a three-year-old April 30. In her first 276 days she gave 426.84 pounds fat in 9784.9 pounds milk. Ida Lyons was 1st prize and grand champion three-year-old at Riverside last year and was also a winner at the State Fair. Nellie's Carnation was first prize two-year-old, Junior, and Grand Champion at the last State Fair. Her record as a two-year-old, finished last Oct. 15, is 425 pounds fat from over 8500 pounds milk. Butternut Queen made 532 pounds fat from 10,000 pounds milk as a two-year-old and is now seven months along in a test as a six-year-old with every promise of making 700 pounds. Imp. Mahy's Nelly II du Douit started a test last Oct. 24 as a five-year-old and made 312.68 pounds fat from 6799.7 pounds milk in 60 days. There are several 500 lb. 2-year-old records in the making.

Two bulls are used. They are exercised on a treadmill. The old one was sired by Imp. Cora's Governor of the Chilmark, A. R., which has 30 Advanced Register daughters and is a son of Governor of the Chene, A. R. The old bull is out of Nevna, an A. R. cow, which was out of Robinia Standard, A. R., Grand Champion at the first National Dairy Show and 6 State Fairs and was never defeated.

The three-year bull, Newgrove King of Briarbank, is a son of King Bell, 1st prize, Senior and Grand Champion at the Michigan State Fair and Grand Champion at the National Dairy Show in 1911. King Bell has some two-year daughters testing 6 per cent and having 530-pound records. Three of his daughters were recently sold at $1500 each at auction. He is a son of Imp. May Rose King, A. R., 10 of whose daughters averaged 705.29 pounds fat, and all of whose daughters averaged over 584 pounds, and 48 of whose granddaughters averaged over 509 pounds. These granddaughters were sired by 13 A. R. sons of Imp. May Rose King. The dam of New Grove King of Briarbank is Imp. New Grove Queen 2nd, which has a record of 639.33 pounds fat from 12,710.4 pounds milk on two milkings per day. She was Senior and Grand Champion of Michigan and took 2nd prize at the National Dairy Show, losing to Glencoe's Bopeep. She was sired by Mashers Sequel, who has more A. R. daughters than any other Guernsey sire. Newgrove King of Briarbank has a beautiful backline carried square out, has great heart girth, and thin withers. He has won first prize wherever shown. He will be shown again this summer.

Showing the hay-storage barn on left and silos on right, and "Ida Lyons," Grand Champion Cow at Riverside Show, 1914, in foreground.

Convenient Sanitary Equipment.—The equipment on the Elliott-Brant Rancho is worthy of the blood on it. Dr. G. H. Hart, Los Angeles city milk inspector, gave them a credit of 99½ points, docking ½ point because silage is fed in the milking barn. One bacterial test showed 10 per c.c., several showed 200 to 300; and the milk is always guaranteed below the Certified limit of 10,000.

The milking barn is airy, well lighted, cement floored, has a tight ceiling and iron stanchions. It has plenty of electric lights, and pressure water to clean out after each milking. Manure is hauled to the fields daily, being dumped onto a spreader from barn manure carrier. There are no flies around.

Two concrete silos, tar-lined, supply succulence to keep up the flow of milk, for the customers must be supplied, winter and summer, with all the milk and cream they want.

A concrete pavement leads from the milking barn, between the silos, to the two yards where the cows manufacture butterfat and milk. One of the yards is concrete paved, with straw under the open shed around it. One heifer has not been off the concrete for two years and has never had sore feet or an inflamed udder, though the hoofs keep well worn down.

Opening off the pavement is a hay feeding barn with iron stanchions of Mr. Brant's own design. It has concrete floors and mangers. The mangers are covered by a sloping slatted cover which is hinged so it may be raised and hooked out of the way. Alfalfa is dropped down between the two lines of stanchions from the 300-ton hay mow.

Balanced Rations.—"We grow and crush, or grind, the barley we feed; and balance it with cottonseed meal besides alfalfa hay and beet pulp. Barley usually is the only grain fed the 30 two-timers," which are milked only twice per day because they are not on test. We fed whole grain for a while, but saw it coming through. Sure, it pays to grind grain.

The cows on test get one to one and a half pounds cottonseed meal per day, though this is varied—some get more, some none at all. They also get 20 to 30 pounds of silage per day besides alfalfa, ground grain and beet pulp.

It became necessary one time to get more milk to supply the demand. The quantity of feed was nearly doubled and the milk came; but the extra expense was not justified, except because it held the customers.

Good Help Obtained.—Equipment makes clean milk possible, but does not make milk clean. A good intelligent class of dairy helpers is necessary. These are attracted to the Elliott-Brant ranch by considerate treatment, a comfortable bunkhouse surrounded by alfalfa and containing running water, baths, and other conveniences. It is not hard to get their sympathetic cooperation in clean milk production.

Handling the Milk.—White clothes are donned in a separate room by the milkers, and only dry milking into sterilized hooded pails is practiced. The hind quarters and udders of the cows are clipped close. Before milking, they are hosed off, brushed down with a stiff brush, then wiped off with a cloth soaked in disinfectant. Daily sediment tests of the milk seldom show more than a tiny speck or two of dirt, and many of them show no discoloration except from cream.

Milk is carried from the milking barn to the bottling house at a distance, carried up a covered outside stairway, emptied into a vat through seven thicknesses of strainer cloth. Thence it runs into the bottling house via a pipe through the wall to the clarifier; thence to a hooded cooler where it is aerated as it flows over the brinefilled cooler. The brine is kept cool by circulation through the ice-making tanks in which the ice is left suspended. The milk is thus immediately cooled to 35 degrees. Aeration helps prevent the milk from absorbing odors when in the customers' ice box. A pipe conveys the milk to a mechanical bottler. This automatically fills the bottles; a pasteboard cap with a lifting tab is put on, and an ornamental soft lead cover is spun over

Lady Martinson (31310), an Advanced Register Cow of the larger Guernsey type that is found in this herd.

(Continued on page 531.)

The Hay Situation to Date.

[Written for Pacific Rural Press.]

It may be safely said that the reatest factor in supply is the con- ition of the grain market and the rain acreage, for while the yield of rain hay is only about 55 per cent f all of the hay grown, all but bout 10 per cent of it is baled for arket purposes, while the tonnage f alfalfa baled for market is only 0 to 30 per cent.

Dry winters naturally have a dis- trous effect on hay supply also, ecause of the shortening of volun- er as well as tame forage, thus ssening the amount of wild hay arvested and materially increasing he demand for tame hay to feed rm animals, particularly so when vestock is in good supply over the tate.

Alfalfa, while of immense impor- nce to the farmer, is not nearly important from a hay market tuation, because all of our larger y markets demand grain hay as he basis for all valuations and con- der alfalfa of secondary impor- nce.

During 1915 an entirely new fac- r entered that materially changed he situation. This was the unheard export business to Australia, mething that had never been heard before and very likely will not e heard of again, unless by some hance that country should experi- ce another drouth of like propor- ons to that of last year. Hay deal- s who have been in the business er 50 years maintain that no per- anency can be expected from this urce in the building of an export siness as it may never be open to em again.

From a market standpoint there no reason at this time to expect heavy a demand as was experi- ced last year, although there is no ason to suppose that it will be naller than in normal years, ex- pt through the gradual decline in ty demand on account of the motor bstituting the horse, which is ad- itted to be general in all of the eavy hay-consuming centers of the tate. On the other hand there is ractically no hold over of the 1915 op, thus leaving the 1916 demand ntirely in the hands of the 1916 pply.

From a State-wide standpoint it ow appears from the best sources information that the acreage anted to grain is about the same is year as last, due to the large creage which was summer fallowed st year.

As this is written the situation in he Sacramento Valley is not favor- ble for either grain or hay, rain eing deemed necessary in the imme- iate future to insure even a normal op.

San Joaquin county, which is a rge grain hay country, promises to roduce somewhat more hay this eason than last because of a large creage which will grow volunteer rops. It is thought that while this ill increase the tonnage it will ssen the general average quality.

Contra Costa and Alameda, both eavy hay-producing counties, will ake a normal crop if favored with howers on or before the early part f May.

Reports from Sonoma county in- dicate a light crop, one man who is in touch with the situation there es- timating it to be not over 50 per cent of normal.

H. J. Baade, Farm Adviser of Napa county, states that the acreage of grain planted in that county is not so large as last year and that the percentage cut for hay will be smaller. He believes that the com- bined crops of alfalfa and grain hay in his county will be smaller this year than last.

A representative of this paper es- timates that the percentage of grain cut for hay in Stanislaus county will be larger this year than last. Al- falfa also promises to be heavier be- cause of the good weather for cur- ing, although the acreage is smaller than in previous years and the num- ber of livestock has been reduced.

In Merced county conditions are favorable for larger crops of both alfalfa and grain hay, according to Dr. L. C. Kennon of Merced who states that the grain acreage is larger there than last year, that more will be cut for hay, that indi- cations at this writing are favorable for large crops, and that there is a larger acreage of alfalfa bearing this year with present indications of a large crop.

Prospects in Fresno county are for about the same sized crop of grain and alfalfa hay as last year accord- ing to Fred P. Roullard, County Horticultural Commissioner of that county. The acreage of both alfalfa and grain is about the same as last year and weather conditions are fa- vorable.

Carl J. Williams, Farm Adviser of Kern county, says that while the acreage of grain in Kern county is larger than last year the percentage cut for hay will be smaller and that the present indications are for a medium yield. On the other hand the acreage of alfalfa is larger and conditions are favorable for a heavy yield. He expects the total produc- tion of grain and alfalfa hay to be larger than last year.

In the northern portion of Los An- geles county the grain acreage is larger than last year in the opinion of D. H. Graham of Lancaster, and while it is still largely a matter of weather it seems probable that a smaller percentage will be cut for hay this year. Many new plantings of alfalfa will begin bearing this year and a large acreage which was neglected last year will be better cared for. All things considered he thinks the amount of hay and al- falfa will be larger this year. He also states that there is considerable grain hay being held over in his sec- tion.

Advices from Imperial county state that because of the prevailing high price of hay and barley sacks, a larger amount of both alfalfa and barley hay is being cut this year than is usual.

The total yield of alfalfa and grain hay will be larger in Orange county than last year. Such is the opinion of Roy K. Bishop of Santa Ana, who says that while there is a slight increase in the grain acreage there the percentage for hay will be

(Continued on page 535.)

Making a Silo Pay

is an easy matter if you have the right kind.

THE UNIVERSITY FARM, Davis, Cal.,

last year bought an

Ideal Green Feed Silo

and tried it out in actual use beside others, including a concrete, a resaw and another stave silo.

THEY RECENTLY PURCHASED ANOTHER **IDEAL GREEN FEED SILO,** which is the best evidence needed of their judgment of its quality and efficiency.

THESE TWO IDEAL GREEN FEED SILOS are used to help make a profit in their farm operations and were purchased out of their farm income.

THE MEN IN CHARGE are businessmen and know a good thing when they see it.

WHY NOT PROFIT by their experience and order your Ideal Green Feed Silo now.

SALE OF

Jerseys at Auction

Modesto, Cal., Sat. May 6, '16

Big Foundation Sale

35 Registered cows.
85 Un-Registered cows.
5 Registered bulls.
Every Animal Guaranteed Free of Abortion and Tuberculin Tested.

IF YOU WANT FOUNDATION REG. JERSEYS, ATTEND THIS SALE. Every cow a producer and of the best breeding.

IF YOU WANT AN UNREGISTERED HERD OF HIGH PRODUCERS, ATTEND THIS SALE. The breeding of the unregistered cows in this sale is practically the same as the purebreds. They have been in our milking herd and are producers.

IF YOU WANT A HERD SIRE ATTEND THIS SALE. We are only offering a few high-class sires, among them the great proven sire, **Dos Rios Pogis,** whose daughters can be seen sale day.

IF YOU WANT HEALTHY CATTLE ATTEND THIS SALE. Every animal sold is tuberculin tested and guaranteed free of abortion. Most of them are fresh or in calf to our best bulls.

In order that we may better provide for your comfort and for auto room to and from the sale, we request that you advise us in advance what time you will arrive at Modesto.

CALIFORNIA HOG BOOK

Every hog-breeder in the State should have a copy of this book handy to refer to in cases of emergency. Every day the practical side of the book will help you. The author, W. S. Guilford, is a swine breeder, and he tells just what you want to know when a difficulty presents itself. The book contains 256 pages of text, besides many full-plate illustrations. Tells how the successful breeders feed and handle their hogs.

Price, $2.00 Postpaid.

PACIFIC RURAL PRESS, Publishers

Big New Purebred Berkshire Ranch.

[Written for Pacific Rural Press.]

"They are spending lots of money on the Sierra Madre ranch," was the remark of various farmers in the Lancaster district when a Pacific Rural Press representative visited Antelope Valley, Los Angeles county. We found the money being spent very economically, reclaiming 240 acres from the sagebrush, on which to grow purebred Berkshires and all the feed for them.

The job was undertaken last fall, when Russ Avery of Los Angeles, J. K. Miller, and J. E. McIntosh of Coachella valley combined their capital, brains, and brawn for the task. They already had about 300 hogs of unknown degree, but they wanted something worth while.

Getting High-Class Stock.—Up at the World's Fair, they bought the boar Ames Rival 106th and the sows Winona Lee Laurel 4th and Columbia's Model.

The boar had been brought from Iowa by Thatcher, Ennis and Williamson. He was farrowed Sept. 15, 1914; sired by Berryton Brummel C and out of Rival Lady 36th. He now weighs 400 pounds at 18 months in working condition.

Columbia's Model, born Sept. 25, 1914, was bought from G. A. Murphy of Perkins and was a second-prize winner at the World's Fair. She was sired by Baron Duke 194th which was bred by N. H. Gentry. She is out of Columbia 4th. Her grandsires are Baron Premier 84th and Starlight Royal. She has 7 fine pigs farrowed Jan. 5, sired by Ruby's King 4th, which was bred by F. W. White.

Winona Lee Laurel 4th was bred by F. R. Steel, sired by Laurel Champion and out of Lady Princess Lee 3rd.

Early in March, 1915, a purebred boar and 29 purebred sows were received from Chas. M. Talmadge. Most of the sows are bred. They are 10 to 14 months old.

The hogs are sheltered from cold north winds by tight houses with open south sides protected by sloping porches.

Hogs Balance Own Ration.—All of them, including 95 hogs now being fattened, but excluding brood sows, have free access to self-feeders containing ground grain (barley or kaffir) and tankage separately. Brood sows get but little grain.

Alfalfa Pasture.—Two hundred and forty acres are being fenced tight for the hogs. About 15 acres of alfalfa is now (Mar. 23) half knee high and being cross-fenced into four or five fields to turn the purebred hogs into. Mr. McIntosh wants to know if there is any danger in leaving them on alfalfa since they are not accustomed to it. There are other acres of alfalfa not so far along, and a large field recently leveled and sown, so that with this spring's planting there are 110 acres of this forage, all of which is to be cross-fenced and pastured. The self-feeders will be put into the pastures to supply grain and tankage ad libitum.

Twenty acres this spring go into feterita, 14 into wheat and barley, 8 into sudan grass. Everything to be raised on the place is to be fed there.

If a creamery is put in at Lancaster as is being talked up, purebred Holsteins will be added to the stock. Everything is to be purebred in the near future.

Irrigation.—About two miles of underground irrigation pipe have already been laid in four lines from the engine pump and reservoir. The pipe are glazed tile and concrete. The valves, etc., are Kellar-Thomason equipment. More are to be added.

ARE ACORN HOGS GOOD?

To the Editor: In a recent issue, under heading "Tuberculosis Hogs a Heavy Loss," you refer to the acorn hog as being on the undesirable list. If it is possible to use acorns at all in feeding to market hogs, kindly advise what time in the hog's life they may be used without putting the hog on the undesirable list. —G. W. P., Oakhurst.

[As a general thing a hog buyer is so suspicious of a hog which he knows has come from an acorn district that he doesn't want to buy him at all. There are, however, a great many hogs brought out of the acorn districts as feeders every year and after two or three months of good grain feeding they pass muster with the butcher. The principle is that they should be grain fed from the beginning along with the acorns to support the acorn fat. An acorn hog is otherwise so soft that it does not make even a medium grade of edible pork. Acorns are a good growing feed for hogs, when grain is fed with them; but the practice of letting the hogs run on acorns alone is surely not a profitable one. —Editors.]

LAMB FEEDING.

We all know, from our experiences in handling animals, how susceptible most of the domestic animals are to digestive disturbances from sudden changes of feed, water, and conditions of environment.

While on the range lambs eat the native grasses and have five to ten miles' exercise every day. When they are brought to the feed lots, conditions are all changed; they pile up in the restricted quarters and become overheated. The feed is changed abruptly. The feeder should always bear in mind that when he takes lambs from the natural conditions of the range and places them under highly artificial conditions, he is jeopardizing the health of his sheep and the welfare of his enterprise. The first month should be given to seasoning the lambs to their new conditions, and gains should not be expected, says a writer from the Colorado Agricultural College.

The crux of the whole matter is that heavy losses in feed lots are due, not to communicable diseases, but to bad judgment in feeding and handling. For this reason the losses are usually heaviest during the first month, and a change of feed, unwholesome feed, or sudden increase in the amount of feed, will mean more pelts on the fence.

To feed lambs without heavy loss and secure satisfactory gains necessitates eternal vigilance, experience and common sense, and there is no other business that requires more.

DE LAVAL

Stands On Its Record

FOR nearly forty years the De Laval Cream Separator has led in the cream separator field. It was the pioneer in 1878. It had a long start and has always held its lead. It has always led in every step of cream separator development and popularity, and more De Lavals are in use today than all other makes combined.

It has always been recognized as the closest skimming cream separator. That's the main reason why 98% of the world's creameries use it to the exclusion of all others.

Because of its cleaner skimming, ease of operation and wonderful durability, every De Laval user is a "booster" and the better its work is known in a neighborhood the more popular it becomes.

The better quality of cream it produces is attested by the fact that De Laval produced cream and butter have scored highest at every annual contest of the National Buttermakers' Association for twenty-four years and in every great representative contest for over thirty years. Last but not least, the De Laval was awarded the Grand Prize at the San Francisco Exposition in 1915 as at every other great exposition since its invention.

The creamerymen's choice can't be far wrong. The world's greatest dairymen and mechanical experts who act as judges at the great expositions can be depended upon to recognize real merit, and the fact that the De Laval is the choice of the majority of all cream separator buyers must mean a good deal to you. In your purchase of a cream separator can you afford to ignore these considerations?

is required with the

Krogh Deep Well Turbine Pumps

For bored or drilled wells from 10 inch inside diameter up; and for capacities of 250 to 3000 gallons per minute. Built for pumping from any depth to and including 250 feet. They are absolutely water balanced and are self-aligning. More water can be obtained from such wells than with any other type. Built in belted or direct motor driven types. If interested, write for Bulletin.

Krogh Manufacturing Company

San Francisco -- Los Angeles

Son of Segis Pontiac De Kol Burke

READY FOR SERVICE.

We are offering at a very low figure a splendid son of this coming young sire. Born March 6, 1915.

His dam has the following records:

Butter 7 days 26.41. Milk 605.5
Butter 1 year 755.40. Milk 20260.2

She is a daughter of Ignaro De Kol, ten of whose daughters have records above 20,000 pounds milk, including Aralia De Kol 28,090. Three nearest dams of this bull average 26.68 lbs. butter, 668.8 lbs. milk. Dam and sire's dam average 920.27 and 24,543 lbs. milk in yearly test. A full sister to his dam has produced 885 lbs. butter in one year.

Price and pedigree on request.

1st Prize 2-year-old Cal. State Fair 1914.
Segis Pontiac de Kol Burke.

JERSEY SALE TO BE DIFFERENT.

[Written for Pacific Rural Press.]

That the Rancho Dos Rios sale of registered and un-registered Jerseys near Modesto, Stanislaus county, is to be different from most auction sales is evident by the measures those in charge are taking to safeguard the buying public.

Not only is the offering almost entirely made up from their own dairy herd, which has been selected and bred for high production, but we are also informed by Ralph Watson, manager of the herd, that every animal which is sent into the ring will carry a guarantee to the effect that they are in perfectly healthy condition and free from both tuberculosis and abortion.

So far as we know this is the first time that buyers have been offered unregistered females at their own price carrying such a guarantee, and as both abortion and tuberculosis are serious factors with the dairymen of the State it seems certain that those who are in search of high producing animals will take advantage of this opportunity.

Mr. Watson informs us that plans are being made to care for a large crowd at the home ranch where the sale will be held. It is expected that many buyers from a distance will take advantage of the State Highway and motor to Modesto, whence it is but a short drive to the ranch.

Those from distant points who expect to travel by rail should notify Mr. Watson at once in order that accommodations may be secured in advance and also to insure ample provision for automobiles to and from Modesto.

Those who have not as yet received a catalog are requested to send for one at once in order that they may thoroughly acquaint themselves with the breeding of the registered animals before the sale.

ANGORA BRUSH CLEANERS.

To the Editor: What is the value of Angora goats on brushy land? Our 40 acres in the mountains is mostly covered with a heavy growth of blackberry, poison oak, greasewood, and buck brush which is rapidly taking what little pasture is left, from our cattle. Some of our neighbors have raised the common goat, but are unable to market the meat.—R. W. M., Napa.

[A regular business in breeding Angora "brush cleaners" has been carried on for 25 years by Mrs. M. Armer of N. M. For 13 years she has been selling young Angora wethers to one Missouri man who pays $1.75 to $2.50 each, turns them onto brush land, until they clean it up. He then shears them and sells the animals for as much as they cost him. Mrs. Armer keeps many of her goats in the mountain woods "where sheep couldn't live." All goats in New Mexico are now crossed with Angoras, says the lady; and she adds that when milk goats are crossed with Angora it is goodbye milk in the offspring except enough to bring the kids up to weaning age at 6 months. There are Angora breeders in California with whose methods we are not familiar, but we refer you to our advertisers.—Editors.]

Sheep pelts and wool are helping to keep sheep prices at extra high level in Portland, with few arrivals. April 5, 1915; $6.75-7 Apr. 5, 1914; Prices for lambs were $10-10.50 $7 a year before that, and $8.50-9 Mar. 30; $9-9.25 Mar. 5; $8.50-9 Apr. 5, 1913.

Tom—You're not turning as fast as Dad does, Mary.
Mary—No Tom, but we'll get all the cream any way with this lovely new machine. Dad says

"It Skims Clean at Any Speed"

That's what this marvelous new invention actually does.

A fixed-feed separator may skim clean if in perfect order and turned at just the ***right speed.*** But every member of the family turns the crank at a ***different rate;*** no one can maintain an even speed ***all the time***—it isn't human nature. Every old type separator has an ***unchanging inflow*** of milk. That's why it loses cream when not turned at exactly the right speed.

THE NEW SHARPLES SUCTION-FEED

Separator gets all the cream because it automatically regulates the inflow exactly in proportion to the separating force—always just right for perfect skimming.

The Suction-feed Separator delivers smooth cream of ***even thickness*** that churns out more butter of choicest quality. If you sell cream you can ***guarantee uniform density.***

You can increase the capacity of the Suction-feed by simply turning faster, and get through quicker if in a hurry. The new Sharples is the only Separator that can be hastened. You can easily pour milk from a forty-quart can into the low supply can. It's the largest found on any separator—and it's only knee-high.

The women folks prefer the Sharples because the simple tubular bowl is so easily cleaned. Has only three pieces—no disks to wash or to get mixed up. The tubular shape gives double skimming force.

The new Sharples is ruggedly built for hard service. It is neat, compact, runs easily and oils itself.

This wonderful machine will earn you a new dairy profit—without added expense. Our new free book, ***"Velvet" for Dairymen,*** fully describes the Suction-feed. Your copy is ready. Send for it today. Address Dept. 31.

DAIRYING AND DAIRYMEN.

The N. H. Locke Co. is erecting two stave silos at their dairy ranch near Lockeford.

Half a cargo of butter for Seattle and Montana was recently shipped from San Francisco.

The American Jersey Cattle Club offers $100 in premiums for the California State Fair, in seven premiums.

Murray and Jones have installed a six-unit milking machine on their ranch near Ceres. One man now milks and cares for 60 cows.

A Wisconsin dairyman who keeps 40 Jerseys on 40 acres and sells to a condensary made $72 per head in 1915 above cost of their keep.

The Sturgill Holstein herd at Salida is headed by a son of King Pontiac Netherland Segis, the herd sire for E. O. McClure of Modesto.

Madera creamery patrons recently imported six carloads of cows. The new irrigation district is encouraging greatly increased dairy production.

In a Michigan county cow-testing Ass'n eight Jersey herds produced butterfat at an average cost of 15.9 cents per pound. They averaged 314 pounds fat.

A registered Jersey herd in Imperial valley is 18 head belonging to R. S. Genet. He has recently sold two related bulls and is looking for one of St. Lambert stock.

A. C. Chappell of Turlock disliked to buy high-priced hay this spring, so he fed about 2 pounds middlings per cow per day. The cows kept up as long as his poor old hay lasted. When new hay come on and he quit the middlings, the cows dropped off considerably. A small feed of concentrates is needed.

Dairy farmers around Chicago have won their starvation fight for an increase from $1.33⅓ to $1.55 per hundred pounds. At one time there was danger of riots, as the supply became very short and city dealers thought they didn't have to yield. There was some rioting at country towns around Chicago.

The pricing of milk according to its food value is coming into fashion. The New York city department of health intends shortly to prevent sale of milk which contains less than 8.5 per cent of solids not fat. Dairymen of the future will have to use cows with records, thus considerably above the average. This can be obtained only by breeding stock which is known to produce such milk.

Guernsey records in the making on the Elliott-Brant Rancho in Los Angeles county showed the following results to April 15: Little Beauty II (2½ yr.-old), 209 days, 5,937.2 pounds milk 306.35 fat; Lois Valentine's Lad's Lassie (2-yr.), 289 days, 8,603.4 milk, 406.55 fat; Nerio's Elsie Granger (3½-yr.), 160 days, 5,210 milk, 276.17 fat; Polly Fisher (5-yr.), 146 days, 5,752.6 milk, 269.53 fat.

BEEF CATTLE.

The new disease called "septicemia" took 11 more calves in Kern county recently.

Two pairs of Hereford twins came in one night recently to J. A. Niles of Porterville.

Two registered Shorthorn bulls have recently been purchased from T. S. Glide of Davis by Mrs. C. Hamilton of Dixon. They will be used to grade up the beef herd now being established on the Hamilton ranch. In addition to the 400-acre home place, 2000 acres of range have lately been secured.

SWINE BREEDERS.

C. L. Buskirk, a Kansas Duroc breeder, is preparing to ship a herd to Imperial Valley and hold a sale.

Jacob Lorang of Imperial county grinds and wets the corn for his hogs. He believes that it takes ⅓ less to fatten them that way.

Fifty bred Poland China sows, including 44 spring gilts, sold for $7,125 or $142.50 each at the February sale of F. S. Sievers of Iowa.

Peters, Lamson and Walker of Devore are getting some fine pigs from Col. the King, the Duroc boar bought at P. P. I. E. from E. N. Manley of Neb.

The Kings County Swine Breeders' Ass'n last Saturday night re-elected M. Bassett president, Dr. J. A. Crawshaw vice-president, and F. D. Ross secretary-treasurer.

The hog show announced for El Centro May 26 and 27 is postponed to be combined with a general livestock show in the fall, under auspices of the Farm Bureau.

J. E. Thorp of Stockton has recently purchased five well bred Duroc Jersey sows with which he hopes to materially strengthen his herd. He states that he expects to show both red hogs and Jersey cattle in better condition this year than in the past.

Geo. A. Smith of Corcoran has recently purchased the Poland China boar Joker from Thos. Hunter of Ohio. This boar was first prize boar under six months at the Wisconsin State Fair last year. Mr. Smith is breeding this boar to a number of fine gilts sired by his herd boar Iowa Wonder, for early summer farrow.

W. I. Showler of Sacramento is establishing a herd of registered Duroc Jerseys on his ranch near Freeport, Sacramento county. He has five registered sows and a son of Defender of Kentucky for a herd sire. There are 130 acres in the ranch and he expects to eventually have nothing but purebred hogs on the place. S. W. Crawford is in charge of the herd.

C. B. Cunningham of Mills has recently bought a bred O. I. C. gilt sired by Wildwood Prince, grand champion at Iowa in 1914, and out of Lenora the 16th, the highest priced O. I. C. sow sold in 1915. The gilt recently farrowed 8 pigs sired by Wonder William which was sired by Wonder. Wonder has a reputation of getting more grand champion boars than any living O. I. C. sire.

F. W. White, the well known Berkshire breeder of Elk Grove, has an unusually attractive lot of open gilts and service boars which he is offering at this time. Mr. White's winnings at the P. P. I. E. in the aged sow classes created much comment and he advises us that some of these gilts and boars are out of the fifth prize sow at that show. He expects to put up a good show at Sacramento this fall.

Ben Garland of El Centro is taking extra care to keep the Duroc hogs on his ranch clean and healthy. His pig pastures open into a large bathing and drinking pool, which is boarded on the bottom and all sides with a slatted framing to keep the hogs out of the silt and mud. This slatted framing runs into the pool on a slope and extends 25 feet back from the edge of pool entrance to keep the wet hogs from wallowing on the banks and getting caked with mud.

R. H. Whitten of Los Angeles recently bought the Poland China sow Big Timm's Lady Wonder for his Terra Bella ranch. This sow was sired by Big Timm, grand champion at Nebraska State Fair last year. His pigs at the same show won 22 ribbons, 5 gold medals, and 2 silver trophies. Big Timm's Lady Wonder was bred to Black Big Bone 2nd, champion at Iowa State Fair last year at 17 months old. She farrowed four boars and six sows Mar. 23, all still vigorous. Mr. Whitten's herd boar is Supreme Wonder, a son of Pritchett's A Wonder and out of Defender Girl.

Ed. E. Johnson reports the sale to S. G. Owens of Madera of 21 sows, 8 of which are bred; also a boar and bred sow to Dr. Reckey of Oakland.

HORSES AND SHEEP.

Orland townspeople complain of sheep drivers leaving carcasses along the highway and streets.

Three cases of rabies and several of glanders were the only livestock diseases found in March in Kings county by Livestock Inspector Frank Griffith.

Hoveley and Doetsch of Imperial county are breeding four purebred Percheron mares to their imported stallion Havane, bought from Harold Bell Wright.

R. E. Blevins of Colusa and J. F. Mallon of Princeton are going heavily into sheep, having recently bought 2700 ewes and 6400 acres in Tehama county for range.

Losses of horses and mules from disease the past year are estimated at 1.3 per cent in Cal.; 10-year average, 2.1 per cent. For U. S., disease, 1.75 per cent; 10-year average, 1.95 per cent.

Contracting for fall lambs is going with a vim in the Rocky mountain region, one man having bought 52,500 Wyoming lambs at 7¼ to 7½ cents f. o. b. for September delivery to Ft. Collins, Colo., where they will be fed.

REGISTERED BERKSHIRES — Prize-winning stock. Sunnyside Stock Farm, Perkins, Cal.

Sheep shipments from Kings county included 23 cars to the East and 28 cars to San Francisco last week.

To bring horsebreeding in Austria to its former standing, the Ministry of Agriculture intends to buy 10,000 to 15,000 mares in North and South America. The "district agricultural alliances and societies" have been invited to submit lists of members who may want to purchase such horses.—Consular Report.

MISCELLANEOUS NOTES.

Congress is investigating charges that meat packers of the Central West are in combination to make undue profits from producers.

The Butte County Nat'l Bank is reported to have provided the prize money for the cattle, sheep, swine, and gardening divisions of the Butte County Spring Exposition to be held at Chico May 22-28.

The best fitted lot of young breeding stock offered for sale at the recent Shorthorn sale in Portland was the sixteen animals prepared by four students of the Animal Husbandry department of O. A. C.

The Ruether Cattle and Feed Co. of southern California have recently purchased a Williams Alfalfa mill which they will use to grind beet tops, bean straw, and alfalfa for beef cattle fattening. They state that they have put in this mill because of unsatisfactory experience last year in trying to fatten old cows having poor teeth or none at all.

THE HAY SITUATION TO DATE.

(Continued from page 523.)

practically the same as last year unless very dry weather prevents grain maturing. Conditions are favorable for a good medium crop of grain hay and a very good crop of alfalfa.

E. B. Spooner of San Luis Obispo reports that the grain acreage in that county is smaller this year than last and that about the same percentage will be cut for hay. The present indications are for a medium crop of grain hay, although it depends largely on the weather from now on. He states that more rain was needed at the time of his report last week.

Indications in Monterey county last week were that the grain acreage this year was much larger than last year and that a larger percentage would be cut for hay, according to Paul Parker of Salinas.

The feeling in hay circles of San Francisco is decidedly uppromising, one large dealer predicting that unless we have more rain at once, the grain hay crop will not be over 50 per cent, but this does not seem to be borne out by the above reports from the growing districts of the State.

SWINE.

50 HEAD OF SOWS bred to IOWA WONDER for spring litters. 60 head of gilts bred to JOKER for spring litters. 50 head of open gilts. 300 head of young pigs three to four months old, both sexes. These pigs are sired by IOWA WONDER, a son of A Wonder. Productive Feeding OF Farm Animals

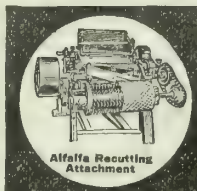
F. W. WOLL, PH.D

Professor of Animal Nutrition, University of California.

FIRST EDITION—1915

360 pages; handsomely illustrated. Cloth bound.



Prof. Woll has had long experience in the work covered by his book. Before coming to California a few years ago to take up his work at the University Farm, Davis, he was for years Professor of Agricultural Chemistry, University of Wisconsin. This book in a practical way covers productive feeding from a scientific standpoint. Every breeder of stock needs this work to make a success of his feeding operations.

Price, $1.50 Postpaid.

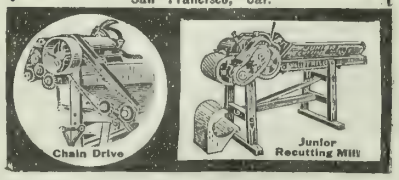
Look Here! Stock Raisers

Thousands of stock raisers are now saving ½ their feeding costs and filling their silos with ½ the labor cost and ¾ the power you use.



Smalley Silo Filler

Patented recutting attachment makes dandy Alfalfa Chop for fattening cattle, sheep, hogs and poultry. *Handles leaves, stems and all without waste or injuring color of the hay.* Sell your No. 1 hay and mill the *off-grades* for feeding. Make combination feeds from clover, rice straw, bean straw, pea vines, oats and rye, or dried corn stalks. Capacities 1200 to 2700 pounds per hour. 500 to 800 pounds of meal per hour can be made with Junior recutting Mill (operated with 6 to 8 H. P. engine.)

Grip Hook Table feeds cutter automatically, saving wages and board of two to three men on large sizes. Low speed, one pulley chain drive blower saves ¼ power cost of silo filling.

Blower independent of cutter. Fan speed increased or decreased without changing speed of knives. Send NOW for FREE Book.

Pedigreed Holstein Bull $250

I am now offering a very fine bull out of a high-testing dam, who was sired by King Pontiac Premier, one of the best sons of King of the Pontiacs, 165 A. R. O daughters. His dam's present record is 21.09 pounds average test, 4.11%, made at four years old. This record was made under very unfavorable circumstances and she will make around 25 pounds with next calf. On the sire's side the bull has the blood of Pietertje Hengerveld Count De Kol, 99 A. R. O. daughters; and dam Deutschland Creamelle, is out of Creamelle Vale, the former world's championship milk cow. This young bull is almost white in color and is ready for service. His high test breeding will count in your herd

Write or come and see him.

Veterinary Queries and Answers.

[Answered by Dr. H. B. Wintringham, Petaluma, Cal.]

[Subscribers wishing an immediate reply should send money order for $1.00. No charge for questions answered through this department. Name and address of subscriber must accompany each query.]

COW DOES NOT COME AROUND.

To the Editor: I have a Holstein cow that had a calf on Oct. 8, 1915, and cleaned well. Seems O. K. in every way, but up to date isn't bred. She has never shown any signs since she had her calf.—D. H. P., McFarland.

[Your cow has probably retained the corpus luteum in one of her ovaries. Manual manipulation is about the only way to rid her of the trouble. Have a qualified veterinarian perform this operation.]

HEIFER MISCARRIES.

To the Editor: I have a 3-year heifer apparently healthy. She miscarries her calf when 3½ months along. She aborted last April and again in December. None of the others have aborted.—Mrs. M. B., Los Gatos.

[Your heifer has contagious abortion. She will probably carry her calf after aborting a couple of times.]

EXTRA TEAT SORE.

To the Editor: A young cow has a small teat on the side of udder. It cracked open and became sore, is swelled a little and has scabbed over.—J. L. S., Lodi.

[Amputation of this teat is necessary. Have a qualified veterinarian do this.]

CATARRH AND SWEENY.

To the Editor: What can I do for a horse that has catarrh? Can it be cured? What can I do to cure sweeny?—D. F. C., Lemoore.

[Give this horse 5 grains potassium bichromate in solution three times a day. Better have your veterinarian treat the sweeny case.]

COW HAS DISCHARGE.

To the Editor: My cow lost her calf last Sept. and she never took bull since. A discharge runs out when she lies down. She seems healthy.—W. A. T., Gilbert, Ariz.

[Douche this cow daily with 1 dram potassium permanganate in one gallon warm water until all the discharge ceases.]

GELDING'S URINE DRIBBLES.

To the Editor: I have a 3-year-old gelding that for the last 3 or 4 months has had his urine dribble away from him a few drops at a time. When the trouble first came on he was being fed alfalfa hay; but does not improve after a couple of months in a Bermuda pasture. Is there a chance for him to get well, or must I lose the animal? Is it infectious?—A. J. S., Fowler.

[This condition is not infectious. Give potassium acetate in one ounce doses dissolved in water twice a day; also fluid extract nux vomica in dram doses three times a day.]

CALVES SCOUR.

To the Editor: Will you kindly advise me how best to cure calves of the scours and to prevent it? My calves are in the Yuma Valley, Arizona. The water is more or less alkaline and has a tendency to physic man or beast. We give our young calves whole milk the first two weeks, then gradually add separator milk until they get nothing but that. They have the run of an alfalfa patch, in which is a water trough, and can help themselves.—F. J. M., Angels Camp.

[There are many makers of vaccines to be given at birth which will prevent the trouble and also act as a curative agent after infection. These are given with a hypodermic syringe. Consult the advertisements of such makers in this paper or, better yet, have a qualified man attend to this work for you.]

COW GIVES GARGETY MILK; CALF HAS SWELLED JAW.

To the Editor: I have a cow which about every two or three weeks gives milk which appears to contain garget, at least the first milk drawn will be thick. Sometimes it is difficult to start. She will then appear all right for some time, when this will recur.

I also have a heifer calf about 4 weeks old. She has a swelling on each side of her jaw. This started on one side and then on the other. I have applied a blister a couple of times. This seemed to remove the swelling, but it has recurred twice on one side and now it has showed itself the third time on one side. Calf seems healthy and eats well. These bunches are evidently sore and occur on the lower jaw opposite the back teeth.—C. D. B., Lemoore.

[Give this cow 2 dram doses twice a day in water for several weeks. The lumps on the heifer require lancing.]

TEAT OBSTRUCTION; NAVEL FOUL.

To the Editor: Our cow has a growth between the teat and udder that interferes with the milk flow. We also have a calf seven weeks old that is apparently in good health and is lively, but has a swelling on its navel that has a foul smelling pus in it. It got stopped up and had to be opened. We have been using carbolized soapy water on it. What is the matter and what can be done for it?—G. E. W., Manton.

[This is a teat tumor and can be removed surgically. The calf should have this infected abscess cavity swabbed out with tincture of iodine twice a day until the discharge stops.]

SWELLING IN VAGINA.

To the Editor: I have a Jersey cow that had her third calf last August. Since that time she has shown a large round substance (large as a good-sized walnut) in the vagina, and sometimes it extends away out, and the more it extends out the larger it gets. It usually shows worse while she is lying down. She has had the bull three times and usually about a week after each time she has a very thick discharge and sometimes every day for a few days. She eats well and looks well otherwise.—M. E. F., Redwood City.

[This requires an examination. Call in your veterinarian.]

HARD TO MILK, GARGETY.

To the Editor: I read in a journal about using goose quills to open the teats of a cow hard to milk. I tried it about two months ago. The cow milks as hard as ever; her udder is apparently all right, but in the bowl of the separator is left caked milk.—J. H. A., Hughson.

[This is a very dangerous practice and accounts for the condition of the milk. Give this cow 2 drams potassium iodide in solution daily for a period of two to six weeks.]

Kaupke Bros. of Woodland have purchased the Hampshire buck, Peter Pan, which won first prize in 1913 at both the English Royal Show in England, and the International at Chicago. One of their lambs weighed 65 pounds at 65 days old.

The Book of Dairy Books

It's *the* book, because it's *the* authority on *the* breed—the beautiful, ever-paying Jersey.

This book, "About Jersey Cattle," goes way back to the beginning of the breed, shows how it was line bred and protected from mixture by law, and shows why it has developed into the most economic and most persistent milking of all breeds. It gives tests, yields, etc., proving that the Jersey is the *money* cow—the "Giant of The Dairy."

The book is free but worth a lot. Send a postal for your copy *today*.

Fattening Market Hogs.

Conditions to be considered before starting to raise hogs for market are (1) market demands, (2) available feeds, (3) measures against parasites and diseases.

[Written for Pacific Rural Press.]

Success in fattening hogs for market depends on the demands of the market, economy of feeding, and freedom from parasites and diseases.

Market demands include size, quality, and dressed percentage. Size and quality depend on feeds, age, and breeding. Dressed percentage depends on breeding and fatness. Economy of feeding depends on breeding, the kinds of feed possible to raise economically on the farm, and a short period between birth and sale.

A large proportion of California hogs are sold locally, and there the premium sometimes goes the other way.

Good Breeding, Early Marketing.—G. A. Smith of Corcoran sells locally at 250 to 326 pounds. On a bunch of 20 barrows 10 months old sold last winter averaging 326, he received a premium of ½ cent above the market price, "and they were the runts and culls from the breeding herd." Mr. Smith claims that they dressed out 85 per cent. They were pure breds.

A small breeder in Sonoma county, S. M. Patterson, fattens grades 250 to 300 pounds to sell locally at a year old. G. F. Wood of Stanislaus county fed a bunch of 19 barrows last fall, finishing at 250 to 270 pounds. S. F. Williams of Chico has fattened purebred hogs to 300 pounds at 8 months.

However, a market is more assured for a 200 pound hog. This is good economy for the feeder, because it costs considerably more per pound to add fat to such an animal than to one weighing 100 pounds. It is also fortunate because it shortens the time individual hogs are exposed to disease, and it brings returns on the investment that much sooner and oftener.

Size at an early age is a matter of both breeding and feeding. The purebreds or first crosses, uniformly beat the rest, if given a chance to develop their possibilities.

Having kept the pigs growing rapidly up to 125 pounds on feeds high in protein, they are in best condition to mix a lot of fat among their muscles and make 200 pounders at an early age. Then it is a matter of providing less exercise and feeds most easily digestible and somewhat higher in carbohydrates from which fat can be made. Experiments at agricultural colleges seem to prove that very little lean meat is added to a mature animal fattening; but purebreds are seldom mature when fattening begins.

Feeds and Breeding Determine Quality.—What to feed depends on what can be grown on the farm and what makes the quality of pork demanded. Some feeds make pork which does not get hard when hung up after butchering. A Texan recently told us how they let the hogs harvest peanuts until the found the market would not pay for the oily pork. Hogs fed alfalfa exclusively have greenish meat not attractive to consumers. A farmer in San Mateo county fed fresh fish from the ocean, and even the dogs wouldn't help eat one of the hams bought by Geo. Croley. Skim milk and alfalfa alone make an inferior pork. Mids in excessive proportion make soft fat.

The San Francisco packers buy hogs from districts where objectionable feeds are sometimes used, subject to condition after butchering. They quote prices on grain-fed hogs, and if the finishing period has been too short, the pork does not harden, and the price is fixed accordingly. Barley is recognized in Europe as making the best flavored pork—better than corn, though a little less of it. The sorghum corns are as good as Indian corn, and wheat makes about as much pork per pound. Alfalfa, skim milk, tankage, oil cake cocoanut cake, and similar high protein feeds are necessary to get the most value from the grain carbohydrates. While very little protein is added to the weight of a mature hog, enough of it is needed to supply energy for eating and the bodily functions, and to replace the wastes. When fattening begins at four to six months, as it can with purebreds, protein for growth also must be supplied. If not enough protein for these purposes is fed, the digestion is rendered less efficient and less fat is gained per pound of feed. Since palatability is a definite factor in digestion, and since one feed alone gets monotonous, a variety of feeds of the same class either mixed or given separately at different times, adds to the fat gained per pound.

All of the best feeds for pork production, except tankage and similar products, are grown easily and abundantly on most California farms. Even Indian corn is coming to recognition even as a dry land crop in coast valleys. The sorghums are especially adapted to the interior valleys where farmers are willing to prepare the seedbed and cultivate properly. Dairy cows in all parts of the State furnish skim milk, and alfalfa is grown as a dry land crop in many parts. Since this produces only two or three cuttings, a silo is necessary to preserve part of it for the dry months. Cull sweet potatoes, squash, dried wine grapes and second crop table and raisin grapes, wormy dried fruit, inferior rice, and many similar otherwise wasted products are nearly if not quite as good for fattening as grain. Fresh fruits, melons, potatoes, etc., furnish good succulence if judiciously used.

Breeding determines quality principally as it creates a tendency to mix fat among the muscles and assimilate the maximum nutrients with the minimum exercise, thus avoiding toughness.

Sheep losses the past year by disease, in Cal. are estimated by the U. S. Dept. Ag. at 2 per cent; 10-year average, 2.5 per cent. Losses from exposure past year, 2.7 per cent; 10-year average 3.6 per cent. For the U. S., disease took 2.16 per cent the past year; 10-year average, 2.48 per cent. Losses from exposure past year, 2.17 per cent; 10-year average, 3.11 per cent.

The Livingston Drainage District was voted on favorably by the Merced county supervisors.

HOW TO CARE FOR LATE-HATCHED CHICKS.

A great many people have the idea that late-hatched chicks are hard to raise, some even say "they are no good."

The chief reason for late-hatched chicks being classed as "no good," is because a few people try to hatch eggs that have been laid by hens that were forced with stimulants and heavy feeding to lay beyond their strength; also in some cases where the male birds were worked too long in breeding pens. Males should be changed at least once a month if we want strong chicks; and hens should be fed a good wholesome ration, but not forced with too much meat, mash, etc. If these things are looked after the late chicks are just as good as early ones.

Late Chicks Easier to Raise.—How any one can say that late-hatched chicks are hard to raise beats me, for I think it is much easier to raise late than early chicks. The trouble and expense of fuel is greatly reduced and much of the mortality.

Be sure not to feed too soon after taking from the incubator and for the first few days feed very light. The late-hatched chicks need more green feed than heavy foods and if this is kept in mind there will be no trouble. Lice and mites breed faster in hot weather, so it is a case of eternal vigilance to keep the brooders, houses, etc., clean and free from mites.

Spray for Brooders.—The very best and safest spray I know for chicken coops, brooders, and everything for small chicks is Kreso Dip No. 1. This is perfectly safe, and sure death to the mites. For lice keep a dust can handy and dust the heads of chicks once a week. If incubator chicks are kept from old stock they will not have head lice. But they must be looked after and if any appear get the insect powder box to work at once. If the brooding is by outside brooders turn them up to the sun every day. There is not anything quite as good or cheap as sunshine. Get the chicks out on the ground and keep the ground stirred up, every day pour a bucket or two of water on one little plot of land and next day stir the soil and watch the chicks enjoy it.

Late-hatched chicks must have shade; so if you have no natural shade, make some. It is surprising what can be done with a few gunny sacks, nails and baling wire. You can make shade for several hundred chicks in one hour with these handy things. Don't be short on shade, for if there is just a little all of the chicks will want it and will have it, even if they have to pile up on each other to get it. It is better to make enough while you are doing it so that the chicks can spread out luxuriously and grow. In warm weather, with sunshine, shade and moisture, they will grow with half the feed it takes during winter and early spring months.

Separate the Weaklings.—Pick out the weaklings or small chicks and put them in a run by themselves. You can feed them a little extra and they will soon catch up with the big ones.

Chicks hatched as late as June 30 can be raised so well that they will lay in December and cost about half what it costs to raise early-hatched chicks.

Another thing in favor of the late-hatched chicks is that they will not go into a molt after laying a few eggs. When they commence to lay it is for the season; provided, of course, that you feed them.

VALUE OF CHICKS SIX WEEKS OLD.

To the Editor: With selling price of 15 cents for day-old chicks, what should be the price of them at six weeks of age if given very best care, housing, and feed?—V. P., Dixon.

[Answered by Geo. H. Croley.]

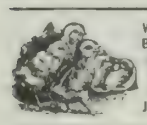
[Years ago, when the "broiler route" was boomed as the sure road to easy money, it was customary for the enthusiast to figure thus: The chicks would eat one pound of feed the first month, two pounds the second, and three pounds the third month, resulting in a two-pound broiler that would sell for not less than fifty cents wholesale. As a matter of fact, different lots of chicks will vary considerably in the amount of seeds, grain, meat, and meals consumed during the first six weeks. Much depends on the amount of greens and vegetables supplied. As a rough basis for our purpose, let us estimate the cost of feed at six cents. Our correspondent emphasizes regarding the best of care and housing and as this special service is worth liberal compensation, it should be fair to add an additional ten cents for that. On that basis, these chicks at six weeks of age should be worth about thirty cents each.]

JACK-RABBIT CHICK FEED.

To the Editor: Tell the best method of preparing jack-rabbits for poultry food, especially for chicks.—E. V. S., Lemoore.

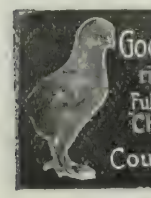
[Answered by Geo. H. Croley.]

[Jack-rabbit meat is not good for chicks until the chicks are at least three weeks old. Before that age, ground bone, with a very little meat attached, is a better form of animal food. When used for poultry food, jack-rabbit meat should be well cooked to destroy any tape worms, and to facilitate removing any great surplus of fat. An abundance of animal fat interferes with the digestion of mature and growing fowls, as well as of chicks. If one has a very large kettle in which to cook the rabbits, they should be boiled in as small an amount of water as possible. When cold, the cake of fat can be moved from the top. The thick soup could be used in a moist mash. The meat and bones, if ground in a green bone cutter, would be better than the meat alone, but if there is no means of grinding them the meat may be separated and fed in a mash. Fowls do better if the meat is fed with other material. Under very favorable weather conditions, the rabbits could be dressed, stripped, and dried similar to jerkie, and then cooked as wanted. The experience of successful poultrymen has demonstrated that it is unwise to feed raw meat to fowls of any age.]



LIMBERNECK KILLS LAYERS.

To the Editor: Please give information as to limberneck. I lost twenty-two nice fat laying hens all in one day. A neighbor says it is caused by a poison bug or some kind of poison. Is that so, or is it a disease?—W. G., Santa Margarita.



[Answered by Geo. H. Croley.]

[Limberneck is caused by serious intestinal disturbance due to indigestion, colic, intestinal parasites, or to ptomaine poisoning which affects the nerves that control the neck muscles, allowing the head to fall on the ground between the feet. In nearly all cases it is due to ptomaine poison and it most frequently occurs among flocks that are fed table scraps. Another source of infection is putrid meat, maggots, or worms that have become infected, particularly when these are found by the fowls in heaps of rubbish, rotten straw, or other heated and decaying vegetable matter. In order to save the fowls,

FLORAL CORNER.

[By Geo. N. Tyler, Los Gatos.]

Dahlias.—It is time now to plant dahlias. They need a moderately enriched soil and should be planted where they are sheltered from strong winds, and if they have shade from the hot afternoon sun, so much the better. If you plant the tubers, make a hole six inches deep, drive a stake about four feet long down on the edge of the hole, tack the label or name of the variety to the stake, put a little clean sand in the bottom of the hole and lay the tuber slanting towards the stake, with the eyes up; put a little more sand around the tuber and then cover with about two inches of soil. Give a good watering and, as the eyes grow, fill in the earth level. The object of the sand is to prevent any green manure from coming in direct contact with the tuber. Allow only one stalk to grow from a tuber and after it has made four leaves, pinch out the top, and a stalk will grow from the axils of the leaves.

If you wish to grow flowers for exhibition purposes, put the tubers in a warm place so they will sprout like potatoes, cut off these shoots and treat them the same as any cutting. Put them in three inches of sharp sand, in a warm, shady place, and keep them well watered until rooted. Plant them out and shade for a few days until they get established, grow these to a single stalk, and when they show flower buds disbud, so as to throw all the strength of the plant to the flower. You can increase your tubers by this method, as the plants make tubers for the following year.

After the tubers are rooted and plants show buds, give them a two-inch mulch of half-rotted manure, and water through this manure. The secret of growing good dahlias is plenty of water—soak them every day and also spray the foliage in the forenoon. If you want extra large flowers, give liquid manure every other watering, and once in ten days give nitrate of soda, one pound to fifty gallons of water.

You can put in cuttings now of all green house plants, such as begonias, coleus, etc.

If you have small greenhouses or conservatories, the glass should have a good shading; use coal oil and white lead, or gasoline and white lead, or whitening and water, so they can be removed easily in the fall.

Plant cosmos now; stake them when you plant them. All of the tender annuals can be planted now.

Ferns, both in the green house and outside, are making strong growths now and should be sprayed every day. If any in the green house require repotting, now is the time to do it. Make a compost of three parts leaf mould, one part loam, and one part sharp sand. Give thorough drainage, and plant loosely in the pots; do not pack the soil.

RECIPES FOR RAISIN DAY—APRIL 28.

Quick Raisin Bread.—Sift together 3½ cups whole-wheat flour, or 2 cups graham and 1½ cups white flour, with 3½ teaspoons baking powder and 1 teaspoon salt. If sweetened bread is liked, add ¼ cup sugar. Work in 2 tablespoons butter and add one cup seeded raisins cut in halves. To 1 beaten egg add 1 cup milk and add gradually to make soft dough that may be handled easily (add more milk if needed). Press dough into well-oiled bread pan, cover with oiled paper, let rise twenty minutes and bake in moderate oven about one hour.

Raisin Cream Cookies.—Beat 2 eggs until light, add 1 cup sugar, ⅔ cup chopped seeded raisins and beat thoroughly. Then add 1 cup thick, sour cream in which 1 teaspoonful soda has been stirred, 1 teaspoon salt, 1 teaspoon vanilla, 3 cups flour with 3 level teaspoons baking powder. Chill the dough, roll ¼ inch thick, sprinkle lightly with shredded cocoanut, press in gently, cut into shapes desired and press seeded raisins in center of each cookie. Bake on buttered sheet in moderate oven.

DYEING.

To make white lace any desired color, put tube oil paint into gasoline and stir until dissolved, then try a sample of the material. If too dark, add more gasoline, or if too light, more paint.

Dip the article up and down until evenly wet all over, shake and air thoroughly. A little pressing on the wrong side helps freshen it. This same method of dyeing is also good for ostrich feathers and works like a charm on artificial flowers.

FILLING PRESERVE JARS.

Use a gravy boat in filling jars with jelly or preserves. It is easily dipped into the hot kettle of fruit or liquid by means of the handle and the long mouth fits into a jar of almost any size and thus prevents spilling and all the stickiness attached to such work.

SALTY SOUP.

If, by mistake, you get the soup too salty, add a few slices of raw potato and cook a few minutes longer. Upon removal of the potatoes you will find that they have taken up the excess salt.

LIMBERNECK KILLS LAYERS.

(Continued from page 530.)

one or two teaspoonfuls of oil of turpentine in the same amount of sweet oil to mature fowls, or a proportionately smaller amount to chicks. Follow in thirty minutes with two tablespoonfuls of ginger tea prepared from two teaspoonfuls of powdered ginger in a cup of warm sweet milk; repeat in an hour if it seems necessary. After twelve to twenty-four hours feed boiled rice lightly salted. Follow this with raw potatoes or beets. Another remedy: Mix equal parts of tallow (or lard), mustard, ginger and red pepper; divide into pills about the size of a large pea; give one pill at a dose and repeat in two hours if necessary.]

HENS WORK OVER-TIME TO HATCH CHICKS.

To the Editor: On evenings of March 1 and 2, I set 36 Rhode Island Red eggs that did not hatch until March 22 and 25, but result was 28 chicks. I also set 12 eggs of same breed on evening of March 7, but now on the evening of March 28 there are no chicks. What is the cause of this delay?—A. L., Raisin.

[Answered by Geo. H. Croley.]

[There are numerous causes for delayed hatching. The following are some of the reasons: Eggs more than two weeks old; hens stay off nest longer than common; the temperature of some hens is below normal; mites, ticks, or fleas in nest that annoy the hens; and too much loose material in nest that allows heat and carbonic acid gas to escape.]

WANTED—FARMER'S FORMULA FOR WINTER EGG FOOD.

To the Editor: I would like a formula to use when feeding hens for heavy egg production during the winter months. I would like to hear through the Pacific Rural Press from a farmer who has nothing to sell.—Mrs. A., Exeter.

[Will some farmer who has solved the problem of heavy egg production in winter, tell our readers how he does it?—Editors.]

SOUTHERN CALIFORNIA GUERNSEY PIONEERING.

(Continued from page 522.)

the lip by an ingenious motor-driven machine. It is then put into a refrigerator room until taken out for delivery to the five regular city customers who take all the product of the dairy—wholesale at retail prices.

Empty bottles are washed with a mechanical brush machine which cleans two bottles at once, inside and outside. They are then stacked onto cars and run into a concrete sterilizer for a half hour at 180 to 200 degrees heat under 80 pounds steam pressure.

The 15 cows on test are milked at 6:30 a. m. and at 2:30 and 10:30 p. m. The last milking is separated for cream.

"The secret of keeping milk is to produce it clean and keep it cold," says Mr. Brant. "And the secret of getting plenty of the best milk is to breed from cows and bulls with good records."

Roosts should be so placed that the fowls will not be required to do much jumping.

MRS. BEST'S LETTER.

My dear Friends:

Last week in this department was suggested the idea that as city dwellers went to the country for their summer vacations, that it would be fine for country people to come to the city for their summer outing. The Southern Pacific Ry. Co.'s announcement in this issue of special rates during the summer will help along the suggestion. San Francisco has a most bracing summer climate, which is doubly welcome to the dwellers in the warm interior valleys—in fact, any of you contemplating a summer trip to "The City," as we who live around the bay affectionately call it, should bring extra wraps and possibly heavy underwear. San Francisco being a city of hotels, there is no difficulty in finding rooms, or room and board for whatever sum you wish to pay. If you have no acquaintance with hotels, you can get all information desired by writing the Hotel Association, 704 Market St. A satisfactory way is to take rooms and get your meals wherever you happen to be. The meals can range from breakfasts at the cafeterias, where the price of everything is plainly stated and a most reasonable meal can be secured, to dinners at cafes, known all over the country, and correspondingly high prices.

Of special interest to women are the big stores, where under one roof you can find everything you use in a home, and of very great interest, the fact that all of the big stores have summer sales in all the departments, at which time you can always make a substantial saving and in some cases, buy for half the original price of the article. This is true, not only of dry goods stores but also of furniture stores, music houses, shoe stores, furriers and the like.

The churches, with their celebrated pastors and fine music, the theatres and movies offer a treat to all of you, while across the bay in Berkeley is the State University, where perhaps you have a son or daughter, or if not now, will have in the future. They are doing a wonderful work there and turning out young men and women who will be leaders in the community in which they live.

Of course, the men of your family will enjoy seeing some of the things that interest you, but they do not need to be confined to that, for San Francisco is headquarters for many lines in agricultural markets, such as the Almond Growers' Exchange, Cal. Dried Fruit Exchange, Dairy Exchange, the Grain Exchange, wholesale markets for vegetables and fruit, large stock yards and packing plants. Investigation along those lines is worth dollars and cents to a farmer. San Francisco Bay is wonderfully interesting with its ferry boats, and usually a battle ship or two and its other shipping. The dry docks at Hunter's Point are well worth making a trip to see and from there along the water front back to the Ferry building may be found the great ocean liners, large iron and ship building plants, and many other interesting sights. Then, too, there is the fishing center at Meiggs Wharf. If your time is not too limited, a trip to Mt. Tamalpais and the Muir Woods is by all means advisable—they are both trips you will never forget. Also there is in the city, Golden Gate Park, the Civic Center, Chinatown and scores of other places of interest. Oakland also offers many attractions and some of you may wish to stay there and cross the bay daily for the pleasure of the ferry trip.

For a change, for pleasure, for profit, we would suggest to those of you who live in the great valleys or in the mountains that a few weeks spent in the cities around the bay would be profitable and result in pleasant memories. If this department can be of further service to you in this matter, do not hesitate to write to Yours devotedly,

Rosabella Best.

DRYING OF CURTAINS.

If you hang your curtains on a line to dry, try putting them over double and you will find they will not pull out of shape as badly as when hung by the edges.

If you have no curtain stretcher, a clean plot of grass and a box of toothpicks helps solve this problem. Pull the curtains carefully into shape and pin down with the toothpicks. When dry, they should be ready to hang. This applies only to white curtains—ecru curtains should be dried in the shade after careful washing and should have steeped tea added to the rinse water.

FARM HOUSES.

City houses must of neecssity conform to the amount of ground space available, but that does not need to apply to houses built on farms. There, where land is not bought by the foot, all sorts of artistic styles can be indulged in at no more expense than the old style four straight walls. Wide houses with generous porches, set well back from the road and approached by a curving driveway bordered with trees make an attractive place to the passerby as well as a joy to the fortunate owner.

USE OF THE FORK.

Almost all foods are eaten with the fork, even including peas, and other dishes of semi-liquid consistency. In eating, the fork should be used in the right hand, with the tines up—the only time it is used in the left is when it is assisting the knife in the cutting of meat. Use the fork for the cutting of salad and pie or pudding. The knife is only used for meat or the spreading of butter on bread.

WEED KILLER.

A subscriber sends in his plan for keeping paths in gardens or lawns free from weeds. Take five ounces of powdered arsenic and one gallon of water, boil the arsenic and water together for several minutes, stirring well. To this, add two gallons of cold water and a half pound of soda. Apply on paths when perfectly dry.

CHAIR TIPS.

Pieces cut from old rubbers, felt or linoleum and glued to the ends of chair legs will save oiled floors from marks and insure less noise in a busy household.

"Come on! Come!" said a gentleman to a little girl at whom a dog had been barking furiously. "Come on! He's quiet now." "Ah, but," said the little girl, "the barks are in him still.

"How are you getting on with your new motor-car?" "Oh, I'm all right. But I'd feel a lot more comfortable if the streets were not so full of careless or inexperienced pedestrians."—Star.

PUSSY'S WINTER COAT.

In winter when the air is chill,
And winds are blowing loud and shrill,
All snug and warm I sit and purr,
Wrapped in my overcoat of fur.

In summer quite the other way,—
I find it very hot all day,
But human people do not care,
For they have nice thin clothes to wear.

And does it not seem hard to you,—
When all the world is like a stew,
And I am much too warm to purr,
I have to wear my winter fur?
—Oliver Herford.

PIGGY CLOVER-LEAF.

Barbara and Ned were playing by the stone wall down in the orchard corner.

"Here's a four-leaf clover," said Barbara, holding up a cluster of green leaves she had found in the grass.

"They're nice things to find," declared Ned. "People used to believe that something good was going to happen as soon as you found a four-leaved clover."

"That's fairy stories!" retorted Barbara. "Something good is always happening, and what difference could the clover make? Anyway, this looks like a place where good things would just have to happen, doesn't it, Ned?"

The two children had never known much about the country until this visit to Mr. Dean's farm, and they thought this corner of the orchard was like a bit of fairyland.

"I wish I could see a fellow about a foot high looking at me from behind a burdock leaf," said Ned, rolling over on the grass. He had been reading about such happenings as that in the book of fairy stories which lay on the ground beside him.

"Or an elf baby asleep in a flower," added Barbara, peeping into a big buttercup. "But I'll tell you what I'd like better than that, Ned—some real live pet that we could play with. We've got acquainted with lambs and calves and chickens since we've been here, and now I'd like some new kind of pet, but I don't quite know what."

"I hear a funny noise," cried Ned, sitting up suddenly.

"So do I," whispered Barbara.

As they listened they heard it again, an odd gruff little noise like an odd gruff little voice talking to itself. It came from behind one of those big burdock leaves.

They crept nearer and Ned lay down flat in the grass to look behind the largest leaf. The leaf was almost as large as Barbara's white apron and it hung quite to the ground from the top of its tall stalk.

"Sh!" whispered Ned. "Stoop down, Barbara—there, can you see him, standing behind that leaf?"

Barbara had knelt down beside Ned, and her mouth made itself into a round "Oh!" as she looked.

Then the gruff little voice spoke out in a frightened way. There was a white flash and something shot out of the burdock thicket and scurried away down into the field.

"He's scared; we mustn't chase him," cried Ned. "But we'll just see where he goes, or he may get lost."

At that moment a big clumsy puppy came rushing out of the barn near by. He spied the little white runaway and was off after him at full speed.

"Oh, oh, Duke won't know any better than to hurt him if he catches him," cried Barbara, and the two children ran after the dog.

The little runaway scampered down into the low part of the field where the waters of the frog pond were rippling clear to the pasture fence. When he came to the edge of the water he stopped. The dog was not far behind him and the little fellow was very much afraid of that big barking creature.

"Here, Duke, here! Stop that!" called Ned. "You'll drive him into the pond, you bad dog."

Duke stopped short at this, but it was too late. The little runaway had plunged into the water and was swimming bravely across the pond. When he reached the other side he slipped through the pasture fence out of sight. Duke stood at the edge of the pond, wagging his tail and looking across the water as if he would have laughed if he had known how.

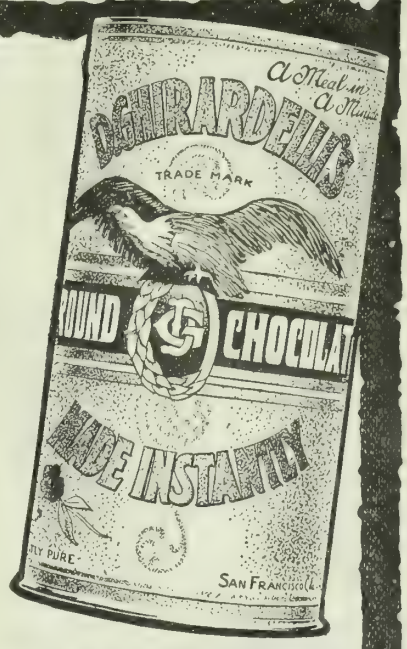
"Who would have thought that little runaway could swim like that?" he seemed to be saying to himself.

Barbara and Ned ran around the edge of the pond and slipped under the pasture fence. They found the little runaway shivering under a clump of ferns, and, after a good deal of trouble and much creeping about in the brush, Ned caught him and wrapped him up in his sweater.

"Look," cried Barbara, "he isn't a bit afraid, now he sees we are going to be good to him. Oh, Ned, isn't he just a dear!"

"He's the littlest pig I ever set eyes on," said Ned, who had been in the country more than Barbara had, and so knew a pig when he saw one.

They carried the little fellow home to Mr. Dean, who had been hunting for him all around the barn.



"I put him in a barrel and he tipped it over and ran away," he explained. "Now, if I make him a pen down in that corner of the orchard where you like to play so much, will you carry him milk and look after him every day while you're here?"

"We'd just like to!" cried Ned, and Barbara added, "If you haven't thought of any name for him, Mr. Dean, I'd like to call him Piggy Clover-Leaf, because, you see, he happened right after we found the four-leaved clover."—Zion's Herald.

"Father, what is a veterinary surgeon?" "One of those fellows at the Pension Office, my son, who examines the veterans for pensions."—Record.

Pacific Rural Press Market Report

PRICES QUOTED AS PAID TO PRODUCERS.

San Francisco, April 19, 1916.

WHEAT.

Outside markets still show some firmness, with rather unfavorable crop prospects in many districts. Locally, however, there is very little demand, and spot values are inclined to easiness, California Club being lower.

Cal. Club, ctl.	$1.57½	1.65
Northern Bluestem.	1.90	@1.92½
Northern Red	1.85	@1.95

BARLEY.

Both feed and shipping have dropped off again, as the spot grain receives very little attention, and some holders have become anxious to effect sales. Supplies, however, do not appear to be very large.

Shipping, ctl.	$1.37½ @1.40
Choice Feed, ctl.	1.32½ @1.35

OATS.

Extreme dullness has characterized this market for some time, and there is hardly enough business to establish definite values. Offerings are not excessive, however, and the old range of prices is allowed to stand.

Red Feed	$1.35 @1.37½
Red Seed	1.45 @1.65
White	1.45 @1.50

CORN.

Eastern Yellow is unchanged, with about the normal demand in this market. Egyptian, etc., are in very fair demand for feeding, and bring about the prices formerly quoted, though local conditions in producing districts vary too greatly for the city market figures to apply generally throughout the State.

Eastern Yellow, ctl.	$1.80 @1.85
Milo Maize	1.40 @1.45
Kaffir	1.60 @1.65
Egyptian	1.50 @1.57½

BEANS,

The bean situation shows no very marked change, though there is a little more inquiry in some lines, and conditions are more favorable for a maintenance of values on about the present level. The demand has been mainly for small whites thus far, this variety having again been marked up. Pinks remain dull, and the general list is quiet, but with less easiness than has been noted in the last few weeks.

(On wharf, San Francisco.)

Bayos, per ctl	$4.50 @4.60
Blackeyes	2.90 @3.00
Cranberry Beans	4.65 @4.75
Horse Beans	3.00 @3.25
Small Whites (south)	6.10 @6.20
Large Whites	5.75 @5.90
Pinks	4.20 @4.30
Limas (south)	4.35 @4.45
Red Kidney	6.50 @6.75
Mexican Reds	4.50 @.465
Tepary Beans	4.00

SEEDS.

The buying season in all lines quoted is now practically over, and the market is quiet, with light offerings and values nominally as before.

Melilotus Alba, lb.	23 c
Melilotus Indica	6 c
Bur Clover	11 c
Oregon Vetch	5 c
Soy Beans	6 c
Canada Peas	5¼ @ 6 c
Alfalfa, per lb.	22 @24 c
Sudan Grass	40 c

HAY.

Arrivals of new alfalfa since the first car came in have been light, but larger shipments are expected very soon, and there is a good demand, with dealers looking for all they can get for early delivery. Old alfalfa is well cleaned up, and little more than nominal in value. Arrivals of hay are keeping up fairly well, and with very little demand in the local market values here show no great strength. Stocks in the country, however, appear to be well cleaned up, and there is a demand for Hawaii and north coast ports which will account for a considerable tonnage if space can be secured on vessels. The weather has been very bad for the new crop, although some districts still seem to be in fair shape. The hot winds have had a very bad effect in many localities, however, and the grain hay everywhere needs rain. On the other hand, rain at this time would probably cause material loss to early alfalfa and volunteer hay.

No. 1 Wheat	$13.00 @16.50
No. 2	12.00 @14.50
Tame Oats	12.00 @18.00
Wild Oats	12,00 @14.00
Alfalfa	12.00 @15.00
Stock Hay	6.50 @ 8.50
Straw, per bale	.25 @ .40

FEEDSTUFFS.

There is nothing new in this department at present. The general demand is not so active as it was a few weeks ago, but values are well maintained.

(Wholesale prices, per ton, carload lots, San Francisco.)

Beet Pulp, per ton	$22.50 @23.50
Alfalfa Meal, per ton.	20.00 @21.00
Alfalfa Molasses Meal per ton	21.00 @22.00
Bran, per ton	24.50 @25.50
Oil Cake	Nominal
Cocoanut Cake or Meal	23.00 @25.00
Cracked Corn	40.50 @41.50
Middlings	33.00lb34.00
Rolled Barley	29.00 @30.00
Tankage	45.00
Rolled Oats	29.50 @31.00

VEGETABLES.

Prices in several lines are holding up very well, especially such goods as are brought from distant points. Florida eggplant has been marked up sharply, and peppers also are higher, while Mexican tomatoes are holding their own. Few have yet appeared from California points. Cabbage is between seasons and high; celery is all cleaned up, and lettuce shows a slight advance on light arrivals. Offerings of good asparagus also are comparatively light, as a large part of the crop is being taken for Eastern shipment and canning; while some trashy stock sells below quotations, the better grades have advanced. Artichokes also are higher, with large stock hard to find. Beans have dropped sharply, and peas and rhubarb are rather easy.

Cabbage, ctl.	$1.25 @1.50
String Beans	12½ @25c
Peppers, bell, lb.	25 @30c
Rhubarb, box, Bay	50 @65c
Asparagus, box	1.75 @2.25
Artichokes, doz.	40 @50c
Lettuce, small, crate	1.00 @1.25
Eggplant, lb.	15 @30c
Peas	3½ @ 5c
Tomatoes	2.50 @3.00

POTATOES AND ONIONS.

New potatoes are arriving in good shape, and move readily at the former prices. The crop is considered about normal in the river district. Old stock shows no further change, with a rather quiet demand. Oregon onions have been marked up, while Australians are easy, with another good-sized arrival.

New Potatoes, ctl.	$2.50 @2.75
Oregon Burbanks	1.75 @2.00
Delta Burbanks	1.25 @1.75
Sweet Potatoes, ctl.	2.50 @2.75
Onions, Delta, ctl.	1.25 @1.50
Onions, Oregon	1.50 @1.60
Australian	3.25 @3.50
Garlic, per lb.	8 @ 9 c

POULTRY.

Ordinary dressed hen turkeys are lower, though choice stock still brings former prices. Hens are easier, with a material increase in Eastern offerings, while fryers are quite firm. Ducks have been marked down a litle, while Belgian hares are higher.

Turkeys, dressed	24 @28c
Live Turkeys, lb.	20 @22c
Broilers, 15 lbs. to doz. and less, lb.	30 @33c
do, over 15 lbs. to doz.	35 @36c
Fryers	35c
Hens, extra, per lb.	21c
Small	20c
Smooth Young Roosters, per lb.	25 @30c
Squabs, per doz.	2.00 @4.00
Geese, per pair	2.25 @3.00
Ducks, young, lb.	19c
Old	16 @17c
Belgian Hares	11 @12½c

BUTTER.

Butter has fallen rather sharply during the week, standing now but little higher than a year ago, and local dealers believe that normal prices will soon prevail, as producing conditions are favorable and the recent high prices have stimulated production. Local buying has been much less active, and there is less shipping demand along the Coast. Some butter is still going East from country points, but buyers there also show less eagerness, as their usual sources of supply are making better deliveries. There has been some European export business, but not enough to be a continuous factor in this market; while little if any Australian demand is expected. There will accordingly soon be a surplus for storage, and it is doubtful if the storage operators will be willing to pay more than last year.

	Thu.	Fri.	Sat.	Mon.	Tu.	Wed

DECIDUOUS FRUITS.

A few raspberries are coming in and find a fair demand as quoted. Strawberries are arriving freely, and prices on Watsonville stock have been marked down, though choice offerings still command fairly high prices. The best Southern stock is

PRUNE AND APRICOT GROWERS COMPLETE ORGANIZATION DETAILS.

Prune and apricot growers will get all that their fruit sells for, less 5 per cent to pay operating expenses. At delivery to the packing house, they will get 4 cents basis advance on prunes and 8 cents advance on apricots. This is the plan worked out in detail for the state-wide co-operative organization, by representatives of the Growers' Information Bureau and of local organizations in Santa Clara, Sonoma, Napa, and Sacramento valleys, who met April 19 in State Market Director Weinstock's offices. The 5 per cent is to pay operating expenses, a big advertising campaign to increase American consumption, and stock dividends which shall never be over 6 per cent.

The proposed organization is to determine statewide standards of quality, making no distinction for the district in which produced. It will develop markets and sell fruit at the highest possible price, returning to the growers all except the 5 per cent. It must have $750,000 capital subscribed and control 75 per cent of the bearing acreage of apricots or prunes or both before March 1, 1917, and before it can do business. Local organizations will be asked to sign up the crops of their members. All other individual growers will soon be visited by canvassers for capital and fruit contracts. Meetings will be called by school districts for the same purpose.

Stockholders will elect 24 trustees and the Sate Market Director will appoint one to keep impartial supervision.

Eastern brokers have written that if the organization will guarantee a minimum price to the trade, of standardized goods, they do not care what that price is, and will do business on a smaller margin.

Prune Crop.—Prunes are still dropping from the trees. A combination of estimates from the various sections puts the probable crop at 120,000,000 to 125,000,000 pounds for the State as against 170,000,000 pounds last year. Packers are offering 5½ cents basis for 1916 prunes.

Special Livestock Market Report.

A few grass cattle arrived last week from the southern part of the San Joaquin valley, but only a few cattle have been contracted for and growers are holding for higher prices. The Eastern markets continue high. With Mt. Diablo as a base line it may be said that anywhere north of that point rain is badly needed. There is a possibility that a continuance of the dry weather may crowd some into the feeders' ranks later

Although there have been plenty of sheep for the past month local concerns are expecting the supply to be pretty well exhausted in another two weeks. There are plenty of lambs and it looks as if this condition would continue through the coming spring and summer. Except for the one shipment previously reported there have been no shipments of lambs East and none are expected before the middle of May.

Hog receipts continue to hold up fairly well but there has been a big slump in fresh pork consumption for the last month on account of the warmer weather. Killers are working on dairy hogs almost entirely and are expecting better quality from now on, also better weights. The Eastern market on Tuesday, at Chicago, maintained a $9.95 top.

WOOL.

Wool is coming in from the country freely for storage. The shrink is said to be considerably heavier than was expected earlier in the year by most of the buying fraternity and as a result those who bought southern wools at the height of the boom are stung. More or less buying is reported but only at prices which buyers consider right. Prices in the East show a hardening tendency, although the volume of business is comparatively small and the mills are well supplied. The London sales closed about five per cent stronger on free long staple but defective wools were lower. Our suggestion to sell when the price was away above the average of past years seems to have been warranted.

a little higher. Loquats are easy, with ample supplies. A few cherries have appeared here, the first lots selling at $2.50 per box.

Raspberries, basket .....30@35c

Loquats, crate ..... 2.00@2.25

DRIED FRUITS.

Spot conditions are beginning to give way to futures in point of interest in this vicinity, as the packers have been buyers in the field for the last few weeks endeavoring to make contracts in several lines, and their offers are quoted low. From all that can be learned here, the growers are not very eager to sell, and no great quantity has been contracted so far. The result of the marked shrinkage in prune crop estimates is reflected both in advanced offers for new crop, and in firmer prices quoted at the selling end. Conditions are still rather uncertain, with growers even more than packers disposed to await further developments. In fact, the interest shown by buyers, in spite of the embargo scare, is decidedly encouraging. The spot market is developing more activity, as old stocks in consuming markets are getting closely cleaned up, and the trade is taking hold better than for some time past. There have been some good-sized shipments of prunes, and peaches are said to be well cleaned up in some quarters. The New York Journal of Commerce says:

"The excitement in the market for future California prunes due to covering by packer shorts by purchases in distributing markets has calmed down. Whether the damage has been as great as some estimates would make it the more conservative people in the trade hold cannot yet be definitely told. The least bullish of these crop estimates place the probable yield based on present conditions at 70 per cent of last season's output, which was approximately 180,000,000 pounds. Several prophets, on the other hand, saying there will not be over 50 per cent of an average crop.

CITRUS FRUITS.

In spite of heavy shipments, averaging over 200 cars daily, orange prices are holding remarkably steady. From most districts in the southern part of the State navels are about all gone. From San Antonio, Ontario, Riverside and Redlands there are nearly 4,000 cars yet to be shipped. Valencias are being sent out from Tulare county and shipments of this variety will start from southern California next month.

At New York on Monday, April 17th, navel oranges averaged on the auction from $2.10 to $3.30 per box, and lemons brought from $2.90 to $3.75. At Chicago the same day navels averaged from $3.25 to $3.50 and lemons $3 to $3.50 per box.

All prices in the San Francisco market stand as before, with quite an active demand for oranges and grapefruit.

Oranges, Navels .....$1.50@2.75
Tangerines ..... 1.25@1.75
Grapefruit ..... 1.50@2.50
Lemons, box ..... 1.75@3.50

HORSES.

The local market remains without animation. A few more drafters arrived during the week, but they move off rather slowly, and it is evident that local buyers are not taking as much interest as usual, even in ordinarily attractive stock. There is a fair country business, however, in all-purpose horses, and stock suitable for military use is said to be pretty well absorbed in most parts of the Coast.

(Approximate values in San Francisco, based on auction sales.)

Publisher's Department

A BOOK ABOUT GARDENS.

(From the Argonaut.)

Professor E. J. Wickson is the chief horticultural authority of California, and therefore any book from his pen should become indispensable to the garden lover and to those who would deserve success in the growing of flowers. Nothing indeed seems to be omitted from a volume that bears the marks of competence and thoroughness upon its every page. Professor Wickson divides his work into four sections. First we have "California Conditions," with chapters on climate, soil, etc. This is followed by "California Cultural Suggestions," with seven comprehensive chapters. Then comes "The California Garden Year," with detailed attention to the months, and then we have "California's Ways with Garden Plants," "Shrubs, Trees, and Vines," and "Plant Protection." It will be a long time before this useful book is superseded, since nothing could be more practical or satisfying.

California Garden-Flowers: Suggestions for Working Amateurs. By E. J. Wickson. San Francisco: Pacific Rural Press.

The Kerfoot-Jones Land Co. has just finished construction of an excellent well on their property in the Weed Patch district near Edison, California. They have equipped their new well with a Layne & Bowler shutter screen in all water-bearing formations, and found after same was installed that they were able to develop more water than the capacity of the pump installed. In order to produce all the water the well was capable of giving they installed a large Layne & Bowler turbine centrifugal pump and are obtaining excellent results. The Kerfoot-Jones people greatly appreciate their well for the reason that they have not been troubled with sand, which caused the loss of their first well.

Peter J. Gannon, near Winters, has just renewed his subscription to the Rural Press for the 46th time. Mr. Gannon has a copy of the first issue dated Jan. 4th, 1871, and thinks he is the oldest living subscriber. He is surely an enthusiastic supporter of the Rural Press and has almost every one of the copies, some of which are bound in book form.

I must say how much I appreciate the Press. The articles are all so timely and able and cover so wide a range. I have recommended it to my neighbors, but they all seem to be taking it and I could not get a new subscriber.—J. C. Galloway, Modesto.

MISCELLANEOUS.

REBUILT GAS ENGINES from 3 to 50 h. p. Thoroughly overhauled and guaranteed. Write us your requirements. A FEW SPECIALS: 6 h.p. 2-Cycle Gas Engine, $125; 15 h. p. Field Gas Engine, $350; 35 h.p. Best Gas Engine, old but reliable, $200; 50 h.p. Otto Gas Engine, $900. Mechanical Installation Co., 181-89 Second St. Motors, Gas Engines bought, sold and exchanged.

EVERY SIZE WROUGHT IRON WATER PIPE and screw casing water pipe, guaranteed as good as new. Prices right. Send for catalogues. We beat no one; everybody gets a SQUARE DEAL. Weissbaum Pipe Works, 160 Eleventh Street, San Francisco.

GAS ENGINES—I can furnish rebuilt Fairbanks, Morse, Otto, Peerless, Samson, Union and other good makes in al sizes. All investigators buy and all buyers are delighted. Pay when satisfied. J. J. Pottinger, 189 2nd St., San Francisco.

MACHINERY FOR SALE—One Junior Monarch Hay-Press, large bale; one Sandwich Hay-Press, small bale; one I. H. C. 12-25 Tractor. All practically new. Terms to reliable parties. Ceres Hardware and Implement Co., Ceres, Cal.

PATENTS THAT PROTECT are procured through Pacific Coast Patent Agency. Savings and Loan Building, Stockton, California. Established fifty years.

"SMITHS' PAYS THE FREIGHT."—To reduce the high cost of living, send for our Wholesale to Consumer Catalog. SMITHS' CASH STORE, 106 Clay St., San Francisco.

IRRIGATION EQUIPMENT—For pumps, oil engines, gas engines, friction clutch pulleys, etc., write us. We can save you money. Commercial Iron Works, 481-497 Fifth St, San Francisco.

APPLES!—Buy direct from producer. Newtowns, 90c; Bulk pack, 4 and 4½ tiers, equal proportion. No. 2 grade for cooking, 65c. In 5 box lots 70c and 50c per box. Edwd. A. Hall, Watsonville, Cal.

SECOND-HAND WATER PIPE and Screw Casing. New threads and couplings dipped in hot asphaltum. All guaranteed. Send us your inquiry. SHECTER PIPE WORKS, 306-8 Howard St., San Francisco.

FOR SALE—Two 40 in. by 60 in. Russell Threshing Machines, with penumatic stackers. For particulars write to owner. H. P. Mohr, Amador Valley, Alameda county, Cal., Pleasanton P. O., Box 277.

FOR SALE—Used Ranch Tools, Windmills, pumps, engines, new galvanized tanks: 1000, $22.50; 2000, $32.50; guaranteed. Save half. Demmitt Company, 120 North Main, Los Angeles.

CONCRETE MIXERS—2 brand-new mixers at manufacturers prices. Write at once. Commercial Iron Works, 481-497 Fifth St., San Francisco.

BUY ROASTED COFFEE WHOLESALE—Best, 10 pounds $3.00 delivered. Order with remittance, WM. J. SCHROTH CO., 112-B Market St., San Francisco.

LIVING EXPENSES REDUCED THROUGH CO-OPERATIVE BUYING—Write for catalogue and particulars. Pacific Co-operative League, D236 Commercial St., S. F.

WINDMILL FOR SALE—16 feet power aermotor and 40 feet steel tower, A1 condition, at bargain. Ogden Bolton, Jr., Route 6, Santa Rosa, Cal.

FOR SALE—A well-stocked nursery in a good business location. 5318 Geary St., between 17th and 18th Aves., San Francisco.

SAMSON TRACTOR—4 H. P. has not run over ten miles. Price, $450. Kellegg Orange Acres, East Bakersfield.

TREES AND PLANTS.

NURSERY STOCK—None better. 2-year-old Navels, Valencias and Lemons, ⅝ and up, 25c, balled or packed in moss. Ask for prices on carload lots. J. C. Johnson, Azusa, Cal.

FOR SALE—Manzanillo Olive Trees, budded on Picholine seedlings. Younger and heavier bearers, longer lived and more vigorous trees than trees raised from cuttings. Geo. E. Rice, R. 1, Box 76, Reedley, Cal.

PEDIGREED BURBANK FRUITING-FODDER—Cactus Plants. 100, $7.50; 1000, $45; 10,000, $300. El Campo Co., 227 Story Bldg., Los Angeles.

FOR SALE—Orange trees from selected two-year-old stock. K. Matsuoka, one mile west of Sanger, Cal.

PROFICHI FIGS, 1916 crop for sale. Limited quantity. T. H. Lynch, Box 21, R. R. 8, Fresno.

FOR SALE—Spineless Cactus Plants. Prices right. B. C. Engbert, Byron, Cal.

SEEDS AND BULBS.

WE BUY ALFALFA SEED containing Dodder, Mustard and other noxious seeds. Send us sample of any high or low grade seed you may have; also of mustard, burr and sour clover seed, flax, etc. Signed Mercantile and Warehouse Co., Fifth and Poplar Streets, Oakland, Cal.

SEED BEANS—We have choice Red Mexican and Buckeyes grown on sand land, producing a heavy crop. Well cleaned and in good order. Write for prices to THE GRANGE COMPANY, Modesto, California.

TEPARY BEANS FOR SALE—Eight cents per pound. Robert Paulson, Lockewood, Cal.

SEED TEPARY BEANS—Six cents. Haffenden Bros., Honcut, Cal.

WANTED.

WANTED—About sixty young men and women to enter the Western Normal to prepare for teaching, or to secure a high school education in the shortest possible time. Western Normal graduates secure and hold good positions. Time and money saved. For information address Western Normal, J. R. Humphrey, Principal, Stockton, Cal., Box 704.

WANTED—A position as ranch superintendent. Qualified by experience and agricultural college training. Straight salary or salary with share in profits acceptable. Box 216, Pacific Rural Press.

LAND FOR SALE

DAIRY BUSINESS FOR SALE—60 head of cattle, consisting of 38 head of milk cows, 1 full-blood Holstein bull, balance young stock, horses, hogs, chickens, turkeys and machinery. Will sell part or as a whole. Located near Sacramento. Lease can be had if desired. Information of Lilly, 725 J St., Sacramento, Cal.

160 ACRES GOOD LAND—6 good springs, house, 60 acres plow land, balance fine pastures, near school, store, postoffice, in foothills, fine climate, $1600—$600 down. A few good Government land relinquishments, $400 to $700 cash. W. Wallace Baldy, Raymond, Madera Co., Cal.

DAIRY RANCH—Four miles from Sanger in the famous San Joaquin Valley. 126 acres on Kings river. Riparian right. Pumping plant, stock, farming implements. Good buildings, fences, etc. Wish to retire. Owner, Route 2, Box 44, Sanger, Cal.

FREE NEW WHITE BOOKLET—Tells "How," "Why," and "Where" of overlooked STATE, SCHOOL, GOVERNMENT and INDIAN Land Bargains NOW on market. Write JOSEPH CLARK, Sacramento.

Overland

TRADE MARK REG

—so now there's no need to sacrifice pride to economy

This Overland costs only $615.

But it is every inch an Overland—a perfect beauty.

Though a small, light, economical car, it is roomy, sturdy and powerful.

And it is absolutely complete to the last detail.

Never before has a stylish, comfortable, completely equipped car been offered at anywhere near so low a price.

Now for the first time, exacting pride and strictest economy are fully satisfied in one and the same car.

And for easy riding this newest Overland is not to be compared with any other car of its size.

In fact, many a big, high-priced car is nowhere near so easy riding.

It has cantilever rear springs which absorb road shocks more perfectly than any other type.

Large four-inch tires add to its easy riding qualities.

And the seats are soft and deep and built up over long spiral springs.

The seats are also broad and wide—ample in their roominess for five full grown people.

Of course it is electrically lighted and started and the electrical control switches are located on the steering column—right at your hand.

You should have a car this spring—

And if you want top c ass at bottom price, it must be this Overland, for no other car meets both these requirements.

No wonder it has swept the country—the biggest and quickest success of all our long line of record breaking models.

But one thousand cars a day is the present limit of our production.

That is more than double the capacity of any other producer of cars of this size and class.

But the demand is in proportion to the excess value in this car.

Order yours now to avoid delay.

See the Overland dealer today.

Catalog on request—Please address Dept. 583.

The Willys-Overland Company, Toledo, Ohio

Efficiency in Fruit Picking.

Study this organization of picking to get sound fruit with highest economy. It is a practicable working plan with suggestions applicable in principle to all shipping and canning fruits.

[Written for Pacific Rural Press by Wm. Curtis Clark.]

THE idea that should be impressed upon every one of a fruit-picking gang is "handle the fruit like eggs." If every field foreman could succeed in getting every man under his supervision to believe that he is handling a frail-shelled egg each time he picks a piece of fruit for the green trade, he would accomplish as much for his fruit association as any other single unit in the organization designed to place that fruit, in perfect condition, upon the market.

No matter how low the intellect of the laborer may be, he can always get the egg idea, whether he be Mexican, Jap, or what not. To handle any class of men intelligently, they must know what they are trying to accomplish and why they must be careful. The time is past when a crew of men may be herded about the grove or orchard like a drove of sheep.

Piece Work—Poor Picking.—Picking by piece work and contract injects too much of the personal enrichment equation as against the production of undamaged fruits. It is a lazy man's method which temporarily offers freedom from the cares of organizing and conducting the work as it should be carried out. Posing under the mask of speed and economy, this method invariably results to the detriment of the marketable product and the ultimate expense of production.

"Fruit that is stabbed, slashed, bruised, jolted and squeezed will not reward careful fertilizing, cultivating, irrigating, packing, loading and cooling."

The height of efficiency is rather to be found in the well-trained crew whose members work on a flat wage basis, at a fairly uniform speed which is controlled by quality; quality being quite as essential as speed. A high quality-speed average marks a first-class picking gang, which offers the first factor important to the success of the association dependent upon its efforts.

Rotate the Handicap.—It is essential in order to systematize a gang, and to know what each man is doing daily, compared with his fellow-men, that every picker be given an equal opportunity to produce a day's work.

As an example, take a crew of say twenty-two men, placing ten men and a rover to pick five rows of trees on each side of a center-box aisle, allowing a ground man and a ladder man to each tree. It is apparent that if the same positions are kept continuously, some will be picking outside rows all the time, while pickers in the center have quick access to their boxes. The difference amounts to over two and a half miles in picking fifty boxes of oranges five rows distant from the boxes. This handicap destroys a fair check on the output of these men. To equalize this we change the position of the men on every new set of rows, moving the outside men in and shifting the inside men to the outside rows in succession.

Working the men in pairs, the ground picker can get more fruit with less effort than his companion on the ladder, so to equalize this, as the men move one row each time, they exchange positions with their companions, from ground to ladder and vice versa.

The diagram on page 542 is given to show the picker's change of positions.

Notice that the men keep the same relative position to each other, i. e., pickers (9 & 10) always follow (7 & 8) outward from the box row on one side, while on the other side pickers (11 & 12) follow (13 & 14) outward.

Notice that pickers (1 & 2) are picking the outside row going up, while in coming back they swing to the inside position next to the boxes and their position is also reversed with respect to the ladder work. On the other side of the box row the same thing occurs with pickers (19 & 20). The position of the rovers or line-helpers always remains unchanged as shown. The duties of these two men (21 & 22) are to keep the line moving in as nearly a horizontal position as possible, which requires their assistance on extra heavy bearing trees or in helping green men to speed up. These two men are selected from the crew especially for this purpose, because of their intelligence and good workmanship. Their example and understanding of the work is a help to the furtherance of the work.

Notice that the trees are numbered in the same order with respect to the box-aisle, and that the ladders are correspondingly numbered and likewise remain in the same position to the trees. When posi-

California Weather Record.

The following rainfall and temperature record is furnished the PACIFIC RURAL PRESS by the United States Department of Agriculture Weather Bureau, at San Francisco, for the week ending at 5 p. m., April 25, 1916.

STATIONS	Rainfall Data: Past Week	Seasonal To Date	Normal To Date	Temperature Data: Max'm	Min'm
Eureka	.45	37.28	41.90	66	38
Red Bluff	0	19.73	22.99	80	44
Sacramento	0	18.16	18.76	80	44
San Francisco	0	27.05	21.12	72	48
San Jose	0	16.30	15.91	78	38
Fresno	0	11.73	8.74	82	44
Independence	0	10.32	8.59	80	—
San Luis Obispo	0	26.85	19.14	86	40
Los Angeles	0	19.89	14.98	80	52
San Diego	0	12.54	9.46	72	54

THE WEEK

IS IT not a little humiliating to California to be celebrating Easter with Florida tomatoes and celery? The market-watchers report that three cars of Florida celery, the first to be shipped from that state to this, have reached San Francisco. Five full carloads of tomatoes, in addition to a large number of express shipments of this and other vegetables, have been received from Florida this season, but celery is a new item in this trade. It is quite possible to grow our own Easter tomatoes and celery, but of course work has to be done in a suitable place. The chief reason we are not doing it now is because our regular season for these things is so long that people weary of watching for gaps in it and to specifically fill them. For instance, we make three thousand carloads of export celery, about half from the Stockton and half from the Los Angeles district, run the cars into the fields, load celery without storage, and deliver it in the Eastern cities from Thanksgiving to Washington's Birthday, and then sit down to take a smoke while Florida runs in three carloads for Easter. We hurry to get out of the way of Florida celery at the East, and when she does get busy she slips one over on us. It does not matter, of course, except that some of our own people, not knowing about the three thousand carloads, hear about the three, and our little trade rival beyond the gulf rises before their eyes like a colossus. Our special celery growers do not pay attention to the local trade, the market gardeners give their time to other things, and our spring celery supply looks like the morning after. Those who have the right place and know how, can spring in celery from fall planting if there is chance enough for it to warrant the effort.

It is something the same way with spring tomatoes. In the almost frostless sunny mesas one can get plenty of open-air spring fruit from fall-planted, hold-over plants, with some little arrangements for cornering heat and averting chill. This, too, offers itself to the ingenious trouble-taker, who would like to do something a little different from the main crop.

THE WARRANT FOR SPECIAL EFFORTS.

CALIFORNIANS have neglected such little out-of-the-regular-season efforts because our population was too small to use enough stuff to make extra effort for extra pay worth while. The population of California is now between 2,854,727 and 3,004,000, according to the annual report of the State Controller. The United States census method gives the lower figure, and the school census method the higher. The rural population is placed at 837,781. The cities claim 2,450,181, but their claims are probably too high. Letting it all go at three millions for the present, for it will not long stay there, the fact grows that we are to have each year a better state for working out special, early or late, products for local use, and there is naturally a growing opportunity for our small farmers, whose fields are too small to run in railway sidings and load trains for distant shipment. And these little jags of tomatoes and celery which come in from Florida should be suggestive to them in another way also. It is to grow something which people know and which they definitely want, and get it to them when they want it worst. That is what Florida is doing to us now; cannot we do it for ourselves? On the contrary, our bright, little anxious ones, who have not strength or capital to get into the great, unique and distinctive products of the state by carloads, generally tackle us about yellow visions which they get from the papers and magazines, and are athirst to grow chicle for chewing-gum, or peppermint oil for stomach ache, or catnip to take wind out of babies, or something else which is difficult to produce and doubtful to sell—perhaps, because the world already has more than it needs of it. But good eating-vegetables, coming out when regular supplies are shy, always get close to the heart of a man, which is, proverbially, in his right-hand trousers' pocket. Florida is teaching us a good lesson.

CLOSE UPON THE PEACH!

THE authorized organizers of the peach-selling corporation issued their ultimatum at the Fresno meeting last Saturday, to the effect that if $33,000 is not subscribed and 3300 acres pledged by May 1st, the contracts will be returned to the growers. That much money and that many acres are needed to market the crop through the co-operative organization. Now, judging by precedent, the peach-growers ought to get 10,000 acres more signed up. The raisin corporation called for 15,000 acres and secured 45,000. The peach organizers might also get three times their demand, but it would be harder because the peach growers so far have had only suffering, and triumph to come. When the raisin-pullers caught three fish at a lick, they had undergone both suffering and victory; and, too, they had the whole community pulling on the line. But the peach organizers ought to understand that they, too, can claim victory in a way. We have heard that dried-peach buyers were out last week behind the back fence of the peach belt offering 5c.—and we do not know how much they have offered behind the front door. Now 5c. is about the minimum for good dried peaches, although it may look big to those who have had to give two pounds for a nickel lately. Is 5c. all a grower of good peaches ought to have? Of course not. He ought to have a lot more, even to twice as much, perhaps. What chance has he to get that? Just one, and that is to sell his own good peaches, properly cured, graded and standardized. Everybody says we shall have a good country to sell fruit in this year. Recently Mr. Virden, manager of the California Fruit Distributors, said: "Commercial conditions in the East at present are better than for some time; more people are working at good wages and more people will be able to purchase California fruits, hence it assures us of a good market." It looks as though the British cold shoulder might not cut much ice! Unless the peach growers wish the dealers to get more than they earn of this outlook, they will throw in those dollars and acres at once and give their organization more time to get at their job.

"SUPPLY AND DEMAND."

THESE two old economic cadavers still lie athwart the pathway of progressive producing enterprise, to trip the feet of those who would run therein. We get weary of discussions in which producers are exhorted to co-operate in selling and which close with these words: "Oh, but, of course, supply and demand determine prices." We protested against this deadly conclusion some time ago, but it is still being put out to divert or weaken public attention to fairer selling, and effort for it; or else the words are used, without any definite purpose, simply because they sound wise. They do not really fix prices because, first, as conditions, they are variable through all kinds of influences; and, second, because, as causes, they are not ultimate—so much so that they are truly rather effects than causes. Consider them, then, as effects; is it not clear that it is not supply and demand which determine prices, but the causes back of them which do it? Look at it this way. Why are the Sunkist people and the Sunmaid people spending hundreds of thousands of dollars to increase the demand for oranges, lemons and raisins by advertising? Is it not to increase the demand? And why are nurserymen and real estate dealers advertising fruit trees and places to plant them? Is it not to increase the supply? Is it not, then, more rational to say "advertising and planting fix prices"? Of course, it is, because that gives you a better idea of causes and shows, also, that "supply and demand" are not grand, automatic impregnable principles, nor are they causes of anything. They are effects; the causes are what you yourselves do or do not do. That is the reason why it always makes us sad and mad when we hear or read of someone worshipping those hoary stiffs, "Supply and Demand," as though they were all-powerful, economic gods! Kick them out of your pathway. You can make them both; therefore trust and worship your own power and acuteness, if you wish it, but not the work of your hands, which is idolatry! Get as near as you can to the first causes of things. In this case of "Supply and Demand," power over them is largely vested in yourself, and their dimensions are determined largely by your own wisdom, energy and enterprise.

WHAT FARMERS' SELLINGS DO.

THE habit of issuing monthly circular-letters on current commercial and financial affairs seems to be growing on our metropolitan banks. It is really a very good habit, for it brings to the eyes of many readers a substitute for the swim and slum stuff of the great dailies and bought to help make some people serious and sober. We find these bank letters very interesting, and we have them from great cities all the way from New York to San Francisco. We find that reading about millions of money is a sort of consolation for not seeing much of it. But, though these bankers' monthly letters are very inspiring and entertaining, they do sometimes set forth very antiquated notions. One which we recall, is combatting the idea that a lapse in our present great foreign trade would unsettle things in this country, with these words:

"Our foreign trade is certainly not more than 2% of our total trade, and it has been estimated as low as 1%. A farmer sells but a very small part of what is grown on his farm, just as we send abroad but a small part of what we produce, either in raw materials or manufactured articles. These small parts, however, are the most important parts; it is the small amount sold for cash by each farmer which keeps him going, and it is our export business, small when considered with our domestic business, which keeps us going and renews our supply of gold, aside from enabling us to buy abroad things which we are not able to produce for ourselves."

We presume the sketch of the relative importance of foreign and domestic trade in this country is all right, and it is also true that in the case of the most wholesome and unique foods which California produces, we can easily develop a much greater domestic trade, thereby enhancing our own prosperity and giving all Americans a better living. But what amuses us in the above quotation is the antiquated notion about the relation of the farmer to the farm, and both farmer and farm to the general domestic trade of the country. The writer evidently has heard something about the settlers' doings when the country was new, and when farming consisted of clearing timber, wearing home-spun, growing grub for the family, and selling something once in a while to get money enough for tea and taxes. It was then true that "a farmer sells but a very small part of what is grown on his farm"—but that was in the days of our great grandfathers. The enrichment and prosperity of the country are largely due to conquering land, not for family-feeding (though that is of very great importance, of course), but for the output of food products for non-farming classes in this country and for world-trade. In 1912 the value of the farm products of this country was about ten billions of dollars, and for twenty years the agricultural exports have reached an annual value of about one billion dollars. In 1910 there were twelve and one-half millions engaged in "agricultural pursuits," as owners or laborers—less than one-seventh of the population of the United States at that date. Therefore, one-seventh of the population fed the whole population of the country and had a surplus of a billion dollars' worth to send to other countries! Where, then, is there any warrant for saying that "a farmer sells but a very small part of what is grown on his farm"?

SHIPS COME SAILING O'ER THE SEA!

THE Panama Canal reopened this week and mariners can now approach, "by the horn around or the isthmus through," as they choose. Our main interest lies in the fact that there is restored to direct world-contact what President Ripley of the Santa Fe, the other day, called the only Pacific Coast port in these words: "The situation of San Francisco as a great seaport is better today than ever before. Its opportunitities are tremendous. So far as other Pacific Coast ports are concerned, it is the only one." It is proper, then, that such a port should now be building ships. It is currently reported that there are now being built at the Union Iron Works more ships than at any other shipbuilding plant in the world. The work is only approached by that of a plant in Japan. More than that, there are more ships under way than were ever before in hand at any yard at any time, twenty-eight vessels being in building. It is stated that less than 250 ships are now building in the yards of the United States, and California has, therefore, a very respectable fraction of them. All Californians should take pride and interest in shipbuilding, for ours should be among the first of maritime states; besides, all our land industries need ships. The way to get more ships is to talk about ships, to popularize them and their invaluable services to industry; so long as we think and talk only of shark-like owners, swaggering captains and mates with belaying pins, the interest in ships will not get much beyond the wharf-rats. And then we have a world duty in ships. The cable brings a word from the all-American conference being held in Buenos Aires that Latin America looks to the United States for the full development of inter-American relations, and this is impossible without an adequate American merchant marine. And this is true also of the full development of California.

Queries and Replies.

Querists must give name and address.

Polycaons and Black Twig.

To the Editor: I am sending leaves from a pear tree which are diseased, also a pear twig and the insect which bores into twigs at the bud.—A. F. W., Potter Valley.

The slim, cylindrical, black-brown beetles, a little more or less than a half-inch in length, are Polycaon confertus. It is often called the "olive twig borer" because fruit growers first found it in olive twigs, but more recently it has been found in very many fruit and perhaps other trees. It is a native and spends most of its time in dead wood on uncleared land, but it also takes to fence posts, old vine stumps, etc., and it seems to go to living fruit trees merely for feeding or for general cussedness. It tackles the twig at a dormant bud and tunnels downward and is often caught with his stern in the air. The beetle takes to small laterals and makes a bore large enough to cause the shoot to break off in the wind. On young trees this may be serious, causing loss of twigs which it is very desirable to retain. On older trees its work is negligible. Neither prevention nor cure has yet been demonstrated, though clearing up all kinds of dead wood, when practicable, would remove breeding places.

The blackening of the pear leaves and the little twig of new growth to which they are attached has some resemblance to the work of the pear blight, but is not surely that disease. Prof. R. E. Smith is now studying this form of die-back, but has not definitely assigned the cause. The rational treatment would be cutting below the injured part to a point showing healthy growth—just as in handling pear blight.

Why Sulphur, Not Sulphide?

To the Editor: What causes red blister-like eruptions on peach tree leaves? Are they a fungus and will liver of sulphur solution like that used for mildew check them? By the way, why is powdered sulphur always recommended for mildew when liver of sulphur is cheaper, more effective, more easily applied and not at all harmful to foliage? I have used both, but am now using the latter on roses, grapes, peas, etc., with the best of success.—H. B. B., Fullerton.

You have curl leaf on your peach leaves. It is caused by a fungus—Exoascus deformans. You are in luck to have a variety or a place where it does not get beyond an "eruption," for it has power to curl up, swell and kill the whole leaf. If it does not get beyond an eruption you need not bother about treatment, and if it is only an eruption as late as this, the chances are that it will soon disappear, having done no appreciable harm.

Liver of sulphur (potassium sulphide) is a very neat fungicide because it does not disfigure the foliage or spot growing fruit. But its effect is very fleeting. It will kill a spore which happens to be ready to be hit, but in a very short time it goes to pieces and will not affect later-developing fungus bodies. Sulphur, even in the minutest particles, will remain long on the leaf and generate, continually, fungus-killing vapor. One good sulphuring would work as long as several sulphide sprayings. Although sulphide can be used in weak solution (say 3 oz. to ten gallons of water) and is therefore cheap in first cost, the expense of sulphuring, with proper sulphur and a proper machine, is vastly less than the spraying which would serve the same fungicidal purpose. But neither sulphur nor sulphide will catch up with curl leaf. The proper treatment is to thoroughly clean the tree of spores before the buds open, either with strong Bordeaux or lime-sulphur, and even that will not prevent the disease if the variety is very susceptible and the spring air moist and promotive.

Walnuts and Olives.

To the Editor: Is it practicable to grow olives in between walnuts—the walnuts being 40 feet apart? My plan is to grow alfalfa in checks 40 ft. wide and grow the trees on the levees.—J. D. N., Modesto.

No; you have your walnuts at minimum distances for valley land and if you wish to try anything between, it should be an almond, peach, apricot, or shipping plum, or something else which would come to full bearing sooner than an olive. But, on the whole, if you wish walnuts at 40 ft. it would be better to be satisfied with the alfalfa as an inter-crop and give the walnuts a better growing chance—not to speak of the risk of unthrift to the olives standing in the bottom of an alfalfa check.

Good Almond Year Coming.

[Written for Pacific Rural Press by T. C. Tucker, Manager, Cal. Almond Growers' Exch.]

Such information as we have is always at your command, and in accordance with your request I am pleased to say briefly the following in regard to eastern conditions as I found them on the trip from which I have today (Apr. 18) returned.

In a general way business throughout the east seems to me at the moment much better than at any time during the past two years. I think this will apply to all lines of merchandizing. All manufacturing plants are working to full capacity and everywhere there seems to be a general air of prosperity.

It is too early to say anything regarding market conditions for the 1916 crop except that all indications point to a very successful year.

There are very few almonds carried over, either in the hands of retailers or wholesalers, and while the market at the present time is inactive, as it always is at this time of the year, still the feeling among the trade is that a very good demand for almonds is expected this fall. We, ourselves, have apparently now more orders than we can successfully fill if these are all confirmed in full. Of course, European conditions will very largely affect us, as the great bulk of the almonds consumed in this country are imported from abroad.

It is too early to make any prophecies as to market possibilities, except to say as far as the United States is concerned there is every likelihood of an exceedingly good market and good prices for almonds.

I find that the feeling of the trade towards California almonds is more favorable each year, as through the medium of organization we have been successful in promoting quality and in filling orders satisfactorily. Above all, the Association has been a big factor in the maintenance of price, which is just as advantageous to the buyer as it is to the producer, as it insures a satisfactory market and profit to both.

New Interior Markets.—We have expanded our market quite considerably by having representatives who are traveling throughout the interior of the country, making the smaller towns, and in that manner enabling us to place California almonds where they have not been heretofore used, direct.

The possibilities for California shelled almonds in the east are very good, and we look forward to quite an extensive business in that direction this season. We have, in fact, all the orders we care to accept for shelled almonds at the present time.

In conclusion, I believe that we are facing the most prosperous year we have had for some seasons, and I think we will see very good business conditions throughout the United States during the next twelve months.

PRUNING PEACHES IN FEBRUARY AND MAY.

[Written for Pacific Rural Press.]

"I have always pruned peaches early in the winter, and there have always been plenty that died back two or three buds." says C. F. Walker of Fresno county. L. T. McKnight of the same county has observed that if you prune early in the winter and happen to split the twigs more or less, they are very likely to die back several inches. He prunes his orchard in February; and, regardless of the size of the job, he believes it would pay anyone to delay and get extra help to do it all in January and February rather than earlier in the winter. The late pruning enables one to tell better the wood to be left. Sap flow will heal the cut; so it is best to cut just above a bud. Frank Henry, also of the same county, believes that under Fresno conditions of light soil, it is best to delay pruning until late May. He then thins out the growth, throwing the sap into fruit and into that wood which he expects to leave the following year.

"It is much less of a strain on tree or vine," says he, "to produce fruit than to produce an excess of wood to be cut off next winter. If winter pruning is practiced, the new growth from the cut should be thinned out in May."

HOGS AND ALFALFA AMONG APRICOTS.

[Written for Pacific Rural Press.]

Alfalfa, hogs, and apricots on the same land must pay T. A. Jenkinson of Hanford, or he wouldn't be continuing the practice followed for the past six years. The alfalfa is plowed out every two to four years from sowing. Purebred unregistered Poland-Chinas are pastured on the alfalfa the year around except three or four weeks during fruit picking. They have never injured the trees except to browse low-hanging, fruit-bearing branches. The alfalfa often requires an irrigation in May, whereas otherwise the orchard would not be watered until the crop is off.

Purebreds make better market hogs than others; as Mr. Jenkinson has observed that they are much bigger at the same age with the same treatment than even ¾-purebred hogs.

One of the many styles and sizes of Fruit Trucks I manufacture. Sixteen years of experience has taught me how to make trucks that will stand the hard knocks and that will last. For prices and particulars, address

California Fruits and How to Grow Them

EDWARD J. WICKSON.

Seventh Edition, Extended and Revised.

Contains over 500 pages of text with many illustrations. Goes thoroughly into every phase of that immense industry, California Fruit Growing.

In the preliminary chapters, the important subjects of Climate and Soils are handled in a masterly manner, with the necessary modifications called for by the immense latitude, the topography of the country and the different regions with their relation to coast, valley and mountain.

The book then goes into the subject of Fruit-Growing from the nursery, on through budding and grafting, preparation for planting; planting, pruning the trees and thinning fruit; cultivation, fertilization and irrigaton right along to picking, canning and preserving, with chapters on injurous insects, tree diseases and the protection of the trees therefrom. Every fruit and nut which can be grown commercially in California or countries possessing a similar climate, has received the attention which the forty years' experience of the author makes of incomparable value to the fruit grower.

ALFALFA FOR ORCHARD FERTILIZER.

[Written for Pacific Rural Press.]

Here is a splendid use for spoiled alfalfa hay.

"Our 20 acres of navels produced 5414 boxes in 1914 and 8730 in 1915, an increase of 3316 boxes. We lay the increase to the use of alfalfa as fertilizer," says W. A. Schaefer, manager for J. K. Lyon of the Redlands district. A bale per three trees was applied in the spring of 1914 and again in 1915. The first season it was chopped and worked in. That was too expensive so next year it was laid out on the ground and one man raked it into the furrow while another plowed. By the time of second irrigation the alfalfa had all disappeared. It had cost about $8 a ton; but according to Mr. Schaefer it would be as cheap fertilizer as could be obtained if it cost $12 a ton. Alfalfa tea, made by soaking alfalfa in water four or five days, beats manure, says he.

Dr. H. J. Webber.—"Alfalfa hay is about 2¼ per cent nitrogen," says Prof. Webber of the Citrus Experiment Station. If it costs $8 per ton the nitrogen in it costs $3.55 per unit, whereas in commercial fertilizer it costs $4 to $5 per unit.

"In applying alfalfa for fertilizer, however, you also apply potash, phosphoric acid, sulphur, protoplasm, and organic matter for humus.

"In alfalfa we have one of the strongest and best nitrogen fertilizers we can use. Food elements in hay become available two or three weeks after it is plowed under.

"I would like to see all the nitrogen fertilizer used in California grown in California. Perhaps alfalfa would best be fed to livestock and the manure applied to orchards, but citrus conditions are not convenient for that at present."

Atomic Sulphur for Grape Mildew.

[Written for Pacific Rural Press by Napa County Horticultural Commissioner J. J. Fox.]

In 1914 there was a 25-acre section in a 100-acre block of vines on the Stanley Ranch in Napa county so badly infected with mildew that the crop was practically a total loss.

In 1915 this 25 acres of Valde Pinots was sprayed with atomic sulphur—using 12 pounds to the 100 gallons of water. The amount of spray used was about 300 gallons to the acre, or ½ gallon to the vine. The vineyard is planted 6x12. Cost of material $2.75 per acre.

Fifteen acres was sprayed with atomic sulphur three times. The first was on April 27 (just before blooming). The second spraying was done 3 weeks after blooming and the third was July 20.

On this 15 acres there was no mildew.

The other 10 acres was sprayed April 28 and had one dry sulphuring after grapes had set and nothing more. The loss on this block was estimated by Martin Zanini, the foreman, at 15 per cent to 20 per cent from mildew. On an adjoining block where dry sulphur alone was used there was no loss. Mr. Zanini says that the weather was warm and still at the time the latter was sulphured, whereas it would have been useless to try dry sulphur at the time of the spraying, as the weather was cool and cloudy throughout. He favors the dry sulphur where weather conditions make its use effective.

As soon as a few gray specks appear on the leaves or on the end of the stems, if the weather be cloudy, then is the time when only atomic sulphur is effective.

I am indebted to Mrs. Bertha Coghill, manager of the Stanley Ranch, for the above dates and figures and offer them as a basis for further experiments by growers.

SUDAN AMONG PRUNES.

To the Editor: I have fifteen acres of three-year-old French prunes that have not been pruned this year. Please advise me whether I ought to let the trees go unpruned till next year, or prune them now.

Would you advise planting Sudan grass between prune trees and irrigating the grass? Is Sudan grass hard to eradicate, and is it possible to obtain its seed entirely free from the objectionable Johnson grass? Would you recommend Sudan grass as a good pasture grass?—C. R. H., Gilroy.

[If we pruned the prunes at all after leafing out, it would be only to thin out the branches that would have to be taken out next winter. We would not cut back any now, for that would stunt the woodgrowth which is most desirable to make a big tree at an early age. Sudan in the middles, some distance from the trees, might be good if you have plenty of water. It is good for hay, not pasture. It dies a natural death; and pure seed can be obtained from our advertisers.—Editors.]

WATER FOR RED SPIDER.

To the Editor: I notice in Pacific Rural Press a good many inquiries as to what will stop red spider. I have noticed that a shower of rain always puts a stop to the work of red spider and have on a couple of occasions recommended spraying with water, and it worked all right.

Atwater. **W. R. Davis.**

[Yes, water will check red spider; but to spray, even with water, the number of times required to keep up with the pest will cost more than to use sulphur dry or to put on a sulphur spray which will put sulphur on the leaves where it will vaporize continuously and keep on killing spiders. A water spray cannot do this.—Eds.]

Get this valuable free book

Do you own an orchard? Or are you going to plant one?

If so, you will find information worth many dollars to you in the Giant TREE BOOK, "Better Orchard Tillage." This book is written especially for Pacific Coast fruit growers. It tells how to have thriftier, faster-growing, earlier-bearing trees by planting in beds blasted with

GIANT FARM POWDERS
STUMPING — AGRICULTURAL

It tells also how to secure better drainage and increased moisture-storage capacity in established orchards, and how to get larger yields and save money on fertilizers.

The book contains illustrations that show exactly how to do the work. There are chapters on preparing the beds for trees and increasing the plant food by deep tillage. Also there are directions for blasting in established orchards or groves, and interesting letters from many prominent fruit growers.

Fruit Picking Efficiency.

(Continued from page 537.)

tions are changed the ladders are carried to the corresponding new rows by the men who have been using them, ready for their new users.

This arrangement of the gang prevents any picker from offering the excuse that he is handicapped in producing as good results are are obtained by the other men. The foreman's work is very much simplified; therefore he is able to handle a larger gang. After the first few rounds the men place themselves automatically in the proper positions. The foreman is principally located in the center of the picking line where he can devote a great deal of his attention to examining the fruit placed in the lug boxes. He can keep a check upon the trees for unpicked fruit without waiting for stragglers to finish their work. He can step to any picker whose poor work he has discovered from the examination of the fruit in his box and show the damage being done, without wasting time. The gang finishes its work on a set of rows as a unit and there is a minimum waste of time in shifting to a new set.

Abbreviations: 0—tree; R—row; L—ladder; P—picker.

Performance Records. — The men are supplied with chalk for numbering their boxes. The foreman notes in his time book the daily performance of each man for number of boxes and quantity, also thoroughness in picking all available fruit. A man who cannot reasonably qualify on all three of these points cannot hold his job, as they are all essential to good work.

With this system a foreman should be able to examine the individual fruits in three or four lug boxes of each member of the gang every day, and by taking the average number of fruits to the box and the number of damaged fruits found he has a percentage check on the quality of the work.

Where the situation is favorable a premium or bonus may be given for good work covering the season or desirable prizes may be offered for the best work during the month. As the foreman has a cinch on the work there is little chance for any but the best men to profit from the results of good effort.

In addition to the regular work of the rovers, one of them assists in loading the packing house wagon and in a short time becomes so expert in swinging full boxes of fruit upon the wagon-bed that there is scarcely a sound, which of course means that the fruit is being handled carefully; also if necessary he replenishes the drinking water for the gang, while the second rover extends his work over the entire line.

For the purpose of quickly erasing chalk numbers at the packing house and to facilitate the foreman in checking the boxes, the men should place their numbers in the upper right-hand corner of the boxes.

The boxes should always be stacked under the shady side of the trees where they may be protected from the sun by the tree foliage, five or six boxes to the stack. Empty boxes should always be turned over and tapped on the bottom to eliminate any gravel or foreign matter that might indent the fruit skins.

Quietness and Efficiency. — The fruit should always be emptied from the picker's sacks into the boxes carefully, which means without noise or thumping on the box bottoms. If the crew works quietly without un-

"IT WORKS WHILE YOU SLEEP."

For use in localities where water levels are affected by action of tides, on lands protected by dikes or levees, or where, for any reason, such as abnormal rainfall, floods, etc., an excess amount of water collects.

Constructed from cast iron, and so perfectly balanced and machined as to automatically open or close with but a slight pressure of water either way. Once installed, may be forgotten, but **IT NEVER FORGETS.**

Used in connection with Armco Iron Corrugated Pipe, forms a combination which works efficiently at all times, without trouble, supervision, or expense, except that of original installation.

Literature, fully describing both products, sent on request.

California Corrugated Culvert Co.

AMERICAN ARMCO INGOT IRON

417 Leroy St., Los Angeles.

406 Parker St., West Berkeley.

HARD GROUND CONQUERED

Weeds Destroyed

Operating Labor Reduced, Breakage and Wear Eliminated.

The above results and other desirable qualities are found in the **Oliver No. 1 Cultivator.** A study of the two sketches, shown below, should prompt the reader to send to the

Oliver Chilled Plow Works, San Francisco

or

Oliver Chilled Plow Works, Los Angeles

for circulars giving full particulars about thorough cultivation of plants in various widths of rows.

The **Oliver No. 1 Cultivator** is a California Cultivator. Everyone knows that a tool which has been designed for the lighter soils of the Eastern States seldom works in California heavy soils. The Oliver Cultivator succeeds in California where other kinds fail.

THE OLD WRONG WAY. THE OLIVER RIGHT WAY.

necessary chatter and noise the foreman is greatly aided in hearing careless work in this respect as well as the wagon-loading. An efficient crew works quietly in the grove or orchard; in fact it may be said that a quiet crew is nearly always carrying on the work efficiently. In this connection it is often necessary to place especially sociable members separate from each other; and this is very easily accomplished where fixed positions are maintained.

It is advisable to establish the "no smoking" rule, as it is impossible to protect a cigarette and get all of the fruit growing inside of the trees. It is sometimes surprising to notice the amount of time that can be consumed by nonchalant workmen in rolling their "makings."

The packing house wagons should be supplied with a canvas tarpaulin to cover the load from the hot sun, especially when the fruit has to be hauled a considerable distance to the packing house.

The men very quickly know that the boss knows what he is about, and if the boss takes pride in having the work right it usually has a good effect upon the spirit in which the work is conducted.

Getting the fruit off the trees and to the packing house properly is one of the most important steps in bringing the article to the mouth of the consumer. Fruit that is stabbed, slashed, bruised, jolted and squeezed will not reward careful fertilizing, cultivating, irrigating, packing, carloading, and cooling. As much attention should be given to carefully organized field work as to the arrangement and management of the packing house and marketing features and where it is practiced the reports returning from market examination will probably be excellent.

UNIVERSITY FARM PICNIC.

[Written for Pacific Rural Press.]

The biggest event in the way of a farmers' picnic yet held in California was that of the State Farm at Davis last Saturday. Estimates of the attendance range all the way from 6,000 to 16,000. The location is easy of access to farmers from the big valleys and the bay section, the day was ideal, the farm had been slicked up till it looked like a gentleman's private park, and the hosts (350 young men) were on the job at every point and all the time.

The outstanding events were the speeches and athletic events in the morning; noon day lunch, followed by a parade which included all of the fine livestock kept on the farm and a dozen or more beautifully gotten up floats; then more sports,—the day closing with dancing in the evening.

To one who went on an investigating tour of the farm there was much of interest to keep him busy during the day. The splendid beef and dairy stock as well as hogs and sheep and the quarters where they were kept, constitute the largest and latest department of the kind in the west. The poultry plant, which contains over 4,000 birds, has everything that a poultryman would want to see. The big creamery and cheese factory, the animal husbandry building are places of great interest. In the machinery building as well as the irrigation division all of the latest and best implements and devices are being shown and experimented with. Agriculture in the several divisions as well as horticulture in nursery and orchard seem to be thoroughly equipped to carry out the thousands of experiments under way.

But to the writer the best exhibit of all were the 350 young men students, who had full charge of the picnic, who secured its publicity and finally took charge of the crowds and made the great success. This body of young fellows, enthusiastic in their work and glad to show it to the visitors, were organized into a working unit that meant preparedness carried to the nth degree, were the motive power that made the day a success. This young blood, properly trained, means great things to the future of agriculture in California.

Carbon Bisulphide

has for over 30 years proven to be the most effective—the only sure killer of squirrels, gophers, rats, prairie dogs, ants, moles, yellow jackets, moths, weevils, lice, etc. It is easy and safe to use.

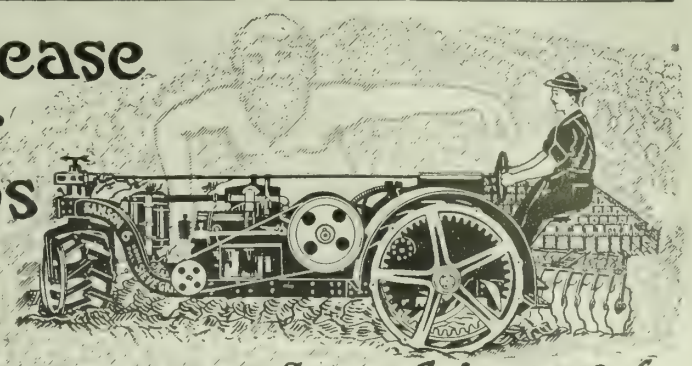
Fertilizer Quality



When you buy fertilizer remember you are buying what is *in* the goods and not merely a weight of two thousand pounds.

When a smelter buys gold ore he buys not merely two thousand pounds but he insists on knowing how much gold is in the ore, and you should know the amount of active nitrogen, which is the gold of the fertilizer.

International Harvester
Mowers and Rakes

HAYING weather is not always perfect, you know. It takes a season when the fields and meadows are in the worst shape for cutting to bring out the dependable qualities of **International Harvester** mowers. When the stand is heavy, lodged, and tangled, or, when it is exceptionally light and you need all the hay you can cut from it—those are the times when a farmer appreciates the ability of his mower to stand up under heavy work, or to cut so closely that scarcely a blade is wasted.

After the mowing, the raking. That, too, can be wasteful, but it won't be the fault of the rake if it's an International Harvester rake, bearing any one of the famous **I H C** trade names.

Choose your mowers and rakes from the **I H C** line. Do away with any chance for trouble. You can always get repairs promptly any day you happen to need them. See a local dealer who handles the **Champion, Deering, McCormick, Milwaukee, Osborne** or **Plano** machines, and buy your mower and rake from him.

Mechanical Power on the Farm.

TRACTORS IN TEHACHAPI VALLEY.

[Written for Pacific Rural Press.]

In the Tehachapi Valley, which has been grain-farmed for half a century and is now being set out to fruit, the big tractors are beginning to be supplemented by orchard tractors. A Creeping Grip 16-8 is used on the Hayward orchards.

A 4-5 h.p. Samson Sieve Grip takes care of 200 acres of nearly level orchard owned by the Tehachapi Fruit and Land Co. But about 75 acres in 10 hours.

Wholesale Seeding of Grain.—A railroad rail is bolted across near the front of the tractor, and a drill with its harrow hung by a chain from each end, one on each side of the tractor. A drill hooked behind the tractor sows the center. The rail is supported also by a chain from its ends to the front of the outfit. The turns are always made to the left so that a marker can be used. The mark is made where the edge of the track should run; as this is easier than watching the center

Did you ever see a better job of plowing? Mogul 8-16.

C. T. McKinnie of the Land Co. advises a larger factor of overpower. In fact he uses teams on the rolling orchard, though well pleased with the performance of the little tractor.

At this altitude a tractor loses efficiency, but this is overcome in the Samson, by a special plate on the piston "to give greater compression."

On a Grain Ranch.—One of the big tractors is a 75 h.p. Caterpillar used on the Ramina ranch. It burns about 30 gallons of distillate per 10 hour run in which it plows about 40 acres during the night, according to L. M. Anderson who has immediate charge of the ranch in the absence of Mgr. J. W. Jennings. During the daytime it pulls three grain drills followed by harrows, sowing ahead. The outfit sows a strip 36 feet wide. Some of the fields take three miles per round. The sacks of seed are distributed ahead at about the proper places.

Operators are protected from sun and wind by curtains. A front and rear light are used. A bell run by a cord to the plow enables the plow tender to signal for starts, stops, and speed regulation.

A master mechanic is kept all the time and is held responsible for all machinery. In idle times, the engine is overhauled, bearings scraped, and repairs made. It is kept in shape, for there are 3500 acres of plowland to be cared for in a very short season, and they can't afford any breakdowns.

Makes Better Farming.—Though purebred draft horses are raised on this ranch, and worked, there is enough for them to do without attempting the grinding work of plowing, harrowing, seeding, and pulling the combined harvester.

An effect of the tractor for better farming is seen in that until last year, Mr. Anderson says they have been skimming the ground; now they are plowing it; and that 7 inches deep for grain.

UNPLOWED ORCHARD SOIL.

[Written for Pacific Rural Press.]

Late plowing is more desirable than early, from many standpoints, for orchards and vineyards especially; but where water is not available and nature disappoints us as she has this spring, there is need of a strong suitable plow for the hardened ground, and sharp disks or cutaway harrows to work the clods down.

Unless at least the surface is fined there will be such loss of water, both from the cloddy soil and from

Snow Portable Deluge Hydrant

As Used With

The Snow Ideal Alfalfa Valve

This combination forms a most perfect arrangement for the handling of large quantities of water used in field irrigation.

The use of this combined device offers a ready means for the attachment of either canvas hose or surface pipe, making possible the delivery of water to any point without waste or inconvenience.

the exposed subsoil, that trees or plants will suffer.

But not only the surface should be fined, but the clods underneath, and this can be done best by thorough disking before plowing.

Needless to say, plowing hard ground in warm weather is a better job for a tractor and a plow designed for the purpose, than to maltreat good livestock.

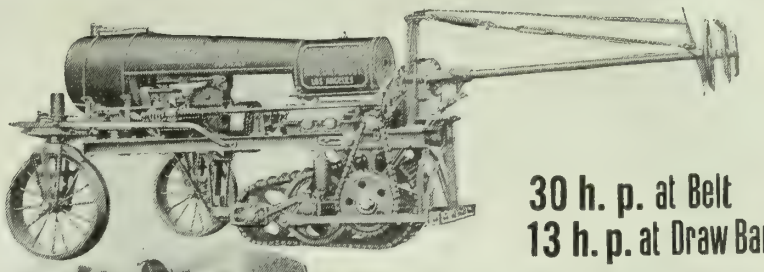
WARMS PUMP WATER FOR RICE.

[Written for Pacific Rural Press.]

Warm water for rice irrigation gives much better results than cold, in the estimation of the Tweed Ranch and Land Co. of Willows, who are putting in a large acreage as a result of their previous two or three years' large scale experiments. For this reason they pump into a large reservoir to warm up the water some before running it onto the rice.

Mr. Tweed uses a 35 h.p. motor to pump from four connected wells. Three of these are about 40 feet deep. The other, put in last year, has a 16-inch casing and is about 200 feet deep. It gives a constant stream.

Besides warming the water for better growth, Mr. Tweed prides himself on his immunity from water-grass, the seeds of which cannot float onto his place through public irrigating ditches. Of course he takes particular pains to sow only such seed as is free from red rice or water grass.



POWER SPRAYER FOR GRAPES.

[Written for Pacific Rural Press.]

A little power sprayer with a 1½ h.p. engine sufficed Geo. A. Ritchie of Kings county for his vineyard spraying last year. But the demands not only of his own vines, but those of his neighbors, led him to buy for this season a Bean Triplex Sprayer of 200 gallons capacity, four lines of hose, and a 2½ h.p. engine. Besides running the sprayer, the engine pumps water in four minutes from a tank wagon to fill the sprayer. It uses only ¼ pint of oil per day of 10 hours, and three gallons of gasoline, according to Mr. Ritchie.

With the small two-hose sprayer he has sprayed 200,000 gallons. It took a day to spray 10 acres of vines set 10x10. With the big one, he has sprayed 2200 gallons between 7:15 a. m. and 4:30 p. m. with an hour off at noon. This was on 15 and 17 year peach trees.

A new book of distinct value to California vegetable growers is the new book, "Subtropical Vegetable Gardening" by P. H. Rolfes, director of the Experiment Station of Florida. All important vegetables are included in the discussion, including those with edible leaves, stems, bulbs, fruits, tubers, roots and seeds. The book is cloth bound, illustrated, and contains 300 pages of text, and is published by the Macmillan Company of New York. Price $1.50 net.

General Agricultural Review.

GRAINS AND FIELD CROPS.

There is a grain bag famine.

Rice planting in Yolo county is humming.

Mid-April frosts injured potatoes in the delta district.

Delta alfalfa is being sold at $10 per ton for first crop.

England has ordered 1,500,000 bags of rice from U. S.

The Cross Creek section of Kings county is producing much grain this year.

Bean planting is beginning around Saticoy. The acreage will be about 11,500.

The Turlock Merchants and Growers have four times as many contracts as last year.

New alfalfa hay is coming to San Francisco three weeks ahead of last year's first shipments.

Nineteen boys in the Salinas High School Agricultural Club have signed up to grow beans.

Five cars of rice were recently shipped from the Wasco district to Louisiana at 2 cents per pound.

Ventura grain and alfalfa acreage is about the same as last year, according to farm adviser W. B. Parker.

The California bean holdover to date is reported at 450,000 sacks, about ¼ of the crop of last year. These are mostly limas.

Despite all efforts, the cotton boll weevil has made notable advances into new territory all along the line. California is still untouched.

Potatoes are being dried for flour at Middle River, San Joaquin county. The plant is being doubled from its previous maximum capacity of 25 tons of potatoes per day.

Grain acreage in Solano county is less than last year, and there will be a small grain hay crop though a larger per cent will be cut for hay than last year, according to Farm Adviser J. W. Mills.

Pink beans, blackeyes, and Mexican reds should not be planted in Stanislaus county before June 10 on account of hot weather of August destroying blooms, according to Farm Adviser C. M. Conner. Late planting also helps avoid spiders, aphids, and thrips.

The Larkin Farm Center had an attendance of 300 recently to discuss grain elevators. They favored it after A. E. Lindstrom, who owns stock in several elevators, told them that for $6,000 they could build a 40,000-bushel elevator which would handle 1,000,000 bushels a year and save $50,000 for sacks.

The heavy rains of Jan. and Feb. almost drowned the grain in Butte county; a lack of rain since has combined to reduce the crop considerably. The straw being short, much that would have been made into hay will be cut for grain. "I believe there will be 70 per cent of a crop," writes Horticultural Commissioner Earle Mills.

DECIDUOUS FRUITS.

First Chico cherries ripened April 20.

Muirs are reported as a heavy crop near Madera.

Pear scab is showing up pretty strong in Napa county.

Sutter peaches are estimated at 75 per cent of normal.

Sonoma prune growers are holding for 6 cents for the new crop.

Canning peaches are reported only ¼ crop in the Gridley section.

Southern packers are negotiating to run the Porterville cannery.

F. S. Jones of Green Valley, Solano county, has sold his cherries on the trees for $22,000.

A 10-pound box of cherries shipped from Vacaville by F. B. McKevitt are said to have sold for $100.

The State fruit standardization law is effective this year on almost all fruits shipped out of the State.

A national general fruit standardization law is being worked upon with especial reference to ripeness.

There were about 44 per cent more apples in storage April 1 than a year ago, according to the U. S. Dept. Agr.

The Placer County Growers' Canning Association put out 60,000 cases last year, a 50 per cent increase over the year before.

Bellflowers in the Watsonville district are almost a failure as reported by our representative. The Newtowns are better.

A few peach rows which Wm. Owen of Atwater could not spray this spring are badly affected with curl leaf, while the rest is free from it.

John C. Rorden is offering to warehouse spot peaches to be turned over to the new Association. Growers can borrow money on these warehouse receipts.

Fruit growers of the Mt. Vernon and neighboring districts in Placer county organized and recently completed a fruit shipping house. Now the Earl Fruit Co. is planning another.

Butte county canning-fruit growers are investigating the plants of the California Growers' Ass'n in Tulare county, preliminary to es-

This announcement tells you how to secure

Your Water Supply at Small Cost

At last—a high-grade, efficient, dependable centrifugal pump at a low price. The Bean Irrigator introduces a new standard of pump values. Though the price is as low as the lowest—the pump is "Bean quality" through and through. If you're interested in irrigation you should learn about

Bean Centrifugal Pumps

For Downright Good Service They are Absolutely in a Class by Themselves

The Bean Automatic Water Balance eliminates end-thrust, thus saving much trouble.
The Bean Water Sealed Stuffing Box makes excessive tightening of the stuffing box glands unnecessary. The shaft where it enters the pump is entirely surrounded by water, which forms a perfectly air-tight seal with very little friction.
Bean Runners are Enclosed, accurately machined and perfectly balanced. This means greatest possible efficiency.

SEND FOR BEAN CATALOG 28-B

It illustrates and describes the Bean line of Horizontal and Vertical Centrifugal Pumps, Bean Turbines, Direct Connected Outfits, etc. Tell us your pumping requirements. The experience of our irrigation specialists is at your command. For our general line of House, Windmill, and other Pumps, ask for Catalog 28-D. For Bean Opposed Gas Engines ask for Catalog 28-C. A postal will bring any or all of these catalogs by return mail.

BEAN SPRAY PUMP CO. 211 W. Julian St., San Jose, Cal.

It's Hard to Decide

Yes, we know it's hard to decide. Probably the young lady would say "YES" without hesitation if her admirer would assure her that he would buy an R & V TRIUMPH ENGINE. Then there wouldn't be any need to wear herself out turning the washing machine, turning the separator, etc. The little R & V would do all the work. Then, too, her husband wouldn't have so much hard work to do. He could let the R & V pump his water, turn the grind-stone, grind bones for the chickens and a score of other duties. Any young man contemplating marriage, and in fact, any one that wants to eliminate the grind and drudge of the ranch will do well to go right straight to

William Gregory & Sons
602 N. MAIN STREET, LOS ANGELES.

and get one of these dandy little R & V Engines. This well-known concern handles all styles and sizes. In addition, they handle pulleys, belting, spraying, farm and orchard machinery supplies, Moline automobiles, accessories, tires, tractors, etc. In connection with their business, they have one of the best machine shops in the city, where ranchers can get all kinds of repairing done.

tablishment of a local, probably at Gridley.

The $39,980 still left to be subscribed before the Peach Ass'n can do business at all, was reduced by $6,270 at a Fresno meeting April 22 and a number of farmers and business men volunteered to canvass during the present week.

President F. S. Jerome, in making his report to the Watsonville Apple Distributors, after showing the great good done, said that if 90 per cent of the Valley's apples had been included, $500,000 more would have come from the crop.

Napa horticultural commissioner J. J. Fox reports 194,569 trees planted the past season. Of these 138,619 were prunes, 17,412 pears, 14,851 almonds, 10,269 apples, 9,837 plums, 4,455 cherries, 3,958 peaches, 1,916 walnuts, 1,728 apricots, 462 oranges, 408 lemons, 229 quinces, 165 olives, 146 figs. About 35,726 vines were set out, 28,000 berries, and 294,569 seedlings.

The Prune and Apricot Growers' Information Bureau reports less than 50 per cent of a prune crop for the State as a whole and still less for apricots. Offers are made of 5½ cents for spot goods. An estimated 20,000,000 pounds which have been sold short are not covered. Offers made of 9 and 10 cents for dried apricots and a 200-ton Ventura crop was recently contracted on the trees at $35. The Bureau believes that $50 is right for green fruit and 12½ cents for dried. Forty dollars is offered freely for pits.

CITRUS, OLIVES AND NUTS.

Tulare county Valencias are estimated as 80 per cent of normal.

Manager R. A. Powell of the Tulare County Growers' Ass'n reports all their fancy 1915 olives sold.

The Lindsay Olive Growers' Ass'n elected W. B. Kiggens president and R. W. Fenn secretary.

E. M. Chace of 8 to 1 orange fame is reported to be working on a maturity test for cantaloupes for the U. S. Dept. Agr.

The California Olive Growers' Ass'n held an all-day meeting in San Francisco April 24, at which several matters were earnestly discussed. Most of the upper California olive districts were represented.

The Cal. Almond Growers Exchange representative in Spain writes that premature springlike weather developed the almonds too far and that this was followed by rain, cold storms, and hurricanes.

Green olives which by processing have been made to appear ripe and which are labeled or sold as ripe olives will be regarded by the State Bureau of Foods and Drugs as mislabeled under the Pure Food Act.

The Fair Oaks and Orangevale Almond Growers' Ass'n on April 22 elected directors as follows: C. D. Levering, Jos. Radke, G. E. King, J. F. Ricketts, of Fair Oaks, and Vey Cramer of Folsom. The members expressed appreciation of the methods of the State Exchange.

GRAPES AND SMALL FRUITS.

A Live Oak strawberry breeder has developed a promising strain.

Sutter county grape growers met April 22 to learn from University professors how to handle phylloxera and mildew.

California tolerance of ½ strawberry variation in capacity per box has also been adopted by Utah so interstate shipments may take place.

A large percentage, perhaps half, of the crop of Tokays in the Lodi district are already under contract to people supposedly acting for Eastern fruit dealers.

Canned seeded raisins packed by the Armona cannery reach consumers without sugaring or drying out. An order has been received for 12 carloads to be delivered to Chicago as soon as possible.

Our Fresno representative reports that the strawberry growers of Fresno county are getting a much better price this year than usual—$1.40 for 25-basket crates and $1.25 for 20 baskets. There are two Associations, one of Japanese, one of white berry growers.

MISCELLANEOUS.

A movement is started by the Visalia Board of Trade for a farm adviser.

Scott's Creek in Lake county is to be diverted to save swamping of Scott's Valley.

Lippia grass for dry lawns is endorsed by Phoebe Hearst, who lives in the hills near Pleasanton.

Princeton, Colusa county, farmers are hoping to organize an 18,000-acre irrigation district.

Honey Lake Valley is organizing an irrigation district to include 37,800 acres. Skeedaddle creek will be one of its boundaries.

The Pacific Gas and Electric Co. has put into effect an elaborate system of pensioning employes after 10, 15, and 20 years of service.

Glenn county fruit growers are trying to get an assistant horticultural commissioner to keep fruit pests from their new plantings.

Plant lice may be destroyed by spraying with 1 pint blackleaf 40 and 1 gallon of liquid whale oil soap mixed with 200 gallons of water.

County supervisors are being asked to post cardboard warnings against throwing lighted tobacco and matches into dry roadside grass.

To protect western white pine forests from blister rust, the U. S. Dept. Agr. is asking eastern nurserymen not to ship pines, currants, and gooseberries west of the Missouri, so that a quarantine will not have to be imposed.

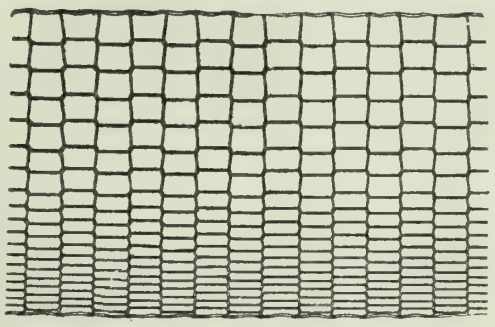
Save Money on Wire Fencing! -send for WHITING-MEAD'S Free 1916 catalog showing how to save money on Building Material

HOG FENCING, 50c ROD



4 FOOT HIGH—LIKE PICTURE.

—With the rapid advance in price of all kinds of fencing, this is an even more important offer than might seem at first reading.

—We are fortunate in being able to secure an unusually large amount of this fencing, so can fill large orders promptly.

—Picture to the right shows just how it looks. However, there is a heavy barbed wire at top and bottom not shown in picture. This prevents cattle from pushing **down** and hogs from **lifting up** this fencing when in use.

—Only best Number 9 and 12 gauge wire used, fully galvanized. This price applies in 20 rod rolls.

WHITE ENAMELLED ROLL RIM SINKS $1

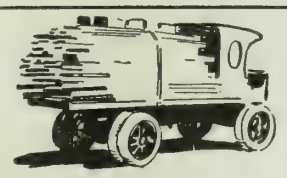
—Another evidence of buying in quantities impossible to small dealers. Roll rim sinks, just like the picture, white enamelled inside and deep blue enamelled outside. Made of best pressed steel. We've sold thousands and despite the war are able to quote the low price of $1.00

Enameled Steel Bath Tub. Our Famous Special. $8

—For years this has been our most talked-of bargain, in fact, we have reason to believe we are the only people on the Pacific Coast selling these tubs.

—Made of finest 24-gauge galvanized steel. Inside white enamelled, outside finished in rich sky blue enamel with handsome bronze trimmings and hardwood rim. Price, ... $8.00
larger sizes, $8.50, $9 and $10.

Low Down Enamel Steel Toilet Combination..... $11.50
Complete to floor—wonderful value.



Low Down Vitreous China Closet Combination..... $15.50
Special value—worth $22.50

Big value in High Tank Toilet Combination $11.50
Complete to floor—a bargain.

Special Bankrupt Stock of Kitchen Sinks. All sizes— from..... $1.00

Best Quality Porcelain Lavatories; every one guaranteed— $10 down to..... $3.75

About our Lumber

—Just as we have been telling you for some time we now have one of the finest lumber stocks in Southern California open for your selection.
—Do not let anyone mislead you. We can prove our lumber to be all we claim it. It is all new and strictly up to grade. Get our prices before you build.

Standard House Paint $1.50

—Regardless of the increased price on paints we are still able to quote you our old prices on the famous Standard and other paints.

—Standard House and Floor Paints, $1.50 per gal.

—Standard makes of varnishes at 25% off regular prices.

Everything in Paints, Wall Tints. Brushes, etc., at big savings to you.

Dutch Kalsomine, 4½c per lb.
Black Graphite Roof.—per gal.*.....50c
Standard Roof Paints—red, green, gray — per gal.* 85c
Shingle Stain, made from pure ground colors per gal 50c
*In 5 gal. lots only at this price.

Ready Roofing $1

—Roofing like this is being sold by many firms for 20% to 40% more. The European War demand is sending the price of all roofing up by leaps and bounds, but by reason of our large stocks we can quote these low prices:

1-ply, double-sanded, per roll of 108 square feet $1.00
2-ply, double-anded, per roll of 108 square feet 1.55
3-ply, double-sanded, per roll of 108 square feet 1.80
1-ply "King" smooth, per roll of 108 square feet 1.40
2-ply, "King" smooth, per roll of 108 square feet 1.65
3-ply, "King" smooth, per roll of 108 square feet 1.90
Send for free sample

Wall Board—2c Sq. Ft.

—It's the very same wall board that many dealers charge you 3c for. But we buy such immense quantities that we can afford to sell it at this low price.
—Makes the neatest inside finish, far better than plaster, burlap, or lumber. Now only, per sq. ft. 2c

"BEST FOR LESS"

9th and Maple Ave., LOS ANGELES

A Jersey Sale That is to be Different.

[Written for Pacific Rural Press.]

Will the auction sale of the future be the auction sale of the past in California? Such is the question that is being raised in breeding circles all over the State and the general impression seems to be that unless breeders take a decided stand on quality of consignments and methods of ring managership, little improvement can be expected.

Experience is rapidly showing that poor animals cannot be sold through the auction ring to any better advantage than at private sale; and that to be successful, an auction sale must be conducted on the same high level as the modern breeder pursues in selling animals at private sale.

These factors were seriously considered by the owners of the Rancho Dos Rios herd of Jerseys before deciding to hold a public sale and it is gratifying to learn that they expect to conduct their sale a week from today in the same trustworthy manner that has been characteristic of their dealing with the public for the past 44 years.

They considered that the average buyer at an auction sale is in search of females; and with the exception of a very few high-class bulls they have made up their offering accordingly.

They believed that the buyer not only wanted females but also known production capacity and breeding qualifications. As the chief reason for holding the sale was to make room for a large number of heifers which are about to freshen, they are able to insure both production and breeding ability, most of the cows having been selected from their milking herd and either being fresh or in calf.

No Disease.—None of the animals either in this sale or on the farm have ever been affected with contagious abortion, which is a big consideration to the buyer of dairy cows today. They have all passed the tuberculin test within the last few weeks. It is expected that this will be of particular interest to dairymen at this time as a result of the new dairy laws which go into effect the first of October.

Those desiring to establish foundation herds of either purebreds or grades can select an entire foundation herd of practically the same breeding. This herd has been established since 1868, being the oldest herd in the State, and as a result there is a uniformity in breeding as well as in conformation.

Because of the fact that Jerseys have not sold at anywhere near their actual value during the past few years in this State, the owners are not expecting fancier's prices. With the general awakening of Jersey interest all over the country though, it would seem that this was a most opportune time to lay foundation herds of this well-known breed, at a ridiculously low first cost.

Headquarters will be maintained at Modesto, where visitors from a distance can secure information regarding conveyances to and from sale. The auction itself will be held under an immense big tent, and seating capacity will be provided for several hundred people.

The sale will be conducted by Col. Ben A. Rhoades of Los Angeles, who will be assisted by M. P. Keppford of Modesto.

There will be no by-bidding. Every animal will be knocked off to the highest bidder regardless of price. Taken altogether, the sale should be a good place to buy high-class dairy cattle at fair prices.

Upper: A reg. Jersey heifer that will be sold at the Rancho Dos Rios auction sale; and, lower, one of the prize-winning herd sires, Biddy's Valet of L., which many of the cows in the sale are bred to.

Beef Fattening With Cottonseed Meal.

[Written for Pacific Rural Press.]

Cottonseed meal and hulls furnished the fattening ration for 1300 cattle at El Centro and 900 at Calexico belonging to the Cook Cattle Co. They were mostly three or four years old when put into the lot, weighing 900 to 1100 pounds. Most of them were from Texas ranges; some of the lighter ones from Mexico.

The ones at El Centro were kept in 10 pens 100 feet square, built next to the cottonseed oil mill for convenient hauling of feed. Those of similar size and grade were kept together.

The cattle were expected, according to W. H. Sprague, to gain 200 to 450 pounds according to size and breeding, in 60 to 110 days. Twenty-five pounds of meal and hulls in the proportion of 1 to 7 was the average day's ration for animals on full feed. Too large a proportion of meal would make too much protein per day. It was gradually increased from 1 to 12 at the start, and some received 1 to 5 on full feed. A little hay was also given. The meal was valued at $24 per ton; the hulls at $5. About 500 tons were used at the mill, according to Mr. Sprague.

The percentage of protein in cottonseed meal equals or exceeds the carbohydrates and fat combined. As the protein in a balanced ration for steers is only ⅛ or 1-9 as much as the carbohydrates and fat, it is evident that there is a great waste of protein in feeding cattle cottonseed meal alone. However, not all of the excess of protein is wasted, for the cattle come from the range pretty thin; and they use more of the protein economically for a few weeks in building up the lean muscles on which later to put on fat. However, the chances are that addition of enough grain to balance the ration after a few weeks would make that grain worth double or treble its price by saving the excess of protein that is now wasted in the cottonseed meal.

HOGS IN WALNUTS.

[Written for Pacific Rural Press.]

Ever since the rains let up L. A. Meredith of the W. R. Rowland ranch in Los Angeles county had about 250 hogs in his big walnut orchards. They have thrived on the rank growth of grass, filaree, and clover, and whatever nuts they have found. Soil under the spread of the branches has been well worked over by porcine noses; and if there were any blighted or wormy nuts, their harmful possibilities have been ended.

There are 325 acres of orchard, one 80 of which is on cold adobe soil which was pastured until plowed in April.

The hogs have no other feed, but will get grain three or four weeks before turning off. Mr. Meredith says buyers do not discriminate on account of the grass feeding.

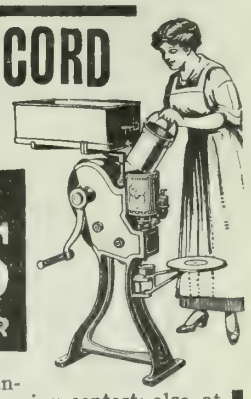
Hog Down Barley.—The system followed is to give the pigs pumpkins, etc., in winter until orchard soil is dry enough not to be damaged, then run them in the walnut cover crop till plowng, then turn them onto springy hill pastures until volunteer or sowed barley in the hills has reached the milk stage.

Then they are turned onto the barley to harvest it cheaply and "it is surprising the amount of fat hogs will put on in a barley field. That's the only way to raise hogs in this country except that we ought to have alfalfa fenced to turn them onto when other pasture is dry."

ANOTHER HORSE SHOW AT RIO VISTA.

[Written for Pacific Rural Press.]

We are advised by E. W. Westgate of Rio Vista that the Rio Vista Horse and Stock Show Ass'n was organized April 17 by electing E. W. Westgate president; Geo. P. Dozier, secretary; John McCormick, Perry Anderson and M. L. Isham as directors. These directors will act with the president and secretary as a managing committee and assist in naming the various sub-committees.



September 23 has been set as the date for holding the show this year and Mr. Westgate promises the best horse show that has ever been held in California, outside of the State Fair. This year a cattle show will be held in connection with the horse show.

Readers will remember last year's show at Rio Vista as being the first colt show ever held in California, and with the start which was made then the coming show may be expected to come up to Mr. Westgate's promise in all respects. All stock men and particularly horse men will be interested in knowing that our best draft horse section is to be the home of a high-class draft horse exposition.

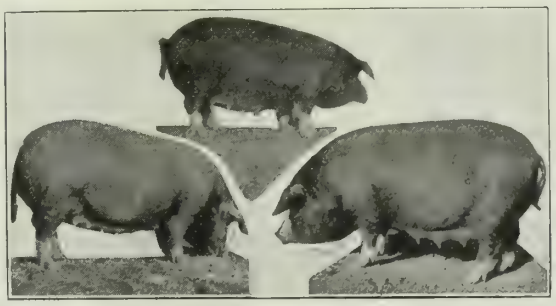
An up-to-date cheese factory is being built in the Petaluma district on the Gaver estate. The company has purchased a number of cows and contracted for milk from surrounding farms.

HOLDS THE ONLY WORLD'S RECORD

For Closest Skimming

THE U. S. Cream Separator won in the most severe competitive contest ever held, covering a period of 30 days. At all World Expositions where there have been working tests the U. S. has won and received **Highest Award,** as has been proved by such Expositions as the Pan-American where the U. S. **wonin the World's greatest skimming contest;** also at the Lewis & Clark Exposition where the U. S. demonstrated its superiority in **actual working tests,** and at the Alaska-Yukon Exposition where the U. S. **scored perfect** in skimming efficiency.

—THE— UNITED STATES CREAM SEPARATOR



Expositions, as in case of Panama-Pacific, which have not judged separators by actual working tes **render no proof whatever** of the merits of one machine over another.

CALIFORNIA HOG BOOK

Every hog-breeder in the State should have a copy of this book handy to refer to in cases of emergency. Every day the practical side of the book will help you. The author, W. S. Guilford, is a swine breeder, and he tells just what you want to know when a difficulty presents itself. The book contains 256 pages of text, besides many full-plate illustrations. Tells how the successful breeders feed and handle their hogs.

Price, $2.00 Postpaid.

With the Live Stock Men.

DAIRYING AND DAIRYMEN.

The Orland Cheese and Butter Co. is turning out almost a ton of butter per day.

Tulare county dairy inspector C. A. Peairs is prosecuting operators of insanitary dairies.

C. A. Beecher of San Joaquin county averaged 62 pounds fat from 40 Holsteins in March.

Blooded stock on 160 acres near Georgetown, El Dorado county, are being introduced by A. O. Nelson.

Hewitt and Hewitt have recently purchased 40 acres near Dixon on which they will place their registered Holstein herd.

H. T. Bailey of San Joaquin county averaged 60.3 pounds fat from 4.7 per cent milk of 11 Holstein cows in March.

L. Moreing of San Joaquin county has 15 Holsteins which averaged 55.6 pounds fat in March and 35 which averaged 54.1.

Laura J. Frakes and Bros. of Amador county have bought 60 acres at Rio Oso, Sacramento county, on which to establish a modern dairy.

The registered Dairy Shorthorn bull Baron Cambridge 2nd was received from Wisconsin April 19 by the John Lynch ranch of Petaluma.

Miss Benedita, a Jersey owned by J. E. Thorp of Stockton, made, in March, a record of 56 pounds fat from 963 pounds of 5.8 per cent milk.

The University Farm produced milk at a cost for feed of 4.09 cents per gallon from good cows and 14.8 from the poorest cow as an average for 2½ years.

B. A. Goodwin of Ripon has three Holsteins which made in March 55, 54.8, and 54.1 pounds fat from milk testing 3.6, 4.1, and 4.9 per cent respectively.

Bacterial and sediment tests to determine the price to be paid for milk or cream by Humboldt county creameries, is practically decided, largely through the efforts of the Farm Bureau.

The Stanford Vina ranch recently sold three purebred Holstein cows to M. H. Tichenor of the Palo Alto Stock Farm. Laurameka has an official test of 32.298 pounds butter; Autun has made over 26 pounds.

The yearly junior four-year fat record for Holsteins was broken by Milanhurst America De Kol, owned in New York, in a strictly official test in which she produced 985 pounds fat from 26,433 pounds milk.

A. B. Parker recently added 60 cows to the 80 head on the 4000-acre ranch of the Round Valley Land Co. in Mendocino county. Purebred Holstein and Jersey bulls head the herd which will all be tested for production.

Successful Queen, Jersey, completed a year's record April 14 making 852.72 pounds fat from 16,389.3 pounds milk. The test began at 4 years 5 months old. Her previous year's record was 682.4 pounds fat from 13,088.4 pounds milk.

Two official yearly Holstein tests have recently been completed. Their results have been compared with what the semi-official record would have been. In each case the actual fat produced was slightly more and the actual milk was slightly less than the semi-official test would have made it.

Cream grading in southern San Joaquin Valley is well established. Swift and Co. at Hardwick, the Central Creameries of Lemoore and Riverdale, the Corcoran Creamery, the Lucerne Creamery of Hanford and the Los Angeles Creamery Co. of Hanford all pay 2 cents less for B grade.

The American Guernsey Cattle Club will hold its annual meeting at Hotel Imperial, New York City, May 10. Other Guernsey men's meetings will be held there May 9. Dr. C. B. Davenport will give an illustrated lecture on Modern Laws of Heredity in Cattle Breeding. On May 11 there will be a large sale of Florham Farms Guernseys.

The John Lynch Ranch of Petaluma has recently sold the following registered Dairy Shorthorns: Five calves to W. E. Rucker, Willits; one 7 months bull and one yearling heifer to Chas. Dumars, Madison; 1 yearling bull to Chambers, Halbash, and Stevens, Los Molinos; a 15-months bull to G. W. Grant, Sanger; a 2-months calf to E. B. Root, Wasco.

Secretary H. J. Culbertson of the San Joaquin County Cow Testing Ass'n reports a Durham cow which produced 94.9 pounds fat in March from 1581 pounds milk testing 6 per cent. She belongs to C. Holman as do 7 Holsteins which averaged 58.2 pounds of 4 per cent milk. N. H. Locke had two Jerseys which produced 71.8 and 66.2 pounds fat from milk testing 6.1 and 5.8 respectively.

W. L. Hodges of El Centro bought 18 purebred Holsteins at the Southern California Consignment sale, thus totaling 400 purebreds and about 400 grades on his ranches. Bettie Snowflake of Sunnyside cost $825. She has a 7-day record of 28.88 pounds fat from 549 pounds milk. The first day following the test she gave 107 pounds milk. Locust Terrace Goldie cost him $535. Her record is 22.28 pounds butter from 565 pounds milk. Mr. Hodges uses a milking machine and is to have two steel silos of 280 tons capacity each. They are 14x40 and will be filled this season with two different crops.

SWINE BREEDERS.

Hogs recently sold at $10.65 in the stockyards of Alberta, Canada.

W. D. Trewhitt of Hanford has 42 Poland China brood sows headed by Nelson and Jumbo Equal.

The Woodland High School Agricultural Club was recently addressed on hog cholera by Dr. B. J. Cady of the U. S. Dept. Agr.

John Russell of Hanford says that during the past 20 weeks 123 carloads of hogs have been shipped from that city and still there are some left.

Felton and Hoyt have recently sold two Duroc boars to breeders in Kings and Tulare counties. They have some pigs coming on sired by Col. King.

Haden Smith of Woodland writes that six of his Duroc sows farrowed 72 pigs. Five of them are raising 51. The average litter for the whole herd was 11 pigs.

An acre of corn hogged off, produced more pork than an acre of corn harvested and fed in the usual way, according to the Missouri College of Agriculture.

Recent additions to C. B. Cunningham's O. I. C. herd at Mills are: a bred sow by Combination Rex, he by Combination the 2nd. She farrowed 7 pigs sired by Young Wonder, a son of Wonder; a fall boar sired by William A, grand champion in 1915 and out of Elmo's Pride, grand champion sow in 1913 and 1914.

Among recent sales of registered Poland Chinas from the Geo. A. Smith herd were three gilts and a boar to the Elwood Ranch, Inc., of Santa Barbara; Quilici Brother of Wells, Nevada, sow and boar; F. R. Morgan of Yuma, Arizona, two sows and a boar; D. W. Wiley of Soledad, sow and boar; J. L. Hall, Van Nuys, five sows.

Benj. F. Brunn of San Francisco purchased of Geo. A. Smith of Corcoran, twelve bred gilts for his ranch near Stockton. They were among the best that Mr. Smith has ever raised and will make a very fine foundation herd. Mr. Brunn is making very extensive plants to start one of the leading herds of purebred

REGISTERED DUROCS of guaranteed breeding. Bred gilts, service boars and fall pigs. H. E. Boudier & Son, Napa.

POLAND CHINAS—Young stock; either sex. Write for pedigree. Reasonable prices. Edwd. A. Hall, Watsonville, Cal.

Poland Chinas in California, and is equipping his ranch for a large herd.

BEEF BREEDERS AND CATTLE.

A union packing house is proposed for Fresno by the San Joaquin Valley stockmen's Ass'n.

Miller & Lux shipped 12 carloads of fat beeves from Los Banos to San Francisco last week.

H. L. Murphy has brought to California two more carloads of registered beef Shorthorns. Most of the animals are bulls.

F. F. Britton of San Jose suggests that the State and county fairs should give prizes to California boys for raising baby beef.

HORSES AND SHEEP.

D. O. Lively recently shipped six Merino rams for Mr. Bullard of Woodland to Paiyta, Peru.

Senator J. D. Bradshaw and A. Pasquale of Paradise Valley, Nevada, recently bought stallions for their ranches.

Wool buyers are paying 24 to 26 cents for spring clip wool in the Dixon section. Some holdover fall clip is being bought at 17½ cents.

Posters advertising stallions for service in Oregon must contain the words "Purebred," "Grade" or "Mongrel" in boldface letters one inch high.

Sheepmen in Solano county are disposing of their spring lambs at $5 to $6 per head. H. G. Brown of Dixon is reported as having sold 500 at $5.50 each.

Sheep scab, formerly the greatest drawback to the sheep industry, is easily controlled by regular dipping in lime-sulphur, nicotine, or sulphur solutions, but according to the U. S. Dept. Agr., stockmen are inviting another scourge by neglecting these measures.

The Wyoming Corriedale Co. has recently sold two Corriedales to Elenwood & Ramsey, Red Bluff; two to Walter McAlpine, Marysville; one ram and 7 ewes to A. M. Harahan, Yamhill, Ore.; three to the Nevada Agricultural College, Reno; and three rams to Adam and McGill, Ely, Nev.

MISCELLANEOUS.

A rabid coyote caused the loss of 23 steers in one feed lot at Winnemucca, Nev.

Honduras cattle have long been barred from U. S. because of the cattle tick, but growers are beginning to treat their herds in order to ship

The Napa County Fair will be held Sept. 13-16 under auspices of the Farm Bureau and Livestock Ass'n. Admission will be free.

Two silos 30x30 will be filled with 325 tons of pea vines each by the Pacific Pea Packing Co. of Oakdale. The vines have heretofore been wasted.

Five 200-ton steel silos are being placed on the Timkin ranches in Imperial county. They measure 19x36 feet and a variety of crops will be tried out in them this season.

SWINE.

Pedigreed Holstein Bull $250

I am now offering a very fine bull out of a high-testing dam, who was sired by King Pontiac Premier, one of the best sons of King of the Pontiacs, 165 A. R. O. daughters. His dam's present record is 21.09 pounds, average test, 4.11%, made at four years old. This record was made under verw unfavorable circumstances, and she will make around 25 pounds with next calf. On the sire's side the bull has the blood of Pietertje Hengerveld Count De Kol, 99 A. R. O. daughters; and dam Deutschland Creamelle, is out of Creamelle Vale, the former world's championship milk cow. This young bull is almost white in color and is ready for service. His high test breeding will count in your herd.

Write or come and see him.

Querists will save time by referring to back files by means of the indexes published in June and December.

HORSE LIES DOWN FREQUENTLY AND RUNS AROUND.

To the Editor: A workhorse apparently well and in good condition would frequently lie down and get up a time or two while eating in the barn. One day after eating well at noon as usual, he lay down in the plow team. I turned him loose. He rolled a time or two, then ran toward home. He lay down in the barn, then trotted around and lay down again. He tried to lie on the manure pile on his stomach with his front feet sticking straight out. He seemed in such pain that he was crazy and would get under the fence and try to go in the shop.

I gave him oil and also injections, but neither had any effect. Later I gave him niter, but that had no effect either. He got no better so about 8 o'clock I gave him a dose of liniment and a few minutes after that he died.

I cut him open. The lining of his stomach was two-thirds gone and red worms about ¼ in. in diameter and ¾ in. long (which I presume were bots) were busily engaged on the remainder. There were a number in the stomach.

The intestines were practically empty, the stomach full of food. Had I doctored him for bots and succeeded in removing them would he have lived with his stomach in that condition? What was the immediate cause of death? If a horse has bots eating the lining of the stomach how can I tell it in time to save him? —J. W. S., Tulare.

[Your horse would have died regardless of treatment with his stomach in the condition you describe. Immediate cause of death was due to destruction of the lining of the stomach and to the absorption of the toxic products due to this destruction. You have described the symptoms of bots and should be able to recognize the trouble again. A good remedy for bots is to give one ounce of carbon bisulphide in a capsule every hour until four have been given and follow with a quart of raw linseed oil.]

ANKLE PUFFS AND THRUSH.

To the Editor: My mare has soft puffs on her ankles. Some people call them wind galls, and road puffs. What is the cause? Are they harmful? She has thrush in her feet, also. Will it be good to shoe her over a stout piece of leather and fill the cavity with hot tar?—W. E. P., Wilmington.

[These puffs seldom do any harm. They are caused from strains of the tendon sheaths. A good treatment is to paint them with tincture of iodine daily over a period of one to two months. For thrush pack the clefts of the foot with cerate of cantharides twice at intervals of four days.]

COW HAS DISCHARGE.

To the Editor: What shall I do for a cow that has a white discharge? She calved Feb. 22. The afterbirth came in pieces. She has not been in heat since.—F., Bieber.

[Douche out this cow with a 1-1000 solution potassium permanganate in quantity about one gallon daily until the discharge ceases.]

OPERATE FOR POLL EVIL.

To the Editor: My horse's head is very sensitive on top just behind the ears. How do you cure poll evil?—F. F. B., Turlock.

[An operation is the only cure for poll evil.]

Geo. A. Smith and D. Wiechman Sales
482 Dairy Cattle 482
Mr. Wiechman will sell at his ranch
FIVE MILES SOUTH OF CORCORAN, CALIFORNIA,
on the Angiola Road.
ON TUESDAY, MAY 16

Poultry for Profit---Producing and Marketing.

DISPOSING OF OLD BREEDING STOCK.

[Written for Pacific Rural Press by Mrs. Susan Swaysgood, Pomona.]

There are several ways open to the farmer with a few dozen good-sized hens, that have been used as breeders, to dispose of them. The first way is to send them to the ever-present commission man and take what they will bring. This way brings ready cash and very little trouble. But it will pay those who are not afraid of the trouble and would like a little more cash to put the hens in a small yard or shed where they can have shelter from the sun and at the same time have plenty of fresh air and feed them up on a fattening diet. If sour milk can be had, or buttermilk, feed them a soft mash mixed with the milk and see that they are kept clean and quiet. It may take three weeks to get them in good shape, or even a month, if they were very poor to begin with. But they will gain enough in weight to make it profitable, besides the gain in quality.

When you have hens in real good condition it is not much trouble to get a good market for them, but small skinny hens are always a drug on any market. Even when sold through commission men it pays to put them through a few weeks of fattening as the increase in weight alone will pay for the trouble.

Advertise Locally.—But if you live near a town of any size, selling good fat hens to hotels, restaurants and private families is a very easy thing to do and at very little trouble or expense. Simply put a small ad in the local paper: "Milk-fed chickens for sale." To this can be added any other information you wish to give, such as "dressed," if you want to go to the trouble, and price per pound.

Dressed Chickens Pay Best.—Most housewives are willing to pay extra to have a chicken "dressed," ready for cooking, and if you make a good job, I know from experience that you can charge almost double the price you could for an undressed chicken. When you deliver dressed fowl, let them be clean outside and in, have a damp clean cloth in the bottom of the box and one to cover the chickens with. Then, too, it is better to have them weighed and a tag tied on each chicken with its weight and price. This saves trouble, and perhaps having to wait at some places while they send out to get the chicken weighed. Sell by your own weight, not other people's, but don't forget to allow a little for shrinkage. Sometimes it is quite easy to get the trade of a good hotel who will take all you have at a fair price, but if that can't be done, sell to private families.

To City Restaurants.—Another good way is to advertise in a city paper, "milk-fed chickens." Or get the names of some hotels and restaurants and write to them stating how many good fat hens you can supply them and at what price, or say so much above market price of common market stock. You might not know the market price, but they will, so if you ask too much that trade will be lost. The markets that sell retail are about the best and most reliable men to ship to if you can correspond with them and find out just what they want, because they will not buy poor, thin poultry; they buy to sell again at once, not to fatten up.

Canned Chicken for Sunday dinner or lunch with a few accessories makes it easy to prepare a meal that will nourish and satisfy during the summer months.

Our Home Circle Editor will perhaps publish my recipe for disposing of a part of the breeding stock to the best advantage; anyway, I will send it in and hope you will try it.

POULTS WITH ROUP.

To the Editor: Is roup in young turkeys caused by a microbe in the ground, and what can I do to cure the sick birds?—J. M. S., Folsom.

[Answered by Geo. H. Croley.]

[All forms of roup are contagious and the germs from affected fowls will contaminate the ground, houses, and roosts. One or two good sprayings with disinfectants made from coal tar or containing carbolic acid usually destroys them. Simple catarrh or a cold, which is often mistaken for roup, is not difficult to cure, but there are two general forms of real roup that are difficult to conquer. The most common form may be classed as contagious catarrh resulting in the formation of cheesy substance in the mouth and nostrils and often in swollen eyes. Diphtheretic roup—also called canker—may or may not include the above symptoms, but is distingushed by yellowish white patches on the tongue and in the throat about the windpipe. To treat either form, first remove affected fowls to comfortable and protected quarters; give them all they will eat of a variety of food or a balanced ration. For catarrhal roup, remedies are generally sold throughout the country, but the following are also good: Cleanse the head, eyes, and throat with a solution of ½ ounce boric acid in one pint of warm water; or a two per cent solution of carbolic acid; or peroxide of hydrogen diluted in equal quantity of water. For diphtheretic roup, in addition to the above remedies, paint the throat with tincture of iodine; pour oil of turpentine on a hot brick placed so that the fowls must breathe the vapor.]

ARSENATE OF LEAD UNSAFE IN POULTRY YARDS.

To the Editor: I have some apple trees in my poultry yards. Would there be danger of poisoning my fowls if I spray these trees with arsenate of lead?—M. C., Sebastopol.

[Answered by Geo. H. Croley.]

[The arsenate of soda and the acetate of lead, from which this compound is made, are both very poisonous substances, and unless great care is used, the fowls might be poisoned. If the spray could be prevented from falling into the yards at the time of spraying, there would be little danger of trouble afterward, for the reason that the compound sticks well and even during an ordinary rain is not likely to be washed off the foliage.]

CHOLERA OR ENTERITIS?

To the Editor: What causes cholera among hens; is it contagious; and how can it be prevented? Is it curable; and if so, what should be given?—Subscriber, Boulder Creek.

[Answered by Geo. H. Croley.]

[Fowl cholera is caused by a germ (bacillus avisepticus); it is very infectious and usually fatal. We have never seen a case of genuine cholera in California, and several careful investigators now believe that nearly all formerly supposed outbreaks that have occurred in the United States were not cholera, but some form of enteritis or serious intestinal trouble. There is no known remedy for the true cholera. The best way to prevent it is to feed the fowls wholesome food and furnish them comfortable quarters that are frequently disinfected. The trouble that is most often mistaken for cholera is enteritis or a serious form of dysentery. There are two general causes for this trouble: bacteria derived from filthy conditions, dirty water, putrid meat, or other decaying food causes bacterial enteritis, while toxic enteritis is created by slow poisoning through eating unslaked lime, salt, paint skins, lye, arsenic, and copper, or solutions containing these materials.

It is difficult to distinguish the two forms because the symptoms are similar. In all cases the birds seem droopy; usually eat little; the comb is pale at first, but later turns a purplish color; always diarrhoea varying from whitish to green, brown, or red; the fowls usually linger for weeks before death; at first the liver is enlarged, but finally shrinks; and the intestines are inflamed and full of mucous; if head is held downward, a stringy, dirty liquid escapes from the mouth.

To remedy the trouble, first clean up and disinfect the premises. If toxic infection is suspected, give large quantities of milk, white of egg, or mucilage; and in any case as treatment for each 100 mature fowls, proceed as following: Dissolve one pound of Epsom salts in water and mix in the mash; reduce the bran and shorts in the mash and increase the middlings; give one dose only of the salts. The next step is to mix in the mash twice daily ten ounces subnitrate of bismuth, three ounces powdered cloves, and ten ounces of powdered charcoal. If this does not check the diarrhoea within twenty-four hours add to the above remedy three ounces bicarbonate of soda, seven ounces powdered cinchona bark, and give three times daily in a less amount of food until the dysentery is checked. When this is accomplished, give in the food once daily to each 100 mature fowls one ounce of the following mixture: One pound each of powdered fennel, anise, coriander, and cinchona bark; two pounds each of powdered ginger and gentian; and half a pound of powdered sulphate of iron. Continue this for from one to three weeks according to the improved condition of the fowls.]

HEALTHY ROOSTER HAS LUMP ON FACE.

To the Editor: I have a fine, vigorous rooster apparently in perfect condition that for six weeks has had a swelling on left side of his head between the eye and the beak. The lump is not hard, is the size of a pea, and does not change in size. The eye seems all right except that it is usually watery, due, no doubt, to the pressure. What is the cause and remedy?—Subscriber, Raymond.

[Answered by Geo. H. Croley.]

[In the absence of any further symptoms or details, we judge the trouble is due to some foreign substance that has lodged in the face of the fowl. A fox-tail, wild oat, or splinter may be found if the lump is carefully opened. If, when opened, some object is discovered, it should be gently removed and the wound washed with listerine, peroxide of hydrogen, or a carbolic acid solution. If, by chance, this is a mild sporadic case of swell-head, this treatment will likely cure it, but it would be well to examine the other fowls to see if they have any affection of the head, eyes, or throat that might indicate the presence of swell-head, canker, or roup.]

The 200-egg hen was discovered many years ago. In the 1901 Poultry Contest conducted by the "American Agriculturist" one flock of hens averaged 247 eggs, while the poorest return was from a flock in the same neighborhood; the hens in this flock averaging less than 10 eggs each hen per year.

KILLING TRESPASSING HENS.

To the Editor: If my chickens go on a neighbor's place, has he the right to shoot them?—H. R. B., Fairfield.

[Answered by Geo. H. Croley.]

[It is the duty of the owner of fowls to prevent them from trespassing upon neighboring property, and the party who is damaged by the trespassing of the fowls may take them up and obtain damages through due process of law. If, on the other hand, he kills the trespassing fowls, he is liable for damage to the extent that may be awarded the owner by a court or a jury.]

FARMERS' UNION SUPPORTS PRUNE ORGANIZATION.

The Farmers' Union stockholders have voted to do for the new prune organization as they did for the raisin company. Their raisin warehouses were used as before, until the raisin company was assured, when the warehouses were turned over to the latter. While the Farmers' Union realizes that thus their own marketing organization will be weakened, they are to be highly commended for the patriotic and unselfish position they have already taken in favor of the State-wide prune association.

NEW AYRSHIRE DAIRY.

A new Ayrshire dairy is being established on the Willow Farm near Woodland by H. A. Johnston of San Francisco. Twenty-six registered females have been secured from Canada, and a bull from E. B. McFarland of San Francisco. Supt. W. G. Baine states that they expect to increase the number and to raise hogs as well. Buildings have been painted; concrete floors laid in the cowbarns; a concrete walk connects the milk house and barn; new fences built, and yards graded to drain off the water. A 150-ton silo will soon be erected.

Poultry Breeders' Directory.

Rates in this directory, 3c per word each issue; or if carried weekly for one year, 2½c per word.

HARES AND RABBITS.

LEADING RABBITRY IN AMERICA—Flemish Giants and New Zealands. Cut your living expenses. Catalogue free. Empire Rabbitry, Empire, Cal.

BELGIAN HARES—Young stock for sale. Hurd Bros., St. Helena, Cal.

HOW ABOUT CROPS THIS SUMMER?

Proper irrigation will more than double your crops—ask your neighbor who has tried it.

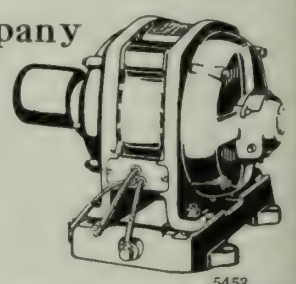
Electric motor-driven pumps will solve any irrigation problem. They need no attendant, deliver water steadily day and night and cost but little to operate. Insist on a

G-E ELECTRIC MOTOR FOR RANCH AND FARM

to do your pumping. It will pay for itself in a short time in bigger crops, perfect satisfaction and low upkeep.

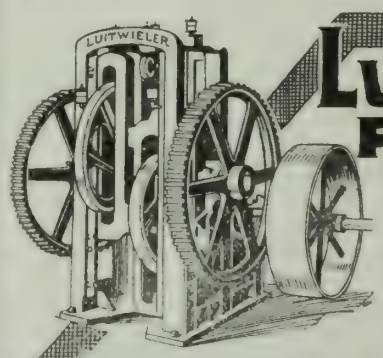
A G-E portable motor can be used to drive various farm machinery, greatly reducing your labor bills and insuring you against scarcity of "help".

Your local power company will gladly tell you what G-E motors can do for you; or write our nearest office for booklet No. 3166 on electric farming—the request will place you under no obligation.



General Electric Company

Los Angeles Office:
124 West 4th Street



San Francisco Office:
Rialto Building

The General Electric Company will gladly answer all questions relating to the use of electric power for ranch and market garden irrigation.

LUITWIELER PUMP

This pump stands alone in point of efficiency, having a guaranteed efficiency of over 80%. The economy of a pump depends directly upon its mechanical efficiency. The Luitwieler has absolutely the highest efficiency and this enables it to produce the cheapest water. Non-pulsating, perfectly balanced, no jerk, jar or vibration, and minimum power required.

There's a thousand and one reasons why you should have a Luitwieler Pump. Write for our 2 booklets on Pumps and Irrigation, which give valuable information.

FLORAL CORNER.

[By Geo. N. Tyler.]

In answer to the questions of A. N. R.:

Question 1. What method do florists use to root carnations?

Question 2. Are cinerarias annuals or perennials?

Question 3. Is it possible for an amateur to grow cyclamen from seed,

Carnations are rooted in the winter months from strong plants free from all diseases. You can root them now, but it is a little late. It would be better to get small plants out of 2¼ in. pots. In taking the carnation cuttings take the shoots from the flowering stems not too high up or low down; the cuttings must be soft. Cut just below a joint, or if they can be taken with a heel, so much the better. If a cutting breaks clean across when bent it is right for rooting, but if it knees it is too hard. Trim up the bottom leaves close to the stem, and trim the top back so that the cuttings will be about three inches long.

Get a box four inches deep that has cracks in the bottom, put in one inch of coarse gravel, and on top of this three inches of sharp sand for top, firm the sand in the box and water.

In making your cuttings throw each one in a pan of water, to prevent wilting, for when a cutting is wilted, its juices are expended and it is thus the same as a hard wooded cutting. At this time of year, put the box with the sand in a shady sheltered situation free from draughts. Put in the cuttings about one inch deep, one inch apart in the rows, and rows two inches apart, keep them well watered and sprayed for the first week, and as they draw moisture from the sand, give less water; they will root in about four weeks if conditions are favorable. Do not let them stay in the sand long after rooting. You can plant direct from the sand into permanent beds where they are to bloom. I will give cultural directions next week.

Cinerarias—Are classed as tender annuals or greenhouse perennials. Seeds should have been planted last fall. It is better to buy young plants now than try to grow from seed at this time of year.

Cyclomen—Are easy to grow from seed if the weather is not too cold. The seed is sown in light sandy soil, and barely covered, in October and November, and as soon as germinated, pricked off into flats, one inch apart, using a light soil with a great deal of leaf mould. I would advise buying small plants and growing them—plants out of 2¼ in pots if possible. I will give cultural directions later. But in chrysanthemum cuttings as described in a former article you can put in cuttings clear up to end of June and still get big flowers.

I have received a query on moving Bermuda lily bulbs. I would advise that you let the lilies grow on and bloom, and seed if possible. By seeding they will mature earlier. If you do not let them bloom, the bulbs after moving will come blind. The reason so many of the Bermuda bulbs come blind is on account of digging them before they mature. After they flower let them go dry, and as soon as foliage turns yellow dig and replant in new location as soon as possible, as it does not do lilies any good to stay long out of the ground.

TO COOK CHICKENS FOR CANNING.

Cut a lemon in two and rub the hen all over with the juice, or if no lemons are at hand rub over with vinegar and leave it to stand all night. Next morning wash off and wipe dry the chicken. Rub over with butter and sprinkle well with flour and salt. Put in greased baking pan containing half a pint of water, cover over with another pan same size to hold steam in (a roaster is the proper thing to bake old hens in), but the pans can be made to do. Now bake until the meat will slip from the bones, take bones out and heat up meat and gravy together and pour hot into fruit cans, any size, and seal up as you would fruit. When needed put can in boiling water and heat through.

TYPHOID FEVER.

The University of California is perhaps the national center of the fight against the ravages of typhoid. The death rate last year was only two-thirds that of the year before. The State Hygienic Laboratory will send typhoid vaccine to any physician in the State and vaccination is easy and practically painless. This is a safeguard to not only one's self but to one's close friends, for many cases of typhoid develop into typhoid carriers.

Other preventive measures against the disease are the State supervision of water, milk and food supplies and the disposal of sewage.

It is confidently expected that by 1918, California will lead all of the states in typhoid control.

GRAPE SYRUP.

One of the Rural Press subscribers, Levi Lindquist of Middleton, has been manufacturing grape syrup on his place and getting one dollar a gallon for it. He advocates all grape growers who have grapes rich in sugar, as the Black Melvoise and Mission and other varieties, to follow his example and unite to form a market for the product.

SMOKERS' SETS.

The stores are showing stands of wood in various finishes that have a good-sized drawer for tobacco and pipes and a tray on top for ashes. These are very light, easily moved around and would make fine gifts for any man who is a smoker.

Cucumbers make a delicious salad and an attractive one as well when served in their own skins. Do not pare but wash the cucumbers well and dry them, slice them the long way, scoop out as much cucumber as possible, take a portion, cutting it into small cubes, mix with diced celery and pimentoes, fill the cucumbers, cover with mayonnaise and serve on lettuce leaves. Garnish with sliced pickled beets.

Keep the coffee pot clean by scalding it out with water to which soda has been added.

TO SPRING.

By Mrs. R. M. Arthur, Turlock, Cal.

Here's to pansies for thoughts they say,
To the new striped marigold.
Here's to the violets' modest way,
And forget-me-nots of old.

Let's welcome these flowers of springtime,
And the daisies so bright and gay,
They bring with them all the sunshine
We need to fill our day.

Friendship's Garden.—Why is it that in the country, we see so few nice gardens, when every advantage is afforded at so little cost?

How different would the out-of-the-way farm look, and what a happy appearance it would present, if the very spring itself were to bloom around its door. Yet it is true, it's seldom seen.

I came to the country almost a year ago, and enjoyed the first few months, it being my first experience on a farm. Soon the novelty wore off. I began to miss my friends and city acquaintances, especially my back-fence neighbors. I became lonely and blue, thinking only of the drudgery part of farm life.

Springtime is here now and with it the sunshine and happiness, inspiring all lovers of nature to awake, —it is garden time.

I have written each of my friends who have gardens to select for me a slip of her favorite flower, that I may plant it and watch it grow.

I have taken much pleasure in tending my garden, and into it is woven fond memories that separation cannot destroy.

My garden of sunshine and love it will be when blossoms will be riotous in their profusion, their fragrance ever present to welcome me.

What more beautiful remembrance of a friend than the living thought expressed in the sweetness of living flowers.

When my garden is an attraction, many will come to visit me and enjoy it with me; too, others will be inspired to have the same around their humble little homes, thereby making the country about me a beautiful sight to behold. It will then, sooner or later, attract more settlers, who will be proud to be one of our community and anxious to make their homes cheerful looking also.

One needs to get away from the washtub and the ironing board once in a while—and a few strokes a day with the spade and the hoe will do wonders to a run-down system as well as a run-down garden.

MRS. BEST'S LETTER.

My dear Friends:

At this time of year, when everything is so fresh and beautiful, we are all moved to freshen up the inside of the houses and whether we have much or little money to spend, if it is spent wisely, we can make a vast improvement. To begin with the walls, paper of course gives a handsome effect, but tinting in soft, pastel shades, makes a very useful wall and one that shows up any pictures to be placed upon it. The exposure of the rooms should decide the color as a cold, north room can be made much more cheery by using a warm, tan wall coloring. The use of bright red and greens is happily a thing of the past. Of course in bed-rooms that are intended for individual use, there is more latitude in choice of colors. Many bedrooms are done in blue, especially if the bedroom furniture is light in color. There are many borders in use, both on papered and tinted walls, and they can be secured in either conventional designs or more ornate patterns with straight edges, or floral patterns in what is called cut out designs. These range from 10 cents a yard up and make a finish just below the picture molding.

If your ceilings are high, drop your picture rail to the tops of the windows and allow the ceiling color, which should be cream, to extend to the picture rail. Some of the paper houses are showing draperies in the same patterns and colorings as the cut out floral borders and they make a very attractive combination.

Woodwork in old houses is quite a problem and there are many reasons why white is not feasible, but it is very pretty and white paint can be applied on almost any woodwork that has not a high varnish and can be done by anyone at all careful in their work.

For kitchens and bath rooms, there is on the market an oilcloth paper of domestic make that gives very good service.

If you have floors that you wish to prepare for rugs, fill the cracks and nail holes with a paste filler, smoothing it over with a knife and when thoroughly dry, sandpaper the rough spots. It will then be ready for the paint. Personally, I prefer a color that is similar to a dark hardwood floor and there should be several coats applied so as to make a good surface.

Paint houses have booklets describing interiors of rooms and floor finishes that they are glad to furnish on request. Devotedly,

Rosabella Best.

Mother: "Why are you so quiet, Bobbie?" Bobbie (aged six): "I was just thinking how glad I am Christmas doesn't come in the summertime." Mother: "Why?" Robbie: "'Cause I wear such teenty-weenty little socks in the summer-time."

Mrs. Wealthy: "Are your berries fresh, little one?" Margaret (experiencing for the first time the trials of a berry-vender): "Yes, ma-am. Our bushes don't raise anything but fresh ones."

Keeping a Good Thing Good Is Next to Making It Good

The Sperry "Red" Packages are absolutely air-tight.

They deliver to you **Sperry Quality Cereals** with all the goodness, all the freshness, all the crispness they had when packed at the mill.

There are forty different **Sperry Quality Cereals** packed and protected by

HOW DUKE EARNED HIS LICENSE.

Duke was a dog that had not belonged to any one until Robin adopted him. The dog followed Robin home from school one day, and ever after had refused to leave him.

Duke proved to be a very civil dog, kind, affectionate, and possessed of more than ordinary intelligence; but—how he did eat! Robin often shared his own dinner with him in order to avoid hearing his father say: "That dog isn't worth his keep. He eats more than his neck is worth," or something of that sort.

Robin's little heart was near breaking one day, when he overheard his father telling his mother that Duke must be got rid of in some way before the time came round for licensing dogs.

His mother found him in a corner of the woodshed with his arms around Duke's neck, while the dog's eyes looked appealingly into those of his boy friend as if begging for protection. Every now and then the dog's tongue would lick the hand that drooped from his shaggy neck, as if in sympathy he could not otherwise express. And altogether it was a picture hard to look upon with dry eyes.

"It really seems a pity to separate them," Mrs. Jordan confided to Robin's father when relating the circumstances to him.

"Yes, it does. But I certainly cannot afford to both feed the dog and pay his license. If Robin will agree in some way to earn Duke's license I will agree to keep on feeding the rascal," Mr. Jordan replied, as Duke, who had slipped into the room during the conversation, snuggled a cool nose coaxingly into his hand.

Robin, who was close behind Duke, heard the proposition, and joyfully acceded to it. Earn the money for Duke's license? Of course he would! There were numberless ways in which he could do it. Why, he almost felt the money in his hand now.

In the first place there were sodas. No more of these until Duke could boast a paid-up license. Baseball games, too, must be cut out. Why, when Robin started in enumerating the many ways in which money slipped through his fingers he was sure that in three weeks, at least, Duke would find himself a respectable, licensed dog.

Duke, unmindful of the unusual interest he was exciting, still followed Robin about in faithful dog fashion all day, and at night stretched himself contentedly upon his bed of meal-bags in the woodshed.

"One dollar of your fee earned already, old fellow," Robin exclaimed, throwing his arms impulsively around Duke's neck one night, as he was settling himself down to dog slumbers.

As if half sensing the meaning of the words, Duke softly licked Robin's cheek, accompanying the caress with a low whine.

"I wonder if Duke understands what I am doing for him," Robin mused as he was undressing himself ten minutes later. "I'm quite sure he would do as much for me, if he could. Not the same thing, maybe, but I know he'd do anything he could to help me if I was in trouble," he assured himself as he jumped into bed.

A couple of hours later Robin was aroused from a dreamless sleep by something brushing his cheek. "It feels just like Duke's tongue," he murmured sleepily, and he was about to drop off again when the touch was repeated, this time accompanied by the clawing of a paw at the bedclothes. He put out his hand; it rested upon Duke's shaggy head. The dog was whining and acting strangely.

"What is the matter, Duke?" Robin said, by this time wide awake.

Duke's answer was a series of loud, short barks that soon woke Robin's father and mother and mother and brought them into the room. Duke immediately rushed through the door and down the stairs, Robin and his father and mother rapidly following.

Robin had wondered how Duke had managed to gain an entrance to the house, but the open door between the shed and the kitchen reminded him that he must have forgotten to close it.

A fire smouldering in the corner of the shed told the rest of the story. The dog had smelled it and hastened to notify the sleeping family of their danger through Robin, his little playfellow and friend. The smouldering flames were soon extinguished, but had Duke delayed five minutes longer they would have burst forth.

After the excitement was over, Robin's father stooped and laid his hand tenderly upon the head of the faithful dog who in all probability had saved all their lives.

"You have earned your license, old fellow; and if I continue to pay it as long as I live I shall still consider myself in debt to you," he said in a husky voice.

Duke's soft brown eyes looked first at Robin and then at Robin's father, while his wagging tail seemed asking, "Who will own me now, you or Robin?" — Helen M. Richardson.

No Rat Can Gnaw Through Concrete

The brown rat probably steals more of the farmer's profits than any other living pest. Every one of the millions of rats in this country annually destroys many dollars worth of produce and property. They breed faster than the farmer can exterminate them by traps and poison. To keep rats out, you have to build them out—with concrete.

How to Build Your House Ratproof

Build the cellar walls, of concrete—likewise the cellar floor. Above the foundation, fill the space between sheathing and lath with concrete to the height of one foot. In the same way fill the space between first floor and ceiling. Build steps and cellar hatchway of concrete.

How to Make Farm Buildings Ratproof

Smaller farm structures, such as milk houses, granaries, silos, hotbeds and cisterns, should be entirely concrete. Such structures are absolutely inaccessible to vermin and rodents, except through open windows and doors. If rats do enter, they can be exterminated easily, as concrete offers no cracks nor crevices in which they can hide.

A farmer can do his own ratproofing with concrete. Write us about any structure you contemplate building. We shall be glad to tell you why you should use CONCRETE.

FIGURES GIVEN ARE INDEPENDENT AND RELIABLE

Pacific Rural Press Market Report

PRICES QUOTED AS PAID TO PRODUCERS.

San Francisco, April 26, 1916.

WHEAT.

The Eastern market has picked up a little in the last few days, but the Coast markets show little strength, and the only change in local values is a slight decline in northern bluestem. Stocks remaining in the country in Oregon and Washington are said to be large, owing to lack of transportation, but the crop is expected to be lighter than last year.

Cal. Club, ctl.	$1.57½ 1.65
Northern Bluestem.	1.87½ @1.90
Northern Red	1.85 @1.95

BARLEY.

The December option has been a little firmer this week, but trading in spot barley is limited, and while holders are not trying to force sales the market has little strength.

Shipping, ctl.	$1.37½ @1.40
Choice Feed, ctl.	1.32½ @1.35

OATS.

There is a small jobbing movement for immediate consuming requirements, but business is very quiet, and values are little more than nominal, standing about as last quoted.

Red Feed	$1.35 @1.37½
Red Seed	1.45 @1.65
White	1.45 @1.50

CORN.

Eastern corn shows some firmness in primary markets, but not enough to affect the local situation perceptibly, the amount required here being limited. The sorghum grains show a rather wide range of prices, even beyond the figures quoted, according to quality of offerings or local conditions in producing districts.

Eastern Yellow, ctl.	$1.80 @1.85
Milo Maize	1.40 @1.45
Kaffir	1.60 @1.65
Egyptian	1.50 @1.57½

BEANS.

Small white beans have been advancing by small degrees for several weeks past, and this week both small and large whites are marked up, as there is an increasing inquiry for these varieties from Eastern markets, where stocks are very light. The local supply in these lines also has been reduced to very small compass, and further advances are considered likely. Other grades show no change this week, and the demand has been very light for several months, while stocks in most lines are fairly large for this time of year. The cleanup of whites, however, is imparting a firmer feeling to the market in general, and will no doubt turn the demand more to pinks, which are expected to show somewhat better prices despite the large supply.

(On wharf, San Francisco.)

Bayos, per ctl	$4.50 @4.60
Blackeyes	2.90 @3.00
Cranberry Beans	4.55 @4.65
Horse Beans	3.00 @3.25
Small Whites (south)	6.15 @6.25
Large Whites	5.90 @6.00
Pinks	4.20 @4.30
Limas (south)	4.35 @4.45
Red Kidney	6.50 @6.75
Mexican Reds	4.50 @4.65
Tepary Beans	4.00

SEEDS.

There is a little alfalfa moving, but the season's business is about over. Sudan grass is getting considerable attention, and is offered at a wide range of prices, though the cheaper offerings are generally regarded with some doubt.

Melilotus Alba, lb.	23 c
Melilotus Indica	6 c
Bur Clover	11 c
Oregon Vetch	5 c
Soy Beans	6 c
Canada Peas	5¼ @ 6 c
Alfalfa, per lb.	22 @24 c
Sudan Grass	35 @40 c

HAY.

Offerings here are about normal for this time of year, and the daily arrivals clean up better than they did a few weeks ago. First cutting alfalfa is figuring more largely in the arrivals, and with old stock closely cleaned up, prices are exceptionally good, some very fine hay having been sold as high as $12 per ton. Much larger shipments are expected within the next week. New volunteer hay also will probably appear early in May. Fancy wheat and red oat hay in light bales is scarce and brings quite a premium, but the medium grades show no great strength; but with very adverse weather conditions in most sections for the last few weeks, comparatively high prices are expected for the new crop. There has been a larger shipping business to the north, but the southern, interior and export demand is light.

No. 1 Wheat	$13.00 @16.50
No. 2	12.00 @14.50
Tame Oats	12.00 @18.00
Wild Oats	12.00 @14.00
Alfalfa	12.00 @15.00
Stock Hay	6.50 @ 8.50
Straw, per bale	.25 @ .40

FEEDSTUFFS.

While the demand shows the usual spring contraction, there is fully a normal movement for this time of year, and with high prices for grain, etc., values are well maintained.

(Wholesale prices, per ton, carload lots, San Francisco.)

Beet Pulp, per ton	$22.50 @23.50
Alfalfa Meal, per ton.	20.00 @21.00
Alfalfa Molasses Meal per ton	21.00 @22.00
Bran, per ton	24.50 @25.50
Oil Cake	Nominal
Cocoanut Cake or Meal	23.00 @25.00
Cracked Corn	40.50 @41.50
Middlings	33.00lb34.00
Rolled Barley	29.00 @30.00
Tankage	45.00
Rolled Oats	29.50 @31.00

VEGETABLES.

Summer squash has been added to the list, bringing 60c to 85c per box. Cabbage is scarce and high, and artichokes hold up well. A little celery is coming from Florida, and eggplant and peppers from that source are easier. Mexican tomatoes are still held at stiff prices. The asparagus crop in the Delta district has been coming on rather slowly, and with a continued heavy demand for Eastern shipment and canning prices on good stock are still high, though there is a lot of poor stuff offered at lower figures. Rhubarb shows a wide range, with plenty of cheap offerings. Beans and peas are coming in freely from several directions, and in spite of large shipping business the prices are much lower.

Cabbage, ctl.	$1.25 @1.75
String Beans	5c @ 8c
Summer Squash, box.	60 @85c
Peppers, bell, lb.	25 @30c
Rhubarb, box, Bay	.40 @1.00

Artichokes, doz.	.40 @50c
Lettuce, small, crate	1.00 @1.25
Eggplant, lb.	10c @15c
Peas	2@ 4c
Tomatoes	3.00 @3.50

POTATOES AND ONIONS.

New potatoes have again been marked down, as the crop is coming in well, and supplies have accumulated a little in spite of a lively demand. Oregons are lower, and old river stock is nominal, with dealers closing out odds and ends at irregular prices. Repicked Delta onions are higher, but poor stock is cheap. Oregons have been marked up sharply, while Australians find very little demand. A car of Bermuda seed onions from Chowchilla is selling at $1.25 to $1.50 per crate.

New Potatoes, ctl.	2.00 @2.50
Oregon Burbanks	1.50 @1.85
Delta Burbanks	Nominal
Onions, Delta ctl.	1.25 @1.75
Onions, Oregon	1.75 @2.00
Australian	3.00 @3.25
Garlic, per lb.	9 c

POULTRY.

Young stock has again stiffened up a little, as there is an active local demand and offerings have been limited. The best fryers sell up to 40c, and small fryers bring a slight advance over last week. Young roosters also have advanced, while hens remain weak. Belgian hares are steady, notwithstanding heavy offerings.

Live Turkeys, lb.	21 @23c
Broilers, 15 lbs. to doz. and less, lb.	35 @38c
do, over 15 lbs. to doz.	35 @38c
Fryers	35 @40c

Geese, per pair	2.25 @3.00
Ducks, young, lb.	19c
Old	16 @17 c
Belgian Hares	11 @12½c

BUTTER.

Butter has again dropped a little, in sympathy with outside markets, though still somewhat higher than last year. Arrivals have been quite large, while the northern shipping movement seems to be over for the present. Eastern shipments continued until very recently, but are expected to stop at any time, as heavy arrivals in New York are causing that market to show some unsteadiness. Local dealers, it is understood, are not shipping at their own risk, the movement being handled on behalf of Eastern interests; and a peculiar phase of the matter is that much of the stock shipped out is picked up on the street at more than Exchange prices.

	Thu.	Fri.	Sat.	Mon.	Tu.	Wed.
Extras	25½	25	25	25	24½	24½
Prime Firsts	25	24½	24½	24½	24	24
Firsts	24½	24	24	24	23½	23½

EGGS.

Storage buyers have been actively in the market, and it is believed that more has gone into storage than at this time last year; but arrivals for the last week has been quite heavy, and prices have eased off a little.

	Thu.	Fri.	Sat.	Mon.	Tu.	Wed.
Extras	22	22	21½	21½	21	21
Sel. Pullets	19	19	19	18	18	18½

CHEESE.

California flats have been coming in very freely this week, and the price is 1½c lower. Y. A.'s hold fairly steady at the former level, while Monterey cheese is a little firmer.

Y. A.'s, fancy	17½c
Fancy Calif. Flats, per lb.	13 c
Monterey Cheese	15 @16½c

Eggs	22½	22½	22½	22½	23	22

DECIDUOUS FRUITS.

There are still plenty of cold storage apples, but with other fresh fruits arriving they receive little attention. The berry market is taking on more life, with a few raspberries and several lots of blackberries appearing and selling at fairly high prices. Strawberries are lower all round, with liberal supplies from several districts. Some small lots of gooseberries have appeared, but hardly enough to quote. Loquats have dropped again, and cherries are declining rapidly, though with only about half a crop no very low prices are expected during the season.

Blackberries, crate	$1.00 @1.50
Raspberries, basket	15c
Strawberries, S'n, crate	50c
Fresno	1.25 @1.50
Watsonville, chest	4.50 @8.00
Apples	.75 @1.00
Loquats, crate	1.25 @1.50

DRIED FRUITS.

Old figs are entirely out of the market, and the packers are getting actively into the market for future supplies. This is one market not affected by curtailment of export shipments, as the annual requirements of the United States are estimated at 20,000 to 22,000 tons, while the California crop, amounting to only about 8,500 tons, will be the total supply, as it will be impossible to get any more foreign stock this year. The market is accordingly very firm, and attractive prices are offered for both black and Calimyrna varieties, with nothing to indicate that values will be lower. Packers and dealers are also taking more interest in most other fruits, both for spot and future delivery. Apricots of the 1916 crop are being contracted at fully the present spot figures, and better figures are offered this week for prunes in both positions, in consequence of the evident shortage. Pears are little more than nominal. Peaches are steady here, with more firmness apparent in the Eastern market.

Apples	5 @5¼c
Apricots, per lb, 1915	8 @10c
Figs, white, 1916	9 @10 c
Black, 1916	5 c

MEAT PACKING PLANT PROPOSED AT FRESNO.

To learn why prices of beef, pork, and mutton are considered lower in California than elsewhere on the Coast or in the East, a committee of growers was appointed Mar. 15. On Apr. 22 this committee "decided to take steps to secure a co-operative packing house and union stockyards" at Fresno. Branch marketing plants are planned for San Francisco and Los Angeles. They hope to handle both fresh and cured meats. As it would take perhaps $300,000 to build and equip the plant and run it until the business would pay expenses, the committee is still making careful investigations of its feasibility.

Special Livestock Market Report.

No change has come to the livestock markets of San Francisco since last week except such a slight weakening on beef and mutton that it has scarcely affected the price quoted last week. Cattle are coming off the grass as the buyers demand them. There may be a shortage of sheep and lambs during May and June till the Nevada and Northern California stock begins to come. J. C. Johnson of San Francisco shipped 25 cars of live lambs to Chicago from Byron this week.

WOOL.

The wool market is quiet except for choice long wools, which move freely. Present arrivals are of poorer quality than last year, being dirtier and with more burs.

California Garden Flowers, by E. J. Wickson, $1.50 Postpaid, PACIFIC RURAL PRESS - Publisher 525 Market St., San Francisco.

20-lb. box $1.25
Imperial Clusters, 6-crown,
20-lb. box 2.50
Bulk, layers, 50-lb. box 2.25

CITRUS FRUITS.

The eastern citrus auctions are a trifle easier than they were a week ago, but the prices are still satisfactory. At New York on Monday, April 24, navels averaged from $1.80 to $3.05 per box; bloods $1.80 to $2.45; seedlings, $2.05 to $2.80; sweets $1.90 to $2.70; St. Michaels $2.10 to $2.45; Jaffas $2.65; valencias $2.65 to $2.90; lemons $3.20 to $3.55.

Shipments from southern California are going east at the rate of about 200 cars daily, and are nearly equal in amount for the season to last year at the same date.

Lemons are receiving a little more attention in the San Francisco market, and oranges are fully holding their own, though the demand will probably be affected by increased offerings of deciduous goods within the next few weeks. Values in all lines stand as before.

Oranges, Navels	$1.50@2.75
Tangerines	1.25@1.75
Grapefruit	1.50@2.50
Lemons, box	1.75@3.50
Lemonettes, box	1.25@1.75

HONEY.

New honey is expected here very shortly, and meanwhile the local market is dull and featureless, with stocks fairly well cleaned up and practically no demand.

Water White, comb	13@15 c
Amber	8@12 c
Water White, extracted	7@ 8 c
Light Amber	3@ 4 c
Dark	2@ 2½c

NUTS.

The nut situation shows little change, California stock of all kinds being pretty closely cleaned up, while the trade apparently has enough for present needs and is taking little interest in the spot market. The outlook for new crop is being closely watched by buyers.

(Prices f. o. b. San Francisco.)

Almonds (1915)	Nominal

Publisher's Department

The circulation of the Pural Press is gaining steadily. Last week we added 153 new subscribers to our list—we should have had more than 200, but part of the field force were off. Those that were at work turned in good lists.

At this season our book department expects less orders than during the winter. However we have a new book which should command sales all through the summer—Second Thousand Agricultural Questions Answered—you need this. Price $1.50, postpaid.

One of our Santa Clara county subscribers writes: "My father subscribed for the Rural Press when the agent for it was a Mr. McGrew in the early seventies, as I remember it, and I think there has not been a break in having it in our home since. For a Saturday night's comfortable reading and general agricultural reading it seems to be in a class by itself, and gives one a restful, though at the same time a progressive outlook for interests connected with the land."

Another new book of interest to horticulturists has just been issued by the Orange Judd Co. of 315 Fourth Ave., New York, entitled "Plant Propagation, Greenhouse and Nursery Practice," by Prof. M. G. Kains, price $1.50 net. The book is well illustrated, bound in cloth and contains over 300 pages. It was written in popular style to cover the new "wrinkles" worked out by plant propagators, and nursery, greenhouse and garden methods simplified. Teachers of agricultural practice should by all means have a copy in the library.

MISCELLANEOUS.

EVERY SIZE WROUGHT IRON WATER PIPE and screw casing water pipe, guaranteed as good as new. Prices right. Send for catalogue. We beat no one; everybody gets a SQUARE DEAL. Weissbaum Pipe Works, 160 Eleventh Street, San Francisco.

GAS ENGINES—I can furnish rebuilt Fairbanks, Morse, Otto, Peerless, Samson, Union and other good makes in all sizes. All investigators buy and all buyers are delighted. Pay when satisfied. J. J. Pottinger, 189 2nd St., San Francisco.

IRRIGATION EQUIPMENT—For pumps, oil engines, gas engines, friction clutch pulleys, etc., write us. We can save you money. Commercial Iron Works, 481-497 Fifth St., San Francisco.

APPLES!—Buy direct from producer. Newtowns, 90c; Bulk pack, 4 and 4½ tiers, equal proportion. No. 2 grade for cooking, 65c. In 5 box lots 70c and 50c per box. Edwd. A. Hall, Watsonville, Cal.

SECOND-HAND WATER PIPE and Screw Casing. New threads and couplings dipped in hot asphaltum. All guaranteed. Send us your inquiry. SHECTER PIPE WORKS, 306-8 Howard St., San Francisco.

FOR SALE—Two 40 in. by 60 in. Russell Threshing Machines, with pneumatic stackers. For particulars write to owner. H. P. Mohr, Amador Valley, Alameda county, Cal., Pleasanton P. O., Box 277.

FOR SALE—A well-stocked nursery in a good business location. 5318 Geary St., between 17th and 18th Aves., San Francisco.

REBUILT GAS ENGINES from 3 to 50 h. p. Thoroughly overhauled and guaranteed. Write us your requirements. A FEW SPECIALS: 6 h.p. 2-Cycle Gas Engine, $125; 15 h. p. Field Gas Engine, $350; 35 h.p. Best Gas Engine, old but reliable, $200; 50 h.p. Otto Gas Engine, $900. Mechanical Installation Co., 181-89 Second St. Motors, Gas Engines bought, sold and exchanged.

FOR SALE—Used Ranch Tools, Windmills, pumps, engines, new galvanized tanks; 1000, $22.50; 2000, $32.50; guaranteed. Save half. Demmitt Company, 126 North Main, Los Angeles.

"SMITHS' PAYS THE FREIGHT."—To reduce the high cost of living, send for our Wholesale to Consumer Catalog. SMITHS' CASH STORE, 106 Clay St., San Francisco.

LIVING EXPENSES REDUCED THROUGH CO-OPERATIVE BUYING—Write for catalogue and particulars Pacific Co-operative League, D236 Commercial St., S. F.

BUY ROASTED COFFEE WHOLESALE—Best, 10 pounds $3.00 delivered. Order with remittance. WM J. SCHROTH CO., 112-B Market St., San Francisco.

PATENTS THAT PROTECT are procured through Pacific Coast Patent Agency, Savings and Loan Building, Stockton, California. Established fifty years.

CONCRETE MIXERS—2 brand-new mixers at manufacturer's prices. Write at once. Commercial Iron Works, 481-497 Fifth St., San Francisco.

WINDMILL FOR SALE—16 feet power aermotor and 40 feet steel tower, A1 condition, at bargain. Ogden Bolton, Jr., Route 6, Santa Rosa, Cal.

TREES AND PLANTS.

FOR SALE—Manzanillo Olive Trees, budded on Picholine seedlings. Younger and heavier bearers, longer lived and more vigorous trees than trees raised from cuttings. Geo. E. Rice, R. 1, Box 76, Reedley, Cal.

PEDIGREED BURBANK FRUITING-FODDER—Cactus Plants. 100, $7.50; 1000, $45; 10,000, $300. El Campo Co., 227 Story Bldg., Los Angeles.

FOR SALE—300,000 yellow Jersey sweet potato plants. Prices from $2 to 50c per thousand. For information, write Parker Bros., Hemet, Cal.

All NAVEL, VALENCIA and LEMON trees, $15 per hundred, packed in moss. Less than 100 lots, 18c each. J. C. Johnson, Azusa, Cal.

PROFICHI FIGS, 1916 crop for sale. Limited quantity. T. H. Lynch, Box 21, R. R. 8, Fresno.

FOR SALE—Spineless Cactus Plants. Prices right. R. C. Engbert, Byron, Cal.

SEEDS AND BULBS.

WE BUY ALFALFA SEED containing Dodder, Mustard and other noxious seeds. Send us sample of any high or low grade seed you may have; also of mustard, burr and sour clover seed, flax, etc. Signed Mercantile and Warehouse Co., Fifth and Poplar Streets, Oakland, Cal.

SEED BEANS—We have choice Red Mexican and Buckeyes grown on sand land, producing a heavy crop. Well cleaned and in good order. Write for prices to THE GRANGE COMPANY, Modesto, California.

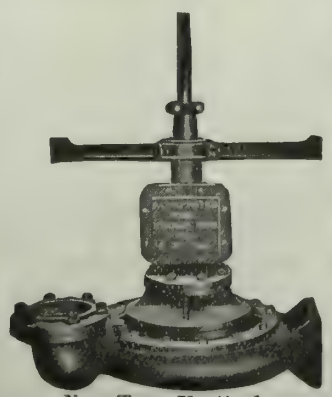
TEPARY BEANS FOR SALE—Eight cents per pound Robert Paulson, Lockewood, Cal.

WANTED.

WANTED—About sixty young men and women to enter the Western Normal to prepare for teaching, or to secure a high school education in the shortest possible time. Western Normal graduates secure and hold good positions. Time and money saved. For information address Western Normal, J. R. Humphrey, Principal, Stockton, Cal., Box 704.

WANTED—A position as ranch superintendent. Qualified by experience and agricultural college training. Straight salary or salary with share in profits acceptable. Box 216, Pacific Rural Press.

LAND FOR SALE



FOR RENT—Dairy ranch—440 acres, about 15 acres in alfalfa (60 more can be planted); 20 milk cows. 10 miles from R. R. depot. County road and creek running through ranch, pumping plant. 20 h.p Ostenberg gas engine, pump water from creek. School, 2 miles. Long lease to satisfactory party. Rental, $1200 per year, in advance. Victoria E. Oldham, Paicines, San Benito Co., Cal.

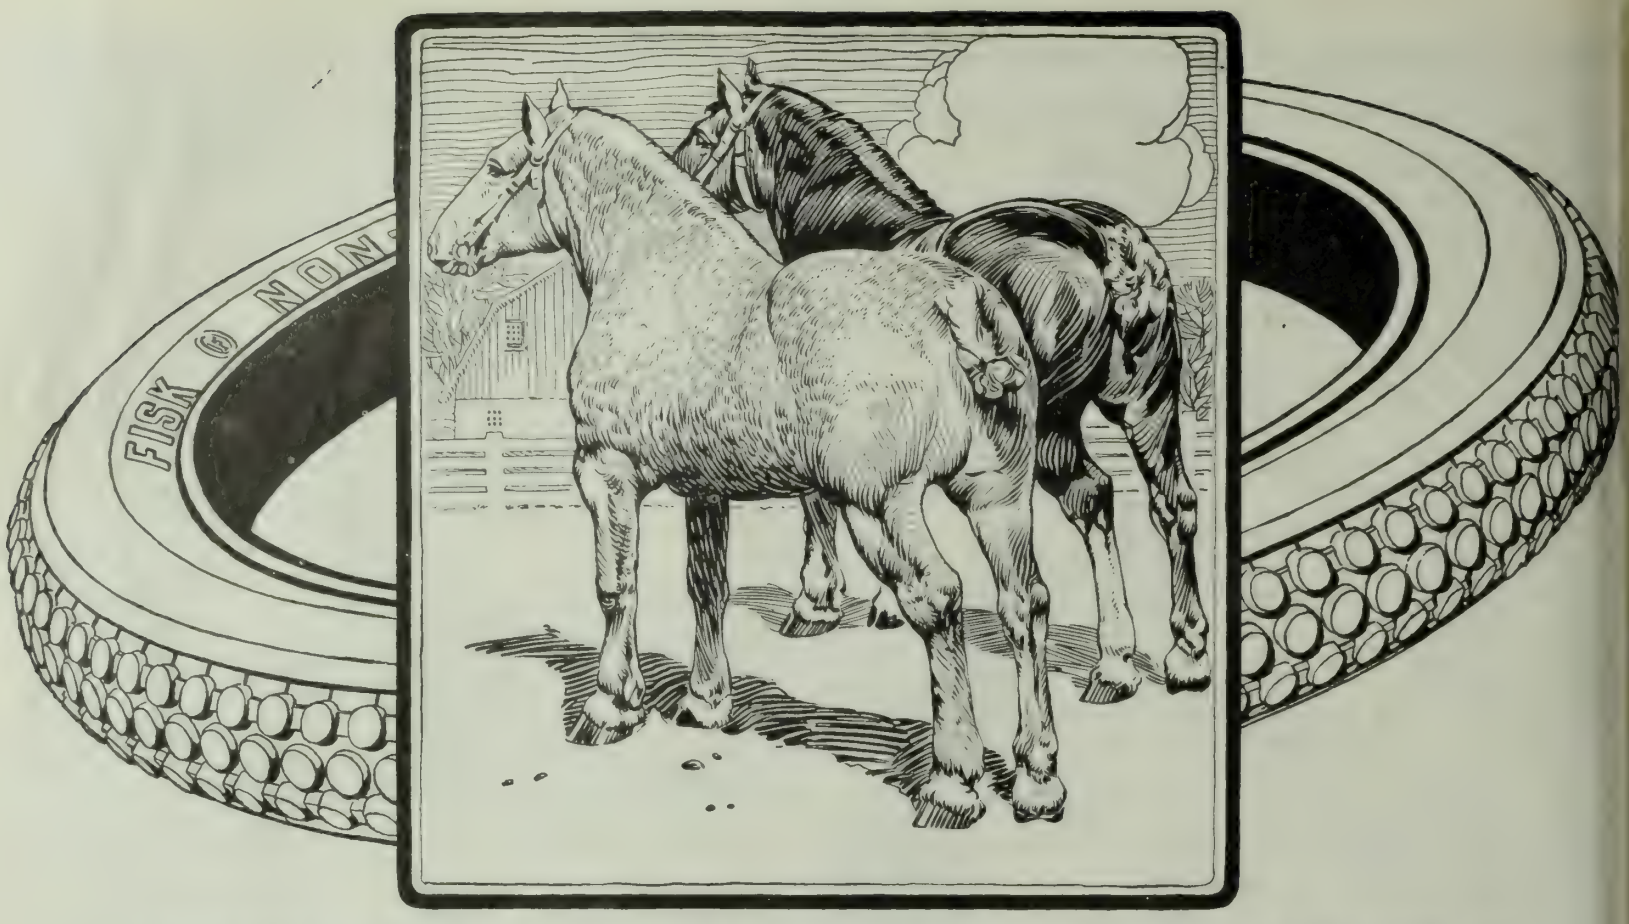
DAIRY RANCH—Four miles from Sanger in the famous San Joaquin Valley. 126 acres on Kings river. Riparian right. Pumping plant, stock, farming implements. Good buildings, fences, etc. Wish to retire Owner, Route 2, Box 44, Sanger, Cal.

FREE NEW WHITE BOOKLET—Tells "How," "Why," and "Where" of overlooked STATE, SCHOOL, GOVERNMENT and INDIAN Land Bargains NOW on market. Write JOSEPH CLARK, Sacramento.

EASTERN KANSAS FARM—160 acres, well improved. Trade for small California farm. J. L. Buck, Chowchilla, Cal.

The KROGH Vertical Pumps

New Type Vertical.



Are automatically water balanced and require no adjustment of any kind. All weights of shafting and rotating parts are carried on the water film; absolutely without the use of thrust bearings or adjustment of any kind.

No BALANCE RINGS or PLATES in KROGH PUMPS. They are unnecessary, and mean only continual trouble. KROGH PUMPS with the least number of parts means less friction and greater efficiency.

Get our Bulletin No. 78 before deciding on a pump.

KROGH MNFG. CO.

SAN FRANCISCO. LOS ANGELES.

It takes years to breed a good horse—years of knowledge of horses to obtain finally the type to meet the requirements for which the horse is intended. You don't expect the saddle horse to do the work of the Percheron—and it is just as unreasonable to compare the average automobile tire with Fisk Non-Skids.

Back of every FISK NON-SKID is an experience of 17 years of "tire breeding"

—an experience that enables us to offer you a tire of proven quality, strength and mileage, which meets every demand of the ordinary road conditions as you find them. That we deserve our reputation for quality "tire breeding" is attested by the fact that today we have the largest factory in the country for the exclusive manufacture of pneumatic tires—29 acres of floor space devoted to one ideal.

Fisk Prices Are An Important Consideration

Especially the prices for the grey Non-Skids. With their heavy traction-tread they cost *less* than the plain tread styles of many other standard makes. Price comparisons will prove to you that you can equip your car with Fisk Non-Skids on all four wheels — and get all that extra protection — for less than you may now be paying for the plain, no-protection styles.

Make Use of the FREE Service at the Fisk Branch Near You

More than 100 direct Fisk Branches in principal cities throughout the country are ready at all times to give you FREE Service, wider in scope than you get anywhere—that is a feature of the policy of Fisk organization. Inflation, inspection, air testing, changing tubes and casings, advice in the care of your tires, and so on—all free, regardless of the tire you use. Only supplies and actual repairs can be paid for. *That IS Service.* Locate the branch nearest you and make use of it.

THE FISK RUBBER COMPANY, Chicopee Falls, Mass.

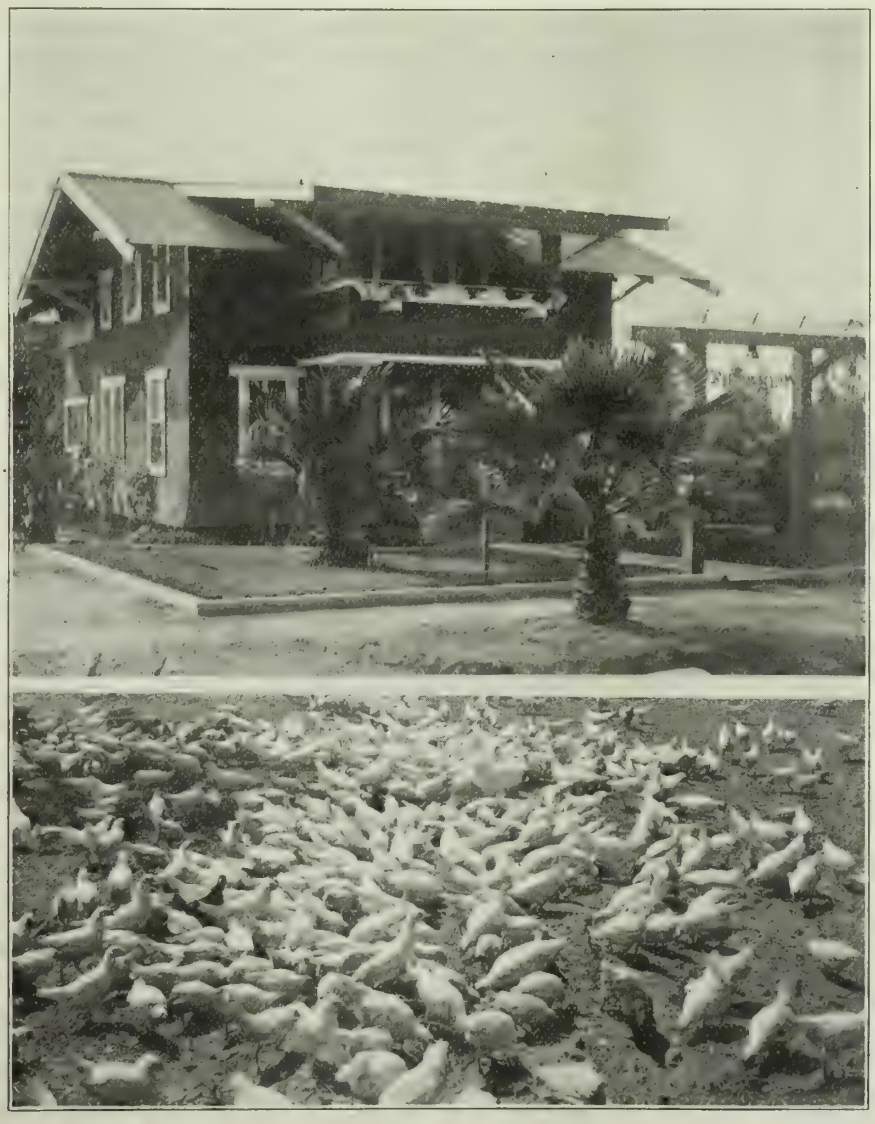
Poultry and Power on Two Acres.

Two acres, a two-horse power engine, a flock of chickens and turkeys, with fruit and vegetables, provide the living, give Hennings and Son more work than they can do, and have enabled them to improve their place to one of the best in the South within six years.



[Written for Pacific Rural Press.]

H. J. HENNINGS of San Gabriel gets more out of his two-horse-power gas engine than anyone else in the country. Even his automobile depends on the engine for air, and if the place on which Mr. Hennings makes his living from varied branches of agriculture were big enough to turn an ordinary tractor around on, we believe the engine would be hitched on by wireless to make steering easy or to start the tractor.

Poultry is the principal means of livelihood at Friedheim, the two-acre "peaceful home." There is so much work to do that Mr. Hennings and his son often have to call the wife and mother to outdoor health-giving exercise. Fruit and vegetables help along, and the flowers and lawn take some well-spent time. Every foot of their ground is made to contribute to their profits, either financial or for more enjoyable living.

The engine runs a dynamo which lights the house and outbuildings and poultry yards. It runs a washing machine, emery wheel, soldering iron, air pump, feed mixer, feed chopper, feed grinder, wood saw, ground feed sifter—well, it does it all on 8½-cent distillate, one gallon for all day's running. "I don't care how high gasoline gets—I haven't used 5 gallons of it in the past six months," says Mr. Hennings.

No lineshaft reduces efficiency of the engine—power is applied direct by belt to everything. The engine and dynamo are under cover.

Poultry, Fruits and Vegetables on two acres keep two men and an engine busily and profitably improving their home with the help of the Wife and Mother.

Electric Lights, Etc.—There are two batteries of five cells each of the latest Edison make. The dynamo generates 20 amperes at 30 volts pressure. This charges the batteries in seven hours if they have fully run down, which they don't. They can be charged at any time as a side issue to other work. The switch-board apparatus is simple as anything, but it enables Mrs. Hennings to run the voltage up high for the vacuum cleaner or the soldering iron. It also shoots the juice backward from the batteries through the dynamo, converting it into a motor which starts the engine at the turn of the switch.

The current may be run through the batteries getting the benefit of both them and the dynamo at once, or it may be run direct from the dynamo when the batteries are in other service.

Thirty-two electric lights are connected to the batteries, though only four or five are used at once. If more are desired, it is a simple matter to start the dynamo by means of the switch. Fire hazard is much reduced on this place. Mr. Hennings wired the house and place himself.

For entertainment, a "mirrorscope" is worked direct from the dynamo by two 50-candlepower lamps requiring 27½ volts. Alfred, the son, has rigged up a burglar alarm on the front gate, using a corset spring under the iron gate, which is connected with the storage batteries so that a bell rings in the house whichever way the gate is opened.

Machinery Galore.—In an opposite direction from the engine runs a belt to the washing machine in the shade outside so it is no trouble to keep clean on this farm. From the other flywheel runs a belt in the same direction to an emerywheel. Its speed of 3600 revolutions per minute is determined in half a minute by means of a watch and a handy vest-pocket speedometer. The neighbors help support the plant by bringing their tools to be ground.

The same belt wheel which runs the washing machine is hitched at another time to the air compressor on the opposite side of the engine. This puts 200 pounds pressure into a small tank. A hose leads to the garage. Everybody got the habit of stopping to blow up their bicycles, motorcycles, automobiles and tires, till it became necessary to post a sign, 1c for bikes, 5c for motorcycles, 10c for autos. The engine is also primarily responsible for the standing offer of $1000 to anyone who will find a chicken mite on the place. (They have 650 hens now and are raising 1500 chickens. There will be 3000 next year.)

A spray tank holding five gallons is hung between gaspipes connected through an old auto wheel into a kind of wheelbarrow. Liquid spray is poured in, the tank connected to the compressed air tank for a jiffy, then the houses are sprayed under 40 pounds pressure, at convenience. A 20-gallon tank for 150 pounds pressure is to replace the small one.

But the engine is hitched to the chickens in a more edible way.

California Weather Record.

The following rainfall and temperature record is furnished the PACIFIC RURAL PRESS by the United States Department of Agriculture Weather Bureau, at San Francisco, for the week ending at 5 p. m., May 2, 1916.

STATIONS	Rainfall Data: Past Week	Seasonal To Date	Normal To Date	Temperature Data: Max'm	Min'm
Eureka	.08	37.46	42.65	70	42
Red Bluff	0	19.73	23.37	88	50
Sacramento	0	18.16	19.07	86	48
San Francisco	0	27.05	21.37	82	48
San Jose	0	16.30	16.09	86	42
Fresno	0	11.73	9.01	90	50
Independence	0	10.32	8.85	84	...
San Luis Obispo	0	26.85	19.66	84	44
Los Angeles	0	19.89	15.15	80	54
San Diego	0	12.54	9.62	72	56

THE WEEK

IT IS hard for reporters to find words powerful enough to adequately express the present prosperity of the American people. It seems to be widely agreed that the phenomenon of unemployment has practically disappeared, which ought to be in itself a demonstration that the country is busy. At the end of April we are told that the monthly survey of business conditions throughout the country, as reported to the Federal Reserve Board by agents in each reserve district, shows that prosperity continued to increase during April in virtually every section of the United States. We have not space for the whole joyful narrative, but a few strong instances indicate the whole. Boston says: "Comparison with a year ago shows that the improvement is extreme"; New York: "Goods produced and sold last month probably greater than any March on record"; Philadelphia: "Trade brisk, prices rising, manufacturing plants working to capacity"; Atlanta: "Manufacturers working full time and many behind on orders"; Chicago: "Manufacturers and wholesalers enjoying good business; volume of general business continues high"; St. Louis: "Business excellent, shipments show large increase; buying power of general public has increased"; San Francisco: "Trade and financial conditions excellent."

It is surely pleasant to read such reports on this edge of the continent, where there is so much need of Eastern appetite and capital for development enterprises and where there are such large special products to minister to good living, and which require the purchasing power of prosperity for their enjoyment. The great Raisin Day celebration at Fresno at the close of last week was a fitting exposition of California's confidence in her calling to do great, unique things for the country and her courage to do them uniquely and well.

CALIFORNIA CHARACTER IN CHERRIES.

THE secret of California's advancement consists in doing one blessed thing after another, and all of them unique and characteristic. The cherry, earliest of the deciduous fruits, trips off first as an exponent of a prosperous year. On Thursday of last week California's carload of cherries sold in the Chicago market for $5470, a record-breaking figure. It is quite possible that this cherry sale may be the exponent of the attitude which Eastern buyers will assume this season toward our first fruit shipments, for surely the Eastern millions can well be unusually free buyers this year. And such attitude seems to have been foreseen by the large Eastern operators in fruits, for they have been rushing each other for supplies. As a result of rivalry among buyers for Eastern shipment, there is reported the sale of 70 acres of cherries on the trees by Fred S. Jones of Green Valley for $22,000—nearly $315 per acre, f. o. b. the top of the ladder. It will keep Fred from worrying about the price of gasoline. And still the buyer may make a lot of money. The Eastern people get very few sweet cherries except from California, for, though our production is worth less than a million dollars, it is greatest in value of all the States, and it is all sweet, while other States' products are mostly of the sour varieties. No State can touch California on the commercial sweet cherry, for though we have nothing beyond Oregon on size and quality, we are a long way farther from harvest showers and brown rot, and this distance settles the question. It may be well to keep your eye on the cherry.

EFFICIENCY.

WE HEAR much about Efficiency. He is an industrial god now making a drive on the esthetic realm. He is a reversal of the old order. Hitherto our earthly gods have moved in the opposite direction; they have rushed their hosts out from the ramparts of the Intrinsically Beautiful, across the plains of industry, wildly waving over the heads of clod-hopping industrialists broad banners emblazoned "The Beautiful for What It Is." But now the gods below have rallied their forces and are moving up the slopes, too slowly to waste breath, with pennants, too narrow to impede progress by catching too much wind, imprinted with letters which do not require too much paint: "The Beautiful for What It Does." It is the resistless, relentless advance of Efficiency!

Now, there is nothing impulsive nor impromptu about efficiency. It is deliberately planned, drawn out, trained, ground down to a feather-edge. It cuts to the quick, but is never hasty about it; it reaches the heart of a thing, but is never warmed by it; it compels admiration, but wins no love. The materialist worships it; the idealist jibes it. It has come to play its part in the world; entering and influencing, perhaps, every industry and enterprise of mankind. It may find in agriculture its greatest opportunity because agriculture is the industry of the most complex conditions and most numerous agencies. But mobilization of all these conditions and agencies will require much time and sustained effort for exact facts, the relations of them and the arrangement of them in systems—but all this work will be done. It is interesting to note that efficiency schemes, which are, so far as we can see, the very last cry in book-farming, should command such wide respect from farming people, who a generation ago were disposed to scout the practicability of even the simplest farming recipe if it were found printed in a book! It is, in fact, a striking instance of what is sometimes called "a complete reversal of the popular judgment."

GUMPTION.

BUT this question naturally arises: "It is possible that any theory and practice of measurements, calculations and tabulations can reduce farming to the exactitude of science and the perfection of mechanics?" To meet that problem with a dogma would surely be unwise, and yet it may be safe to say that, in such light as we now have, efficiency schemes can never constitute an adequate basis for farming success, though they may prove indispensably helpful thereto. Possibly that is all that is authoritatively claimed for them in any producing effort, and yet it is not toward such limited devotion to efficiency that the public mind is now running. Not only are efficiency operations sought for all material lines of production, but they are being advocated for the filling of churches, the emptying of penitentiaries, the perfection of professional service—so that the time is anticipated when either devils or appendices can be taken out of men, on the average, in one minute and seven seconds at an average cost of thirty cents.

It would be, of course, unwise to claim that such a capable efficiency could not do farming, and yet we must suggest that efficiency is not a creator of work; it is only a way of working, and though it may prescribe method, it can never displace design and initiative. We build no general argument on that proposition; we sustain it concretely by reference to an agricultural quality, which underlies all farming success. It is the quality of gumption. The word has a slangy sound, and loses no music in our ears thereby, but it is really a good dictionary word, and Carlyle, who had a good ear for 70-centimeter words, used it effectively—we almost said efficiently. And gumption is a word of grand dictionary definitions, to wit: "ready perception and discrimination; quick discernment and adoption of the elements of practical success; acuteness and common sense."

Each of these definitions is descriptive of some factor of success in farming, and probably all of them have been recognized as essentials to good husbandry since writing began. On the whole, then, in most human affairs, gumption is the endowment of success; efficiency-schemes the methods; efficiency the measure of it. We have no space to rummage the antiquities, but will say, with a reviser of Solomon, that gumption is the principal thing.

FARMING NEEDS BOTH.

IT NEEDS no argument to convince the open mind that the superior farming of the future will stand upon gumption and efficiency. In the two previous issues of the Rural Press we have emphasized efficiency, in the details of rotation principles and achievements of Prof. Gilmore, and in the organization of fruit-picking by Wm. Curtis Clark. In this issue the emphasis falls on gumption, as illustrated by the achievements of the Hennings' on their two-acre

farm near San Gabriel. As it would need a microscope to plot the elements of efficiency in curves and tabulations on a two-acre farm, the account which we give on other pages this week becomes a clearer demonstration of the achievement of unwritten and unmeasured gumption. To transform cheap distillate into power, and express power in such terms of poultry products and prosperity; to banish from small farming so much of the drudgery which too often is the chief component of it; to live in light and reasonable leisure because one can use his joy and mastery in mechanics to save his muscles; to be so good in business that even the wind generated on the place is turned into money—these, and the many other achievements which the account records, are suggestions of the agricultural uses of gumption. In other words, they are demonstrations of the pertinence of the personal equation in farming, which cannot be displaced by any amount of analysis, tabulation, rule-making and computing. We are glad to emphasize such an illustration, because we fear that there is danger of putting too much faith in farming by formularies. No one can either make an efficient formula, or use it efficiently, without gumption. On the other hand, to be naturally endowed with a modicum of gumption, and to draw continually more and more of it from study and experience, is to demonstrate mastery of things in their relations—and to practice that mastery, along well determined lines of successful action, is efficiency.

GUMPTION IN PRICE-FIXING.

ONE reason why gumption is indispensable in farming is because the business is so full of situations which cannot be put through efficiency processes. Efficiency properly calculated will hit the mark if you know where the mark is, or efficiency will show you exactly where the mark ought to be and hit that place—but suppose the mark is not there? For instance, there is no mark which it is now more important to hit squarely than the "minimum price" for prunes—which means the price which will induce enough growers to part company with their prunes to a co-operative selling corporation, to make such a corporation potent and successful. Theoretically, efficiency-processes will indicate clearly where that price ought to be. Take the total of investment in an acre of bearing trees and figure a fair interest on it; add to that taxes, insurance on buildings, etc.; add to that a safe figure for depreciation of buildings, working agencies and appliances of all kinds; add to that the operating expenses of that acre from plow to delivered product, including cost of management. Divide the sum of these items by the number of pounds in an average crop of prunes, and you will have the efficiency-prophecy as to what the minimum price of prunes should be—that is, when you sell your prunes to yourself as a member of a growers' selling corporation. This should be the price because it fully covers cost of production, including the earnings of your invested money and of yourself as working manager. Obviously, in the case of an association, the price should be drawn from data covering thousands of acres of prunes not from one acre, but we will not go into that now. When we have a figure which covers cost of properly invested and prosecuted production, we may call it the "efficiency minimum price," because it has been correctly calculated to include all economies, and to exclude all wastes and extravagances. Now, what is the next move? Efficiency in production has closed; efficiency in marketing must begin. As you as producer are to do the marketing and to have your share of the profits, your basis in your selling enterprise should be the cost of production, and then you should go to it and make all you can—with surety that all the stock will be disposed of and the public made hungry for more. In a whole-hearted and courageous co-operation, efficiently conducted, the "minimum price" should be the figure which covers all costs when production ceases and marketing begins, and this would be the "efficiency price"—taking some liberty with the word "efficiency," which is pardonable until some one tells us just what the word means in its new uses.

Now, what will happen if the projectors of the prune-selling corporation offer to the growers the "efficiency price," which producers should receive for the product when they turn it over to themselves as a selling concern? As soon as the turn-over price is fixed, dealers will offer Tom, Dick and Harry a quarter of a cent more on a three-year contract perhaps. They will sign up Harry, befuddle Dick so he will not sign anything, and brave, conscientious Tom will have to try co-operating all by his lonely. Manifestly it may be difficult to assure all people that they should draw their profits from the selling, and not from the producing side of their co-operative enterprise. The directors, therefore, may have to include in their minimum price profits sufficient to save Harry from giving the dealer most of the money which he should have for himself, and stiffen up Dick so that he will help Tom carry through the only scheme which will get what prunes are worth and prepare the way to sell more and more prunes as crops increase in volume. If efficiency will not do this, what will do it? Only one thing known to us and that is gumption. Gumption will teach co-operating growers not to expect too high minimum price. Gumption alone can tell the projectors what can be offered safely in view of a large year's product. What the prune situation needs is gumption and plenty of it, well distributed. Without gumption all around there can be no efficiency in the pending prune project. If you doubt it, read again the definitions of gumption given above.

Irrigating Steep Orchards.

[Written for Pacific Rural Press.]

Contour and basin irrigation combined is practiced by D. C. Lefferts of the Redlands district, while the contour system has been discarded in favor of surface pipe and basins in the National Orange Co.'s orchard in the Corona district.

Part of Mr. Lefferts' land is so steep that two basins were made per tree to avoid digging into the subsoil near the upper end of the basin. A furrow is contoured above the upper basin for each row and the water cut in with a hoe. Water is run in a 16-inch stream first to the lower end of the ditch where one man divides it into four streams, one per basin. When they are full, the stream is cut into the next four.

These basins are never cultivated but are filled with spoiled alfalfa hay in lieu of manure which has been too expensive, except the year the basins were first filled with it, when they were made in Jan., 1913.

Surface Pipe and Basins.—The 780-acre orchard of the National Orange Co. near Corona lies on a beautiful slope next to the hills, and was for years irrigated by contour furrows. Basins were made between the trees in the spring of 1915 and most of the livestock disposed of, since there would be no plowing or cultivating. Some of the basins were dug down at their upper side and leveed at their lower side so they would hold water about a foot deep. Others were made two basins between each two trees, one being higher than the other, thus avoiding the deep digging required for the larger basins. In every case, each tree was left on a three-foot shelf between basins so water would not come close to the trunks.

The rows run straight toward the mountains, about 180 trees in each row. The orchard is divided crosswise in three sections, the lowest and less steep having 80 trees per row, the others having about 50 each.

For irrigation, about 100 rows in each section have been assigned per man, though this is probably increased this season. Each man has a string of surface pipe long enough to reach from the ditch at the top of his section, to the lower end, 80 or 50 trees as the case may be.

One man handled 25 inches of water before the summer was over, according to D. Rycraft, who has charge of the irrigation; though at first it was a bit awkward. Pipe lengths were such that though the distance between trees up and down the slope varied with its steepness, one joint would always carry water to the next basin below. The first one below the ditch would be filled, then a joint added to carry water to the next. There was plenty of time to get a joint from the row last irrigated while the basin filled. When near the bottom, trenches would be dug so water would overflow from each of the last few basins into the next while the irrigator would go back to the ditch and change the water to run into the next row similarly.

In about 20 or 21 days, a man finished his block; but the first row in the next block would then be ready for another irrigation. He would simply go on irrigating it and so on until he had worked several blocks. Such a system required that an entire line of pipe be hauled back to the other side of the orchard every 21 days.

The basins were always moist when the next irrigation came due, because they were filled with mulch; but that is another story.

Old Muscats Double Crops.

[Written for Pacific Rural Press.]

Twelve acres of Muscats, nine of which are over 30 years old, belonging to G. M. Flint of Fresno county, hadn't borne a ton per acre in any of the three seasons preceding 1915. They bore 9654 trays in 1915 including the three acres of young vines which did not have much crop; and because they were picked after Sept. 14, each tray carried over six pounds of raisins. The crop weighed 30 tons 1500 pounds. The increase was very largely due to changes along three lines: pruning, irrigation and holeing.

The pruning was done so that a large part of the crop would have rested on the ground. No tall trunks with long arms to impede sap flow to the leaves and fruit. To prevent bunches resting on the ground, a man worked 10 days digging big holes four feet in diameter around all the vines. When the hot winds came, which did evaporate such an excess of moisture from the grapes in many vineyards that they "sunburned," Mr. Flint's crop was protected.

There was another element in the great freedom of this vineyard from sunburn. Whereas, Mr. Flint, along with his neighbors, had a habit of irrigating early in April, he investigated the condition of the soil before irrigating. A soil auger showed the ground soaked. So 20 rows on the north end were not irrigated until June. That 20 rows bore the largest berries, the fewest water berries, and the biggest bunches. The soil had dried out by June so that surface roots, induced to grow by the early saturation of the ground, would have been compelled to draw sap from the deeper roots to the detriment of the crop, but June watering kept them busy.

Grapes Instead of Wood Growth. The main reason for the greatly increased crop was the clipping of the terminal buds shortly after the "forms of grape bunches" appeared. The children did this using a little knife. Mr. Flint says that one of them could clip two acres per day.

MADEWELL SURFACE PIPE
ROBINSON HARDWARE CO.
GILROY, CAL.

Lock Seamed and Soldered

There is a tremendous difference in surface pipe. This is appreciated most by the man who has wasted time and money on inferior makes. If you want absolutely the strongest and best surface pipe you can buy, select

Madewell Surface Pipe

It has many distinctive important advantages you can't afford to overlook.
The Madewell Long Lock Seam is made doubly sure and strong by soldering the entire length. A better seam can't be made. The Madewell Lock Seam Sleeve—used in Madewell pipe only—is decidedly stronger and smoother than the old fashioned lap and riveted seam used in other pipe. This feature alone puts Madewell Pipe in a class by itself.

Send for Free Booklet—which tells just how Madewell Pipe is constructed

Robinson Hardware Co. Box B Gilroy, Cal.

North Whittier Heights Citrus Nurseries
Growers of
HIGH GRADE CITRUS TREES
Oranges Lemons Grape Fruit
We have spent our entire life growing citrus trees. You cannot buy better citrus trees than we offer you. All trees from stock of 1 and 2 year buds, selected with greatest care, and taken from our own grove. Our nursery is located in a clean district—our trees absolutely free from insect pests 5-8 and up, guaranteed TRUE-TO-NAME. You cannot beat our prices for quality stock.

The effect of the clipping or pinching while the tissue of the young growth was soft, was to suddenly divert sap flow into the "forms of bunches" and to enlarge the sap channels in that direction so they continued all summer to divert much more than usual into the grapes. Pinching a little later after the young growth hardened, would have prevented the enlarging of the channels.

Shortly after the shock of the pinching was adjusted by the vines, laterals were put forth from the shoots, and these bore an extra large second crop. Ordinarily, the second crop is so late that it cannot well be picked for raisins, but the pinching started laterals so early that the second crop ripened in time to pick with the first crop and were dried. This was further helped by delay in ripening of first crop bunches hanging in the holes because they were sheltered by such abundant foliage.

This spring, about April 25, the grape shoots were pinched back as previously, and again several days later to catch the shoots which were not out far enough at the first pinching. He will not irrigate at all until June, his soil is not dry, and he has prospects for another fine crop.

Time to Plant Avocados.

[Written for Pacific Rural Press.]

Avocado planting time is late March, April, and May, says L. E. Nigh, who has for many years specialized on this fruit for the Armstrong nurseries of Ontario.

Trees grown in boxes about 5x5x6 inches are preferred because, as a rule, they have developed a mass of fine feeder roots, having been grown in a mixture of 1-3 soil, 1-3 sawdust, and 1-3 sand with a very little dried blood fertilizer.

Trees grown in the open and heavily manured have not worked for a living and consequently have a few big roots with very few feeders. Mr. Nigh believes that feeders do not grow well from these big roots, but the tree "invariably sends out new roots from the center of the ball." However, where field-grown trees have plenty of feeders they are as good as any.

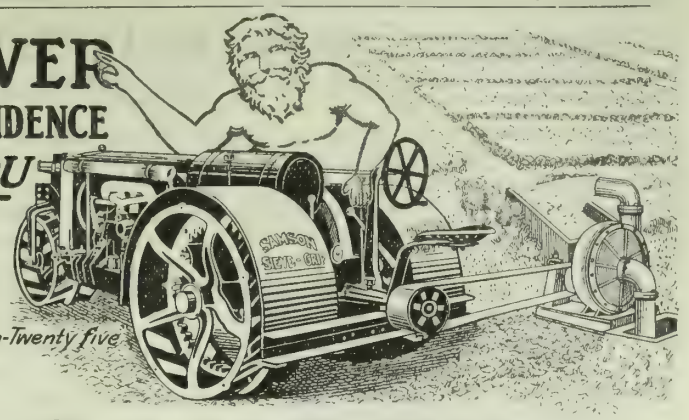
Plant in soil well drained either naturally or artificially without trying to straighten out the roots, whether of field grown and balled trees, or those grown in boxes. If there is any tendency toward sour soil, apply some air-slaked lime around the tree. Fill around the roots with top soil which will immediately furnish food. Subsoil is not fit to put next to the roots until it has aerated a season. In light soil, it is well to set the trees a few inches deeper than in the nursery. Thorough soaking after planting is needed to get the dirt close to roots and avoid their drying out.

Protection. — Protect the trunks from the sun and wind with tree protectors; and the tender varieties should be shaded on the top, south and west sides during the first season with thin burlap tacked over four stakes set about the tree. This is for both summer and winter protection.

Take off most of the large leaves, especially if planted in hot weather or places exposed to much wind. If left on, they would evaporate too much of the water stored in trunk and roots, before newly started rootlets could gather enough to compensate for evaporation.

Irrigate every two weeks during the first season, with variations according to climate and natural soil moisture, being careful not to waterlog the soil. Monthly irrigation is enough after the first season.

No pruning is necessary at planting, and all future pruning will be simply to balance the tree and keep it low and bushy; so it will protect the fruit better from sunburn and from injury by swinging in the wind; also to make picking easier.



PRUNE OR PEA APHIDS.

To the Editor: Pale green lice which get small wings as they grow larger, cover the under side of my plum and prune leaves and kill them. Last year they killed my peas, and are in the garden again.—J. M. S., Ceres.

[They are the destructive pea aphids. Spraying at first appearance is far more effective than waiting till leaves are covered, on account of their rapid multiplication. Spray upwards with 1 pound blackleaf 40 mixed cold with 1 gallon liquid cresol soap and 200 gallons water.—Editors.]

The new Peach Ass'n proposes to grade the dried fruit into four different qualities and to put up a family pack containing 4 pounds. The grading will be inspected and labeled by the State.

POWER INDEPENDENCE for YOU

SAMSON SIEVE-GRIP

Reg. U. S. Pat. Off. and Foreign Countries

TRACTORS

will make you independent of labor conditions, of caring for stock, of special stationary plants.

The Samson Sieve-Grip 10-25, at $1250 f. o. b. Stockton, is a one man outfit, will do the work of ten good horses and give you full 25 horsepower for belt work. There is also a Sieve-Grip 6-12 at $725.

The operating and upkeep costs are surprisingly low. Read the article "Tractors and Their Costs in Farming" in the next issue of "Samson Siftings."

On receipt of $1.00 we will send a sample gallon can, all charges prepaid, to any express office in California."

Deciduous Crop and Market Report.

[Written for Pacific Rural Press.]

The extraordinary prosperity of the East makes its unusually busy and highly paid wage-earners able as seldom before to indulge freely in the luxury of California fruits, fresh, canned, and dried. That they will comprise a highly profitable market for California farm products is reasonably assured—this in addition to possible developments in the foreign countries which are destroying more than they produce, but which will continue to eat whether or no.

Prospects for foreign sales were far more unsettled and the attempt more hazardous a year ago than now. Yet last year's crops moved off surprisingly well.

Supplement a healthy consuming market with a general shortage of fruit crops, not only in California but also to some extent in the East, and we have a very hopeful season ahead.

Cherries are moving in considerable quantity out of the State and fabulous prices have been paid as usual for the first few shipments. The crop for the State as a whole is light, perhaps 50 per cent. Santa Clara reports all varieties very light as do Placer county and the Sacramento river orchards. Suisun and Vacaville will go heavier than last year by 25 per cent. Aside from Santa Clara, San Joaquin county is the heaviest producer. The estimate for the latter is given at 25 per cent of normal in the tabulated crop report issued by Geo. P. Weldon, Chief Deputy State Horticultural Commissioner as compiled from reports of the county horticultural commissioners.

Apricots for eastern shipment will soon be moving at a rate depending on the prospective prices for canning and dried fruit. The apricot growers' Information Bureau estimates that there will be only 60 per cent of last year's crop in the State. With the prune-apricot organization launched, growers of dried and canning fruits are holding for such prices as will insure a minimum supply of shipping fruit and thus hold up Eastern prices. Santa Clara, with 21 per cent of the acreage as figured out by Mr. Weldon, has present prospects for only 50 per cent of a crop while Riverside, Yolo, San Benito, and Ventura with about 6 per cent each have 40 per cent prospects, and Alameda with 14 per cent of the acreage is on the way to half a crop. Pajaro Valley has many orchards which are total failures and as a whole may not be over 15 per cent.

Apples in cold storage far exceed the quantity of a year ago, but can scarcely depress the market for the coming crop, either for canning, drying, or shipping. The strong hand exhibited last season by the apple organizations of the Watsonville, Sonoma, and Beaumont districts augurs well for the present season's marketing. Santa Cruz with 51 per cent of the State acreage according to the horticultural commissioners has an 80 per cent crop, and Monterey with 12 per cent and Sonoma with 16 per cent have present promise of a ¾ crop or less. In the Watsonville district Bellflowers can not exceed a 40 per cent crop, while Newtowns may be 75 per cent according to our own representative.

Plum acreage in Placer county equals 39 per cent of the State and the estimate is an 80 per cent crop as given in the tabulated report. Solano has prospects now for a fairly good crop. Sacramento and Yolo with 8 and 4 per cent of the State acreage respectively have had good conditions with present prospects of a 75 per cent crop. Tragedies, Climax, Duke, and Diamond are generally full crops, though some varieties fall to 20 per cent.

Peaches are spectacular. With all their hoariness due to the preposterous prices heretofore prevailing, spot peaches are moving freely now at 5 cents, partly due to a clean-up of other fruit, but mostly due to the evident preliminary success of the growers' organization which guarantees a 5-cent minimum. The holdover that has year after year been used as a club to squelch ambitious holders of dried fruit, is dwindling away. Butte county reports 30 tons left. Notwithstanding the havoc wrought by little-leaf, blight, etc., in which Fresno county with 29 per cent of the State acreage has been the chief sufferer, the state crop as a whole has a chance of 75 per cent. Fresno reports only 50 per cent, partly due to bad weather at spraying time. Muirs seem generally nearly a full crop. Fresno growers report canning peaches at 65 per cent. If orchards had been better pruned, cultivated, fertilized and sprayed last season, the good prices ahead would be making more money for the growers, as was pointed out last summer in Pacific Rural Press.

Prunes for the State are estimated at 65 per cent of last year which was light, and there is no doubt that extra good prices will be received for the coming crop. This position will be strengthened if the proposed organization meets the necessary approval of growers. However, it is becoming a problem to keep Santa Clara county orchards bearing well, though perhaps judicious pruning might make a startling difference if applied all over this Valley where over 55 per cent of the acreage lies. The prunes now on the trees are most likely to stick. Butte county also reports trouble with the old trees. But her young trees seem well set. Their crop for this year is estimated around 1800 tons or 2-3 of last year's crop. Sonoma and Napa as well as the Sacramento Valley have very light crops; but Tulare county is fortunate with nearly a normal crop.

Pears will probably always have a strong market owing to their use in canning, drying, and fresh shipment, combined with the difficulty of getting men to cut out pear blight without spreading it. Some scab has shown up, but even this merely shuts the fruit out of the shipping class. A ¾ normal crop is likely for the State, though Sacramento with 18 per cent of the total acreage is estimated at 70. The Vacaville and Suisun crops are reported twice last year's.

Grapes promise well for table and raisin varieties, both as to crops and markets. Tokays and Malagas have large bunches and lots of them. The table-grape market is benefited by the experience last season of shipping them under the law providing for 17 per cent sugar. The markets have learned not to fear sour grapes. The vineyards are in good condition. The Raisin Co. has 5,000 tons more on hand than last year owing to the 30,000 tons more than normal that were produced. Such a crop is not to be expected this year. Mildew, however, which hurt last year, is being generally prevented by early sulphuring.

Almonds are mighty short in Butte county—estimates being made of only 15 or 20 cars from that district. In Yolo, Contra Costa, and San Joaquin counties, each of which also has about 12 per cent of the State's acreage, the crop is 50 per cent or more, though less than that

TOP DRESS all your Crops with **Nitrate of Soda** alone, no matter what other fertilizers you may have used. 100 pounds to the acre for seeded, and 200 pounds to the acre for cultivated crops will do the work. The increase will yield large profits over the cost.

"The Perfection"

Prune Dipper and Grader.

This is an automatic machine; no guess work about it; gives three grades, three trays up at once; dipping fluid is heated by a large oil-burner and a superheater, to supply hot water to the tank when needed. The prunes pass through every inch of 65 gallons of hot water, therefore no sediment. Fuel expense from 6c to 7c per ton; labor cut 50 per cent; no installing expense; most efficient and economical machine on the market.

in San Joaquin. Paso Robles reports a very heavy crop, about 70 tons in prospect or double last year's. Colusa also reports good crops. The State crop may reach 50 per cent of normal.

EXCLUDE ALFALFA WEEVIL.

To the Editor: The writer has just returned from an important conference of quarantine representatives of Ariz., Cal., Col., Ida., Mont., Utah, and Wyo., held in Salt Lake City, April 20 and 21. This conference was called by Governor Wm. Spry of Utah, for the purpose of arriving at some uniform regulations governing the entrance of products liable to carry alfalfa weevil into the state.

The conference brought out the fact that there is grave danger of the weevil gaining entrance in sacks of potatoes, because green alfalfa is often used to cover the potatoes, as tules are used in California. In Montana a number of weevils have been taken in potato cars. It was agreed that some restrictions should therefore be placed on the shipping of potatoes from Utah into other states, and that such restriction should compel the screening of all potatoes before shipment, and transference to clean sacks, the state inspector of Utah to certify under oath to this work being done.

Emigrants moving from an alfalfa weevil state are apt to use hay in packing goods or cars, hence the seeming necessity for restrictive quarantine measures in this case. It was agreed that the state horticultural inspector of Utah should certify, under oath, that every carload of emigrant movables was free from material liable to carry alfalfa weevil, before it could leave the state.

No good reason could be given by anyone present for a quarantine on alfalfa seed, bees, or grain.

Every state except Utah favored an absolute quarantine on hay and cereal straw. All of them favored restricted quarantine on nursery stock, potatoes, livestock, emigrant movables.

The conference was characterized by a spirit of fairness throughout, and the practically unanimous action of those present indicates the possibility of more uniform regulations in the western states.

Sacramento. **Geo. P. Weldon.**

PREVENTS ONION SEEDS.

To the Editor: I have noticed inquiries in your paper about onions running to seed, and I should like to give my experience if you think it would help anyone. When I plant either old sprouted onions or fresh onion sets, I always watch my onion rows and whenever a seed stem appears with pointed bud on top, I cut it off as close to the ground as I can. The same onion never sends up two seed stems; and if the sets have plenty of moisture, they will make big onions in the usual way after the seed stem is gone. Otherwise, they would all go to seed with no onion left at the bottom. And the sprouted onions will (if the seed stems are kept cut out) make quite a quantity of smaller onions that are fair size to use, and keep well all winter when stored for home use.

Pope Valley. **Mrs. S. P. Barnett.**

A Lesson in Economy

The result of installing construction, which is at best only temporary to effect a saving of a few cents on the initial cost.

Such an installation is far from being a saving. The labor cost alone of digging out this broken-down culvert and placing a new one, will more than pay for the difference between its first cost and the cost of

ARMCO Corrugated IRON Culverts

LASTING, because constructed from the purest and most rust-resistant iron on the market.

STRONG, because of use of corrugated material, method of joining sections, and manner of reinforcing exposed ends.

ARMCO IRON Culverts are a permanent improvement to any piece of property, and consequently an important factor in increasing the value of the land upon which they are installed. Catalog and price list on request.

1916 SMYRNA FIGS

Mr. Grower, how many will your trees produce this season? They have brought as high as ten cents per pound in the sweat-box on account of the war interfering with importations. You have done your pruning, plowing, irrigating and cultivating, but this expense will be wasted, unless you secure a sufficient supply of **PROFICHI FIGS** of the right varieties. The Mamme crop was short this season and the **PROFICHI** crop will be short as a consequence. I have a larger Capri orchard than my Smyrna trees require and will have a surplus of **PROFICHI FIGS** for sale. After spending your time and labor to secure a crop, can you afford to lose a $200 a ton crop by neglecting to secure the necessary **PROFICHI FIGS?** Limited quantity, June delivery, for sale. Order now.

THOMAS H. LYNCH, BOX 21, R. R. 8, FRESNO.

Mechanical Power on the Farm.

HANDLES BULK GRAIN FROM COMBINED HARVESTER.

[Written for Pacific Rural Press.]

A tractor-hauled combined harvester cuts and threshes 1000 bushels of grain per day for J. W. Jennings of the Ramina ranch at Tehachapi. This grain is hauled without sacking, directly to the elevator erected on the railroad by the ranch company. The saving of sacks and labor the first year (1915) on the 2500 acres, paid for complete installation of the elevator and conveying system together with bins and cleaning machine and smutter. The total cost of these was nearly $2,000.

A 50-bushel hopper was built under the harvester grain discharge. A spout from this discharged into a wagon driving alongside the harvester. At the elevator the grain was dumped by allowing the hind wheels to drop into a small chute. A rubber belt with buckets carried the grain into the cleaning and smutting machine; and thence a conveyor or elevator dumped it into the bins. This installation can be made for $25, says Mr. Jennings, plus the cost of the cleaning machine and a 2½ to 5 h.p. engine to run it. The grain is conveyed by machinery from bins to cars.

Owing to the distance, three four-horse teams are used. Two are continuously hauling while the other loads the wagons.

Saves $47.30 per Day.—The cost of the teams is figured at $6.50 per day including the driver. An extra man at the warehouse, and fuel for the distillate engine there are figured at $5, making a total cost of $24.50 per day to handle 1000 bushels of grain from harvester to bins.

The cost by the old system was 3 teams @ $6.50, sacks for 1000 bushels $36.80, man on harvester as sack gig $2, sack sewer $3, man to pile sacks in warehouse $2.50. This totals $63.80 per day besides the loss of 10 per cent of sacks by mice equaling $8 per day. The advantage in favor of bulk handling is $47.30 per 1000-bushel day.

Loss of grain in sacking on the harvester is avoided, and it is not re-handled to run through the cleaning machine, both of which are big savings. In case of storms the grain is all under cover.

"I am satisfied from my own experience," says Mr. Jennings, "that every grain farmer should, by himself or co-operating with others, equip himself to handle grain in bulk."

TRACTOR SPADES FURROW BOTTOM.

[Written for Pacific Rural Press.]

A plowpan is pretty general in California. It is caused mostly by plowing always the same depth so that year after year the walking of horses in the bottom of furrows, and the pressure of plows on the bottom as they lift and turn the top dirt, has made a hard layer under the plowed ground. Roots have more or less trouble to penetrate this layer; water does not drain through it, nor does subsoil fill up with water so well in the wet season. In the dry season, the subsoil moisture does not come up through it so well.

This has been a problem in the transition from horse plowing to tractor plowing. Some tractors have partially avoided it by running on the unplowed ground ahead of the plows. The objection to this on wet or easily packed soil is that it is likely to turn over in chunks. These become non-productive injurious clods if not worked down at once. This objection has less weight, perhaps, with track-laying types. Another solution has been for the tractor bull wheel to run in the furrow. This bull wheel has lugs which spade up the bottom of the furrow more or less and leave it loose.

Even where a gang plow is used and the plow pan of only one furrow in several is loosened, this affords drainage into the subsoil reservoir whence moisture will be drawn in dry seasons. Anyway, after several years, most of the plowpan would be broken up by this means.

But in another way, tractor plowing is eliminating this plowpan. One does not have to be merciful to a tractor up to its reasonable limits. Tractor plowing is deeper plowing, in which the plowpan is turned up and mixed with the other soil year by year. The subsoil is opened to roots which in turn make it more pliable for other roots and permit its locked up fertility to be worked into available forms.

Running in the furrow, especially on soft land, reduces appreciably the loss of power due to slippage, though it requires some leveling device for the lubrication.

"We tried to run the bull wheel on the land," says L. C. Tuck of Dixon, who operates a Big Bull tractor with lugs on the wheels, "but the land over which the wheel passed turned up cloddy. With the wheel in furrow, there was less slippage and the land was turned over loose and in fine condition."

Fits Any Pump. A Child Can Operate It

A Vital Necessity On Every Farm

This Farm Pump Engine should be on every farm, not because of the time, work and money it saves but because of its great adaptability for all kinds of farm labor. This engine will supply from 270 to 2450 gallons of water per hour on the hottest, coldest and calmest days. It will enable you to have all the water you want for your stock, household use and for washing your wagons, farm implements, etc. And in addition, the

Fuller & Johnson Farm Pump Engine

will run your cream separator, washing machine, churn, grinder or any other mechanism that is run by hand power. This Farm Pump Engine runs steadily, easily, without watching and without vibration. It comes to you ready for instant use, there are no extra parts to buy and it can be attached to any pump without extra fittings, special platform or foundation.

Write Now for Interesting Literature

The literature on the Farm Pump Engine describes in detail just what it will do. It shows clearly and briefly how it can save its owner work and money, and the many testimonials we have prove conclusively that the claims of the makers as to what it can do are not only truthful but very conservative.

The Fuller & Johnson Farm Pump Engine is the lowest priced machine of its kind on the market. It is also the only one of its kind made which will give such a variety of long, dependable service.

OIL FROM ASPHALT-BASE CRUDE WINS IN ENGLAND.

It would seem that Pacific Coast motorists are not the only ones who believe in oil made from asphalt-base crude.

According to the National Petroleum News, such motor oil is very poular in England. The publication referred to prints the following quotation from a letter received from a British marketing company, regarding the use of oil from asphalt-base crude, in the isle across the pond:

"We have sold several thousand tons during the last six months and we understand from buyers that these oils are giving every satisfaction."

TRACTOR BUILDS LEVEE.

[Written for Pacific Rural Press.]

Building a levee with a tractor has its conveniences, for the tractor can be moved on its own power, to whatever position is desired. Instead of using a dredge, J. Gilcrest for the Yolo Orchard Co. hooked the winch of a Yuba 18 tractor to the cable which hauled six cars, each holding a yard of dirt, some 200 to 300 feet to the top of the levee, where it was dumped. The grade was often 20 to 30 per cent. Over 60,000 yards of dirt were handled in this way from July 1 to Dec. 26, 1915. This was an average of about 400 yards a day moved at a cost of 9 cents per yard. The gearings were in first class shape at the end of the job, according to Mr. Gilcrest.

TRACTOR HAULS BEES.

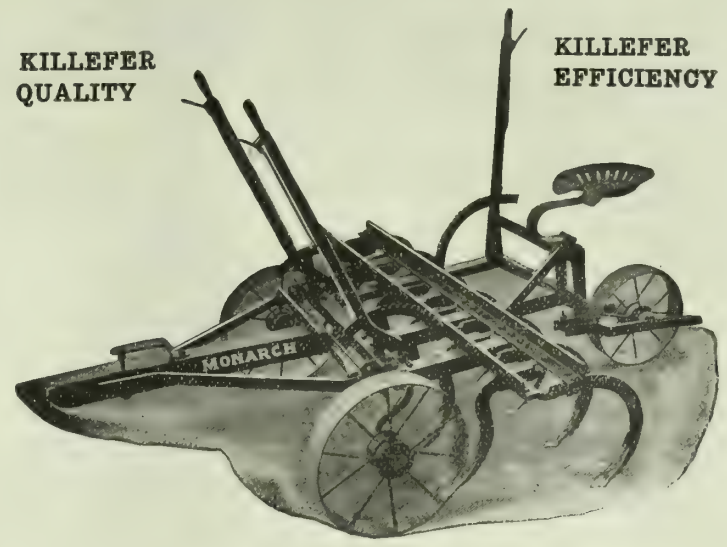
[Written for Pacific Rural Press.]

Tractors are being used for about every purpose these days. H. C. Powell of Visalia recently purchased a Bates Steel Mule tractor and on this occasion hitched four wagons to his "Mule," each wagon loaded with bees and honey. The total load was 12 tons and this was hauled from Tagus Switch to Lindsay, a distance of about 28 miles. The amount of distillate consumed was 22 gallons. Only three-quarters of a gallon of oil was used on the trip. The average speed maintained throughout the trip was two and one-half miles per hour. In speaking of the above Mr. Powell says it was very interesting to see how the "Mule" took hold of the load and with what ease it did the work.

OIL MOTOR AVOIDS DELAY.

[Written for Pacific Rural Press.]

A three weeks' run without a stop right after equipping their plants with Victory oil motors, is the record recently made by the New Almaden Mining Co., who have one of the largest quicksilver mines in the world.



As quicksilver has reached the price of $300 per flask, delays for lack of power would be expensive. This sounds like the oft-repeated admonition for farmers to overhaul and repair machinery in slack times because time has a multiplied value at rush seasons.

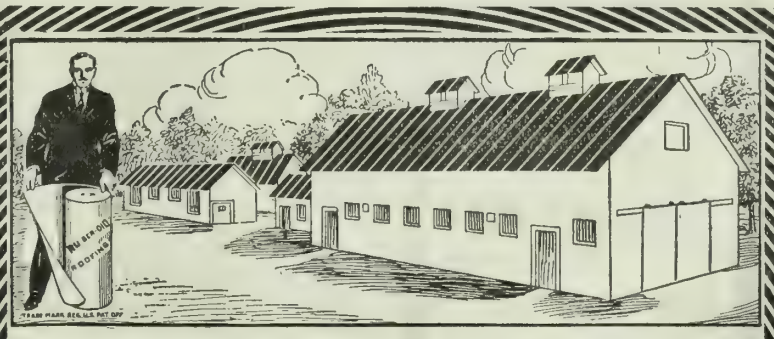
A band-saw run by an automobile cut up 150 cords of stove wood last winter, according to Art. Florey of Downey, who operated it. He claims that the band-saw required less power than a circular saw, and that it would easily run through a log two feet in diameter.

Monarch Cultivator (K)

KILLEFER QUALITY

KILLEFER EFFICIENCY

The Killefer Monarch Cultivator has more varied uses on the ranch than any other tool we manufacture. As a Chisel for bean and beet ground before planting, it has no equal. As an Orchard Cultivator, where deep cultivation is desired, it gives perfect satisfaction.



As an Alfalfa Cultivator, when fitted with our Special Alfalfa Tooth, it does excellent work, loosening the ground to a depth of from six to eight inches without injuring the stand. This deep cultivation enables the water to percolate to a greater depth than any cultivator on the market. Made in 5, 6 and 8-foot sizes.

Corvallis, Ore., April 3, 1916.

THE KILLEFER MFG. CO.,
2209 Santa Fe Ave.,
Los Angeles, Calif.

Gentlemen:—
The Monarch Cultivator did us a good job in our Alfalfa field, taking out a tough grass sod which nearly had the Alfalfa whipped out. Am pleased with its performance. We are handling it with a 30 H. P. Motor.

Yours,
J. B. CORRIE.

GRAINS AND FIELD CROPS.

The Dodge Rice Co. is talking about putting up a mill at Colusa.

Santa Barbara and Ventura bean planting will be going on till May 15 safely.

Yolo county wheat has taken better color on account of cooler weather.

About 30,000 acres of rice are to be planted in Glenn and Colusa counties this year.

The Wasco Land Co. shipped 5 cars of rice to Louisiana; supposedly for European ports.

A state-wide corn-growing contest has been arranged for Arizona by the State Bankers' Ass'n.

Two carloads of Tulare county rice were shipped to Europe and two to Texas this season.

Asparagus growers of Oakley are pleased with results from the shipping season just closing.

A. L. Gilbert of Oakdale has contracted for the pea vine silage of the Pacific Pea Packing Co.

Dr. Washington Dodge of Butte City is to test rice for silage for cows, says the Colusa Sun.

Canned peas have been going to Europe from Oakdale so much that there is less holdover than last year.

Perris Valley alfalfa growers held a mass meeting recently to discuss storage warehouses, uniform prices, and electric rates.

The Oakdale pea cannery started its 10 weeks run Apr. 27. They have 550 acres of peas, of prime quality owing to favorable weather.

Will the short straw increase the amount saved for grain, or will the uncertainty of grain maturing increase the quantity cut for hay?

Manteca sugar beets last year tested 19 per cent sugar, some of them going up to 21.9 which is about as high as they go anywhere.

Most of the alfalfa on the east side of the Sacramento valley has been cut and is already in the stack, being of a better quality this year than usual.

Gridley rice acreage is increased 20 per cent over last year. The seeding was done two weeks earlier than last year, an important feature in getting the rice to maturity before fall rains.

About 2000 acres of sweet potatoes are being planted around Atwater and Livingston, Merced county. The normal crop is around 21,000,000 pounds, besides hog feed which comprises tons of the small potatoes.

Grain prospects north of Chico as far as Red Bluff are better than in the district south of Chico, but the entire east side of the Sacramento is badly in need of rain and some growers say that the grain is too far advanced in many localities to be materially benefited by rain from now on.

Twenty-eight representative men from the Sacramento and San Joaquin valleys and Los Angeles have been appointed by the Sacramento Valley Development Board to investigate the feasibility of substituting elevators for bulk grain instead of sacks. This committee is to meet in Stockton 10 a. m. May 6.

CITRUS, OLIVES AND NUTS.

Eat olives on Ripe Olive Day May 16.

The Spanish almond crop has been damaged by frost and rain.

The net gain of membership in the Cal. Almond Growers' Exchange to Apr. 26 since Sept. 11, was 169.

Demand for orange trees to plant in Tulare county is said to be considerably stronger than a year ago.

Reports coming from the country are that as high as 17 cents has been offered for Nonpareil almonds.

The San Fernando Fruit Growers' Ass'n met May 1 to learn all they could about controlling citrus and olive pests.

Grow small-sized Valencias. They sold at $3 to $15 per box in Chicago recently when large sizes dragged at $1.90 to $2.60.

The California Avocado Ass'n held its semi-annual meeting and display of fruits Apr. 29. A specially interesting program was given by the best authorities.

The olive holdover is practically all of the small sizes, and even these are being sold as if all would be gone before another crop comes on. The demand for oil is said to be growing stronger.

The Eastern Contra Costa County Almond Growers' Ass'n admitted 13 new members at their recent meeting, making 33 new members in that association for this season. They market through the Cal. Almond Growers' Exchange.

DECIDUOUS FRUITS.

The Cal. Cured Fruit Exchange has closed its Sacramento plant.

Prune buyers have recently offered 5¼ cents for Shasta county prunes.

R. C. Merryman of Exeter recently subscribed for a large block of Peach Ass'n stock.

Hayward prune and apricot growers are to hold a big mass meeting soon in the interests of the proposed State organization.

Over 77 per cent of the peach growers of Winters and Capay valley districts had signed up in the Peach Ass'n two weeks ago.

It is safe to say as this is written, that the Peach Growers' Ass'n has enough acreage and stock subscribed

A Plain Statement of Fact

Mogul 8-16: $725 Cash f. o. b. Chicago

AT the present prices of gasoline and kerosene, no farmer can afford to use a gasoline tractor. Gasoline averages now over 100 per cent higher in price than kerosene and is likely to go higher rather than lower, in the opinions of men who know the oil business.

Again, it is neither safe nor economical to use kerosene in a tractor not specially designed to operate on kerosene. Merely changing the fuel mixer is not enough; the design of the whole motor must be changed.

Kerosene and gasoline tractors of equal power sell for about the same price and use practically the same amounts of fuel. On that basis a **Mogul 8-16** tractor saves each year, in fuel bills alone, about a third of its price. The figures prove the truth of this statement.

If you are considering the purchase of a tractor this year, give these facts careful study, from every point of view, before you spend your money.

Mogul and **Titan** tractors are designed specially to operate on kerosene and to give their users the full benefit of this advantage. There are four sizes—**Mogul 8-16** and **12-25, Titan 15-30** and **30-60.** Write us for full information before you buy any tractor.

o warrant continuing the work.

Five cents has been offered for Shasta county dried peaches and $42.50 per ton for green pears. But the growers there believe that this is not the time to sell.

Thermalito's opportunity for berry and vegetable growing is being urged to public attention by the Oroville Register. A proposed irrigation district will help if carried.

A pony of 10 boxes of Advance, Guigne, Chapman and Maubra 12-row cherries sold in New York Apr. 21 at $12.25, $7.50, $11.50 and $3.37½ per box respectively.

The first full carload of cherries shipped from the State left Vacaville Apr. 22 partly filled. It was completed at Sacramento and sold in New York for $5,473 for the 2285 boxes.

Machinery for the Lake County Canning Co. is ready to be installed before the crops are ready. Only beans and a few samples of fruits and other vegetables will be put up this season.

Loganberries and strawberries of the Watsonville district will be canned this year if pending arrangements are made. The cannery will employ 250 hands when running full blast on blackberries.

Pres't W. J. Wilson of the Kings County Packing Co. says that his company is paying twice what it did last year for freestones to can—that is, $15-$16 per ton. He is boosting for the Dried Peach Co.

Visalia growers of canning and shipping peaches have turned over their 5000-ton crop to a committee of their organization who recently refused to contract at the prices offered by Southern California canners.

Members of the Tulare County Growers' Ass'n have tentatively sold their fruit to the Golden State Canning Co. of Ontario and will probably not operate their own cannery this year. The company wants 1500 tons at $15 for frees and $20 for clings.

Every apricot grower in Kings county should look for brown apricot scale now, and if many are found, should spray next winter with distillate emulsion, is the warning given by Horticultural Commissioner Fred K. Howard, who has found these scale unusually abundant.

Horticultural Inspector Tom Henry of Paso Robles reports the following shipments into his territory: almonds 74,434; prunes 18,234; pears 5,024; apples, 1,345; cherries, 1,149; peaches 987; apricots 798; walnuts 541; plums 330; grapes 1,720; berries 1,328; ornamentals 1,732. Over 3,000 almond trees were rejected.

The Pacific Coast Ass'n of Nurserymen will meet this year at Medford, Ore., June 20-22 inclusive. The program will include discussion of Reforms and Financing the Industry, Improvements and Methods of Selling Stock, Standardization of Selling and Salesmen, Cost of Production, and Expense of Growing Nursery Stock.

MISCELLANEOUS.

The Orland Farm Center holds its annual picnic May 6. All farmers of the county are invited..

The Southern Counties Flood Relief Ass'n, consisting of representatives from nine southern California counties, recently organized and adopted a resolution asking Congress for an appropriation to help prevent future floods. Steps for a State flood control scheme were also planned.

May 11 will be Irrigation Day in Glenn and Colusa counties. Gov. Johnson, Elwood Mead, Max Thelan, A. B. Humphrey and others will give addresses at a luncheon at Willows. A tremendous effort is being made to settle the legal difficulties of water users in Glenn and Colusa counties so that the country may be developed properly.

Chas. Cristadoro sends us "Ten Commandments for the Dairy Farmer," one of which is elaborated with the statement that a cow which produces 4000 pounds of milk in a year just pays for her keep, though she costs as much to keep as the 8000-pound cow.

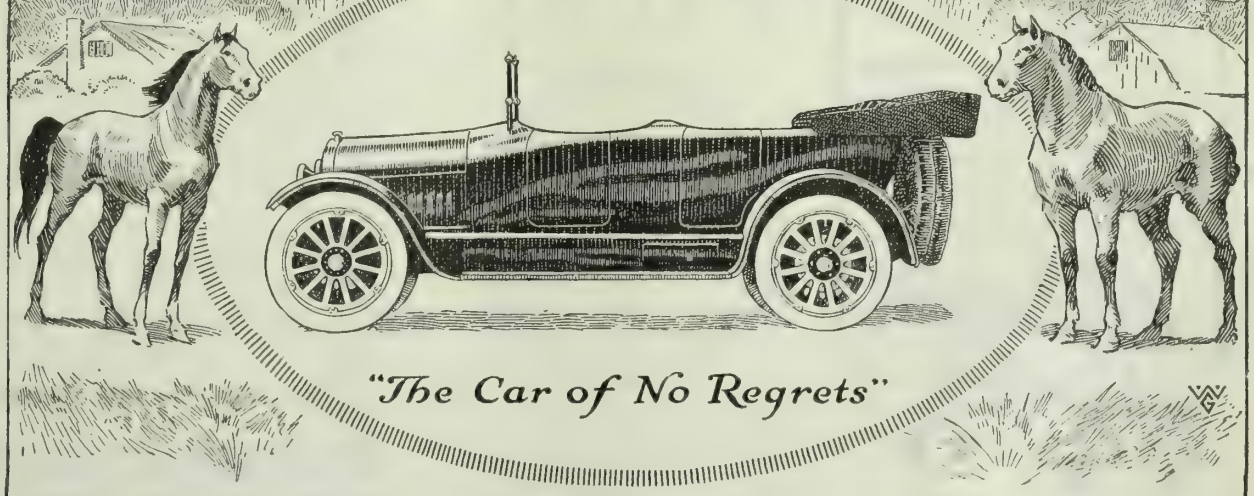
"Jackson MADE"

Write for Catalog No. 47 F

A Better Maker Not Made

For Water Deep Under The Ground

Jackson Deep Well Turbine Pumps give continuous and efficient service. They do not get out of order as they have no valves or plunger rods. Very little care or attention needed as they are oiled from the surface. Are much lower in cost than other types of deep well pumps when the expense of dug pits, cribbing and timbering is reckoned. They raise water from the very bottom of the well, thus eliminating heavy vacuums and delivering all the water the well yields. They develop slow wells and increase their flow.



Like all Jackson Made Pumps These Deep Well Turbine Pumps Are the Very Best Pumps Made for the Purpose—They are Dividend Earners, Not Expense Makers

Whatever your water problems may be our Expert Pumping Engineers will help you out free of charge—write

KING

EIGHT CYLINDER

"The Car of No Regrets"

The admired characteristics of Thoroughbred and Percheron are combined in this *pioneer* Eight. The Speed, Grace and Stamina of one are merged with the Power, Sturdiness and Reliability of the other

The Farmer is quick to recognize *quality* in stock and no less appreciative when he finds it in machinery. His motor car is as personal to him as his fine horses and is generally purchased with the same care.

We are confident that the King is so very much the car he has long desired, that we urge his investigation of this successful Eight before deciding on *any* other make.

The Eight-Cylinder King has been in operation for over a year throughout America and in more than thirty foreign lands. Prior to this, the King Four made a most enviable reputation the world over for efficiency and reliability.

The new Model E is larger and more powerful than our *pioneer* Eight, and contains many thoroughly tried advances in automobile engineering.

Aluminum pistons are a feature of this model; one-third the weight of iron pistons, they greatly increase engine power and reduce the strain on crank-shaft, bearings and all reciprocating parts. They also resist carbon and economize fuel.

Cantilever Springs—which the King introduced to America—reach their highest efficiency as designed for this car. These springs give a restful, lazy motion over the roughest roads and keep the tires gripped to the road.

From a stand-still this car will accelerate to 25 miles per hour *in eleven seconds*, without gear-changing, and lightning "get-a-way" from a start "in high" is only a small part in the amazing performance of the King's super-motor. Hills melt before this powerful car, and they're mostly taken in high gear. "Locomotive" speed is always ready—for the need that comes once in a lifetime. Silence, economy, and ease of operation are naturally features of this perfect mechanism.

Model E, 7-Passenger, 60-Horse-power Touring Car, $1350

New Pointers on New Dairy Law.

[Written for Pacific Rural Press.]

Several points of special and new interest to dairymen were brought out April 27 at the conference in San Francisco of city health officers, veterinarians, and others interested in the new dairy law which is to go into force Oct. 1.

Many dairymen are being solicited to buy pasteurizing plants for their ranches, and many are doing so. Many cities already refuse to allow milk to be sold unless it has been pasteurized within the cities. The law provides that milk for human consumption must not be repasteurized. It is suggested that before buying a pasteurizer, each dairyman find out what is likely to be required by the city where he expects to sell milk. Owing to difficulty of supervising the cleanliness and accuracy of the many small country pasteurizers, it is thought that most cities will require their supplies to be pasteurized at central plants.

Moreover, the cost of cooling to 50 degrees after pasteurization exceeds the cost of pasteurization in most cases, and should also be considered before investing.

Score Card Changes.—Milk from tuberculin-tested non-reactors must be from dairies which score 70 per cent for Grade A raw; and 60 per cent for Grade A pasteurized from cows not tuberculin tested. Scoring must be based on the score card of U. S. Dept. Agr. as printed in another article. The objections pointed out in that article are insurmountable unless the State Dairy Bureau can prevail on the U. S. Dept. Agr. to incorporate certain suitable changes in the score card as applied to California. This the Dairy Bureau is attempting.

Tuberculin Testing. — The intradermal tuberculin test must be applied after the law goes into effect Oct. 1, by members of the State Veterinarian's force, unless the milk is to be pasteurized. Four men will be added to that force under civil service examinations to be held in June. Cattle supplying small towns which do not now have milk and dairy inspection will be tested first. Applications for test, made from now on, will be considered evidence of good faith until it can be done. A means of marking and identifying reactors is being sought by State Veterinarian Chas. Keane.

The intradermal test is considered more searching and far more accurate than the thermal test on account of the many conditions that make a cow's normal temperature vary; and Dr. Keane believes also that five or six herds can be tested in the former way in the same time as one by the thermal test.

Milk Temperatures. — Temperature of milk before delivery to pasteurization plants is left to the discretion of the State Dairy Bureau. F. W. Andreason, the head of this Bureau, contemplates that milk shall be cooled immediately as much as possible with the water on the place provided it be delivered to the pasteurizer within two hours of milking, otherwise special cooling will be required.

Efforts will be made to get railroads to furnish refrigerator cars. These have been refused to certain milk shippers supplying Oakland, but are furnished to shippers over 50 miles from Los Angeles because such dairymen would not otherwise ship to that city. Refrigerator cars will be necessary especially in the interior, to keep the bacteria down to the required 100,000 per cubic centimeter for Grade A raw, 10,000 for Grade A pasteurized, and 50,000 for Grade B pasteurized.

LAMBS SHOULD BE CASTRATED.

To the Editor: I am raising a small bunch of lambs and expect to market the buck lambs when about six months old. Will you kindly advise whether it is best to castrate these lambs.—C. E. G., Fernley, Nevada.

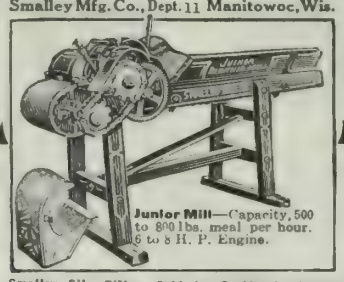
[Yes. Wethers grow and fatten much more quickly than rams and do not worry the females in the flock. Also you should be able to realize a better price for them from the butcher. Experiments have been made showing that wethers make 11 per cent more gain in weight under similar conditions than do rams.—Editors.]

Make Your Silo Pay Big Profits

Save the day wages and board of *two or three* men by getting a Smalley—the *only* machine with a real Grip Hook *self-feeding* table.

Save 1-5 to 1-4 the *power cost* and needless belt wear with the one pulley, low-speed chain drive on blower.

Save excessive *repair expenses*, break downs and delays. Steel in castings makes Smalley one-fourth heavier with a wonderful record for long service.



Smalley Silo Filler

Cut feeding costs in half. Fatten cattle, hogs, sheep and poultry with alfalfa chop. Patented alfalfa re-cutting attachment handles leaves, stems and all. No waste. Sell your So. 1 hay and mill off-grades for feeding. Make combination feeds from clover, rice straw, bean straw, oats and dried corn stalks.

Blower built independent of cutter. Fan speed increased or decreased without changing speed of knives. Extension table on hopper prevents accumulation of litter.

The Supremacy of the De Laval Cream Separator

Supreme in Skimming Efficiency

Over 35 years of experience and thousands of tests and contests the world over have demonstrated the De Laval to be the only thoroughly clean skimming cream separator, under all the varying actual use conditions, favorable as well as unfavorable.

Supreme in Construction

This applies to every part of the machine—to the bowl, the driving mechanism, the frame and the tinware. The De Laval Patent Protected Split-Wing Tubular Shaft Feeding Device makes possible greater capacity, cleaner skimming and a heavier cream than can be secured with any other machine.

Supreme in Durability

The De Laval is substantially built. The driving mechanism is perfectly oiled and the bowl runs at slow speed, all of which are conducive to durability and the long life of the machine. While the life of other cream separators averages from three to five years, a De Laval will last from fifteen to twenty years.

Supreme in Improvements

This has been the greatest factor in De Laval success. Not a year goes by but what some improvement is made in De Laval machines. Some of the best engineers in America and Europe are constantly experimenting and testing new devices and methods, and those which stand the test are adopted.

Supreme in Service

With its worldwide organization and with agents and representatives in almost every locality where cows are milked, no stone is left unturned by the De Laval Company to insure that every De Laval user shall get the very best and the greatest possible service from his machine.

Supreme in Satisfaction

De Laval users are satisfied users, not only when the machine is new, but during the many years of its use.

Supreme in Sales

Because they are supreme in efficiency, construction, durability, improvements, service and satisfaction, more De Laval Cream Separators are sold every year than all other makes combined.

Order your De Laval now and let it begin saving cream for you right away. Remember that a De Laval may be bought for cash or on such liberal terms as to save its own cost. See the local De Laval agent, or if you don't know him, write to the nearest De Laval office as below.

Lupines are not Loco Weeds.

And yet Lupine hay may cause animals to act crazy and may kill them. What precautions should be ta ken?

To the Editor: I am sending two weeds which are common here with us. A neighbor contends that the larger of the two is "loco weed." Please give me the common name of both, also if there is any difference between the two. The smaller was grown on poor soil, the larger on deep, rich soil.—O. B. I., Corning.

[Answered by Dr. H. M. Hall, University of California.]

The plants sent by O. B. I. of Corning are both species of lupines. The small one is the small-flowered lupine (Lupinus micranthus); the larger one, although also a lupine, cannot be specifically determined in the absence of flowers. Neither one is a loco weed and neither would produce the symptoms of loco poisoning. It is well known, however, that the seeds of most, if not all, species of lupines are poisonous, and it is therefore very advisable that they be not fed to stock during the period when the seeds are forming. If your correspondent does not possess a copy of California Experiment Station Bulletin 249, he should write to the Director at Berkeley for one, since information regarding poisoning by lupines is there given.

What the University Bulletin Says.

As lupines are now shooting their beautiful blooms in all parts of the state it should be generally known in what way they may be dangerous to live stock. The Bulletin to which Dr. Hall alludes says these things:

Nearly all cases of poisoning with lupines occur in the northern part of the State where the plants are used to some extent for hay.

Poisonous Characters.—Several of our species of lupine are known to be poisonous to stock and it is quite probable that many more will be found to be more or less injurious. As far as present investigations go the seeds are the only part of the plant positively known to be poisonous, although the green herbage may cause bloat if eaten in large quantities, especially when it is wet or when eaten by animals just in from a dry range or when hot or very hungry. Animals do gradually become immune to bloating. Lupines are often fed as hay with no ill effects if gathered either before the seeds have matured or after they have fallen from the pod. Sometimes stock have been poisoned by lupine fed under apparently the same conditions as in preceding years when no ill effects followed. But in every case of poisoning it was found that the hay had been cut after the poisonous principle had formed in the seeds and before these had fully matured and shattered out. Lupines, therefore, should never be fed nor cut for hay while mature or nearly mature seed is in the pod, unless it has been positively proved that the species used is not poisonous. Even when not in seed great caution should be exercised in the use of lupine hay.

Symptoms.—The animals appear crazed and rush about in all directions butting into each other and other objects. This first stage of frenzy is followed by a second characterized by irregularity of movement, violent spasms, and falling fits, increasing in severity until finally collapse occurs. When the animal is unable to stand, convulsions follow each other at short intervals. Death usually occurs within one-half to one and one-half hours after the first symptoms, although animals may sometimes linger on for a day or so. During the attack the pulse is strong and irregular, there is often frothing at the mouth, the flow of urine is increased and this is sometimes bloody. The lungs and cerebral membranes are congested and in more violent cases small blood vessels are found ruptured in various parts of the body.

Remedies.—The permanganate of potash remedy is recommended for cases of poisoning by lupine, but it must be administered very early in the attack to be effective. By the rapidity with which the symptoms appear it is evident that enough of the toxic substance to cause death enters the general circulaion very soon after the seed has been eaten.

The permanganate remedy is administered in this way:

Horses—Permanganate of potash, 15 to 20 grains; Sulfate of aluminum 15 to 20 grains.

Cattle—Permanganate of potash, 30 to 50 grains; Sulfate of aluminum 30 to 50 grains.

The thoroughly pulverized chemicals are first dissolved in a pint to a quart of pure hot water and after cooling, the solution is administered as a drench. Great care must be exercised to insure a complete solution of the permanganate since any undissolved crystals may lodge in the mucous membrane of the mouth and throat and set up a serious irritation. The powder should be added to the water, the solution thoroughly stirred and allowed to settle for several minutes, the solution is then drawn off and any dregs which may remain in the bottom discarded. All organic matter, such as sugar, syrup, etc., must be kept out of the liquid and the water used should not be strongly alkaline.

Acids are also recommended for lupine poisoning. For this purpose acetic acid or very dilute sulphuric acid is suitable. Since vinegar contains acid its use would be beneficial. Alkalies should be avoided.

MICA AXLE GREASE

SALT YOUR HAY DOWN

When You Stack It or Bale It

The modern way—
The sensible way.

WHY NOT?

Costs You Nothing---

—the salt more than pays for itself in the weight of the hay—holds the moisture, makes 5 tons equal 6.

Prevents Musting---

—checks the growth of molds when the moisture content is high.

Improves the Feed---

—the cattle thrive on salted hay and they like its taste. Stock will eat it up clean, where unsalted hay will be mussed over and wasted.

—leading dairymen use **SALTED ALFALFA HAY** all the year round for feeding dairy cows to increase the flow of milk.

20 Pounds of Salt to Each Ton of Hay

—that's the proportion. Stack three feet of hay, sprinkle the salt over by hand; then another layer of hay, more salt, and so on.

IT PAYS!

With the Live Stock Men.

DAIRYING AND DAIRYMEN.

Morris and Sons have been buying granddaughters of Tillie Alcartra.

A. B. Humphrey has a purebred Guernsey community nucleus at Escalon.

Post and Card have brought in 29 Holstein cows from Wisconsin for their ranch at Angiola.

J. W. Benoit of Modesto reports the sale of a choice young service bull to A. J. Zabala of Salinas.

Mr. Rowley of Exeter reports the loss of half of his Jersey cattle and hogs from feeding moldy alfalfa silage.

A rabid dog attacked J. W. Jones and his daughter near Hanford and also caused the death of several head of cows and hogs.

O. J. Ames of Oakdale recently sold the last of his young Jersey bulls of serviceable age, Dainty Maid's Diploma, to J. F. Tulloch of Oakdale.

Owners of the Pure Gold Stock Farm of Elk Grove have recently erected a stave silo and are planning a 60-cow sanitary milking barn for the near future.

Geo. Cochran and C. F. Nowlin of the Sanitary dairy, El Centro, milk over 100 cows and handle the milk in a sanitary way similar to that described in a recent issue of the Pacific Rural Press.

Shieber Bros. of Calexico are reported to have recently purchased a son of Tilly Alcartra from Morris & Sons Corp. of Woodland for $700. He was sired by Westside Mayflower Prince. This is a splendid investment.

Manager W. A. Beard of the Sacramento Valley Development Board has purchased 74 grade Holsteins for his 120-acre alfalfa ranch near Marysville. To head the herd he bought the purebred bull Segis Oak Tritomia Fobes from the Jas. Henderson Co. of Sacramento.

From Mar. 16 to 22, reports of tests of 575 Holsteins were entered in the Advanced Register. Over half of these were with first or second calves. In 7 consecutive days, they produced 241,276.8 lbs. milk, containing 8525.225 lbs. fat with an average test of 3.53 per cent. The average production was 419.6 lbs. milk containing 14.8 lbs. fat.

An auction of 300 Holstein and Durham milk cows and heifers, 200 of them now milking, and most of them not over five years old, is to be held May 17 beginning 9:30 a. m. at the Wm. Collier ranch between Livingston and Turlock. Col. R. R. Briggs of Turlock is the auctioneer. Many of the cows are giving over 80 pounds milk per day. The owners, Wm. Collier and Manuel Mancebo, are going out of the dairy business.

HOG BREEDERS AND STOCK.

Dr. C. C. Park of Santa Barbara is going into hog raising on a newly acquired 120 acres.

Hayden Smith of Woodland shipped on Apr. 27 a Duroc hog 7½ months old weighing 212 pounds to J. T. Donaldson of Modesto.

At the Cal. Swine Breeders' Sale, Chico, May 24, E. H. and H. L. Murphy will sell six Berkshires.

H. L. Murphy of Perkins will show two carloads of cattle and hogs at the Butte County Exhibition May 22.

H. H. Hoppin of El Centro is experimenting extensively with several varieties of beets to be fed to several varieties of hogs for pork.

Pig scours is a symptom of indigestion caused by two much feed, changing the sows' feed, dirty feed, or chilling the sows or pigs, says the Mo. Col. Agr.

Miller and Lux recently bought 22 registered Berkshires from Markofter and Latta of Elk Grove. The stock will be distributed among their several ranches.

Keeping hogs clean by lining their bathing pools with wood is practiced by H. G. Farnsworth of El Centro. Sheep dip is also kept in pools 5x5x1 foot deep.

Frank and Lewis Gill, Hodges Bros., and Will Thompson of Porterville combined Apr. 27 to sell two cars of hogs for the Los Angeles market. The price was $7.75; the average weight 190 pounds.

Dr. T. B. Spalding of Turlock recently bought from J. W. Sepit of Iowa, two bred big-type Poland-China sows, and from J. W. Pfander of Iowa a purebred service boar. Dr. Spalding sold 8 gilts and a boar to the Browning Stock Farm of Woodland.

Willoughby & Sons of Calexico keep clean water for hogs to bathe in by submerging floors surrounded by cribbing, in pools through which irrigation water runs as regulated by gates. Unless these hogs are vaccinated there is great danger of cholera.

H. G. Farnsworth of El Centro keeps his hogs healthy and cholera-resistant by mixing 1 teaspoon saltpeter, 4 tablespoons salt, and a cup of sulphur and feeding the mixture with tankage once a week. He does not vaccinate though cholera has surrounded him. These things ought he to have done and not left the other undone.

At the semi-annual meeting of the Cal. Swine Breeders' Ass'n at Davis May 6, 10 a. m., Wm. Bernstein of Hanford speaks on "The Value of a Good Sow"; J. M. Bomberger, Modesto, "Substitution of Feeds as Regards Cost, for Growing and Fattening Hogs"; at 1 p. m. R. R. Ingals of the University, "Boys' Pig Clubs"; D. O. Lively, San Francisco, "Hog Industry in Cal."; A. B. Humphrey, Mayhews, "Hog and Vineyards"; Prof. G. H. True, "Livestock at University Farm."

BEEF CATTLE AND BREEDERS.

Miller and Lux have just imported 90 purebred Hereford heifers and 110 Hereford bulls from Midland, Texas.

E. H. Murphy of Perkins took a car of purebred Shorthorn heifers and a bull Apr. 29 to Lanfair, San Bernardino county, where he reports a ready sale.

W. H. Hammond of Chico, who recently bought a carload of purebred Shorthorn cows and heifers, will show them at the Butte County Spring Exhibition, Chico, May 22-28.

The demand for purebred beef stock in the East is very strong since foot-and-mouth disease has been cleaned up and it seems like the bull supply would be short there this fall.

SHEEP AND SHEEP BREEDERS.

High lamb markets have led to the warning by State Veterinarian Chas. Keane not to sell off too many of the ewe lambs.

Blevins Bros. of Colusa recently moved 2700 head of sheep from their winter quarters near Arbuckle to the Moulton ranch pastures.

In eradicating hard scab on fine wool sheep the first dipping should

AUCTION SALE
300 Cows and Heifers

On the WM. COLLIER Ranch on the State Highway, 1 mile north of Livingston or 8 miles south of Turlock.

WEDNESDAY, MAY 17.

At 9:30 a. m. (Rain or Shine).

This is one of the finest Dairy Herds in the San Joaquin Valley, and consists principally of Holsteins, with a few Durhams; all young and in fine condition; most all have 1st, 2nd, or 3rd calves. They are heavy producers, many going from 80 to 100 lbs. of milk per day. The owners invite inspection before sale. 200 Cows milking at present time. 100 Heifers, many springers, and lots of Calves. Owing to the large number of Cows to be sold, the Sale will commence promptly at 9:30 a. m.

The Bulls at the head of this herd are registered Holsteins.

All will be sold without reserve as owners are retiring from the dairy business. No outside stock will be sold at this sale.

FREE LUNCH.

ast three to five minutes according o the U. S. Dept. Agr.

An unusually large amount of nutton is being shipped east from California this season in refrigerator ars, seeming to indicate lamb short- ge everywhere.

W. H. Samson and E. E. Thomp- on, who have 1000 ewes on their iver ranch above Tehama, have old upward of 900 lambs at $5.25 o be delivered in July.

A "wool car" run by the U. S. Dept. Agr. and the agricultural col- eges, has been exhibiting sheep earing different grades of wool, amples of the various grades with heir prices, and exhibits showing he natural shrinkage, strength, and haracter of the grades.

According to T. H. Ramsey of Red Bluff there are not a thousand head of lambs in Tehama county that have not already been contracted for. The prevailing prices have been $5.00 to $5.25 with a few outstanding bands that will range close to the railroad selling as high as $5.25 for summer delivery.

Most of the wool in Tehama coun- y has been sold at prices ranging rom 24 cents upward. The con inued dry weather is drying up the owland pastures so fast that sheep men are already beginning to go to the summer ranges, although there s still too much snow in the moun- ains to allow general moving of locks. The situation is considered one of the most serious in recent years. The large flocks on the Stan- ford University's Vina ranch are still being held on the foothill pas- tures.

SWINE.

FOR SALE—Fancy belted Hampshire hogs. Well belted young sows and boars, registered. Prices reasonable. Ben F. Thorpe, Manager, Canfield Estate Ranches, Bonsall, California.

BOAR'S SHEATH SWOLLEN.

To the Editor: I have a boar whose sheath is swollen and bags water. He lies down most of the time and gets up only to eat.—H. B., Bethany.

[Douche out the sheath daily with a 1-1000 solution potassium permanganate warmed.]

CALF PASSED RED URINE.

To the Editor: During the latter part of last winter a four-months-old calf, fully weaned and running on volunteer pasture, commenced to mope around and lose flesh. I could not make out what ailed it, but one morning saw it pass red urine. That day a veterinarian said it was white scours. I'm sure this calf never had any scours and its manure was like any other animal's on green grass. He gave me some white powders. When I got home the calf seemed some better, and improved from day to day until now it is almost fat and very lively. So it never got the medicine. A few weeks ago another calf three months old, getting a feed of six quarts of milk with a big spoonful of Croley Calf Meal and running on green grass, took sick like the other calf. I gave it some of the medicine and it died. On opening it, I found the bladder very full of red urine and the whole length of the large intestine was filled with hard manure, but it was all green like it should be.—B. H., Glenn.

[This is haematuria. It is caused by eating feed produced on sour soils. Give ounce doses of alum twice a day for two or three days.]

VACCINATION FOR BLACKLEG—FEED CALVES OFTEN.

To the Editor: I have been reading the Pacific Rural Press for some time. But one very important but neglected subject is the calf. I undertake to say that this State sustains a loss of $100,000 every year from one cause or another from calves that have never been properly started, stay "runty" and are subject to all kinds of setbacks. Then the healthy calf from four to twenty months old is subject to blackleg at any time of the year. Whether he is gaining flesh fast or losing flesh, he drops off.

Now I would like to know about this vaccine problem. I have used both pills and government vaccine, and I have bled them, and they still drop off. It is possible I have not given them the best treatment, so I should like to know how often to vaccinate and the best manner of treating them.

I see from the "Medical Journal" that it is an open question whether vaccination for man or beast is best. If you think the subject worth while, give us some light.

I have also heard all sorts of opinions as to the best time to castrate animals. Should one regard the signs of the zodiac to get the best results?—B. F. R., Adelaide.

[Your estimated figure is placed far too low; losses far exceed this figure. Practically all the digestive troubles of calves are due to faulty methods of feeding. A suckling calf if allowed to run with its mother will take small amounts of feed many times during the day. The present practice of giving a calf away from its dam all it will take twice a day is bad, and if dairymen would make a practice of feeding four and five times a day in small amounts the youngsters would be stronger and better constitutionally and be much freer from digestive disturbances which are at the root of the great percentage of calf troubles.

Vaccination for Blackleg is absolutely a success. The makers of this vaccine give full directions for its use, which cannot be improved upon provided the calf actually gets the vaccine injected into its anatomy. Blackleg vaccine will not, however, protect the animal from any trouble other than blackleg. With all due respect to the article you refer to in the Medical Journal, the writer absolutely believes in vaccination for both man and beast, which is proved by its results in his daily practice

The signs of the Zodiac have nothing to do with the results of castration. An operation properly performed with the proper after care will bring uniformly good results. The weather in the spring of the year when it is mild and before fly season begins is the best time.]

If present plans carry out, Chico will have the biggest livestock show ever pulled off north of Sacramento, May 22 to 28 inclusive. J. H. Guill, Jr., who has charge of the livestock division of the Butte County Spring Exposition, states that they are expecting good Shorthorn, Holstein, Jersey, Shire horse and hog exhibits, as they have already received entries from a number of Sacramento and San Joaquin valley breeders. It is thought that this show will stimulate interest in better stock in the upper Sacramento valley more than any other one thing. Mr. Guill says that 41 head of hogs have been consigned to the hog sale which will be held May 24. Prof. Gordon H. True and Prof. J. I. Thompson will do the livestock judging. The entire show will be held under immense tents.

Skim Milk-Barley Hog Ration Pays.

[Written for Pacific Rural Press.]

As long as hog buyers persist in paying the same price for soft half-finished hogs, does it pay to feed high-priced grain even in face of the more rapid gains?

This is the question asked on all sides when a suggestion is made that more grain in the pig's ration would make a better growing hog. S. F. Bonner of Gridley is most emphatic in saying that it does. His conclusion is based on results he has secured in raising and fattening hogs for the market on a dairy ranch, where skim milk and alfalfa are the usual feeds for hogs. In fact his records show that when charging 12 cents a hundred for skim milk and $1.15 a hundred for barley, the actual cost of producing a pound of pork was three and three-quarters cents a pound.

Mr. Bonner starts to feed his pigs before they are born, giving the sows a ration composed of rice bran slop. This is continued till two weeks after farrowing, when rolled barley and skim milk are substituted. These are fed all the sows will eat, being mixed about one part barley to seven parts of skim milk. This not only keeps the sow in good flesh but also gives the pigs a healthy start.

As soon as the pigs are old enough to eat some, five or six weeks, they are fed in separate troughs, fenced off from the sow, a ration of barley and skim milk, mixed one part barley and three parts milk. They are given all of this ration they will eat from weaning time till marketed, which is usually right around six months at a weight of 200 pounds.

In April a bunch of pigs was seen on Mr. Bonner's ranch that were three months old. This lot was receiving a little better than two pounds of barley and seven pounds of milk a day and were making gains of eight and nine pounds a week each.

While such gains are largely due to the feeding, Mr. Bonner attributes no small portion of his success to breeding, his practice being to breed grade Poland China sows to registered Chester White boars, and the value of this cross is evidenced by the large uniform litters on the ranch.

Not only does Mr. Bonner disagree with the usual feeding method in vogue, but also with the idea that white hogs sunburn in the hot interior valleys. He states that in his experience he has never had a white hog sunburn or become scaly and contends that the reason for this is filthy wallows, where the hogs roll and get covered with mud, which later dries and irritates the skin. He provides his hogs with plenty of good, clean drinking water but no wallows.

At a small expense he has erected movable farrowing houses in the division of each pen, large enough to accommodate two sows. So far he has not fed alfalfa hay or pastured his hogs on alfalfa, but later he expects to seed each pen to alfalfa.

HOGS SHOULD DRINK MORE.

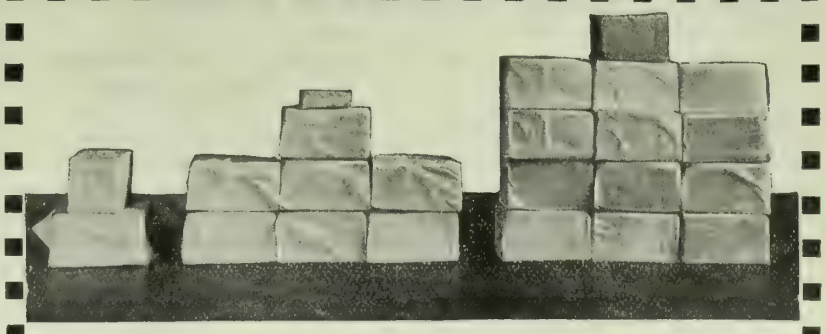
[Written for Pacific Rural Press.]

Keeping only the best sows for breeding purposes, as well as careful attention and feeding, are the causes as given by Elmer Lamb of Ceres for the general healthy condition of his Duroc herd, splendid litters full of life, and with practically no runts.

Mr. Lamb has fed a great many spineless cactus the past season, and has found them fine succulent feed especially in winter when he has no other green feed. The large percentage of water in the cactus keeps the hogs healthy, as in the cold season with ordinary feeds they would not drink enough water.

Two weaned sows and a boar by Oran Cherry King Jr. and out of Ohio Lady were recently sold to F. A. Heron of Modesto; 1 sow and boar of the same breeding to John Kincaid, Bakersfield; 1 gilt to J. H. Herch of Denair; 2 Oct. gilts to Wm. McIntyre, McFarland; 2 bred gilts to Mrs. Hattie Bingham, Denair.

Lieut. Bryan, U.S.N. stated before the Am.Soc.of Naval Engineers: "Oils made from the asphalt-base crudes have shown themselves to be much better adapted to motor cylinders, as far as their carbon-forming proclivities are concerned, than are paraffine-base Pennsylvania oils."



Zerolene is scientifically refined from selected California crude—asphalt-base. Highest competitive awards, San Francisco and San Diego Expositions. For sale by dealers everywhere and at service stations and agencies of the Standard Oil Company.

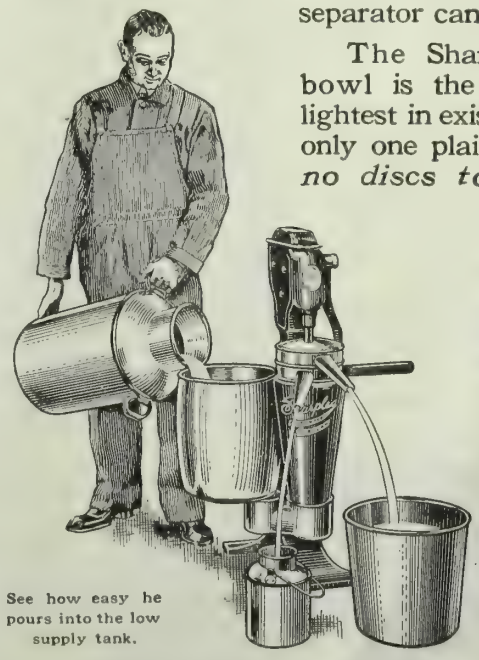
Separator running at full speed. Loss of butter 1.75 pounds
Speed reduced 10 revolutions. Loss of butter 7.28 pounds
Speed reduced 20 revolutions. Loss of butter 12.74 pounds

Which pile did *you* lose?

These figures from the Purdue Experiment Station Bulletin No. 116, show the loss in butter resulting from not turning a fixed-feed separator at exactly the speed stamped on the crank.



And investigations showed that 19 out of every 20 separator operators thruout the country turned their machines too slow much of the time.

THE NEW
SHARPLES
SUCTION-FEED

is the *only* separator made which *will not lose cream at varying speeds.* The wonderful "Suction-feed" always feeds the milk to the bowl in exact proportion to the separating force being generated. At 45 revolutions it *skims clean;* at 55 it *skims clean* and at 35 revolutions it *skims equally clean.* No other separator can do it.

No matter how you turn the New Sharples you always get *even thickness* cream. Just set the cream screw at the desired thickness and it will come out *velvety* and *even*—no matter how you vary the speed. No other separator can do it.

The Sharples Tubular bowl is the simplest and lightest in existence. It has only one plain part in it—*no discs to wash* and bother with.

See how easy he pours into the low supply tank.

All these and many other features explain why the New Sharples is the profitable separator for *you* to use. It is described in detail in catalog *"Velvet" for Dairymen.* Send for your copy today. Write Dept. 31.

Farm Poultry for Profit.

GREEN FEED FOR LATE HATCHES AND HENS.

[Written for Pacific Rural Press by Susan Swaysgood, Pomona, Cal.]

Green feed must be had if any profit is expected.

For the farmer with land plowed and harrowed in season there is no need to be afraid to venture planting green feed, the moisture will come up to grow it if he does his part right and selects the kind of feed that does best in dry weather.

I have always found that the Dwarf Essex rape seed was the quickest to respond to dry weather conditions. It likes a soil a little moist to germinate the seed, but after that it thrives and grows even though the ground is dry and hot.

It is best to sow the seed rather thick in the row and have the rows rather close together. As a help, run something over the rows of seed to pack the soil close. The finer the soil is worked the better, because it holds and draws moisture better than when rough and chunky.

After the plants get up it will be well to stir the soil between the rows every few days until they cover the ground. Now by planting about every two weeks one can have a succession of green feed with very little labor. If the ground is so dry it will not germinate the seed, dig a shallow furrow and put the garden hose on it for a half hour, then when the water has soaked in stir the soil and sow your seed. This will insure your crop starting.

Lettuce also gives good return for labor, and most everything likes lettuce. Chickory is also a good green feed for old and young alike. Of course the man that has alfalfa is ahead of all these things except in the fall when chickens do not care much for alfalfa.

Good strong kale plants or cabbage can be set out where the ground is too dry for starting seeds. Plant as you would tomatoes by putting water in a hole prepared for the plants, drop the plant in the hole and seal the root from the air by pouring about a cup of water over the soil. When all are planted cover up with the soil taken out and shade the plants if day is very hot; by planting in the evening it is possible to do without shading and this saves much work.

Kale and cabbage plants are very subject to plant lice in our dry climate, but these pests can be kept down by blowing insect powder on the under sides of the leaves.

POULTRY AND POWER ON TWO ACRES.

(Continued from page 561.)

All those chickens receive ground grain and chopped green stuff daily throughout the year and the cost is not prohibitive, for a sack of corn is ground up in 20 minutes and cracked in half that time by this 2 h.p. distillate burning engine. Wheat is often cracked because less of its energy is thus consumed in digestion. Oats and barley are ground. Shells are ground finer and made more economically available. Oat hulls are sifted out to be used in the brooders. They make the finest kind of dry litter to keep the chicks healthy scratching for the fine feed that is thrown on this litter. The hulls always contain more or less flakes of the oat grain nearly like rolled oats—"makes fine picking. Here are 200 chicks hatched two weeks ago. Haven't lost one."

Feed Grinders and Mixer.—The feed grinder is fixed solid outside the engine house and runs from the same broad engine belt wheel as the air compressor. Another belt runs from the same belt wheel to the feed chopper located above the grinder. Another belt from the same wheel runs still higher to turn the feed mixer. The grinder hopper is removable so that a larger one with larger opening can be put on, and dry alfalfa hay is ground to meal in the same machine. When oats are being ground, a little belt is fixed to the grinder shaft to run the shaker which sifts out the hulls.

Chops Green Stuff.—"Green stuff makes eggs. We have 10 layers' yards, five on each side of an alley, besides a big yard and some little ones. The hens are switched back and forth onto the stubble after we have cut the greens. Where the hens have just been switched to other yards, we sprinkle the ground, sow grain broadcast, plow it under, and don't have to wet it again. In 9 days it is up three inches. We have more greens than we can use. We cut most all of it and run each

Poultry Breeders' Directory.

WANTED—A position as ranch superintendent. Qualified by experience and agricultural college training. Straight salary or salary with share in profits acceptable. Box 214, Pacific Rural Press.

day's cutting through the green feed chopper. We have a little alfalfa patch which Alfred chops and dries on trays for the rabbits. Green stuff makes eggs. Here are 100 Hoganized white Leghorns shelling out 80 to 85 eggs per day. We got 425 eggs yesterday from the 650 hens. We chop a cartload of greens per day and feed it in troughs where it keeps clean. The sides of the troughs are spaced off with vertical lath 16 inches tall so there is no waste."

The octagonal feed mixer is housed with the sacked ground feed, though its belt wheel is in line with the engine. The composition of the feed varies daily, for the Hennings family watch their chickens closely. It is different, too, for the growing chickens, the brooder chickens, the layers, and the breeding pens which are kept separate.

The mixer holds several sacks of feed which are dumped in proper quantities and rotated so that the feed falls through wires stretched across inside to help mix it. Five minutes does the work. Besides the grains and greens, oil meal, beef scrap, bone meal, shorts, and charcoal go into the ration and a scratch feed made of assorted whole grain is fed in the open, after mixing it dry by hand.

Capital.—Mr. Hennings used some of his original capital to buy the two acres and put up the buildings six years ago. All stock, trees, machinery, and living have been made on the place. He saved $125 on the cost of the house by sawing lumber with the little engine.

To Markets by Auto. — San Gabriel is some distance from Los Angeles, so it was necessary to fit the automobile with a body to carry eggs, etc. Gasoline being too expensive, he put on a Spitdorf magneto and Master carbureter so that the automobile burns cheap distillate. This car has been in use five years. After a cold night it requires a little gasoline priming to start, but no priming is used during the day. At night the magneto is switched onto electric headlights. One cafeteria takes all their eggs with some from their neighbors twice a week; "124 dozen last Tuesday."

Vicissitudes. — The Friedheim Poultry Ranch was not built in a day nor without misfortunes. An acre of rhubarb made them $1500 the first year, $1000 the next year and then went to the bad for lack of markets. They turned to turkeys, up to 400 or 500 per year. These paid well for a while, but are now being reduced in favor of the more staple White Leghorns. The last of the rhubarb was dug out this spring and the orchard trees which have been planted on this ground are being intercropped with potatoes, berries, garden vegetables, sweet corn, beets, and mangels, the latter to be chopped for the chickens if green feed ever gets scarce.

Every tree was planted by the Hennings. Their first house was a little temporary cracked paper-finished shack. Their home now is a large two-story ornamentally finished bungalow, a credit to the neighborhood. Large palms decorate the front lawn and tropical as well as California flowers about the house and yard. Concrete gate posts support the ornamentally designed name of the ranch. An umbrella tree shades the screened summer kitchen, a piano and phonograph supplement the mirrorscope for entertainment, and the Hennings are now really living.

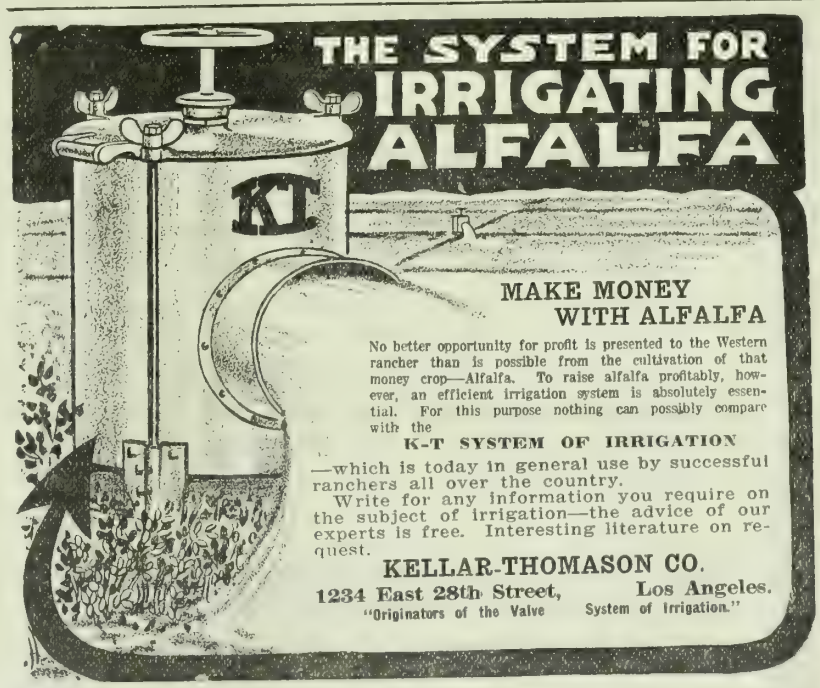
MISCELLANEOUS.

EVERY SIZE WROUGHT IRON WATER PIPE and screw casing water pipe, guaranteed as good as new. Prices right. Send for catalogue. We beat no one; everybody gets a SQUARE DEAL. Weissbaum Pipe Works, 160 Eleventh Street, San Francisco.

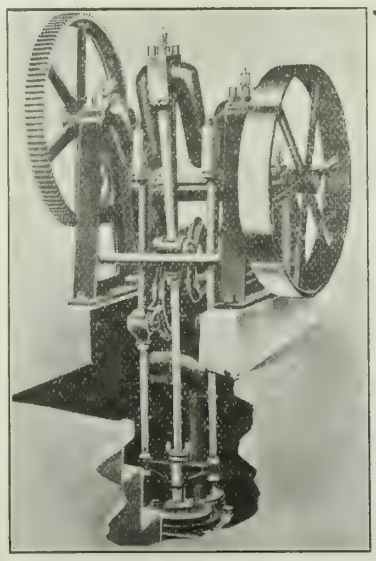
GAS ENGINES—I can furnish rebuilt Fairbanks, Morse, Otto, Peerless, Samson, Union and other good makes in all sizes. All investigators buy and all buyers are delighted. Pay when satisfied. J. J. Pottinger, 189 2nd St., San Francisco.

IRRIGATION EQUIPMENT—For pumps, oil engines, gas engines, friction clutch pulleys, etc., write us. We can save you money. Commercial Iron Works, 481-497 Fifth St., San Francisco.

SECOND-HAND WATER PIPE and Screw Casing. New threads and couplings dipped in hot asphaltum. All guaranteed. Send us your inquiry. SHECTER PIPE WORKS, 306-8 Howard St., San Francisco.



FOR SALE—A well-stocked nursery in a good business location. 5318 Geary St., between 17th and 18th Aves., San Francisco.



POULTRY NOTES.

Scarcity of poultry combined with the Easter demand, caused a sharp advance of prices. Remember this next Easter.

For lice and mites Geo. Fan of Ceres sprays with water which has been run over carbide, 50 gallons per 10 pounds. He says it is sure death to all vermin on poultry or stock and will cause the vermin to vacate buildings.

Plans for a $6,000,000 reservoir to catch flood waters of Kings river and prevent recurrence of the disastrous floods recently experienced at Tulare Lake, have been approved by officials of the Alta Irrigation District. It is proposed to assess the cost against all water companies in Kings River Valley.

MRS. BEST'S LETTER.

My dear Friends:

I saw a new thing in rugs at one of the furniture houses called Siberian Porch rugs that looked as though it were made of heavy twisted cord. It comes at about the same price as the Crex rugs and was certainly much better looking.

Displayed in this same store were the most brilliant colored tables and chairs for use out of doors—bright yellow tables and vivid green chairs with the gaudiest of chintz cushions—color and plenty of it seemed to be the object of the display. While an adjoining window had the always practical, everlasting rustic hickory in both tables and chairs.

One of the big china houses is having a silver display of many patterns which are made in both plated and sterling ware—in fact they state that only a jeweler can distinguish one from the other. The trend is most decidedly toward the plain patterns—something anyone who has the care of silver will be glad to hear, for it is much more work to keep an ornate pattern clean than a plain one. All table silver is to be advanced in price the first of the month, due to the increased cost, not alone of silver, but of the baser metals.

Those of you who are clever with your needles or who have a bridal shower to prepare a gift for, will be interested in a window of stamped linen articles that I saw. These included card-table covers, pillow cases, small bath towels, hot roll and sandwich holders and they were all most reasonably priced.

One of the gift shops had leghorn hats painted in wreaths of forget-me-nots and roses—we have had the painting on maline and net some time, but these are the first hand-painted straw hats I have seen.

Some of the stores are showing fancy collars of crepe or net with plaited frills attached to extend to the waist line. They would dress up the plainest kind of a waist.

I saw in a clothing store very good looking leather belts in either tan or black with initial buckles. Some of them with the three initials, while others only had one. I could not help but think how proud any boy would be to have one for a birthday or graduation gift. They were only seventy-five cents. Devotedly yours, **Rosabella Best.**

KEEPING HAMS.

Many different plans for keeping hams through the summer are suggested. A very successful method is to dust the ham with pepper, especially around the bone, wrap in paper, then enclose in a muslin bag with a loop to hang it up. After the bag is carefully closed, paint it all over with melted paraffine, paying especial attention to the seams. Hang the meat in a dark, airy place with the windows well screened.

Oil of lavender placed in a saucer and slightly diluted with warm water is claimed to rid a room of flies in a very short time.

PREPARE FOR SUMMER TIME

From the Imperial Valley, where it does get warm in the good, old summertime, comes a description of a house built for summer comfort, that may interest some of the dwellers in other valleys of the state.

The secret of the coolness of this house is in the double roof, dropping windows and a long screen porch.

Over the regular roof of the house, there has been constructed a second roof with a space for passage of air between. At the ridge of the outer roof, there are provided a number of ventilator shafts, so that warm air reaching the top may readily escape.

The dropping windows of the house are a novelty. They are built high in the wall and are rather shorter than the ordinary window and when opened are shoved downward into the wall. This causes the opening at the top of the window, giving the air at the top of the room, which is the hot air, a chance to escape.

A desert cooler, which can be built very easily at home, is also a feature of this house and helps keep food in good condition in the extreme heat. Build it just as you would an ordinary cupboard, only have the back and door at the front made of burlap.

Cover the top of the cupboard with a zinc pan, in which there are tiny holes around the edges. The zinc pan when filled with water will keep a steady drip over the burlap sides of the cooler, and the breeze passing through the damp cloth thoroughly cools the interior. The cooler should be kept on the porch or outside the house where the wind can strike it.

In the corner of a back room of the house, or out-of-doors if desired, a shower bath may be improvised. If outside the house, there must be a board walk laid, for comfort. If the farm has an artesian well or a gasoline engine, that will pump water into a high tank, the problem of water pressure for the shower will be easily solved.

The screen porch makes an outdoor room by day and can be used for a sleeping porch at night. The collapsible cots that can be turned up against the wall during the daytime make comfortable beds and do not occupy too much space.

Trellises or arbors with quick-growing vines combined with a few flower beds about the yard help make a restful atmosphere about the home.

HOME LAUNDRIES.

The Home Economics Specialist of the University of Arizona urges all farmers who have gasoline engines to have power-equipped laundries in their homes, to relieve the busy wife of one of the hardest burdens. The cost of the laundry is not prohibitive as washing machines with wringers are about $25, stationary tubs about $10 and then there would be the expense of piping connections, which expense would be comparatively small, if the men on the farm could do the work themselves.

FLORAL DEPARTMENT.

[By Geo. N. Tyler.]

Carnations are, next to the rose, the most popular variety, but new varieties quickly run out, due to overpropagating and forcing. Where today is the Mrs. Thos. Lawson, the so-called $30,000 Flora Hill, the leading white of its time, and so on? Even the old reliable Enchantress is on the go and in a few years you will see the last of it, but a new one will come along to take its place. Matchless and White Wonder are displacing White Enchantress.

Buy your small plants now, out of 2¼ or 3 in. pots. They should have been planted a month ago. Make your bed very rich, also give plenty hydrated lime in the soil, for they thrive on lime; before blooming give a liberal application of bone meals.

After planting them out, give the bed or plants a good watering and when it dries out enough to work, cultivate thoroughly and let go on the dry side till growth starts. After they are up four or five inches, pinch the tops out to make them branch; you can continue the pinch at intervals till August, then let them run up flower shoot and they will make good flowers as soon as the cold weather sets in. At this time give them a liberal dose of bone meal, and about one inch dressing of half rotted manure. They like sandy soil, but will do well in most any soil except heavy adobe. They like an eastern exposure, shelter from strong winds, and shade from hot afternoon sun.

Insect Pests.—The green lice attacks them; keep them down by a strong spray. A climbing cut worm eats out the heart of the flower buds; there is only one to a plant and if you go out after dark with a lantern you can generally find them working, or else look around the base of the plants where they hide in the day. They are about ½ inch under the soil. Fungoid diseases, die-back, anthracnose fairy ring, black spot, and a new disease, yellows—branch rot. These can all be kept under control with a good fungicide; Bordeaux mixture is good.

Here is a fungicide that I have used with success for a number of years with good results, both in the garden and greenhouse: Take 25 lbs. of quicklime and put in a fifty gallon barrel, add enough water to cook the lime, and while cooking add 10 lbs. of flowers of sulphur. After it is all cooked up fill the barrel with water and stir thoroughly, then let settle. After the resulting liquor is clear it will be a golden color. In spraying the plants in the garden, that require a fungicide, use one part of the liquid to one of clear water; spray the ground around the plants, and the foliage. It will burn up all diseased foliage but will not hurt the tenderest growth. Spray on a hot day, the hotter the better, about noon. It will keep indefinitely as it forms a scum on top and does not evaporate. After you have emptied the barrel you can fill it up with clear water, stir thoroughly, and when settled use the resulting liquid clear.

Gophers greatly love carnations and do a great deal of damage. If you cannot trap them off or smoke them out, make a wire frame and grow carnations in it. Dig your hole for your plants and frame about 10 in. square and 10 in. deep; cut a piece of one-inch chicken wire that has been galvanized after weaving, 10 inches square and place in bottom of hole. Cut a piece 10 inches wide and 30 inches long and make a round cylinder. Place cylinder on 10-inch square piece, fill up with soil and you have an absolute gopher-proof cage to grow your plants in.

Supports. — Make a cylinder, as thick through as you desire, out of 12-in. wide 1½ in. mesh wire; get some flat stakes ⅛x1¼, about 2 ft. long; weave the stakes through the 1½-in. mesh, first painting them green, so they will look nice in the garden. Any plant that you desire to fix up, first tie to a center stake, slip the support over them and then cut the strings. As the plants grow you can slide the support up on the stakes. Never tie a plant up to a center stake as it only breeds fungoid diseases. The air must circulate through the plants so they will dry off thoroughly after spraying, etc.

FRUIT JAR COVERS.

To the Editor: I have been told that the Mason Jar Co. (or some other company) is making a new cover for the Mason jar, similar to the Economy jar top, that seals by suction in the same way, and requires no screwing. Could you tell me if this is so; and if so, where I could buy the covers? If this is so, I shall keep my Mason jars; but if not, I shall do away with the Mason jars and buy Economy, as the fruit is so much easier canned, of so much better flavor, and keeps so much better in the Economy jars.—Mrs. S. P. Barnett, Pope Valley.

The Mason Jar Co. have on the market a new jar the same shape as the Economy and sealing in the same manner. They have a new top for the old style Mason jar, made in two parts—a circular piece which just covers the top of the jar and a rim which fits over the edge and screws on.

TO DESTROY ANTS.

To the Editor: Will you please tell me how to keep ants out of a house?—L. D. G., Fairmead.

The Kellogg Ant Paste, which is like a very thick syrup, is good to spread along the line of march and they come in swarms to devour it. Then they leave, supposedly to die, and none will return for some time, but ultimately they do come back, unless this paste is renewed from time to time. The University of California, which has been waging a war of extermination on the Argentine ant, is recommending the use of preventives in the yards. There are small tin cans on the market containing sponges which are to be wet with an Argentine Ant poison and placed wherever ants are in evidence. Any druggist can get this for you. The theory is that if the ants are destroyed in the yards, there will be none to enter the house.

Get the mosquito netting in place and fly-traps in working order.

Saves 1/3 Your Fuel

—a one-third saving on your fuel bill, year after year, doesn't that make it worth while to find out about this range instead of picking out a range on its "looks?"

It's a perfect baker first and always, and needs no blacking.

Arcadian Malleable Charcoal Iron Range

Built like a locomotive boiler. It stays airtight, because it is rivited metal to metal with no stove putty to crumble and let in false drafts, that boost fuel bills, and spoil baking.

Write for inside secrets about ranges — learn how to judge range values and get the most value for your money, FREE. Write today.

MARTINEZ, CAL.

IT CAN BE DONE.

Somebody said that it couldn't be done
But he, with a chuckle, replied
That maybe it couldn't, but he would be one
That wouldn't say so till he tried
So he buckled right in, with a trace of a grin
On his face. If he worried, he hid it.
He started to sing as he tackled the thing
That couldn't be done; and he did it.
There are thousands to tell you it cannot be done
There are thousands to prophesy failure.
There are thousands to point out to you, one by one
The dangers that wait to assail you;
But just buckle right in with a bit of a grin,
Then take off your coat and go to it;
Just start in to sing as you tackle the thing
That "cannot be done" and you'll do it.

WATCH YOUR SNEEZE.

There is trouble enough in the world without sneezing more trouble into it. Every time you sneeze while you have the grip or a cold, several million cold or grip microbes are sent flying out into the air which other people must breathe. So the New York health authorities are circulating a card bearing this easily remembered couplet:

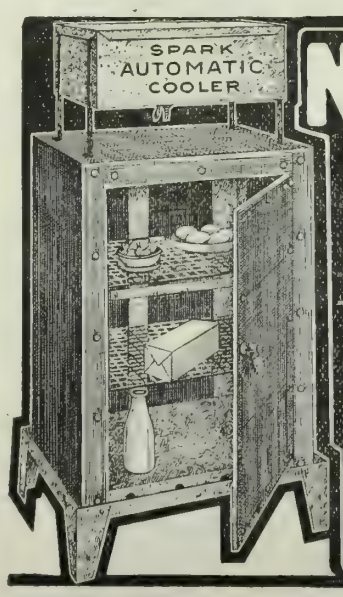
"Cover up your cough and sneeze;
If you don't, you'll spread disease."

If it is easy to remember that couplet; it ought to be still easier to remember to "cover up" the coughs and sneezes. The old idea was to teach this little act of decent thoughtfulness as a simple matter of good breeding. But now the health experts want everybody to know that it is more than that. It means preventing the spread of discomfort, disease, possible death. For grip and colds in America are almost, if not quite, our deadliest plague.

This is why school children, passengers on elevated trains and others have been receiving wholesale this little bit of practical poetry. Don't forget it. When that mischievous titillation begins back of your nose, reach for your handkerchief. And instead of scattering microbes scatter this advice both by word and example:

"Cover up your cough and sneeze;
If you don't, you'll spread disease."

In the prevalent epidemic of influenza, there is hardly a community that is free from its attacks. Fortunately its assaults can be guarded against and its virulence modified. In these changeful spring days, with a jumping temperature and alternate wet and dry weather, sufficiently warm clothing is a first necessity. Doctors suggest care in keeping the feet dry, the avoidance of overheated rooms, a moderate diet, and absolute abstinence from alcoholic drinks. Perhaps one of the best safeguards against grip is not to worry about it. A case of "nerves" is more likely to invite it than not, all other things being equal. Keep your head cool, your feet warm and dry, and go about your business as cheerfully as you can, and the danger will be reduced to a minimum.—Christian Herald.



the undisputed LEADER

A publication of large general circulation in California recently asked its subscribers, among other questions: "What brand of cocoa or chocolate do you use?" In the answers received ten brands were mentioned, Ghirardelli's being named in more than 60% of the total. The reason must be Ghirardelli's undisputed superiority. Order

California Garden Flowers, $1.50 Postpaid Pacific Rural Press

FIGURES GIVEN ARE INDEPENDENT AND RELIABLE

Pacific Rural Press Market Report

PRICES QUOTED AS PAID TO PRODUCERS.

San Francisco, May 3, 1916.

WHEAT.

According to reports from the north, wheat crops both there and in the Middle West are rather backward, with the outlook for a very moderate yield. This is causing a somewhat stronger feeling all along the Coast, and club wheat has been marked up a little here. There is no buying of any consequence at the advance, however.

Cal. Club, ctl	$1.60 @1.65
Northern Bluestem	1.87½ @1.90
Northern Red	1.85 @1.95

BARLEY.

Local barley prices unchanged, trading is very dull, with buyers apparently waiting for new crop. Export business is greatly hampered, and shippers are taking little interest; demand for feed is keeping pace with current needs.

Shipping, ctl	$1.37½ @1.40
Choice Feed, ctl.	1.32½ @1.35

OATS.

There is no seed moving, new red feed will be coming in in about a month. Demand is closely limited. values remain steady at the former level.

Red Feed	$1.35@1.37½
White	1.45@1.50

CORN.

All grades are quoted at the former prices.

Eastern Yellow, ctl	$1.80@1.85
Milo Maize	1.40@1.45
Kaffir	1.60@1.65
Egyptian	1.50@1.57½

BEANS.

The close cleanup and high price of white beans has diverted attention to Pinks, which are beginning to move in good shape, and have advanced rather sharply in price. Otherwise there is no change in the figures, but local dealers report much more firmness throughout the entire list, as the consuming markets are again beginning to show an interest. It is accordingly expected that there will soon be a general stiffening up of prices.

(On wharf, San Francisco.)

Bayos, per ctl.	$4.50@4.60

Canada Peas	5¼ @ 6 c
Alfalfa, per lb.	22 @24 c
Sudan Grass	35 @40 c

HAY.

The first cutting of new crop alfalfa is now arriving quite freely, bringing price down to new-crop level. The value is still very fair, however, as the hay is of good quality and moves freely, much going up and down the coast. Some new wild oat hay has appeared, but not enough to establish new values; quality so far has not been attractive. Offerings of old hay have increased, dealers are endeavoring to clean up before the new crop comes in; while considerable hay has been shipped north, local values show weakness. Dealers look for large offerings from new crop shortly, and it is expected it will be marketed as early as possible. Production in some sections will be short, while in others crop is normal; some grain fields are expected to be cut for hay.

No. 1 Wheat	$13.00@16.50
No. 2	12.00@14.50
Tame Oats	12.00@18.00

Middlings	33.00@34.00
Rolled Barley	29.00@30.00
Tankage	45.00
Rolled Oats	29.50@31.00

VEGETABLES.

The movement of California garden truck to the East has been unusually heavy this season, keeping prices in several lines at high level during late spring. This was first noted in asparagus, the shipping demand being especially heavy. There is still a fair movement, prices are fairly high, though the large amount of mediocre stock offered caused some decline. Peas moved out for some time at the rate of two or three carloads a day; the large offerings from the east side of the Bay have kept pretty well cleaned up. The movement is now about over, and the peas are of poorer quality, owing to hot weather; prices have dropped sharply. Local offerings of string beans are beginning to show up in better shape. Sacramento cabbage is scarce and high, while lettuce from local gardens is holding down the price of that article. Rhubarb is weak, and tomatoes have dropped sharply.

Cabbage, ctl.	$1.75@2.00
String Beans, lb.	7 @ 8c
Summer Squash, box	.75 @1.00
Peppers, bell, lb	.25 @30c
Rhubarb, box, Bay	.40 @85c

DECIDUOUS FRUITS.

Strawberries are arriving in large quantities from many districts, prices fairly easy. Blackberries and raspberries are sparingly offered at firm prices; gooseberries are firmly held. Loquats in ample supply at lower prices. Several varieties of cherries are in the market, but arrivals are light, prices for good stock are well maintained, though off lots easier. A few apricots have appeared, not enough to quote.

Per lb., black	8@10c
white	4@ 7c

DRIED FRUITS.

The Associated Raisin Company has sent out a new price list, announcing prices in several lines for the 1916 crop, all the changes being strongly upward. The lines covered are layers, clusters, and bleached Thompsons. The general dried fruit market shows a little more firmness, although few changes of prices have occurred since last week. Present figures for apricots apply to either spot or future stock, the former being quite scarce, the new crop is in good demand. Peaches are responding to better domestic consuming demand; new-crop goods are a little higher, while supplies of old stock are getting down to narrow limits. Prunes show no change, but there is said to be a fair tonnage of old stock available for consuming needs until new crop comes in; though there will be little surplus, the apparent shortage of the coming crop is causing very firm feeling. Figs are entirely cleaned up on spot, future offerings are firm. Apples receive little attention; there is considerable stock left. The New York Journal of Commerce says:

"Further purchases of 1916 early shipment contracts have been made here and in Chicago for the account of short or speculative interests in California. One New York holder of such contracts was given the chance to turn over five cars of 40s to 90s on a 5¼c f. o. b. Coast bulk basis, the report goes, but he was willing to release only three cars. Another local contract holder is said to have disposed of two cars 40s to 60s to a Coast interest on the same basis.

"Holding it to be a certainty that the new crop will be light and that the small sizes will be extremely scarce as a consequence, Coast operators are unwilling to accept bids of anything less than 4¼c Coast for 100s to 120s. There seems to be more buying interest in the small fruit than in any of the sizes above 100s."

Apples	5 @5¼c

CITRUS FRUITS.

The Eastern citrus auctions are taking lots of oranges from California these days at fairly good prices, and it now looks as though the navel season would be one of the best for several years. At New York on Monday, May 1, the auction averaged for navels from $1.70 to $3.40 per box; for bloods $2 to $2.25; for seedlings $2.20 to $2.55; valencias $2.65 to $3.15; St. Michaels $2.30; lemons $2.10 to $2.90. Shipments are going from California at the rate of about 200 cars daily. Some valencias are being shipped from Tulare and Orange counties. Florida oranges have been nearly all marketed.

Special Livestock Market Report.

Hogs have held steadily, but never before have so many been condemned for tuberculosis. Week before last, 6 per cent of the hogs killed by one firm were condemned. These were mostly dairy hogs fed unpasteurized milk. The meat shows lack of hardening feed.

Cattle and beef have weakened on account of a big run of grass stock; and they seem likely to weaken further. Grass fed steers are being shipped to Portland. One firm which has been shipping about 300 frozen beeves per month to Honolulu will lose that market July 1 because the Hawaiians are raising their own beef.

Sheep and lambs have scarcely changed, but the supply may let up soon.

WOOL.

London sales opened May 2 with values firm. Prospects for higher prices during this series of sales, which ends May 20. Australian and other foreign markets and American primary markets decidedly firm for good quality. Choice California fleece wools all sold at firm prices. Burry, seedy, defective wools moving slowly at concessions to buyers.

While larger offerings in the San Francisco market of deciduous goods re taking attention from citrus ruits, everything under this head as been in active demand locally or the last week, and all prices are teadily held.

CALIFORNIA AND EASTERN CROP CONDITIONS.

By J. L. Nagle.

Sacramento, May 2, 1916.

Herewith for the benefit of your ubscribers a resume of the Cali-ornia fruit crop at this writing: Early varieties of cherries light; Oregons fair crop. All varieties of apricots light—not in excess of 60 per cent of a crop. Bartlett pears in most sections less than normal. On the Sacramento river about 20 per cent scabby, other districts fairly clean but light. The plum crop in general is below normal. This applies especially to Diamonds, Grand Dukes and Japanese varieties. Peaches in most sections normal, with the exception of the lower San Joaquin Valley, where all varieties are not over 50 per cent of a crop. Malagas Fresno district about 80 per cent. Tokays in the San Joaquin Valley, American River and Florin districts, Winters and Vacaville well set; indications for a normal crop.

Advices from the East indicate that the peach crop in Missouri and Texas has been affected about 25 per cent. This is also true of the Ozark district and Arkansas will not ship over 50 per cent of a crop this season. Northern Georgia has been damaged by frost, which will affect the shipment of early peaches, Georgia Belles and Carmens, but the Elberta crop of Southern and Central will be normal. There are no reports available at this writing on New York State, Michigan or Connecticut.

Every indication points to a satisfactory season, as the California crop, as you will note, is hardly normal, and furthermore the season is in advance of last year by two weeks. Business is more stable and all markets very active, as the satisfactory sale of oranges and early cherries indicates.

Publisher's Department

Last week we added 187 new subscribers to our list and we expect to do better from now on. Several hundred subscribers were taken from the list during the past week because they were a year or more in arrears. We disliked to remove these names, but the postal regulations do not permit us to extend credit for over one year. However, after dropping these unpaid names our list is now larger than it was two months ago; in fact, at no time in the history of the Rural Press has it been as large and in as good shape as now. Our growing advertising patronage assures us that this journal is bringing good results to our advertisers. In all departments the paper is in fine condition and if the growth continues we shall have to add more press facilities to properly handle the business. The publisher expects to go east soon to look into the matter of better equipment that the paper may grow until it properly represents the agricultural interests of California and the Coast.

MONEY FOR FARMERS.

Another step forward for the farmer is the announcement made in another column wherein a large city bank is offering farm loans without the usual commission of one or two per cent. The custom of charging a commission for securing a loan has been made by the broker, who usually did nothing for the borrower but fill out the application blank. When large banking houses offer farm loans at a straight interest rate there is no "catch" in the deal. The agricultural interests seem to be coming into their own when the producer with good security can secure the same treatment as the city business man.

So many advertisements in this issue that we were compelled to leave out the usual book ads, but we have these standard agricultural books for sale just the same.

Quality First

Price, $1090 Detroit—One Reason for a 900 Per Cent Increase in One Year in Chalmers Farm Business

A car that merely looks well, "steps" smartly, and rides comfortably on boulevards, is emphatically not for the rigorous demands of the American farmer.

The value of length of life in a piece of machinery is nowhere more thoroughly understood and more keenly sought, than on the farm.

Length of life is a thing of scientific certainty in the 3400 r. p. m. Chalmers. Its high engine-speed is in part responsible, for the higher the engine speed, the less the side-thrust of the crankshaft, and the side-thrust means destructive wear and tear that rips an engine to pieces.

Long life is also insured by the big margin of reserve between your normal driving speeds and this car's safe maximum engine-speed of 3400 revolutions per minute.

3400 r p. m. does not mean that the engine turns at this high rate at all times. It means that it can attain this record speed without skipping and with absolute safety. Normally, you do not require any such crankshaft turning. At 10 miles an hour, for instance, you need only 500 r. p. m., at 20 you require 1000 r. p. m., and at 30 miles 1500 r. p. m.

She delivers all ordinary driving speeds with from 16 to 40% of her available might, holding 60 to 84% in reserve and in hair-trigger readiness for grades, mud, ruts, forcible hill-work, spirited acceleration, and bursts of 50- and 60-mile-an-hour speed when you need speed.

Here is conservation of energy at its best; ahead of the 3400 r. p. m. stretch years of obedient work; and all intelligent judges of machinery know that a car thus built and thus conducting itself cannot wear itself out in a few years of hard usage.

Buyers, moreover, are reminded that with every 3400 r. p. m. Chalmers goes a book of 100 half-hour free service and inspection coupons, negotiable at any Chalmers dealer's on the map.

Women appreciate the riding comfort of this car. Your wife or daughter won't be able to discover any pitch, jolt, jar, lurch or sideway in her. Correct distribution of weight, perfect balance, great multiple-leaved vanadium steel springs, 9-inch cushions and enduring leather, combined with her smooth, even delivery of force, are responsible.

Go and see this machine the next time you go to town. Examine her engine. And you'll no longer be in doubt what machine you ought to own.

Five-Passenger Touring Car, $1090 Detroit;

Two-Passenger Roadster, $1070 Detroit;

Three-Passenger Cabriolet, $1440 Detroit;

Color of Touring Car and Roadster—Oriford maroon or Meteor blue. Cabriolet—Oriford maroon, Valentine green, or Meteor blue. Wheels—standard dark, primrose yellow or red. Wire wheels optional on Roadster or Cabriolet at extra cost.

Handling Grain in Sacks is Wasteful.

Elevators on country highways and railroads to handle bulk grain cost less than sacks. Bulk handling from harvester to mill saves big money. The Pacific states are the only ones in the world that use sacks principally.

[Written for Pacific Rural Press.]

BULK handling of grain is an economic necessity. It is too late this season to introduce the change. Grain growers will have to be shown how much it is to their advantage, before time to buy sacks for the 1917 harvest. The expense to producers, of grain-tight wagons and elevators, and the danger in shipping bulk grain by sea are the principal obstacles to overcome.

Holt combined harvester, handling grain in bulk.

These are the fundamental conclusions of the state-wide committee named by the Sacramento Valley Development Ass'n., as brought out at their meeting in Stockton May 6. The committee organized with J. W. Jennings of Tehachapi as president and Manager W. A. Beard of the Development Ass'n as secretary. Mr. Jennings is probably the first grain farmer in California to put up an elevator. He paid for it out of the saving on his first season's crop last year and had some spending money left. The committee will be further enlarged with men who will make a systematic educational campaign each in his own community.

Elevators Cost Less than Sacks.—W. T. Colley of Chowchilla is building a 70,000 bushel elevator; Chas. and Lewis Moreing, with 22,000 acres of grain on the Natomas Consolidated, are planning an elevator for their own seed and feed and perhaps for their shipping grain.

Sacks for the 35,000-sack grain crop of E. T. Cunningham and the Hayes Co. of Merced county would cost now 14½ cents each or $5075. Instead of buying sacks they will have by June 10 a cleaner and elevator at Athlone at a cost of less than $3,000 to handle their grain in bulk. They are saving $2,000 which would have to be paid clean out of pocket if they were sacking the grain as heretofore. They are saving what Mr. Cunningham estimates at $6 a day for two months, or $360, on the cost of gig and sack-sewers for each of the partners. As Mr. Cunningham lives 12 miles from Athlone, he will put his $360 into a field bin of redwood and 2x4's on the bank of a dry creek, about 12 feet deep. A spout will run the grain by gravity onto motor trucks in the creek, whence it will be hauled to the elevator in bulk. The man who will truck the grain offered to collect grain from harvester, store it in the bin, and haul it to the elevator at $1.50 per ton, which is the same cost as last year for hauling in sacks. The Hayes Co. are within three miles of the elevator and will haul direct from the combined harvester to the elevator with three wagons. Their crop is estimated at 10,000 centals. The combined crop of the partners if sacked and warehoused would cost for warehousing through the harvester season, 50 cents per ton for the first month and 25 cents for each of the next two months, or $1750 cash out of pocket for storage. This would more than half pay for the 40,000 to 50,000 bushel elevator they are putting up.

Reasons for Bulk Grain.—The Globe Milling Co. and the Sperry Flour Co. are already handling grain in bulk. Geo. R. McLeod of the latter company submitted the following reasons for the practice: (1) "excessive cost of trucking, piling, re-sacking and handling grain in sacks (they draw it from barges and wagons into the mill directly by suction); (2) leakage of grain en route from spout of harvester to mill when handled in sacks; (3) rapid deterioration of value of sacks the grain is packed in, which are subject to sunburn, cutting by mice, trucks, piling machines, etc. Cost of re-sacking sometimes runs up to 40 cents per ton.

"Actual shipments of sacked grain weighed by the the Sperry Flour Co. at both point of shipment and destination show loss by leakage of 10 pounds per ton on shipments of over 500 tons. Similar shipments in bulk lost one pound per ton.

"Ordinary California grain contains 1½ to 3 per cent screenings. Off grades run 5 to 7½ per cent; some lots run 10 to 15 per cent. The buyer when purchasing, discounts for this and the farmer pays the freight on dirt and screenings for which he receives nothing and which are of no value to the mill. If the elevator and cleaner system were used, the screenings could be used at home, the grade of grain and prices obtained would be improved."

Sacked grain on the San Joaquin river. It would be easier, faster, cheaper, and less wasteful to load by gravity from an elevator and unload by suction. (Courtesy Stockton Chamber of Commerce.)

It was brought out in the discussion that the railroads are ready to handle bulk grain; most of the mills are ready or can easily be made ready; the farmers are not ready but could get that way

California Weather Record.

The following rainfall and temperature record is furnished the PACIFIC RURAL PRESS by the United States Department of Agriculture Weather Bureau, at San Francisco, for the week ending at 5 p. m., May 9, 1916.

STATIONS	Rainfall Data: Past Week	Seasonal To Date	Normal To Date	Temperature Data: Max'm	Min'm
Eureka	1.02	38.53	43.32	62	40
Red Bluff	.20	19.93	23.79	88	38
Sacramento	.01	18.19	19.45	84	38
San Francisco	.07	27.12	21.61	66	46
San Jose	0	16.30	16.26	78	34
Fresno	0	11.72	9.22	92	40
Independence	0	10.33	9.06	86	—
San Luis Obispo	.02	26.87	19.89	74	48
Los Angeles	0	19.89	15.34	74	52
San Diego	0	12.54	9.74	70	54

THE WEEK

AS WE go to press the sun of appreciative publicity is shining full-orbed in the Sacramento, celebrating the consummation of the long-hoped-for permanent highway connecting the State capital directly westward, across rivers and low lands, with the prosperous towns and rapidly developing country of the west side of the valley—thus opening to free highway inter-communication, large areas of the State, extending from coast to mountain-top, which hitherto have only been able to reach each other by long detour. The achievement is important and it is being fittingly celebrated.

Another celebration to which the foregoing is, in a way, an indicator, is the event, centering at Willows and extending from Hamilton on the north to Maxwell on the south, which is the public announcement that the west side of the Sacramento valley has at last found itself irrigationally in a great popular movement to dispose of intervening interests, and attach the water directly to the land. This is to be brought about by the enterprise of the Central Water-Users' Association, composed of representative citizens in the territory tributary to the Sacramento Valley Irrigation Company's canals, who are attempting to form several irrigation districts and bring about a co-operative proposition for the handling of all of the irrigation in that territory. The celebration consists of a popular auto-pilgrimage, over a circuit of about a hundred miles, around a center of feasting and oratory. There have been celebrations in the west side of the valley before, over expectations never fully realized, but this promises to be greatest and most influential of all because it opens a way by which the people can gain possession of their own.

THE CALIFORNIA RIPE OLIVE.

OF ALL the products in which California can claim originality in substance or in method, none is so unique and characteristic as the California ripe olive as it is now entering the world's trade. Olives in a ripe condition have figured from time immemorial, as a local food supply in Mediterranean countries; dried ripe olives have long traversed considerable distances in trade; pickled green olives have for decades encircled the globe, but a pickled ripe olive, safe for export over long distance and time, has been but recently attained and California has achieved this new commercial thing. We have had ripe olives for ourselves for half a century perhaps—just as they have had them for millenniums on the Mediterranean border. We taught visitors to enjoy them and to call for them in their distant homes long before we learned how to deliver the goods in durable condition; which was greatly to our loss and to the disappointment of others. However, solution came to the problem in time; heat has destroyed the agencies of decay and hermetical sealing has held their kind aloof from their prey. It is now possible to pour out on the world's tables, in maximum of wholesomeness, nutritiveness and deliciousness, as many ripe olives as the world's wealth can pay for. Of course, we shall not have a monopoly of this uniquely desirable production, for the Mediterranean countries will borrow our processes for export, as they have for other fruit products; but if American labor and investments are properly protected, we shall have the joy and reward of distributing throughout this country a food better than classic poet ever praised or epicure of classic time ever worshipped, because we have made it practically imperishable. The California ripe olive is now ready for popularization and enterprising producers are working for it. All the California people should participate in the undertaking. Aloft on our first page this week is emblazoned the appeal to Californians to begin on May 16 to fill themselves with ripe olives and to send to their friends, throughout this land and beyond, good generous samples of a unique product which California delights to honor.

RURAL CREDIT COMING FAST.

THE great agricultural event of the week is the rapid approach of rural credit. Using a modern metaphor, we should say that it is coming on a political motor-truck, set at top-speed; some years ago we would have said that it was coming on the wings of political wind. But metaphors do not matter, one is as good as the other. The chief thing is that rural credit will soon arrive. Those who do not care to see it keep saying: "It is all politics"—but that does not distress us. Everything that arrives in this country has to come through politics, and if you plan to achieve a reform in this country "out of politics," you had better forget it before you waste time on it.

The reason why we say that rural credit is coming fast is because the U. S. Senate last week passed a rural credit law containing practically the provisions which we outlined on page 362 of the Pacific Rural Press of March 18 last. It provides for organizations for rural credit under government supervision; for the creation of a federal loan board, as a bureau of the U. S. Treasury, which shall issue bonds upon the mortgages granted by the loan associations and for the deposit of government funds to help finance these mortgages, in connection with receipts from sale of the bonds. We shall not have, in time for this issue, the details of interest rates and of margins for covering operating expenses. The talk is of interest at not above 6 per cent, and margin of not more than 1 per cent between what the borrower pays and the lender receives. There has been much debate over such details; there will be more debate in the House and there will probably be need of settlement by joint-committee of the two legislative bodies so that the enactment may go forward for the president's signature before the national presidential conventions assemble. We can count on some speed because this is one of the things at which the administration party expects to point with pride. We do not care whether the automobile truck which brings this thing through is a donkey or an elephant, so long as it is safely landed—but there are others who do care a lot, and the ruling party will no doubt quite fully remind the country that in the Senate the only delay in the schedule of the rural credit law was because the elephant tried to pull back the donkey by the tail. The fact is that the only negative votes in the Senate were five, and they were Republican. But the discerning public will see that these votes were not chargeable to Republicanism, but to geographical finance, for the five votes all came from States cornering into Wall Street. In fact the majorities of both parties are working for rural credit legislation, and each trying to beat the other to it. It will not be a matter of counting most affirmative but fewest negative votes and the Democratic score now stands zero to five.

WHAT COMING PROVISIONS MAY DO.

THE measure which is making the political animals step so lively now is long-term or land-mortgage credit, with low interest and small amortizing payments. It still leaves short-time personal credit unprovided for. There is much complaint among farmers' representatives at Washington on this score, but all they can get, so far, from the national political financiers is the consolation that re-discounts can be secured, by proper organization, through the reserve banks. That kind of legislation may come later, but it will take a lot of fighting, and it will not have the self-starter, which is only rigged to act before election. Its speed after that will depend upon what the rural credit advocates are able to get into the national platforms this summer.

Those who are looking at this question of mortgage credits through the wide eyes of publicists, and not through the holes in their own pockets, will take chief interest in this apparently assured enactment and contribution by the national government, as much simplifying the problem of land settlement and advances to settlers to which California is being progressively committed. It may render it possible to advance the proposition of settling good men and women on good land, at a living cost, with only the expert efficiency and moral credit of the State, by using the national machinery to achieve the financial requirements. This will make public work for State development easier and remove the objections of those who opposed it on the claim that it was using public money for class advancement. But even

as originally proposed, with State credit, it was not class legislation, in the real meaning of the term. At its worst, the proposition was but half-class legislation, for the only rational objection to it, if there was any, was in the interest of the self-financed farmer against the assisted farmer. And there becomes mighty little of that when one remembers that it has always been the practice of fore-handed farmers to lend money to their neighbors needing more capital. The promotion of self-interest, by efforts to limit the number of producers, has never been fortunate, for a good man's share of general prosperity is probably always greater than the amount to be gained by exactions forcing adversity upon other people. Rural credit provisions are for the purpose of advancing general prosperity among the producers of the world's food, and that is a service to mankind. It is not a scheme for the sole benefit of any class.

WOMEN AS FARM LABORERS.

WE MUST acknowledge that we have never accomplished much by telling women what they ought to do. We have once in a while gained a point by persuasion, but we have a conviction that commands or references to their duty, as we see it, have never moved them much. Therefore, when we recently saw notice of a new book entitled "Women and the Land" and understood that its purpose was "to awaken women from their lethargy," and go "actually at work on the farm, in the dairy, and in the fields," we had to smile at the folly of the author of such a book. But, going farther along, we found that the author was a titled lady and that only made us more doubtful how the proletariat of untitled ladies for whom the exhortation was evidently intended, would take it. The argument seems to be condensed in these sentences:

For years French and Belgian women have lived so that they were able, at the first call of war, to take over the plow, the spade, and the barrow. They have milked the cows and seen to the pigs; and, what is more, they have thoroughly understood how best to market their home-grown produce. Why should not English women do the like? Why should not English women find in work on the land the best, the patriotic field for the exercise of their indubitable energy and skill?

We do not intend to dispute this woman's argument, for we do not know from observation how great the need may be, and yet we fear that she knows as little, from observation and experience, of the kind of work, which she so confidently prescribes for the lowly ones of her sex, as we do of the crying need for it. We would not interfere or endeavor to dissuade women from heavy farm work, if they feel called to it, any more than we would lay it upon them as a duty. But we have an ingrained hatred of the enlistment of women as common farm laborers. What we have seen of it on the continent of Europe does not lead us to desire it for England nor for any other civilized country. It has come about in Europe through two social conditions—both of them bad. One is the family tyranny of man, which is a hateful relic of barbarism. The other is the fancied need of governments for men soldiers, which has brought the world into its present distress—worse than any barbarism ever engendered. Must we humbly bow before these two bad social conditions, and try to base the civilization of the future upon men-tyrants and men-killers and women-slaves, growing of the men for killing and the women for breeding and working? This is the social order with some kinds of bugs; is this the ideal of civilization for mankind?

But we do not desire to pursue this matter at any length. Each one can con it over in his own mind and see whether he, as a man, thinks remanding women to common farm labor will make either for his nobility or his comfort, or for the quality of his offspring, upon which the future of mankind depends. As for women prescribing common farm labor for their own sex, we have really no right to speak—except to cite the fact that, in certain instances, at least, women's cruelty to women has been held to be incomparable. Beyond that, a titled lady's prescription of farm labor for the lowly of her own sex, taking them out of the cottages, which are their castles, to be besmirched with muck of byre and fen, is effrontery.

BUT WOMEN WANT FARM WORK.

WE ARE not discussing tastes or wishes, but only the dispositions of people to prescribe duties and obligations for others. If a woman wants a farm for the employment of her time and capital, or if she wishes to do farm work for others for her livelihood or for the joy she finds in it, both of these things come within her rights and privileges as a human being, and to curtail them is as wrong as to try to enforce them upon her as duties or obligations. We only ask for a woman the same rights of choice that a man has, but she should understand that she will have to do the same work as a man, and in the same way that a successful man does, if she expects to succeed. We are interested in a statement credited to Mrs. Pauline Barfield, superintendent of the woman's and girls' department of the government employment bureau in San Francisco, viz.: "With the coming of summer scores of gray-haired women, who have to toil the year round in city occupations, long to get into the open. We have recently been able to place many of them on ranches and at fruit-picking work, and despite their years they are happy to get outdoors."

We are glad that these dear old girls are getting more joy into their lives and doubtless they are often very welcome assistants to farm wives in their various tasks and are capable in fruit-cutting, etc., but that they can be farm-help in any considerable way is impossible. And yet, probably, on the basis of Mrs. Barfield's statement, we shall soon have some tender-hearted uplifter writing a book for the purpose of driving the forlorn out of city tenements into the country and calling upon the farmers to do their duty in making homes for such willing workers! We hope Mrs. Barfield may continue to do much good to individual employers and employes by joy-riding her proteges into the country, but she should remember that the service she can do to farming in that way is strictly limited, both in numbers and in opportunities for efficiency. We are happy, however, to recognize the farming ability of women who get next to their problems, as one woman shows on another page that she has done, in learning how to conserve the energy of young apple trees to the best uses of man.

Queries and Replies.

Is There Peat in California?

To the Editor: I desire to know if there are in the State of California any large bodies of peat and, if so, is any movement afoot to develop them? Where are these beds located? Are they owned by the State or privately? —J. H. J., San Luis Obispo.

It was held for some time that there is no true peat in California, though there was plenty of stuff on its way toward peat. We understand now that experts maintain the fact of occurrence of true, typical peat and they locate it under the tule islands of the deltas of the San Joaquin and Sacramento rivers, to which Stockton is the nearest large town. So far as we know, the amount of it and the availability of whatever there is, have never been determined. We believe that these tule islands are largely, if not completely, in private ownership—but of that the facts can be determined by inquiry of the State Surveyor General at Sacramento. We are not aware that the occurrence of peat elsewhere in the State has been determined.

Grasses for Golf and Grazing.

To the Editor: Can you recommend a book treating of all or most kinds of grasses? I want to procure a collection of seeds for experimental purposes to find out which is best for golf greens and fairways under varying conditions of soil and climate.—T. S., Brentwood.

Books on grasses written for humid climates will not help you to get a perennial sod on dry uplands in California because the turf grasses which they recommend will not live through the summer here except on naturally moist or irrigated land. The grasses which will maintain summer verdure with least irrigation and will make winter verdure with rainfall are English and Italian rye grasses; and they will afford pasture and be easily eradicated by plowing under if the land is needed for crops. The grass which makes turf without summer irrigation and even with moderate rainfall, is Bermuda grass, but Bermuda has two defects: it will become brown under frost and it is practically impossible to get it out of the land in our mild climate when it is once established. It is, however, good for grazing and to a less extent for hay.

Temporary Yellowing of Plum Leaves.

To the Editor: Our four-year Wickson plum trees come out yellow every spring. Later in the season they become green and seem quite healthy. We find no crown gall. Peach trees and Climax plums in the same soil are doing well.—H. C., Lafayette.

The partial yellowing of the leaves you send is not caused by aggressive disease, for no visible cause thereof can be detected. It is probably caused by some condition which induces temporary unthrift. This may exist in the aerial parts of the tree or in the root and is possibly analogous to sour-sapping in a mild form, which only interferes for a time with normal functions, which are able to re-assert themselves, as conditions improve, and restore thrift. Cause and treatment are conjectural. If it is due to unfavorable temperature attending very early growth, it may be beyond treatment. If it is due to too much cold water in the soil at that time, underdrainage may prevent it.

June Pruning Young Apple Trees.

[Written for Pacific Rural Press.]

To the Editor: Will you give instructions for pinching back Gravenstein apple trees which are now making their fourth year's growth. They now have 4 to 6 main branches and were headed back to the height of one's shoulder.—R. C., Yountville.

[Leave not over two new limbs per branch and these coming from the outer side in order to open the center of the tree. We reprint part of an article written by Miss Vida French of Sebastopol for Pacfic Rural Press May 29, 1915. Miss French is personally acquainted with the individual trees in her large apple orchard.

"In June, each tree in the young orchard should be gone over carefully and all side shoots, not desired as scaffold limbs, should be pinched back leaving a short stub with two or three buds. If these shoots are cut off close to the main limbs, as is commonly practiced, the bearing age of the tree is postponed from three to five years.

"If these shoots are allowed to grow all season and cut to stubs or entirely removed in the dormant period, it is a clear loss. All the strength and energy of the tree in producing them has been wasted; the remaining branches are smaller and weaker than they would have been if the tree had been able to concentrate upon a few limbs, and the stubs, so desirable for developing fruit spurs, will merely force their way into undesired branches again.

"Distributes Load.—In caring for a young tree, the first consideration is to produce a strong framework, capable of carrying heavy loads and yet at the same time distribute the load in advance by placing fruit spurs evenly all along the scaffold limbs. How often we see young trees carrying their crop at the ends of the branches, while the limbs bear nothing at their strongest point! Results from summer pruning should not be expected the first season, though some spurs will be formed. It takes one to three years to develop a fruit spur. The June pruning of the young tree is primarily to direct all energy into permanent framework. A later pruning about midsummer is necessary, if the pinched-back shoots have started a second growth. Thus all that remains for winter pruning is the heading back of the terminal growth."

NEW METHOD OF PEELING PEACHES.

[Written for Pacific Rural Press.]

Peeling peaches by hand is an expensive proposition. However, owing to the extra price received for peeled dried peaches, many growers are planning to handle their whole crop in this manner this year. They will find an easier and far less expensive method of peeling peaches as described by N. Vipoond of Newcastle.

By his method the peaches are left on the trees till perfectly ripe before picking. They are then picked, cut, laid on trays and sulphured in the usual manner. Immediately after removing the trays from the sulphur house the peaches are picked up, one at a time, and laid on another tray.

In picking up each piece, the fruit is slightly compressed in the fingers. This causes the skin to slip off. The trays are then set on the drying ground in the usual manner. On the second or third day, depending on how fast they are drying, they are loosened from the tray with a dull knife. In three more days they are ready to stack. A slight amount of juice is lost in moving the peaches from one tray to another but not enough to lessen the quality.

To insure success with this method the fruit, as mentioned before, must be perfectly ripe, otherwise the skin will not slip off and the trays must be perfectly clean or the peach will absorb the flavors of dirty wood.

Mr. Vipoond estimates that it costs him less than one-fourth cent per pound to peel his dried peaches by this method.

ALMONDS AT BANNING.

[Written for Pacific Rural Press.]

Figures on last year's almond crop are approximately totaled by the secretary of the Banning Almond Growers' Exchange, who gives the following approximate tonnage of the different varieties. It may be that 1915 was an off year on some varieties and the figures may not represent acreage accurately, but acreage figures are unavailable. The local Exchange marketed the last of their nuts in January through the California Almond Growers' Exchange. The secretary estimates that fully 90 per cent of the local growers are members of the co-operative organization and that not over three cars were shipped by outsiders. Of Ne Plus about 60 tons were shipped by the Exchange; of Nonpareil 44½ tons; I X L 36 tons; Drake 25 tons; Texas Prolific, mostly from younger orchards, 9½ tons; California Papershell 2 tons from older orchards but recommended by the State Exchange; Golden State, Jordan, Peerless, Languedoc, and hardshells the balance of 191 tons. Exchange shipments in 1914 were 106 tons; in 1913, 84 tons. The annual increase is due to greater age of trees and to the 15 new members in 1913, 30 new ones in 1914, and 9 in 1915.

Four tons of meats representing about 12 tons in the shell were marketed. These were just the nuts broken in the hullers, of which there are two at Banning.

W. W. Anderson, for eight years a commercial pruner in this vicinity, remarks that I X L's are losing favor here on account of shy bearing and the nuts being most subject to gumming. He estimates that 25 per cent of the I X L's last year were not good nuts.

The Ne Plus, according to Mr. Anderson, are the most consistent regular bearers, being heavy pollenizers and good for block planting. To use them to pollenize other varieties, however, would be risky as they are nearly through blooming here when the others are just opening.

Wheat acreage was increased around Porterville this year and a 325,000 bag crop is estimated in spite of warm dry weather.

The men who sold you your fruit trees say:

"Your trees must be planted *right* if they are to thrive. Make the holes deep and wide and break up the subsoil. The best way to do this is by blasting."

Nearly every Western nurseryman uses and recommends blasting for tree-planting. "We know the value of such work," say Fancher Creek Nurseries, California. "We favor blasting," says Oregon Nursery Co. "Blasting is important," says Puyallup Nursery, Washington.

Blast with

GIANT FARM POWDERS

STUMPING — AGRICULTURAL

—which do their work cheaper and *better* than ordinary dynamites. These improved explosives—made in two brands, Eureka Stumping Powder and Giant Stumping Powder—are prepared especially for Pacific Coast *farm* work. They pulverize the soil several feet deep and wide, and place it in the best condition to insure the rapid growth of trees and crops.

Be careful to get the genuine, made by the company which originated all "giant powders." If your dealer has only ordinary dynamites, write us and we will see that you are supplied with the *real* Giant Powders.

Get Some of These Five Free Farm Books

Get our valuable, illustrated books. They tell how to save money by using Giant Powders for Boulder Blasting, Stump Blasting and Ditching, how to grow bigger farm crops by blasting the subsoil and how to blast in new or old orchards. Mark in coupon the subjects that interest you, and the books will be sent free.

Cost of Walnuts and Limas Interplanted.

[Written for Pacific Rural Press.]

Lima beans interplanted with alnuts on 600 acres of the San Joauin Fruit Ranch in Orange county ay well in both crops and furnish eanstraw to mulch the 400 acres of ranges and lemons about once very three years at the rate of 5 to tons per acre. From 500 acres ast year 150 tons of Placentia Perection walnuts were sold, while the verage yield of Henderson's Bush imas per acre for a number of years as been 1200 pounds. These are old in the East for seed at 6 cents er pound, particular care being aken to keep the seed pure, accordng to Andrew Cock who has charge f the ranch and furnishes the data.

The walnuts, which were planted n 1907, are 60 feet apart. A dozen ows of beans 30 inches apart are lanted in each center.

Costs.—Plowing is usually done ry in the fall, 10 inches deep, with nules. It costs an average of $3.20 er acre. Pruning the trees in winer costs $2.34 per acre, requiring bout 140 days. Burning brush last vinter cost 38 cents per acre, after he stove wood was pruned out at a ost of $39.90 for the 600 acres, or .0665 per acre. Hauling the wood ff cost 20 cents and of course made valuable addition to the crop rofits.

Harrowing both ways costs 50 ents per acre; and each of the four ultivations during a season costs 2 cents. Furrowing for irrigation osts 42 cents each of two times, and rrigation costs $6 each run. Pickng costs 80 cents per hundredweight ($4.80 per acre last season). uring costs 40 cents per hundredweight or $2.40 per acre including sacks, which are used only to haul to he warehouse of the Cal. Walnut Growers' Ass'n. The same sacks do for four or five years. Bleaching at he warehouse costs 1 cent per pound or $6 per acre, and the Association selling expense is taken from the selling price.

The beans have been growing at he same time. It costs about $1.25 per acre to cut and pile them ready for the thresher. Threshing costs 25 cents per cwt. or $3 per acre, the sacks 10 cents each, or $1.20, and hauling to station $1 per ton or 60 cents per acre.

RASPBERRY RUST.

To the Editor: We sprayed our raspberries early in the season with Bordeaux for the rust, which came on the under sides of the leaves. Now the leaves are getting rusty on the upper sides. It starts on the leaves nearest the ground, and works upward.—F. G., Santa Clara.

[Bordeaux as late as possible before growth starts and then sulphur in some harmless form, about two applications at intervals of 10 days, will prevent the attack if thoroughly applied to the under sides of the leaves. Dry sulphur can be thus applied with a blower, or atomic sulphur can be sprayed safely. It is hard to cure this trouble. Affected leaves will probably drop and affected new wood growth will be weakened at least. But the sulphur spraying will check its spread even now. The rust seems more prominent on the upper surface in its early stages, even making eruption, but later it sends out its rustlike fruiting bodies from the under surface. The sulphur in wet spray is more finely divided and thus vaporizes more readily when warm weather comes, and it stays in place till then, unless severe rains wash it off. That on the under surfaces remains even then. It is the vaporization that kills the rust fungus.—Editors.]

YELLOWED VALENCIA TREES.

To the Editor: You may be interested in knowing of the results obtained from an application of lime used on my orange grove. It is on the red soil found along the foothills of Tulare county on the east side. The trees were five years old, and in several places in the grove were so yellow that you could hardly find a green leaf on the trees—many of the trees even shed their leaves. They set no crop and I thought they would have to be taken out. I tried an application of hydrated lime, and in ninety days, or less, there was a marked change. In six months you could not tell them from the other trees. Since that time the trees have done fine and I now have as fine a Valencia crop as you would care to see.

The soil at these places was at times very wet—remaining so for some time—and when we would get it dry it would bake so we could hardly break it up. Now it works as nice as any other part of the grove. **G. W. Trauger.**

Lindsay.

FIGS, RABBITS, HOGS.

To the Editor: I have been greatly troubled with rabbits barking and girdling fig trees on my Merced ranch. Have trees wrapped but the jacks reach up into the crotch and get in their dirty work. Will you outline some plan of poisoning? I have heard that arsenic in bran would do the work. How about it? Also, what is the best authority on hog raising on the Pacific coast?—G. G., Los Angeles.

[Rub your fig trees with any kind of rancid meat grease or fat. Rabbits won't hurt the trees while the odor is there. The best authority on Pacific Coast hog raising is, we believe, the California Hog Book, published by Pacific Rural Press for that reason. In it, hard and fast rules are avoided; but experience of widely scattered successful hogmen are related so that each reader can apply the suggestions to his own conditions.—Editors.]

EARLY IRRIGATION CAUSES GRAPES TO DROP.

To the Editor: Answering your request for our experience with early irrigation of grapes, we did not irrigate early, but we irrigated June 15 last year with good results. My opinion and experience with early irrigation is "not good." It causes the grapes to drop.

Kingsburg. **Nels Hanson.**

The State Water Commission has granted permission for C. A. Stribley, of Dixieland, Imperial county, to appropriate 30 miner's inches from Cariso creek to irrigate 60 acres.

Efficiency

VACATION LAND

What section of California holds forth such inducement to the vacationist as that traversed by the Northwestern Pacific R.R. Anglers will find the finest fishing; sportsmen an abundance of furred or feathered game; swimmers and bathers have a wide choice of ocean, river and bay; lovers of wild, primitive spots will find miles of great redwood and other forests; rugged mountains and elevations will appeal to trampers; cozy camping locations will entice the family; this wondrous collection of nature begins at Sausalito and extends to the world-old forests of Humboldt county.

A very interesting description of this territory is found in the booklet — Vacation—1915, free copies of which may be obtained at 874 Market Street, San Francisco, or on application to J. J. Geary, G. P. A., 808 Phelan Bldg., San Francisco.

Handling Grain in Sacks is Wasteful.

(Continued from page 585.)

cheaper than they can buy sacks for one good crop. Ocean boats are not ready; but only 28 per cent of our crop is exported and there is far less danger now than previously. Two bulk shipments were made to Europe last year. The results showed that there will be no trouble in arranging safe transportation. River barges are not as a rule equipped for bulk grain; but many of them are, and the rest could be fixed quickly.

Objections Not Serious. — Objection was made to bulk handling that it would be hard to keep separate the various grades and the different quality grown in each section. That this is simply a matter of adjustment is implied in the fact that California, Oregon, and Washington are practically the only section in the world handling grain principally in sacks. It is believed that bin arrangements will be made so far as necessary and the committee expects to ask the Port Costa warehouse to put in a small elevator so that the transition from sacked to bulk grain may be made gradually and without any very expensive mistakes.

Grading in Sacks Unsatisfactory.— Sampling of sacked grain is not only wasteful, but very unsatisfactory on account of variation of dirt, weeds, straw, etc., in various sacks. A few weedy patches in the harvest field may reduce unjustly the grade of a large proportion of the crop, and with no one to be justly blamed. Bulk grain is very easily and satisfactorily sampled for sale.

Elevators on Roads or Railways.— Owing to much of our grain-hauling to market being done at the muddy time of year, one man said that farm elevators would not only prevent the marketing all winter but would prevent the borrowing of any money on a crop thus interned. It was pointed out that the increase of electric lines and good roads and motor trucks would enable any farmer or group of them to build an elevator at a railroad, a good highway, or a river landing. Here the grain would naturally be insured; and any insured grain would be good collateral for bank loans. Mr. Jennings borrowed as much last year on his bulk grain in elevator on railroad as he did the year before on sacked grain, though ordinarily he wouldn't figure on quite so much.

Now What of a System?—F. F. Lyons, the San Joaquin farm adviser whose suggestion was probably the starting point of the present agitation, emphasizes that from the start, the country elevators be kept under control of the producers. Many farmers are asking what kind of a cinch the mill men would have on them if they put their grain in mill-owned elevators. One suggestion at the meeting was that growers, mill owners, transportation men, and warehousemen must combine to make bulk handling possible. This looked so formidable that the final sense of the meeting was that it is strictly up to the farmers to put in their country elevators. Then all the other factors will come to it. Meanwhile much good development work is being done by the mills and this is in no way harmful if they do not obtain a monopoly as was done in the Middle West. The Canadian government has fostered the building of terminal elevators to receive the supply from farmers' co-operative elevators in the interior. Co-operative elevators are common in the grain states of the East.

IMPEACHING THE APPLE.

The sovereignty of the apple in northern markets is being impeached by southern fruits. In the course of an article on the orchardists' future written for the apple growers of the country, Prof. S. A. Beach of Iowa says this, in the Fruit Grower of St. Joseph, Mo.:

"Another important factor in the situation is the way in which other fruits, especially sub-tropical fruits, are competing with the apple. Not only the markets of the large cities, but also those of the smaller cities and towns are continually filled with fresh fruits. This means that they are being supplied to the consumer in many cases in place of the apple. Peaches are in the market from early summer until late fall. Small fruits, grapes, cherries and plums are also in good supply for a considerable period of time. But perhaps more important still is the competition which comes from the banana, orange, grapefruit and other citrus fruits. The banana trade, which a few years ago was insignificant, is now reported to have a value of over $15,000,000 annually. The citrus growers' organizations have pushed the sale of oranges and grapefruit until it is reported that the annual consumption of citrus fruits in this country is now over 100,000 carloads per annum. All of these fruits are also competing more and more strongly with the apple in foreign markets.

WINTER-GROWING TOMATOES.

To the Editor: Apropos to your timely editorial on shipments of tomatoes and celery from Florida, it may be of interest to know that a few days ago I was shown a three-year-old tomato plant, still producing fruit, in the vicinity of Porterville, Tulare Co. At another place a one-year-old plant with plenty of ripe tomatoes. At the ranch of John Linden a plat of banana plants produced last season 25 of the most perfect bunches of bananas I have ever seen grown in California. With many cozy nooks along the foothill belt bordering the great valley of California where tomato and banana plants survive the winters without protection, it seems hardly necessary to depend on Florida for early tomatoes. G. P. Rixford.

1813 Pierce St., S. F.

SULPHUR RED SPIDER.

To the Editor: How and in what proportion should I mix lime and sulphur to spray almonds for red spider?—A. G. Z., Esparto.

[Do not use lime, but spray pure dry sulphur, using a mechanical blower as soon as the first spiders appear and as needed thereafter, or dilute commercial soluble sulphur paste with water. Do not let them get ahead of you.—Editors.]

System in Alfalfa Harvesting.

[Written for Pacific Rural Press.]

Heavy alfalfa yield of prime quality on Woodward Bros.' ranch in Perris Valley is largely due to their system of harvesting. They get "long hay," perhaps a bit too coarse for cows, but fine for horses and for heavy tonnage. It is cut as soon as sprouts come out of the crowns. This, taken with a darkening of color from the light green of thriftily growing alfalfa, indicates maturity and maximum tonnage combined with maximum tenderness and le ess.

According to C. W. Woodward, if alfalfa were irrigated only once per cutting, it wouldn't send up the new sprouts in time and he would have to depend on the blossoms and would lose growing time. He irrigates twice per cutting after alfalfa is three or four years old. When it is younger, it often gets five or six irrigations per cutting. The second irrigation of the older alfalfa comes two weeks before cutting, so the ground is not wet for the hay, but is still moist on account of the shade.

The 80 acres all slopes gently in one direction with 40 half-mile checks 33 feet wide. About two of these are cut each afternoon as close as possible to the ground, perhaps 1 or 2½ inches. By the time all the checks have been cut, the first are ready again. Irrigation follows removal of the hay. The small quantity of hay cut per day permits continuous irrigation night and day, and keeps three men and a boy busy all season harvesting and baling it.

Hay lying flat and fresh cut will stand considerable moisture without damage. Mr. Woodward points to a two weeks' drizzle on some hay lying flat last year. The hay was hauled as soon as it was dry enough, and was nice and green last winter. If it had been in the shocks, wet, and turned over to dry it would have turned black and spoiled, says he. Alfalfa heats right away when wet in shocks.

As there is a heavy dew on most nights in Perris Valley, it should appear on fresh-mown flat alfalfa rather than on cured and shocked hay. This is one reason for afternoon mowing. Another is that the afternoons are too hot to cure hay. It dries outside while still too moist inside to keep. If dried enough, the leaves would fall and the stems crack to pieces. The slower drying of the morning is preferred. If hay were shocked afternoons and became damp with dew, the outside of the shock would be discolored by next day's sun before hauling and the crade lowered.

Discolored Hay Separate.—Many people do not re-rake the wisps of hay which fall back onto the field in hauling. These remain to discolor and mix with the next cutting. But in the Woodward ranch every check is re-raked, leaving only the finest stuff which the rake does not pick up and which forms a needed mulch till growth shades the ground again. All of these "rakin's," bleached and broken hay are kept separate, to avoid lowering the grade of the rest. The good hay is baled first each afternoon, so if any is left it will be the poorest grade. The good baled hay is piled onto the poor bales to protect it from the ground. Reraking also prevents the bunches of hay from smothering small patches of alfalfa; and it loosens the top soil to a certain extent.

SORGHUMS ON HEAVY LAND.

To the Editor: I have 30 acres too wet to plow for grain. It is somewhat heavy, and the watertable lies within 15 inches of the surface. It was pastured last year because it was too wet for grain. Would Egyptan corn do well if planted as the ground dries out, and would it be the same as summer fallow?—H. R. C., Woodland.

[Answered by Prof. B. A. Madsen, University Farm, Davis.]

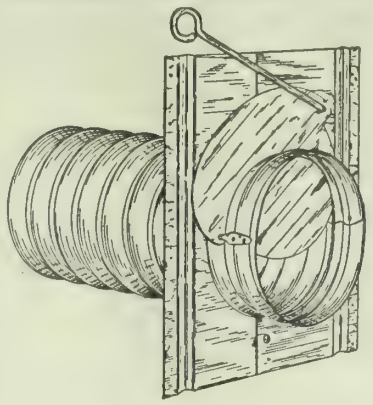
All forms of the grain sorghums do very well in the Sacramento Valley, and there is no reason why a good crop should not be obtained on the land in question. On soil that is heavy and where the water table is near the surface, it is usually not so advisable to seed as early as in sections where the soil is of good physical condition and moisture conservation of greater importance.

In preparing land for Egyptian corn it should be plowed as early in the spring as conditions will permit, and worked down into a good even seed bed. In growing crops of this character, a thorough preparation of the seed bed is of utmost importance, as the greatest difficulty with crops of this character is securing a good stand. Egyptian corn should then be planted about the middle to the latter part of April, drilling in rows three and a half feet apart, using approximately nine pounds of seed per acre. Throughout the growing season it is handled in the same manner as any other corn crop. On heavy soils thorough cultivation during the earlier stages of the growth is usually necessary to prevent the soil from baking and packing around the young plants, as well as to check evaporation. However, where the water table is near the surface this latter factor may not be of importance.

In the Woodland section it would be better to use Dwarf Milo than any of the other Durra types, as it is more prolific and seems to be better adapted to conditions in this valley.

HOW TO SECURE PRISON BAGS.

To the Editor: Will you please tell me if the State Prison at San Quentin sells grain bags direct to the farmer, and if not how are they put on the market? If they are sold to the farmers, how should I write for price and terms?—Subscriber, West Sacramento.



[Answered by J. A. Johnston, Warden, California State Prison, San Quentin.]

[San Quentin bags are not sold in the open market, but are sold direct to consumers, and in each case we require an affidavit that the bags are for their own personal use. Copy of the affidavit form I inclose for your information. Purchasers file orders like these forms with the warden. I am obliged to say, however, that it would be useless to send any more order blanks out at this time as the full capacity of our mill for the remainder of this year has already been sold.]

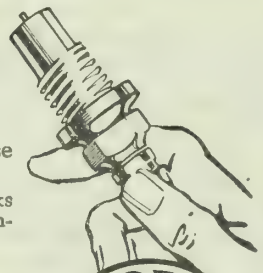
[Copies of affidavit to which Warden Johnston alludes may be secured by writing him at San Quentin.—Eds.]

Alfalfa Growers

If you are using clumsy, leaky and undependable gates in your irrigation work, **GET RID OF THEM.** Every one installed means just that much more loss to you in water and money, as well as much added and needless labor in transporting and operating them. At best, they are only temporary. **REPLACE THEM** with

4-C IRRIGATION GATES

Made from Rust Resisting
"ARMCO IRON"
99.84 Per Cent Pure



Built for service. Simple and easy to operate. Water-tight for all practical purposes. Above all, free from repair or maintenance cost, and on the job season after season. Easy to transport from one place to another.

It is to your interest to know more about these gates. **DROP US A LINE TODAY.**

1916 SMYRNA FIGS

Mr. Grower, how many will your trees produce this season? They have brought as high as ten cents per pound in the sweat-box on account of the war interfering with importations. You have done your pruning, plowing, irrigating and cultivating, but this expense will be wasted, unless you secure a sufficient supply of **PROFICHI FIGS** of the right varieties. The Mamme crop was short this season and the **PROFICHI** crop will be short as a consequence. I have a larger Capri orchard than my Smyrna trees require and will have a surplus of **PROFICHI FIGS** for sale. After spending your time and labor to secure a crop, can you afford to lose a $200 a ton crop by neglecting to secure the necessary **PROFICHI FIGS?** Limited quantity, June delivery, for sale. Order now.

THOMAS H. LYNCH, BOX 21, R. R. 8, FRESNO.

Mechanical Power on the Farm.

FITS ENGINE ONTO BICYCLE.

[Written for Pacific Rural Press.]

Thirty miles an hour on a bicycle is accomplished by Alfred Hennings, the youthful son of a poultryman near San Gabriel. He bought a new bicycle and fitted a light 2-cycle valveless engine into its frame. Since gasoline costs too much, he put on a new Bosch magneto in order to burn distillate. The total cost was $110 including an electric headlight. He now has a "cyclometer" which can be quickly dismantled to use as an ordinary bicycle. The engine burns a mixture of distillate and lubricating oil. When the distillate has vaporized, the oil remains for lubrication. The engine is started by running the bicycle a few feet.

BALES HAY ON DAIRY RANCH.

[Written for Pacific Rural Press.]

Twenty-five to 30 tons of hay is baled per 10-hour day by C. H. Snell of Ontario with an I. H. C. baler, a 6 or 8 h. p. engine, and six men. The men cost $50 a month or $35 and board, making the labor cost about $.40 to $.48 per ton average. This is offset considerably by the labor saved in handling, hauling, and storage. There is also a smaller investment in storage room or else smaller loss of hay and quality from weathering.

The baling is done, even though the hay is practically all fed to cows on the ranch. Two men pitch off the stack or run buck rakes as the case may be, one man feeds the machine, one punches wires, one ties wires, and one handles the bales.

GASOLINE WILL BE CHEAPER.

"There are today two and a quarter million automobiles. Figuring conservatively, estimated 25 horsepower each, we have 60,000,000 horsepower. The combined horsepower of all the steam motives in America is less than 50 per cent of that," says Dr. Rittman, in whose work with gasoline the government has become interested.

"We do not ordinarily realize that you figure 500 gallons gasoline per machine per annum. There is considerably more than a billion gallons right there. Then, our rough estimate is that for other purposes, including export, we use 50 per cent as much as we do for the internal combustion engines.

"Now, then, a plant that would turn out a thousand barrels of gasoline a day, would make just enough to take care of 20,000 automobiles, which is only five days' supply—a big plant, so it seems. But merely to make up the deficit in gasoline production which has occurred since last July in Oklahoma field alone, we will have to build fifty such plants and we are going to be some time catching up with it.

"No two crude oils are the same. Two wells in the same oil field are different, and one will contain more gasoline than the other. The average gasoline content of petroleums in America is below 12 per cent. By breaking processes we can bring that up to 60 per cent; in other words, five times what it was.

The average gasoline contained in California oils for about a 100,000,000 gallons produced per annum, is about 2½ per cent. But we can produce gasoline from these oils by the 'cracking process.'

"This very day there are 300,000 automobiles in the country that run on 'cracked gasoline'—gasoline made from other materials, such as kerosene, gas oil, etc.

"Now, how much gasoline can we hope to get by this method? On those Eastern crudes from which we are now getting 25 per cent as gasoline, we should get 70 per cent to 80 per cent of the crude oil. So you see, we can hope to solve this gasoline problem by various 'cracking processes.'

"I say that 'synthetic' gasoline will catch up with the demand in the next six months. You can look for higher prices before lower prices, but in the course of a year or so, most certainly we will have an available supply of gasoline. We will catch up with the demand."

LITTLE ENGINE SUPPLIES WATER FOR SANITARY DAIRY.

[Written for Pacific Rural Press.]

To cool milk which is sent to Los Angeles on motor trucks by E. Hertrich of Pomona, as well as his neighbors, Mr. Hertrich has a simple cooler. It is a set of nine horizontal tubes through which fresh water is pumped while the milk flows over them from a tank through a hopper as wide as the pipes are long. A 2½ h.p. Fuller and Johnson engine pumps the water from 30 feet below the surface of the ground into a 2000-gallon tank 15 feet off the ground. Water from the tank is also used for the stock, to clean out the cement-floored cowbarn, to irrigate the garden, and to supply the family.

STANDARD PUMPING PLANT GUARANTEES.

[Written for Pacific Rural Press.]

In Arizona, farmers buying pumps have had difficulty getting satisfactory guarantees of efficiency. One such bought a pump outfit on an impossible guarantee. He asked the University of Arizona to test it; and with proof of faithlessness, he has successfully refused to pay the $500 balance.

READ-MAIZER CO.

Baled Hay at Lowest Cost

THE price of hay, and the profit in it for the grower, depends upon the condition in which the hay is marketed. Hay of the same quality, in tight, smooth bales, brings a higher price than when shipped in loose, ragged bales.

International Hay Presses, with their powerful toggle-joint plungers, produce tight, solid bales. The roller tucker makes the bales smooth. The bale chamber tension produces bales of uniform size. The presses work fast, the different sizes and styles baling from 6 to 35 tons per day.

The line consists of one and two-horse presses, motor presses, belted jack presses and fast power presses. The one-horse press is made in 14 x 18 size only—all others in 14 x 18, 16 x 18, and 17 x 22 sizes, the accepted standard. The capacities vary from a small horse power press for the man who wishes to bale a little hay, to the largest, fastest custom power presses ever required.

An attractive mailing folder, in colors, shows **International Hay Presses** as they are, and gives complete specifications. Write for it.

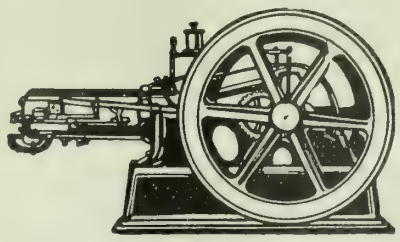
The University has been circulating a letter asking manufacturers to adopt a standard form of guarantee specifying that the fuel consumption shall not exceed a certain amount when the plant is delivering a certain amount of water lifted a certain number of feet.

A dozen dealers, including the De Laval Dairy Supply Co. and Smith-Booth-Usher of Los Angeles, replied favoring the standard guarantee and expressing willingness to use it.

GRINDS STRAW AND HAY.

[Written for Pacific Rural Press.]

An alfalfa meal mill and its 100 h.p. motor were mounted, some years ago, on a freight car by the Patterson Ranch Co. of Oxnard, so the mill could be operated at several places connected by railroad. Manager J. Ruopp writes that "in addition to the saving we have made in feeding dairy and beef cattle with various ground feeds, we have saved about $1.25 per head per month, or about $5,000 a year, on the feed of our 300 to 500 head of work stock."



They grind lima bean straw, alfalfa, oat, and barley hay. This is mixed when ground, with beet sugar residue molasses vaporized by steam. Better grades of meal containing grain hay and more molasses have been used as part rations for the horses, while the poorer grades have been successfully fed as part of the ration to hundreds of fattening beef cattle. It is figured that all digestible nutrients are in this way digested, while much would be wasted when fed as whole straw, vines, or hay. The cheap straw with cheap molasses, thus takes the place of more expensive roughage.

Their difficulty lay in the necessity of getting too large a mill. They cannot keep it busy grinding feed for their own stock. A smaller one, however, would not take the flakes of baled hay or straw without loosening them up. Anyhow it is not necessary to run the mill all the time.

CURED MISFIRE OF ENGINE.

To the Editor: I notice in your issue of April 8, A Subscriber, Denair, has some trouble with his engine missing fire. I had the same trouble with mine, a Western 12 h.p. I thought it was weak batteries, and got new ones; then I blamed the points. Then I got an expert but he failed to locate the trouble, and I got another; he found the lower valves were somewhat dirty. That was the trouble. When an engine begins to miss fire it leaves a deposit of soot on the lower valve and the engine loses some of its compression. The fuel is then not properly vaporized and consequently misses fire. I could run my engine by using about four times as much fuel, but it gave lots of black smoke. I think dirty valves his trouble.

General Agricultural Review.

GRAINS AND FIELD CROPS.

Oakdale pea crop is reported unusually good.

Cotton for bean bags is being proposed in Orange county.

San Lucas grain is turning for the harvest. So it is around Tracy.

Beldi barley seems to thrive in the experimental plots near Porterville.

A 1200 acre job of rice planting was completed near Richvale in early May.

Stanislaus farmers are using sulphur fertilizers for alfalfa under direction of the Farm Bureau.

Practically no grain hay will be cut around Wheatland, but most of the grain hay in the hills bordering western San Joaquin county is cut and shows a good crop.

Seed potatoes are to be grown extensively in Modoc county by W. V. Shear of U. S. Dept. Agr. and Frank McArthur.

Rice freight rates from California to Colorado, Utah, and Wyoming, have been reduced from 60 cents per cental to 50 cents.

A heavy north wind in Butte county last week blew down a lot of grain. Late sown grain is not much good in Pajaro valley.

The Orland Alfalfa Mill will grind second crop hay, offering growers $7 per ton loose at the mill. They expect to handle 500 tons or more.

A decrease of 20 per cent U. S. winter wheat acreage and a harvest of ⅛ less than last year is estimated by the U. S. Chamber of Commerce.

Twenty boys in Douglas county, Nev., are raising what they hope will be a carload of potatoes. Work is under supervision of State University.

Kings county grain is reported in excellent condition; 190,000 acres were sown, 10,000 of which were lost by Tulare lake floods. They are looking for 25 sacks per acre.

The last Delta shipments of asparagus to the East were made last week. Prices averaged over $2000 per carload. One car sold at $2485. From Oakley 100 carloads were shipped.

The crying need of nitrogen for grain on worn out land is being demonstrated on Roberts Island near Stockton in about 30 plots on which various fertilizers are separated by unfertilized strips.

Express shipments from Los Molinos last summer were 2500 crates cantaloupes, 2500 crates tomatoes and 2500 of sweet corn, string beans, sweet peppers, cucumbers, radishes, lettuce, onions and eggplant. These are from small farms.

Grain between Sacramento and Wheatland looks bad. It is considerably better north of Marysville and is fine around Tracy, San Joaquin county. In Yolo county, rain knocked down a little, but damage is exceeded by benefit.

The rice acreage this year will be the heaviest ever planted in this State, estimates by Geo. Harvey of the California Rice Growers' Association, being right around 100,000 acres. This is three times as large as last year's acreage. Planting has been done ten days to two weeks earlier this year than last on account of the favorable weather for planting. Unless early fall rains interfere, the growers expect large yields. Mr. Harvey estimates a two and a half million sack crop for the State this year. Last year's crop has been taken out of the growers' hands at good prices, about seven cars a day being shipped from Butte county to Lake Charles, Louisiana, whence it it is re-shipped to Argentina.

CITRUS AND SEMITROPICAL.

Southern navels are still plentiful.

Imperial county inspects imports of citrus fruits, to prevent infestation.

Two carloads of citrus trees have been shipped by the San Dimas nurseries to South Africa.

Florida grapefruit has been of poorer quality than usual. The California crop looks fine.

Valencia shipments have been so heavy that the market reacted a bit. This is said to be partly due to immaturity of the early Valencia shipments.

Tulare county estimates its Valencia crop at 1200 carloads. None have yet sold at less than $1.25 net to the grower, while $1.40 is about the average.

In the exhibit of avocado trees and nursery stock at the recent convention of the Califoria Avocado Ass'n, the gold medal was awarded to the Hart and Barber Avocado Company for the best display. The awards were made by the Association's committee on classification and resistration headed by Dr. H. J. Webber, director of the State University's citrus experiment station at Riverside.

DECIDUOUS FRUITS.

About 30,000 strawberry plants were brought into Imperial county in April.

Reports from Southern California indicate a very short cling peach crop.

The first carload of cherries out of Placer county went forward May 2 by express.

Thirty boxes of apples from Washington were sold in Imperial county in April.

William Pierce of Suisun sold his cherry crop on the trees to the Earl Fruit Co. for $18,000.

Suisun is boosting for a dried peach packing plant to be located there by the California Peach Growers.

The Hemet Canning Co. is contracting apricots at $40, cling peaches at $25, and freestone at $20. Apricot crop light.

The Evening Pajaronian is putting forth a strong plea for support of the Watsonville Apple Distributors by the minority still outside.

Washington cherries, peaches, and apricots were badly injured in low orchards by a frost late in April. Pears and apples seemed uninjured.

Offers of $20 per ton for Lovells and Orange clings and $25 for Phillips are being made in the Selma district by cannery representatives.

Cherries in Yucaipa Valley ripened early this month. Automobile parties come there, as to the Beaumont orchards, to pick the fruit for themselves.

The Shanahan fruit ranch in Shasta county, consisting of 140 acres of prunes and 10 of other fruits besides 148 in other crops, recently sold for $40,000.

April imports of deciduous trees to Imperial county were 14 pears, 277 peaches, and a few miscellaneous. It was rather warm planting time there.

E. H. Erickson of Brawley, shipped the first apricots April 28 to Los Angeles. They were of the Newcastle variety and crates weighing 25 pounds brought Mr. Erickson $4.00

A report from Ukiah states that there is a considerable showing of scab on the young fruit in the pear orchards; in some cases it has even attacked the young and immature blossom stems.

Two hundred prune growers in the

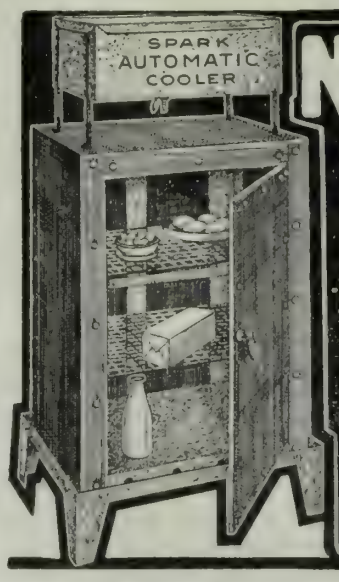
California Fruits and How to Grow Them

EDWARD J. WICKSON.
Seventh Edition, Extended and Revised.



Contains over 500 pages of text with many illustrations. Goes thoroughly into every phase of that immense industry, California Fruit Growing.

In the preliminary chapters, the important subjects of Climate and Soils are handled in a masterly manner, with the necessary modifications called for by the immense latitude, the topography of the country and the different regions with their relation to coast, valley and mountain.

The book then goes into the subject of Fruit-Growing from the nursery, on through budding and grafting, preparation for planting; planting, pruning the trees and thinning fruit; cultivation, fertilization and irrigaton right along to picking, canning and preserving, with chapters on injurous insects, tree diseases and the protection of the trees therefrom. Every fruit and nut which can be grown commercially in California or countries possessing a similar climate, has received the attention which the forty years' experience of the author makes of incomparable value to the fruit grower.

Price, $3.00, Postpaid.

CALIFORNIA HOG BOOK

Every hog-breeder in the State should have a copy of this book handy to refer to in cases of emergency. Every day the practical side of the book will help you. The author, W. S. Guilford, is a swine breeder, and he tells just what you want to know when a difficulty presents itself. The book contains 256 pages of text, besides many full-plate illustrations. Tells how the successful breeders feed and handle their hogs.

PRICE, $2.00 POSTPAID.

PACIFIC RURAL PRESS, Publishers

Salem district (Ore.) with a combined acreage of 1500 have pooled their fruit. About 1000 acres are outside The acreage is 10 per cent more than last season.

The Bogue Farmers' Protective League endorsed the new Peach Ass'n after hearing its purposes and system explained at a meeting April 21, writes Sec'y B. M. Coe. Forty members signed up.

Shasta County Horticultural Commissioner Lamiman reports that the prune crop of Anderson Valley will be only 60 per cent of normal. Peaches will be only half a crop. Pears will be a quarter of a crop.

Growers of 7,000 tons of canning peaches in Tulare county have organized the Tulare County Canning Peach Growers' Association. They have fixed a minimum price of $35 for Tuscans, $32.50 for Phillips, $30 for Orange, $25 for Lovells, and $22.50 for Muirs.

The Tulare County Growers' Cannery may be run this season. It is said that the buyers of the crop want to ship it to the Ontario cannery, at a cost of $8000 freight and ice, whereas $8000 would put the local cannery in first-class shape and provide local employment.

According to Carl Ley, horticultural commissioner of Glenn county there have been about 3,000 acres of fruit trees planted in that county the past season. Almonds, prunes, pears, oranges and lemons comprised the principal varieties planted. Prospects for almonds and prunes seem very good.

Final action by the State Central Committee of the Prune and Apricot Growers' Information Bureau was taken May 8 on the forms of voting trust and subscription agreements and crop contracts according to Secretary G. E. Merrill. A promotion committee of nine, including one of the members of the State Central Committee will be appointed to supervise the canvass.

At a meeting held in Gridley, Butte county, Saturday, May 6th, the permanent organization of the Feather River Growers' Association was completed. The Association which covers a territory extending from Chico, Butte County, to Tudor, Sutter County, is the sixth local Association to become affiliated with the California Growers' Association.

PEACH GROWERS OPERATING.

The million dollar California Peach Growers was officially announced in operation May 1. The officers are: William Glass, president; J. F. Niswander, vice-president; A. E. Sunderland, secretary; Directors Chris Jorgensen; John C. Rorden, Selma; F. H. Wilson, Dinuba; W. J. Wilson, Hanford; Warren H. Woods, Suisun.

The canvass for subscriptions up to $1,000,000 and for dried peach crop contracts will be continued vigorously. The offices in Fresno will be moved to the Holland Building about June 1. The Sacramento Valley is coming in strong with subscriptions.

MISCELLANEOUS.

President Wilson has restored to entry 148,000 acres in the Salinas valley oil reserve.

Contracts have been let for part of the work on the Anderson-Cottonwood Irrigation system.

Warm land with hardpan west of Dixon is being suggested for rice by the Dixon Tribune, provided water can be obtained from Putah canyon.

The State Fish and Game Commissioner suggests an English-sparrow-killing week, because the pest drives out insectivorous and song birds.

Smudging Butte county olives saved 40 to 80 per cent of the crop, while a practical total loss of fruit was reported by horticultural commissioner Earle Mills where smudging was not practiced.

All export records were broken by U. S. in March, which were valued $410,000,000 which is double the March average for the past five years.

Pole lima beans are being advocated for city backyards by the Santa Barbara Daily News on account of their nutritious quality and fast growing.

Alfalfa seems scarce in Alexander Valley, Sonoma county, where one farmer sold 100 tons to 75 farmers who drove over for it and loaded it themselves.

Shasta County Sealer of Weights and Measures Frank Erwin reports that 65 per cent of the scales examined in the county were out of order. Four-fifths of these were weighing in favor of the dealer.

Oakdale rice growers are planning a nine-foot dam to impound the drainage water from their fields, to be pumped back onto the rice if the regular irrigation water gives out. Two million gallons may thus be conserved.

State Supt. of Public Instruction Edward Hyatt is passing on an appeal from the U. S. Dept. of Commerce that people save the 15,000 tons of paper made in U. S. every day, as the sources of supply are becoming exhausted. Old paper and rags may be used again.

Prof. Elmore Chase of Fair Oaks advises spraying almond nursery trees thoroughly with Bordeaux before heeling them in, as it has been found that they are attacked by the lemon gum disease.

LATE FROST DAMAGES GRAPES.

[Written for Pacific Rural Press.]

One of the severest late frosts on record visited the Sacramento and other valleys of the coast last Saturday night. Grapes were the severest sufferers, the State Viticultural Commissioner having estimated a $5,000,000 loss. The Sacramento Weather Bureau estimated 40 to 50 per cent grape damage in the Sacramento, Napa and American River Valleys. Sonoma county was hard hit. Santa Clara had damaging wind May 5th and frost Saturday night. The latter hurt only the vegetables and a few grapes. The northern half of San Joaquin county suffered severely, but the report of heavy damage to potatoes does not seem to be confirmed. Practically all tree fruits were uninjured. Tender vegetables suffered even in Tulare county.

Dairy Score Card Changed.

[Written for Pacific Rural Press.]

The new dairy score card, printed herewith and which will be used by the State Dairy Bureau after October 1, is distinctly different in many respects from the one now in use.

It will be used only in those dairies whose products are sold under approved inspection departments whch may or may not be provided by cities or counties or both. The State Dairy Bureau is trying to have the objectionable features removed by the U. S. Dept. Agr., making special provisions on the score card for California.

Under the old card a dairy was scored on a basis of 50 per cent for equipment and 50 per cent for five with the old. Utensils and milking 17 per cent under the new and 12½ under the old. Handling of milk 16 per cent under the new and 10½ under the old.

The chief objection to the new score card is that it was made by the U. S. Dept. of Agriculture to apply to eastern conditions, and as a result is impracticable in certain respects in California.

For instance it will be noted that bedding is allowed one point, fresh air controllable flue system three points, four square feet of glass per cow four points, 500 cubic feet per cow three points. In a large majority of California dairies these provisions seem, in a measure, absurd.

Under "methods" the most radical changes are in the percentages allowed for cooling, storing, and transporting, the new card allowing more points for these than the old.

DAIRY SCORE CARD TO BE USED UNDER NEW LAW.

EQUIPMENT. Cows:	SCORE. Perfect.
Health	6
Apparently in good health	1
If tested with tuberculin within a year, and no tuberculosis is found, or if tested within six months and all reacting animals removed	5

EQUIPMENT .....METHODS ....FINAL SCORE

NOTE 1.—If any exceptionally filthy condition is found, particularly dirty utensils, the total score may be further limited.

NOTE 2.—If the water is exposed to dangerous contamination, or there is evidence of the presence of a dangerous disease in animals or attendants, the score shall be O.

methods. Under the new system 40 per cent will be allowed on equipment and 60 per cent on methods.

In comparison of the main points the percentage allowed under "equipment" for health is six per cent in each case. Food under the new ruling is allowed one per cent, under the old two per cent. Water under the new one per cent, under the old four per cent. Stables under the new 18 per cent, under the old 16½ per cent. Utensils nine per cent under the new and eight per cent under the old. Milk room five under the new and 13½ under the old.

Under "methods," eight per cent is allowed for cleanliness under the new and five under the old. Stables under the new 16 per cent, and 17 per cent under the old. Milk room three per cent under the new and

The annual losses of livestock on the National Forest ranges of the West due to predatory animals are over $500,000. An organized campaign is now going on to exterminate these animals. Wolves are responsible for about 70 per cent of the cattle losses, while bears cause most of the remainder. Approximately 75 per cent of the sheep losses are due to coyotes, 20 per cent to bears, and 5 per cent to lynxes and wild cats. Mountain lions are charged with killing only a few head of cattle and sheep.

GRANDSONS OF TILLY ALCARTRA

At Prices within Reach of Every Breeder and Dairyman.

A Grandson of Tilly Alcartra.

We have several splendid grandsons of this now famous cow, which we can deliver to you at prices which will suit the pocketbooks of every dairyman wishing to improve the quality of his herd, whether it be a grade or pure-bred herd. These bulls are sired by our herd bull, Prince Alcartra Korndyke and out of A. R. O. cows, and are the only living grandsons of a cow having a record of over 30,000 pounds of milk in a year. Such an opportunity for increasing production has never been offered DAIRYMEN AND BREEDERS in California, price and quality considered. Buy one of these bulls and solve your low production problem. AUCTION SALE

300 Cows and Heifers

On the WM. COLLIER Ranch on the State Highway, 1 mile north of Livingston or 8 miles south of Turlock.

WEDNESDAY, MAY 17.

At 9:30 a. m. (Rain or Shine).

This is one of the finest Dairy Herds in the San Joaquin Valley, and consists principally of Holsteins, with a few Durhams; all young and in fine condition; most all have 1st, 2nd, or 3rd calves. They are heavy producers, many going from 80 to 100 lbs. of milk per day. The owners invite inspection before sale. 200 Cows milking at present time. 100 Heifers, many springers, and lots of Calves. Owing to the large number of Cows to be sold, the Sale will commence promptly at 9:30 a. m.

The Bulls at the head of this herd are registered Holsteins.

All will be sold without reserve as owners are retiring from the dairy business. No outside stock will be sold at this sale.

FREE LUNCH.

WM. COLLIER—Owners—MANUEL MANCEBO.

Holstein Bull

Peterje Cornucopia Creamelie.

The Dam of this bull is almost a 25-lb. cow; her average fat testing, 4.74%. This high percentage in fat of the dam shows that this bull would be an excellent buy for any dairyman who aims to improve the butter-fat output of his herd.

Write or come and see him.

Jersey Faith Shown at Sale.

[Written for Pacific Rural Press.]

The auction sale of Jerseys held at the Rancho Dos Rios near Modesto, May 6 was the first public demonstration of faith in the Jersey cow that has occurred for almost two years in this State; and for that reason breeders and dairymen were present in large numbers from all parts of central and northern California.

To those who viewed the offering before the sale, it was evident that the owners had taken every precaution to conduct the sale on a straightforward basis and fully up to the previous announcements. A more uniform lot of Jerseys has never been offered at public sale in the West.

This naturally instilled confidence in the buyers' minds with the result that while no startling fancier's prices were paid, both the registered and unregistered animals brought prices which were satisfactory to the sellers and on which the buyers will be able to realize at the milk pail.

This is largely because prices were made by dairymen who have learned the value of good grade Jerseys by experience and who have sufficient faith in the merits of the breed to put their money into registered animals. They have the firm conviction that Jerseys have been selling below their real worth and for less than they will ever sell for again.

The registered aged cows in the offering made the highest average with $134.50 on 17 head, the top price being $190 for Oledera, a six-year-old cow. It should be borne in mind that this cow as well as most of those in the sale has little or no official testing back of her on her dam's side and that the prices realized were largely based on individuality.

The 21 purebred heifers made an average of a little over $113 a head, Pegajosa, a three-year-old, topping this division with a price of $160. For foundation purposes the heifers in the sale were as a whole exceptionally promising individuals, and as most of them were sold to parties with plenty of feed and where good care will be exercised in growing them out, they should do much for the breed in this State in years to come.

Value of Registration.—One of the best illustrations of the value of registration papers that the writer has ever seen was in the difference in price of the registered and unregistered cows sold. Although most of the unregistered animals were of pure breeding and many of them the same breeding as the registered ones, the average prices were about $43 less for the grades; this in face of equally good individuality in most cases.

Considering the fact, however, that many of the unregistered animals showed the need of development in size the $80 average was fair to both seller and buyer.

The heaviest purchaser was H. T. Harrold of Orland, who with W. G. Gernett purchased a carload of registered and unregistered cows, together with the registered bull Dos Rios Pogis. Mr. Harrold runs a large dairy of grade Holsteins, a part of which will be substituted for the Jerseys he bought.

N. B. Hunter of Petaluma purchased a nice foundation herd for his ranch in Sonoma county and F. M. Johnson of Napa purchased a nice lot of registered cows to add to his foundation of registered Jerseys. H. T. Bridgeford of Bethel Island near Bethany bought 35 head.

N. H. Locke was another heavy buyer of registered cows, which will be added to his already large and choice herd in San Joaquin county. A number of local dairymen were heavy buyers of the unregistered cows.

The average for the entire lot was close to the $100 mark, which was entirely satisfying with the large percentage of unregistered animals that were sold. Future sales from the Rancho Dos Rios herd will meet hearty response from the buying public.

CONCRETE SILOS WITHOUT FORMS.

[Written for Pacific Rural Press.]

Two concrete silos built without forms may be seen on the ranch of the Sherman Institute for Indians near Arlington. A similar one is owned by C. W. Main, who lives near the ranch.

Metal lath were fastened to the inside of a 14-foot circle of vertical 2x4's. Jos. Schoulder, the Indian cement man of the Institute, supervised the work and the school boys did it. They plastered a layer of cement 1½ inches thick onto the metal lath. Then they pulled off the 2x4's which had been fastened by small staples, and plastered another 1½ inches onto the rough outside surface. The reinforcing in these silos is as good as the best, and is entirely protected from rusting. There is a solid 3-inch concrete wall smooth inside and out.

The silos were filled with the 1915 crop of Indian corn, each holding 90 tons; and was fed off with practically no spoilage except on top, according to Supt. J. R. McClellan.

Silage Increased Milk. — Each of the 25 milking cows gets about 30 pounds of silage with alfalfa hay and grass in season. They had been receiving alfalfa hay alone, but increased in quantity of milk immediately when fed silage. Dry cows get no silage, though perhaps they need it as much as the others.

The roofs of the silos are distinctive. They were shingled, and rested directly on top of the silo. A hole was knocked in the shingles for convenient filling, but that didn't suit Mr. McClellan. He had the roofs elevated to rest on upright 2x4's four feet long. This allows the silage elevator to be run in on any side and allows the silo to be filled and tramped clear to the top, with a maximum of fresh air for the men inside.

Two kinds of lice, sucking and biting, afflict farm animals. Wash thoroughly or dip the animals with a 2 per cent solution of lysol or creolin. If washed, precede the operation by scrubbing with a lather of soap, says the Washington Experiment Station.

With the Live Stock Men.

DAIRYING AND DAIRYMEN.

F. J. Stimson recently brought 29 Holsteins to El Centro from Seattle.

H. W. Mongenville of Chowchilla recently brought in 15 Guernseys from Wisconsin.

W. L. Mitchell of Napa has purchased two registered Jersey cows and a registered bull from Wisconsin.

A Guernsey belonging to Mr. Young of Yolo led the Solano-Yolo Cow Testing Association for April with 75.9 pounds fat.

Hunt Bros. Co. of San Francisco are stocking an alfalfa ranch with purebred cows, and purebred Berkshires to use the skim milk.

J. R. Coon of Modesto has sold five grade Holstein cows for $790 to M. G. Green of Merced. These averaged $158 each. The bull did it.

Three dairymen of the Chowchilla district recently paid fines, following a visit by the State Dairy Inspector, who found them neglecting sanitary conditions.

A national convention of milk producers and other dairy interests was held May 5 and 6 in Washington, D. C., to discuss national constructive laws and practices.

The Visalia Co-operative Creamery last week shipped their sixth car of butter to Eastern markets. It contained 21,000 pounds for Philadelphia.

Several farmers of Imperial valley have built cheap barns of old railroad ties costing 15 cents a piece. Some have been split in two for light timbers.

Dr. F. H. Shanks of Susanville has been traveling over the State to find a suitable herd of grade Holsteins with a few purebreds to mate with a purebred bull for an eventual purebred herd.

Alexander and Kellogg of Suisun report sale of the 16 months Dairy Shorthorn bull Suisun Darlington to Thos. Griffith, Spokane, Washington, and a four months bull, Solano Star, to Miss E. Park, Santa Barbara.

At least 1.5 pounds butterfat per day for April was made by each of 109 cows in the Stanislaus Cow Testing Association. A Holstein owned by L. D. Thompson, led with 77.1 pounds fat from 1884 pounds milk.

Two dairy Shorthorns led in butterfat production for April in the Gridley Cow Testing Association. A Shorthorn led for March in the San Joaquin Association. The Gridley cows produced 67.6 and 61.7 pounds fat from 4.5 and 4.3 per cent milk respectively.

The report of Supt. Malcolm H. Gardner of the Holstein Advanced Register is given in terms of butterfat, not butter. The statement of a cow's record in terms of butter seems an unfair attempt to create a false impression of superiority and is unnecessarily cumbersome to the industry.

Five hundred and sixty-eight Holsteins, more than half of them with first or second calves, were admitted to the Advanced Register for tests reported March 23 to April 5. The average production for seven consecutive days was 15.473 pounds fat from 420 pounds milk testing 3.68 per cent fat.

N. H. Locke of Lockeford reports that the Jersey cow Empress Lass is continuing to pile up milk and butterfat in surprisingly large quantities her record at the end of 158 days being 7,388 pounds of milk containing 388.77 pounds of fat. Dereen's Lassie of L., another cow in the Locke herd, had made 6,099 pounds of milk containing 316.8 pounds of fat in 152 days.

Guy Miller of Modesto reports the completion of three yearly official tests in his herd of registered Jerseys. Amethyst of Venadera made 578 pounds of fat, Beatrice of Venadera, 522 pounds of fat and Signora of Venadera, a two-year-old, made 458 pounds of fat. This latter record is next to the highest record for that age ever made by Mr. Miller.

Over 900 cows have already been signed up for the Orland Cow Testing Association and a meeting will be called this month to complete organization. Many dairymen in other sections of the west side of the Sacramento valley are anxious to enter their herd, but the promoters are endeavoring to confine the work of the association to the country close to Orland.

Carruthers Farms reports the sale of six service Berkshire boars to Miller and Lux, San Francisco, one service boar to the Fair Oaks Ranch at Willits, three sows and a boar to Frank Robinson, Esparto, two sows and a boar to H. H. Gable, Esparto, 10 Hereford heifers to H. H. Gable, four Shorthorn bulls to Hollister Estate Co., Santa Barbara and three Shorthorn bulls to O'Connel Bros., San Jose.

Allison Peck of Imperial has for the head of his Holstein herd, Rowena Hartog, Clothilde De Kol, sired by Hartog Pontiac; the dam being Whittier Rowena Clothilde. A recent purchase for the Junior herd sire is Mistletoe Alcartra Pontiac a grandson of Tillie Alcartra, Dam Aida Pontiac, sire Tillie Alcarta Son. Mr. Peck has also 10 registered heifers bought from State Whittier School a year ago, and has just added three registered cows.

The Holstein cow Winnie Korndyke Cornucopia de Kol, purchased by the J. S. Gibson Co., at Sacramento last fall for $1500, finished the first 120 days of her official test with 12,040.07 pounds of milk or a trifle over 100 pounds a day. When she was started on test she was in poor physical condition, and besides pro-

ducing heavily at the pail she has added over 300 pounds of flesh, which leads Mr. Gibson to hope for a wonderful yearly record.

SWINE AND SWINE BREEDERS.

Dr. B. J. Cady spoke on hog cholera at Thalheim recently.

The Tulare County Swine Raisers' Association reports steady growth.

A class for Dairy Shorthorns will be provided at the State Fair this year.

A. F. Roach of Los Angeles has 600 hogs doing well on alfalfa and rolled barley.

Miller and Lux have just bought the entire Berkshire herd of Sam Wright, Santa Rosa.

Geo. Showler of Colusa recently bought 150 hogs near Meridian at $7.40 for his butcher shop.

D. E. Betts of San Diego is well pleased with his half dozen Tamworth hogs in Imperial Valley and will give them more company.

The Merced County Swine Breeders' Association, has asked the supervisors to require licensing of all country dogs to prevent their carrying cholera.

Ray Ingram of Colusa County, 15 years old, bought a brood sow three years ago. Last fall he sold $100 worth and this spring $375 worth and has $70 worth left.

There is reported a mechanical process of refining and sterilizing hog cholera serum by which all bugs dead or alive are taken out of it, thus removing danger of infection.

A shipment of hogs and cattle from the Oregon Agricultural College recently brought a little better than the highest prevailing prices. They included 24 beef cattle and 91 hogs.

Recent additions to C. B. Cunningham's O. I. C. herd near Mills are: A bred sow, sired by Bobst Modelerhe by Modler and out of Viola, she by Sir Hannah; champion stock on both sides. She farrowed 8 pigs by Lenora's Chief, he by Elmo Chief, a three times grand champion. A bred sow sired by O. K. Mikado and out of Iowa Queen by O. K. Model and bred to Chief's Wonder. He by Joy Boy, by Chief Keokuk, by Wonder. Joy Boy, Chief Keokuk and Wonder are all Grand Champions. A fall gilt open, sired by Des Moines 2nd and out of Perfection Lady. Des Moines 2nd is a Wonder boar and Perfection Lady is from champion stock at the World's Fair at St. Louis.

BEEF CATTLE AND BREEDERS.

Chas. Monhikie of Bishop is successor to the Longley Ranch Co. with Polled Angus cattle.

Three shipments of two carloads each of steers were recently sent to San Francisco from Oakdale.

A carload of yearling steers from Burley, Idaho, sold at Portland, May 8, for $9.15, the highest yet for yearlings.

A plague of "rinderpest" is spreading among the cattle of the Philippines. Fifty towns in twelve provinces were already infected May 5th.

Two carloads of purebred bulls, seven jacks, and eight stallions were recently shipped from the San Joaquin Valley to Miller and Lux ranches near Winnemucca, Nevada.

The Tennessee Experiment Station is telling stock growers that a $125 bull will enable a farmer to sell a three-year steer for $20 more than a scrub from the same cow. At a recent meeting 40 purebred bulls were ordered.

MISCELLANEOUS.

Modesto is suggesting a desire for union stock yards.

F. J. Mendoza shipped 900 lambs from Maxwell to Chicago last week.

Sheep from the Stanford Vina ranch will soon be moved to Lassen county.

Belgian, Percheron, and Shire horses and mares will be shown at the Butte County Spring Exposition.

Additional tents have been secured for the livestock entries to the Spring Exposition, Chico, May 22-28. Entries have exceeded plans.

The Napa County Livestock Ass'n held its regular monthly meeting and luncheon May 6 at the Napa State Hospital, writes Owen Duffy, hospital business manager.

Six cars of sheep were sent to Chicago from Oakdale May 4. They were collected from the San Joaquin valley and were the first sent East from this point, in several years.

J. L. Murphy of Los Angeles is having two 156-ton silos put up on his ranch near Turlock. His foreman, J. Holgate, says he expects to try 20 acres of sudan grass for silage.

Control of rabid coyotes is made possible by the appropriation by Congress of $75,000. Five inspectors and 190 hunters are scouring the western states, so goodbye night music of the deserts!

If a cow is producing more than a pound of butter per day, good pasture should be supplemented with grain about 5 pounds daily for 1½ pound cows and 8 pounds daily for 2 pound cows according to the Mo. College of Agriculture.

The project is proposed in Australia of extracting lanoline directly from greasy wool. If all the wool were so treated, it would mean about $34,000,000 a year to Australia at the normal price of lanoline, which is 1-7 of the present price.

The unhappy bride threw her cake to the chickens. They died. The state food inspector found that it was not poisoned, but that salt had been used instead of sugar.

DAIRY CATTLE.

JERSEY BULLS AND BULL CALVES—Sons and grandsons of 2 and 3 lbs. cows. None better. Cheap for quality. N. H. Locke Co., Lockeford, Cal.

Grapewild Farms Berkshires
GRAND LEADER 2ND, No. 190,377. Winner of the Grand Championship at the Panama-Pacific International Exposition.
SIRE OF STAR LEADER, who won Junior Championship and Reserve Grand Championship at the same show.. STAR LEADER is now at the head of the CALIFORNIA UNIVERSITY FARM HERD at Davis.
GRAND LEADER 2ND is also sire of MAYHEWS LEADER 6th, a prize-winner at the P. P. I. E., of whom L. E. Frost, Editor of THE BERKSHIRE WORLD, said: "He is one of the best to be found in America and will, without question, make a great sire." This young boar now heads the herd of BUTTE CITY RANCH, one of the largest and best selected Berkshire herds on the Coast.
GRAND LEADER 2ND also won first and second with six of his daughters for Sire and his Get. This is the most highly valued of all the trophies to most breeders, and is particularly so where the sire wins Grand Championship honors. In this connection, Judge Scott, who judged the Berkshires, said: "The real test of a breeding boar is in the kind of off-spring he produces, and here are a lot of animals (speaking of the Get of Grand Leader 2nd) that are superior individuals, as like as peas and a wonderful demonstration of the ability of a great individual to reproduce himself."
After six years of careful breeding, during which time steady improvement in quality has been our aim, we now have 75 Brood Sows, rich in the blood of every famous Berkshire strain. With Grand Leader 2nd at the head of this herd, not only himself a Champion, but the sire of Champions, and with several other Boars of prize-winning strain, we believe we are in a position to give you the best to be had in Berkshires. Satisfaction guaranteed. Stock of all ages for sale.

Veterinary Queries and Replies.

[Answered by Dr. H. B. Wintringham, Petaluma, Cal.]

[Subscribers wishing an immediate reply should send money order for $1.00. No charge for questions answered through this department. Name and address of subscriber must accompany each query.]

Querists will save time by referring to the indexes published in the last issues of June and December.

BOAR DOES NOT AFFECT LATER LITTERS.

To the Editor: Does a Duroc sow that has farrowed a litter from a black boar produce black spotted pigs in succeeding litters?—E. L., Ceres.

[The color of one litter will have no effect on the succeeding litters.]

DELAYED AFTERBIRTH.

To the Editor: What can I give a cow to make her clean well after calving? I have one which didn't lose the afterbirth for two days and she has gone down in milk flow.—C. E. T., Visalia.

[Give 2 lbs. Epsom salts for this trouble.]

MILK FOR MOTHERLESS COLT.

To the Editor: I am giving a new motherless colt a pint of cow's milk every three hours. It seems constipated. Am I giving it enough or should the milk be modified?—A. W. H., Newark.

[Modify the milk with 20 per cent water and enough sugar to sweeten.]

PIGS' EYES STICKY.

To the Editor: What causes pigs' eyes to glue together. They are about three weeks old and seem healthy. They choose to sleep outside. Only 7 out of 30 are affected. Greasing with vaseline does not help.—G. E. D., Marysville.

[Use a saturated solution Boric acid dropped in the eyes twice a day.]

HIP JOINT LOCKS.

To the Editor: When my cow walks, her hip seems to lock and she can't step until she has stepped backward, when she can go forward a few steps. After walking some distance she can walk without stopping. She seems healthy and has not been hurt. Gets worse since first noticed a year ago.—E. F. K., Fresno.

[By all means employ a veterinarian.]

MARE HAS SWELLING.

To the Editor: I have a mare 10 years old that will foal in a month. I noticed a swelling on the right side of her navel about as thick as your hand. In two or three days it had left the right side and was on the left and is about twice as big as it was. She is running out on pasture and this is her first colt.—H. W. W., Princeton.

[These swellings appear on mares heavy with foal. They disappear when the colt is born.]

CALF DYSENTERY.

To the Editor: A calf seemed very weak when born, breathing heavily with mouth open. Nose runs. Developed dysentery after 2nd day. Excretion slimy with some blood, sometimes watery, varying from yellow to olive color, and offensive. Seems sore to touch along the back and acts as though in pain at times. Let it suck twice per day now as it seems too weak to drink. Eats freely.—J. H. I., Ripon.

[Your calf has scours. Go to your druggist and have him order some serum and a syringe from the Cutter Laboratory and follow directions.]

MARE BLOATS ON ALFALFA —ALL RIGHT ON WHEAT.

To the Editor: I have a 10-year mare that seems to bloat and have a rumbling about the kidneys if I let her have alfalfa or barley hay or rolled barley. She strains to urinate. Has been so for two years. Now if I turn her onto wild grass she does the same. If I feed oats and wheat hay she is all right. She now has a cold; will it affect the colt? She keeps in good flesh.—E. V. F., Corning.

[Use the feeds that do not affect her. The colt will get along all right.]

PIGS BREATHED HARD.

To the Editor: Two hours after morning feeding a weanling pig was found stiff and stretched out on the ground, but living. Careful examination showed that the pig's jaws were closed very tightly as if affected by lockjaw. Jaws were pried open and the tongue pulled out as far as possible. The labored breathing which had been noticed from the beginning was not relieved. About two hours after finding the pig he was dead. What was the cause and is there any way of preventing it in other pigs? There were no apparent scratches to indicate that the pig had been exposed to lockjaw germs. A post-mortem examination was made—all parts looked perfectly healthy.—D. H. G., Lancaster.

[This was not lockjaw. The animal died of acute indigestion.]

VACCINATE FOR BLACKLEG.

To the Editor: I weaned thirty head of large calves last November and vaccinated them for blackleg. Some other calves around close were supposed to be dying from that disease. I fed these thirty calves alfalfa hay for six weeks and then changed them onto a grass pasture and in about a week three of them died about the same day. I did not lose any more until March 10 and then another one died the same way. They lose the use of one leg and froth at the mouth and die in 10 to 12 hours. When dead they swell quickly and the skin seems puffed and rattles when thumped with the fingers. Neighbors have lost several. Would you vaccinate these calves again?—J. A. B., Woodlake.

[This is blackleg. Revaccinate the calves.]

HORSES DROOPY — SWELLINGS UNDERNEATH.

To the Editor: Four or five horses in good condition on pasture have first gotten droopy and at the same time two swellings run lengthwise one on each side of the center line of the belly. In a few days the swellings work forward and unite; appearing on the chest, but not between or in front of the front legs. When the swellings were punctured a waterish yellow matter would run out. By rubbing with turpentine or sheep dip we bring the swellings down and the animal gets well in 3 or 4 weeks.—A. W., Olancha.

[This is a form of forage poison caused by some plant in the pasture. Give a large dose of Epsom salts, 2 lbs. dissolved in 1 gallon of hot water.]

The war between cattle and sheep men is not yet over. Raiders in Colorado recently shot 100 sheep said to be purebreds.

Tamworths and Duroc-Jerseys

We can fill orders for mature stock and weanling pigs of both sexes. This is the largest herd of TAMWORTHS in the State. Our Stock is sure to please.
Write or call and see us.

Swine Breeders to Promote Industry.

[Written for Pacific Rural Press.]

The semi-annual meeting of the California Swine Breeders' Ass'n, held at the University Farm, Davis, May 6, was one of the most important ever held. Final steps were taken towards the promotion of the swine growing industry of the State on a much larger and more comprehensive basis than has ever before been possible.

This will result from an arrangement which has been made with D. O. Lively of San Francisco, who will immediately start a publicity campaign through the press, the local Chambers of Commerce over the State, and by co-operation with merchants and bankers. Mr. Lively will also co-operate with the U. S. Dept. of Agriculture and the University of California in the promotion of Boys' Pig Clubs; and will endeavor to better the marketing conditions that have faced the producer of good hogs in the past.

All of these have been under consideration by the directors of the association for some time as a means toward "More and Better Hogs." With an experienced man in charge of the work, many of the producing and marketing conditions which have heretofore been stumbling-blocks will doubtless be overcome.

An interesting and instructive program was provided by various speakers. W. Bernstein of Hanford read a paper on the value of a brood sow. It is Mr. Bernstein's belief that hog raising is a most profitable occupation for the man who is willing to work, especially if he does not try to operate on too large a scale. If he does operate on a large scale, he must pursue sanitary methods.

Mr. Bernstein was most emphatic in his belief that few men realize the true value of the good brood sow and quoted experiences at length as to what a good sow is capable of producing.

W. Hough, of the Western Meat Co., of San Francisco, spoke on the requirements of the packers, giving it as his belief that the acorn hog is the only real undesirable hog that is being raised in California; although he states that it is with great difficulty that the packer is able to get enough packing hogs at all times of the year. Mr. Hough stated that the big run of hogs in California comes in the fall of the year, after the grain has been harvested. At this time of year the packer's facilities are strained in caring for the supply.

Mr. Lively addressed the meeting on the manner in which the hog-growing industry in this State should be enlarged, stating that $75,000,000 worth of pork could be easily produced each year in the State, if our farms were producing the maximum instead of the minimum as at present.

Prof. Thompson, of the University told the members why the University believed in exhibiting their hogs at the various fairs, saying in part that University efforts in pure-bred breeding are for educational purposes, rather than commercial and that the show ring is undoubtedly of great educational value to students as well as farmers.

A committee was appointed to work out the various phases of the Boys' Pig Clubs in the State in order that the association might co-operate in their advancement. This committee was composed of D. O. Lively, H. L. Murphy, C. B. Cunningham, Wm. Bernstein, J. K. Fraser, and R. R. Ingals. This committee will report at the swine sale which is to be held at Chico the latter part of May.

MAKES CHEESE TO SELL.

[Written for Pacific Rural Press.]

R. Donomegoni, a pioneer Swiss cheese maker of El Centro, Imperial county, is getting 1200 pounds of cheese each week from 50 cows and an over-run of 20 to 30 pounds in cold weather.

"Most of my neighbors," says Mr. Donomegoni, "are selling cream, but I never could figure things that way. It takes 3½ gallons of milk on the average to make one pound of butterfat, which is now worth 30c. Three and one-half gallons of milk make a good 3 pounds of cheese, which brings me net 16 cents or more, or 48 cents instead of 30, had I sold to the creamery.

"My cows are mostly Holsteins; the bull and several cows are registered stock. My aim is to breed up a registered herd. My last year's record shows an average of $10 a month for each cow milked, including the strippers. Most of my cheese I am shipping to Swift & Co."

CITY MAN WANTS DAIRY INFORMATION.

To the Editor: What are dairymen throughout the country receiving for their milk per hundred pounds from the different milk concerns in San Francisco? Also would like to know the per cent of butterfat in a hundred pounds of milk and at the present time the price of butterfat.—H. L. S., San Francisco.

[The prices dairymen are receiving for sweet milk for delivery in San Francisco vary from 12½c to 15¾c per gallon. Of course, this does not apply to certified milk. The actual net returns to the dairyman depend largely on his location, because of the difference in the express rates.

The percentage of butterfat in 100 pounds of milk varies so greatly that no definite figures can be set, but the requirements in San Francisco are for a 3.6 per cent milk. That means that there are 3.6 pounds of butterfat in each 100 pounds of milk. Generally speaking, the Holsteins produce about a 3.6 per cent milk; the Guernseys, a trifle over 4 per cent; and the Jerseys, something over 5 per cent. However, these are only average figures and cannot be applied to any single individual.]

Why PRINCE ALBERT

gives smokers such delight!

Ralph Bingham discovers the "national joy smoke"

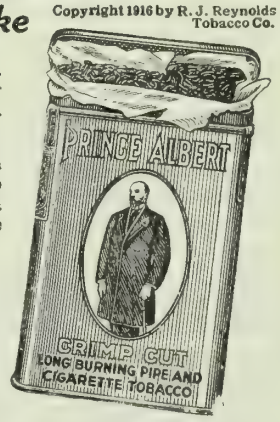
—*why*, its flavor is so different and so delightfully good;

—*why*, it can't bite your tongue;

—*why*, it can't parch your throat;

—*why*, you can smoke it as long and as hard as you like without any comeback but *real* tobacco happiness!

On the reverse side of every Prince Albert package you will read:



"PROCESS PATENTED JULY 30TH, 1907."

That means to you a lot of tobacco enjoyment. Prince Albert has always been sold without coupons or premiums. We prefer to give quality! And read this:

PRINCE ALBERT

the national joy smoke

Copyright 1916 by R. J. Reynolds Tobacco Co.

is certainly worth your while getting on talk-terms with if you'd like to know what will please your jimmy pipe or cigarette makin's appetite *most*—in flavor, coolness and downright satisfaction to the high-top-notch degree!

For Prince Albert is tobacco made by an exclusive patented process *that cuts out bite and parch* and lets you fill up your pipe or roll 'em to your heart's content without a flareback of any kind! You'll get chummy with Prince Albert in a mighty short time.

Prince Albert is sold everywhere in toppy red bags, 5c; tidy red tins, 10c; handsome pound and half-pound tin humidors and in that fine pound crystal-glass humidor with sponge-moistener top that keeps the tobacco in such perfect trim—always!

R. J. REYNOLDS TOBACCO COMPANY, Winston-Salem, N. C.

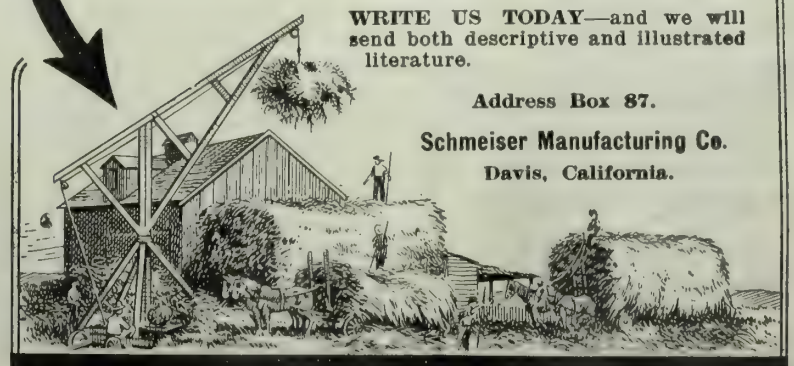
Stack Your Hay

—the Schmeiser way *this way*

With the Schmeiser Portable Automatic Derrick

Saves time—saves work—saves money. Handles hay, loose or baled, in the easiest, quickest, most economical way. **It is the modern derrick for the modern farmer.**

Lets Three Men Do the Work of Nine By Hand



Can also be used for hoisting machinery, building material dirt, or heavy loads of any kind. Has a lifting capacity of over half a ton. It is always ready, and being portable, it can be moved from place to place as easily as a farm wagon. No modern farm should be without it.

Now being used with great success all over the Pacific Coast

CARE OF GROWING STOCK IN WARM WEATHER.

[Written for Pacific Rural Press by Susan Swaysgood, Pomona.]

What future a hen has before her depends on the care she has during warm summer days.

The first care for growing stock in summer is to feed them properly, according to the weather. Not so much heating food because it is not needed, not so much fattening food because what growing stock needs is bone and muscle. Bone and muscle come chiefly from the mineral world. Minerals are found in all vegetables and also in all cereals.

Oats are one of the greatest bone making foods we have and if the fibre is softened by soaking and sprouting there is no other daily feed equal to them. This is so because the hull, which contains more fibre than anything else, is so softened by sprouting that the growing chick eats it readily and it acts as a filler and carrier for the other feeds which are more concentrated in form, and without which a growing chick would eat its head off and yet not be contented.

If a chicken does not have the fullness its nature calls for, it does not grow, and its feathers look rough and coarse.

Sprouted oats, all kinds of tender green feed, wheat bran, bone, milk, and beef scrap all abound in mineral matter and should be fed to growing stock in a proper ratio to the carbonaceous foods.

During the hot days of June, July, and August, it is better to go easy on corn meal and white middlings, and use instead brown midds or shorts, ground barley, and oats with bran.

Milk in quantity almost serves the place of three other elements in the food and is the best substitute known for green feed. So in proportion to your supply of greed feed, the milk can be fed to growing stock as it is both feed and drink.

Don't feed too much mash. While a little mash is certainly good because it is so easy to digest, if growing stock are fed too much soft food the gizzard will have nothing to operate on and the natural healthy organs will get out of use. The gizzard is a chicken's teeth and it should always be furnished with working material to give it exercise. Soft feed does not do this, but sprouted oats does and so do all forms of grai , bone, etc.

Water.—Never allow the water to stand in the sun during the heat of the day; if there is no natural shade, provide some, if it is but a box to cover the water vessel. Flies deposit their eggs around dirty fountains and the chickens eat them and thousands of worms find a breeding ground in the chickens' intestines.

It is always better to feed and water in the early morning, while it is yet cool; then the chickens can get what they need and seek the cool, shady places during the heat of the day. No matter how many times they have been fed they soon fall into the twice-a-day plan, because they really don't care to eat in the heated hours.

Shade.—Provide some sort of shade that keeps off the hottest of the sun's rays a part of the day. The price of gunny sacks will soon make them prohibitive as a chick shade, but we will no doubt find a substitute.

See that there is plenty of fresh air but no cracks or drafts in the sleeping quarters. The doses of fresh air that creep through them are usually mixed with malice for chicks and owner. Tight back and ends and open front are good for all kinds of growing stock and matured hens, too, but a little too airy for baby chicks.

Room.—The next care for growing stock is to be sure to remember that they are "growing." The space they formerly occupied in brooder or house must be doubled. This is one of the mistakes most people make and pay for: they will forget that chicks grow, and in doing so must have more room. Make your calculations for that when you hatch. Have room enough to give the growing stock plenty of breathing space on the perches, in the weaning pens and in the brood coops. This is the only way to have a good healthy flock that does not show a lot of runts. Weed out the very big ones.

GREENS FOR POULTRY.

[By Susan Swaysgood.]

Beets are a good dry-weather green crop. Beet seed may be soaked in warm water twelve or fourteen hours and then sowed in rows already prepared as above and they will germinate quickly; where if sowed dry, they are rather slow to germinate. Press the soil close to the seed as that holds the moisture and nature can work better. All kinds of beets are good for poultry of all kinds. For the molting hens they are one of the best feeds; they are succulent and satisfying and therefore save grain. For hens I always split in two and lay in yards split side up, until the hens get to know they are good; then they do the work themselves without any invitation. Chickens are always a little shy of new kinds of feed so if they don't rush at a thing some people will decide that their hens will not eat this or that. Give them time and they will come to it.

Another thing that gives an enormous lot of green feed for the trouble is to sow radish seed rather thick, the giant white Stuttgart, or the white Chinese are summer kinds that grow immense roots and tops both, and chickens are very fond of them. The roots go deep in the ground and find water for themselves. When gathering take a pick or stout hoe along to loosen the soil.

HATCHING WINTER LAYERS; BREEDING AGE.

[Answered by Susan Swaysgood.]

Questions interest everybody, therefore don't fail to read this page because if you do not need it now, you may at some future time. A question that comes very often is, "When is the best time to hatch for winter layers?"

Chicks from all the small breeds, when properly fed and cared for, should lay at five months old. All chicks of these breeds that are hatched during April and May, cost less to raise, are easier to manage and will commence to lay the latter part of August and early September when eggs are just commencing to go up.

All fowls, irrespective of breed, should be of full maturity and size. The young fowls will breed, certainly, but the chicks will never be so strong nor have the vitality to resist disease as chicks from older birds, nor will they ever be quite so large. A chick hatched from a two-year-old hen is better fitted for the struggle in life than a chick hatched from a yearling hen, and not less than a yearling should ever be permitted in a breeding pen.

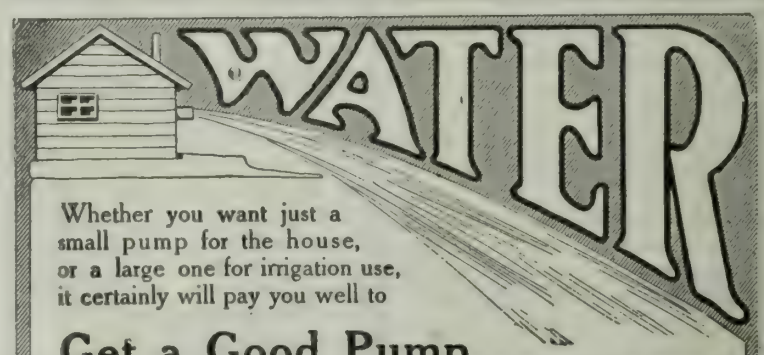
Turkey Troubles.—My little turkeys have yellow substance in the mouth and throat. A neighbor told me to wash it out with peroxide. Is that right?

Entirely so for small turks or chicks, but if you make a swab of clean cotton on a small pointed stick and swab the throat and mouth well it would do better. I would use full strength as the druggist dilutes it enough, and it requires strong things to kill canker.

The exact earning capacity of the average hen has never been fully determined; as in all other lines of business, the results depend principally upon the knowledge and attention of the owner.

CHICKS DIE IN SHELL.

To the Editor: In trying to hatch eggs with hens, the chicks die in the shell. The hens set well.—A. R., Bowie, Ariz.



[Perhaps in your climate the eggs dry out too much, the inside skin getting tough, and the pores closed to the passage of air. Perhaps the eggs are weakened by use of too many hens per rooster, or by forcing the hens to lay too heavily, or by allowing hens to get too fat.—Editors.]

The farmer's family, of all the people in the world, are best fitted in every way for profitable poultry culture.

Disease is seldom thought of until it makes its appearance in the poultry yard. It is a wise plan to be prepared for emergencies, thus heading off an epidemic.

CHICKENS AND STOCK EAT SPINELESS CACTUS.

Referring to your article on spineless cactus in the April 8th issue I can add that during January I had occasion to examine a farm at Ora Loma, a few miles south of Dos Palos and I found the owner feeding his dairy stock spineless cactus. He told me that when he first offered it to the cows they would not touch it, so he cut it up and mixed it with bran. They soon began to like it until now they eat it freely without being cut up or mixed. He considered the cactus a very satisfactory feed, especially in winter, and a very cheap one as the plants grow with practically no attention and multiply rapidly.

I had some twenty plants growing in my back yard. Last spring I fenced that part of the yard and used it as chicken run. At first the hens did not bother the cactus, but as summer came on and green stuff became scarce, they started pecking at the smaller slabs and finally ate up all of the plants to the roots.

Fresno. A. W. Percival.

CHICKS WITH GOUT.

To the Editor: I have some small chicks whose legs and feet are badly swollen, white spots appearing upon the feet, and their combs are black. —W. H. H., Byron.

[Answered by Geo. H. Croley.]

Your chicks have articular gout, which is caused by a diet too rich in protein—feeding too much meat, especially beef liver. Give one dose Epsom salts (two teaspoonfuls to each dozen chicks). The following day put one-half teaspoonful common baking soda in quart of water and give to chicks. Rub affected joints with camphorated or carbolic ointment. Reduce amount of meat and greatly increase amount of green food. Continue treatment until symptoms disappear. There is also another kind of gout called visceral gout, but the only symptoms shown by affected birds is loss of weight and slight yellowish tinge to the skin, comb, and wattles.]

Light unfavorably affects eggs in the incubator. If the machine has a glass door, hang a cloth curtain over it.

GOOD BYE! MorningGlory

Don't let this troublesome weed sap your soil and ruin your crop.

NONPAREIL

is the one sure exterminator that does the work without injury to the ground. Read what Luther Burbank says:

"We find that Nonpareil destroys not only morning glory but also horse-radish. We consider it a thoroughly satisfactory weed exterminator"—Luther Burbank.

One gallon of Nonpareil is sufficient to kill 250 plants. It does not prevent the ground from producing regular crops. It acts as a tonic to the soil. It is easy to apply and economical to use. Write today for interesting folder on this profit saver.

GOOD LUCK WITH CHICKS.

[Written for Pacific Rural Press.]

Healthy eggs make healthy chicks, which do not die off while growing, thinks H. J. Hennings of Los Angeles county, who pointed to 200 incubator chicks two weeks old, of which none had died and all were happy.

No Roosters are kept in the laying pens. Four breeding pens of 20 hens each are fed so as not to force the production of weakened eggs, though in March they were averaging over 60 eggs per day. A 500-egg incubator in an incubator cellar will be supplemented by another, because heretofore Mr. Hennings has had to sell half of the hatching eggs every 10 or 12 days for lack of equipment. This will permit his treasured plan of having three houses for 1000 hens each, with pens on both sides of each house, so the present system of alternating green stuff can be continued. Hens are sold at three years of age.

Brooder House. — The brooder house has two compartments for 500 chicks each. It is warmed most economically. A lamp in the center of one side next to the alleyway burns a gallon of distillate per day. The fumes and burned air from the flame pass upward two feet through a pipe and then vertically both directions through the brooders; thence through an extra brooder outside each end of this building in which the older chicks are kept for a while. By that time all the heat has been used for the chicks. Around this pipe and around the burner, leaving an air space, is an asbestos jacket, through which fresh air is drawn upward as it is heated around the burner. This pure warmed air is led to the center of each compartment and released under a hinged platform which can be raised or lowered and where chicks can get warmer when they wish.

No Toe Picking. — The balanced feed, plenty of light, and scratch litter are held responsible for lack of toe picking, but if for any reason a chick gets off feed, it is put into a hospital cage over the burner. A thermometer and removable supports enable this to be adjusted at varying heights to keep the desired temperature.

Three fruit trees in each of the small yards provide shade outside the houses, and underground pipes supply constantly dripping faucets as well as the sprinklers which are attached to outlet pipes and soak the ground sufficiently in an hour for the new green crop.

Raising vegetables and green stuff among fruit trees is the practice of E. H. Cowell on three acres in Los Angeles county. He expects to handle 2000 hens.

Fowls which have once had a severe sickness should never be used in the breeding pen.

Poultry Breeders' Directory.

Rates in this directory, 3c per word each issue; or if carried weekly for one year, 2½c per word.

YOU'LL GET EGGS from stock purchased here. All tested by Hogan system for egg-laying qualities. Butcher gets all testing less than 125 eggs per year capacity. Going to breed Reds exclusively. Have some good White Leghorn and Barred Rocks, yearling and two-year-olds, will sell reasonable. Get busy. Write today. C. W. Hinrich, Palmdale, Cal.

BABY CHICKS—Strong and healthy, from high-bred free-range White Leghorn stock. Prices on application. Western Hatchery, W. S. Waldorf, Petaluma, Cal.

NOT TOO LATE for chicks if you get our White Orpingtons, trapnested and bred for early maturity as well as heavy laying. Begin laying at five months, just when eggs are highest. Baby chicks and hatching eggs for sale from 1000 grand range-raised birds known throughout the West as big money-makers. Prices reasonable. Catalog free. WHITTEN RANCH, R. D. 5, Box 647, Los Angeles.

LIVABLE BABY CHICKS—We are supplied by reliable Breeders and experienced hatchers. Better chicks cannot be had from any source. All varieties, any number. High quality birds, bargain prices, laying hens and pullets. Free exhibit. Everything in Poultry, Pigeons, Rabbits, Dogs, Cats, Canaries, Pets. Give us a call or write. Fancier's Exchange, 642 S. Main St., Los Angeles, Cal.

WYANDOTTES—Beautiful, useful and profitable. Best for showing; best for egg-laying; best for table. Largest Wyandotte Farm in the Southwest and the only complete family of Wyandottes known. Eleven varieties and each from the finest strain bred in the United States. Hatching eggs and baby chicks reasonable. Write us for full particulars. VILLA WYANDOTTE FARM, Villa Road, Lamanda Park, Cal.

ALL OUR PURE-BRED CHICKS from Hoganized, trapnested flocks, have been reduced in price. Barred Rocks, Rhode Island Reds, Black and White Minorcas and Anconas, 12½c each. 1 or 1000. Brown Leghorn, 10c each, $9 for 100; White Leghorns, 9c each, $7.50 for 100. Brown's Poultry Yards, 2550 San Pablo Ave. Phone Oak 2183, Oakland.

MODEL POULTRY FARM—White Leghorn Specialists. We are now booking orders for Hatching Eggs. Baby Chicks and 10 weeks' old pullets for delivery after January 1st, 1916. Prices on application. Twelve years of breeding have made our Leghorns the desired Heavy Winter Layers. W. C. Smith, Prop., Corning, Cal.

BARRED PLYMOUTH ROCKS—"The kind that Win and Lay." Eggs for hatching and choice stock for sale. Have bred Barred Rocks for over nineteen years exclusively. Write for Catalog showing winnings at California's leading shows. Chas. H. Vodden, Box 396, Los Gatos, Cal.

MAY CHICKS—Our utility breeds, R. I. Reds, Barred Rocks, Black Minorcas, White, Brown Leghorns by the dozen, hundred, thousand—at prices that mean business. Send card for special circular and offer. Will save you money. Roofden Poultry Ranch, Campbell, Cal.

STIRLING FARM—Place your order now for eggs and chicks from Stirling Layers. Utility Leghorns exclusively. Our pure-bred tested layers are bred for size, vigor, quality and heavy-egg production. Send for descriptive circular and prices. Route 2, Box 1416, Sacramento, Cal.

BABY CHICKS—We will hatch during May and June, so order now and get them when you want them. All good strong youngsters from good layers. White and Brown Leghorns, Barred Rocks, R. I. Reds and Black Minorcas. Campbell Poultry Ranch, Campbell, Cal.

PLACE YOUR ORDER NOW for May delivery of White Leghorn chix from Jackman's pure-bred, heavy-egg producers. You get the best at lowest price. $7 to $8 per hundred. Special low prices in large lots. Sunnyside Poultry Farm, Route 2, 1610 Vine St., Sacramento, Cal.

EGGS FOR HATCHING—True-to-type Barred Rocks of a first-class utility strain. Large birds bred to lay $1.25 per 15; $6.50 per 100, charges prepaid and safe delivery guaranteed. G. L. Horine, Box 52, Winton, Cal.

CROLEY'S DRY MIXED INFANT CHICK FEEDS for twenty-five years have been California's standard feed for baby chicks. Insist upon getting same from your dealer. Manufactured by GEO. H. CROLEY CO., INC., Poultry Supplies, San Francisco.

INCUBATOR CHICKS—White Plymouth Rock, White and Brown Leghorn. Highest class of stock bred to standard and to lay. If you are interested in the best send for catalogue. Mahajo Farm, P. O. Box 597, Sacramento, Cal.

BUFF ORPINGTONS; BUFF LEGHORNS; BOURBON RED TURKEYS; BUFF DUCKS—Summer sale of high-grade breeding stock and hatching eggs. Send for price list. The Ferris Ranch, Route 2, 144D, Pomona, Cal.

MRS. BEST'S LETTER

My dear Friends:

Now that Easter is past, those of us who do not buy at the very first of the season, can buy many things in the clothing line at quite a considerable saving. Millinery especially is very much reduced, while novelty suits and waists are also marked down. This is the beginning of the clearance sales that practically all of the stores have, covering all the departments, sometime during the spring and summer.

Those of you who can arrange to spend a week or two away from home and come to the bay section will not only be assured of a cool welcome as far as the weather is concerned, but you will find it a very good time of year to shop to advantage.

The big dry goods stores have in July their white sales when you can buy table linen, towels, bed linen, bedspreads and the like at prices well below what we usually pay.

The china houses have clearance sales in dishes, glasses, statuary, clocks, lamps and many other useful and ornamental articles, while at the same time the furniture houses are making radical reductions in lace curtains, rugs, bedroom sets and all lines of furniture.

All of the better-class stores in San Francisco (and this is true of any city) are careful to not misrepresent their goods and you will find them courteous to do business with and anxious to please you. If you think you might like to order articles after your return home, if you bring in references, the privilege of credit will be extended. In most of the dry goods stores there are clerks whose business it is to fill the orders of out-of-town customers and great care is taken with those orders. Yours devotedly, **Rosabella Best.**

JAM SHORTCAKE.

For an emergency dessert or a dessert for a busy day the jam shortcake has no equal. It is simple, and within the possibility of any country housekeeper. The jam is put up at convenient times, and is on hand each month in the year in all well-ordered households.

Strawberry Shortcake.—Make a nice biscuit dough with one quart of flour, two heaping tablespoons of butter, pinch of salt and two teaspoons of baking powder. Mix well and add enough sweet milk to make a stiff dough. Roll out and with a large biscuit cutter cut a biscuit for each person. Bake as you would ordinary biscuits, and when done split and butter liberally. Cover the lower layer with thick strawberry jam and put on the top. Add more jam on top or at the side and heap with whipped cream. Serve at once.

Boy (in library): "I want to get Louisa Alcott's Jewish book." Librarian: "What? I never heard that she wrote a Jewish book. Haven't you made a mistake?" Boy: "No'm. She wrote one. My sister told me to get it. The name of it is—lemme see—it's 'Rosenbloom.'" — Boston Transcript.

GOOD LEMON IDEAS.

Lamb chops, dipped in lemon juice before cooking, are delicious.

Add 1 teaspoonful lemon juice to each quart of water while boiling rice. The rice will be very white and each grain separate.

To keep lemons, put them in water and change the water once a week. This way they will keep a long time.

In cherry or strawberry jelly, add the juice of one lemon to four cups of fruit juice. This makes the jelly firm and gives an excellent flavor.

MENACE OF THE FLY.

Prof. Hermes of the University of California, in a lecture on the fly, has the following suggestions as to its extermination:

The common house fly is one of the most dangerous bearers of disease in the home. It carries disease by habit, as its stomach is a bacteriological incubator and even if the fly is not infected, it carries vile dirt on its feet. Consider where the fly breeds and try to control it there.

From experiment, 900 thousand flies breed from a ton of manure in four days. It also has been proven that 95 per cent of the flies breed from fecal matter of horses and the other 5 per cent in garbage. How much easier it would be to control the fly question through breeding places than to attempt to kill them as they fly about.

A scientific and easy method of control would be to have a closed manure bin with small opening, in a dark place of the barn, so that flies would not lay eggs in the warm moist manure, an ideal breeding place. Also raise the bin from the ground on low stilts that rats will not breed below it. The manure can be removed when necessary and the fly is cheated out of a place wherein to breed.

Another method is to spread the manure out to dry in the sun. This assures no flies, but also spoils the manure for a fertilizer.

There are chemicals which kill the fly maggots, but these chemicals have to be applied every day, are expensive and also spoil the manure as a fertilizer. These chemicals are stomach poisons, so if the flies lived, human beings would run the risk of being poisoned too.

Better than fly paper and patent preparations for use in the house is a 2 per cent solution of formaldehyde, sweetened and set around in saucers. The fly drinking such a solution dies, but is disinfected and as it is said, "It is better to have a clean, dead fly in one's flood, than a dirty, live one walking on it."

FRUIT JUICE FOR JELLY-MAKING.

Cook fruit slowly, using a quart of water to a gallon of fruit. When fruit is soft, strain through a jelly bag. (Flannel bag makes a clearer jelly.) Return strained fruit to the stove, and heat to the boiling point and skim well. Sterilize jars, tops and rubbers and fill up as for canning fruit. When wanted for jelly open and proceed as usual, adding the sugar. In this country the juice will keep for years this way.

Domestic science is domestic sense.

TO WASH A WOOL SHAWL.

Make a warm suds of pure soap. Press the shawl down into this firmly and let it soak for 15 minutes; then putting your hands down under the water, squeeze the shawl, never lifting it out of the suds. When the suds looks dirty, squeeze the shawl into a ball, still under water, and wash again in more clean suds. Rinse well in water of the same temperature, being careful never to lift the shawl. In this way, it will not stretch. Spread the shawl carefully on a sheet on the grass, as it dries shake it occasionally; if fringed, pull the fringes apart. The shawl will be as soft and fluffy as when new.

DYE FOR WAISTS.

If you have a flesh-colored crepe-de-chine waist that you wish to restore to its former color, try rinsing it in cold water to which has been added a drop or two of red ink, or what is thought still better a small piece of red crepe paper. This should be done after the waist has been washed and rinsed very thoroughly.

THE DOCTOR KEPT HIS WORD

Mr. Newman had just recovered from an operation and was talking to a friend. "The surgeon," he remarked, "said he'd have me on my feet again in three weeks."

"Well, he did it, didn't he?" asked the friend.

"He did, indeed," responded Mr. Newman. "I had to sell my motor car to pay his bill."

A long-suffering traveler on a single-track railroad ventured to complain of the exasperating unpunctuality of the service. The employee remonstrated in virtuous indignation. "I've been on this line now upward of eight years"— he began. "Have you, indeed?" interrupted the other, sympathetically. "At what station did you get on?" The attendant did not pursue the subject.

Salsoda dissolved in boiling water is useful to cleanse and disinfect poultry drinking vessels, etc.

DO YOU KNOW THAT

Walking is the best exercise—and the cheapest?

A little cough is frequently the warning signal of tuberculosis?

Bad teeth and bad tonsils may be the cause of rheumatism?

Unpasteurized milk frequently spreads disease?

The air-tight dwelling leads but to the grave?

FLORAL DEPARTMENT.

[By Geo. N. Tyler.]

Asters should be in strong growing condition now. Give them abundance of water.

Roses have made their first crop. Prune them back—that is, if you have not cut your flowers with long stems; they should be cut back to two eyes of this year's growth. Cut out all blind and weak wood. You can put in cuttings this month of two to three eyes of the half-ripened flowering wood; make a clean cut just below an eye with a sharp knife; pruning shears bruise the bark. Plant in sharp sand or in sandy soil in a shady, sheltered spot; keep them soaked and they will root in about four weeks. If not planted too close, and in too shady a place you can let them stay till early winter and then plant into their permanent beds. I like sharp sand to root them in, and as soon as they have formed callous, I pot them in 3-inch pots, and after growth starts I plunge pots and all into the soil, in a partially shaded location where they are sheltered from the late afternoon sun. I also mulch them with straw manure or leaves, and keep them well watered; these will make fine blooming plants next spring.

Flower Fertilizer.—A fertilizer, or liquid manure, that I have used with success in growing exhibition flowers for the last twenty years is as follows: Take one bushel, or a 40-lb. fruit box of the filings and parings from horses' hoofs—which any blacksmith will save for you—put them in a fifty gallon barrel, fill up with water and let stand for ten days, when it is ready for use. It is not only a fertilizer but a plant food. It brings out the dark glossy green foliage, and brightens the colors in flowering plants. It does not hurt the foliage if any gets on; you can water with it every day for a short time and if you discontinue the use of it there is no effect on the plants—they do not go back. You can grow plants in smaller pots. It is a safe stimulant for ferns of all kinds and makes the foliage a deep glossy green. You can empty the barrel one day, fill it up with water, stir it up, and the following day it is ready for use again. It acts marvelously on mums, pansies, asters, roses and almost any variety of plant, but with all its good qualities it has one bad one and that is its odor.

Another fertilizer that is fine for lawns is as follows: Take one box of fresh chicken droppings to five of sand or fine sediment soil, mix thoroughly and wet down. Keep turning it over every other day for about two weeks when it is ready for use. The sand absorbs all the fertilizing properties of the chicken manure. Give your lawns a dressing with this mixture, about three quarters of an inch thick. After watering you will see the immediate effect both in the growth and color. Give one-half inch on the second application, which should be in about three months, or sooner if the lawn begins to get light colored.

A SMALL BOY'S PROBLEM.

I wonder how I'd like it,
And I wonder who I'd be,
Supposing I was somebody else,
And somebody else was me!
I wonder, I just wonder,
What boy I'd like to be,—
Supposing I didn't like him
When I found that he was me!
—St. Nicholas.

A QUEER PLAYHOUSE.

By Bertha Gerneaux Woods.

Bess and Judy had had a busy morning, decorating the little house they had built under the trees. The big boy next door had helped them in the making of the house, which was shaped like a cone or an Indian's wigwam, round at the base and coming to a point at the top. It was built of long, dry, slender branches, the little twigs meeting and interlocking to form a support for autumn leaves and carefully cut strips of moss. Have you children ever made such a house? It is great fun, and I would advise you to try it if you never have, and you will enjoy it as much as Bess and Judy did.

"Aren't these clam-shells pretty?" Judy asked. "We'll play they're our best set of dishes, our blue-banded set, and this is our common, every-day set," and she pointed to a collection of cracked and nicked china which had been the cook's contribution to their housekeeping.

"Yes, it's all so nice," Bess said with a big sigh of happiness.

"Where'll we put the peacock feather?" Judy inquired. "Over the doorway?"

"Yes; that'll be a nice place for it."

"Well! Well! Well!" There was Uncle Jack stooping his tall form to peer in at the doorway. "I didn't expect to find two little bower-birds on this side of the water; no, I didn't."

"What do you mean, Uncle Jack?" Judy and Bess both wriggled through the low doorway, to come out into the open where they could talk comfortably to this nice uncle who had come home only the week before from a long stay in Australia."

"What do you mean by bower-birds?" Judy asked with a happy little smile, for it sounded as if a story was coming.

"Well," Uncle Jack said, and settled himself comfortably on the grass, "out in Australia there are some very queer birds that make playhouses and fit them up with bright-colored things for ornaments, just as you children are doing. They are called bower-birds because they build in this way, and they belong to the bird of Paradise family, though their feathers are dark and plain, and not beautiful like the bird of Paradise we know from pictures and out at the Zoo. Perhaps if they wore bright feathers themselves they would not take such trouble to collect pretty things for their playhouses."

"But Uncle Jack, what do you mean by playhouses—their nests?"

"No, they build a different kind of nest to bring up the young birds in. These bowers seem to be built just for pleasure. First the bower-birds clear a space in the forest till the ground is clear and clean as your lawn is after John goes over it with his rake. When they have made this nice and clean they begin on the playhouse. It is really a little hut made of slender twigs, very much like this playhouse of yours. It looks like a wee wigwam. After the birds finish their bower they set to work to decorate it. They hunt everywhere for bright feathers, and shells, and broken bits of glass, or anything else that is bright and shiny. Sometimes they fly a long way to get such objects, and once back at their bower they spend a great deal of time arranging and re-arranging their bric-a-brac! When their pretty things grow worn or faded they put new ones in their places. They have even been known to pick up pieces of jewelry belonging to people who live near, and it is not at all uncommon for women who have lost some of their treasures to go out into the woods and hunt through the bowers to see if they can find them."

"My! How funny!" said Judy. "And how big are these bowers?"

"I have seen different sizes," replied Uncle Jack. "Some species build them five or six feet high—others are smaller. About the queerest kind of a bower-bird is one found in New Guinea, and called the gardener-bird. He makes a cone about a foot and a half high out of moss, and then a few inches outside of this he goes to work to plant tall, straight twigs, to make a hut surrounding this moss cone. He leaves a doorway on each side of this outer hut. These birds always choose twigs from an orchid which stays alive and goes on blooming for a long time, so it is a real 'bower.' The bird also scatters flowers of different kinds over the floor of the bower and on the cleared space outside of it."

"It sounds like a fairy story, doesn't it, Uncle Jack?" Bess said. "I wish we could go to Australia and see them."

"I'll tell you what you can do, without taking such a long journey," Uncle Jack answered. "Some day I'll take you to the Smithsonian Institution at Washington, and you shall see some stuffed bower-birds in one of the glass cases, and their bower filled with shells and bright feathers, just such as I have seen many times in Australia."

Pacific Rural Press Market Report

PRICES QUOTED AS PAID TO PRODUCERS.

San Francisco, May 10, 1916.

WHEAT.

Crop prospects in both Pacific and Middle Western States are rather below expectations, tending to stiffen the market, though lack of shipping facilities prevents any noticeable improvement in values on the Coast. The California crop is still uncertain, but it is known that some heavy losses have occurred in important producing districts. The local market is very quiet.

Cal. Club, ctl	$1.60 @1.65
Northern Bluestem	1.87½ @1.90
Northern Red	1.85 @1.95

BARLEY.

Crop reports from various parts of the State show considerable divergence, some sections having a fine yield while in others the crop is a failure. The general opinion among dealers is that the output will be disappointing, though no really accurate information is yet available. This market remains dull for spot barley, with unchanged prices, though there is a little more speculative interest.

Shipping, ctl	$1.37½ @1.40
Choice Feed, ctl.	1.32½ @1.35

OATS.

There is no movement of any consequence locally, but white oats have been marked up in sympathy with the northern market, which shows considerable strength, with holders looking for higher prices. The Government is taking bids this week for a large lot of oats for the Hawaiian Islands.

Red Feed	$1.35@1.37½
White	1.50@1.55

CORN.

Arrivals of Eastern corn are mostly on orders from milling concerns, the movement here being light. There is a fair demand for Egyptian, etc., at the range quoted.

Eastern Yellow, ctl	$1.80@1.85
Milo Maize	1.40@1.45
Kaffir	1.60@1.65
Egyptian	1.50@1.57½

BEANS.

(On wharf, San Francisco.)

Bayos, per ctl.	$4.80@4.90
Blackeyes	2.90@3.00
Cranberry Beans	4.75@4.85
Horse Beans	3.00@3.25
Small Whites (south)	6.25@6.50
Large Whites	6.20@6.30
Pinks	4.75@4.85
Limas (south)	4.50@4.90
Red Kidney	6.50@6.75
Mexican Reds	4.50@4.65
Tepary Beans	4.00

SEEDS.

The alfalfa movement for this season is pretty well over, and nothing is doing at present in the other lines quoted. Some sales of brown mustard have recently been made at 4 to 4½ cents.

Melilotus Alba, lb.	23 c
Melilotus Indica	6 c
Bur Clover	11 c
Oregon Vetch	5 c
Soy Beans	8 c
Canada Peas	5¼ @ 6 c
Alfalfa, per lb.	22 @24 c
Sudan Grass	35 @40 c

HAY.

Local offerings are a little lighter than last week, but still too heavy for the local demand, and while the movement has consisted largely of new alfalfa for shipment up the coast, values here have shown some easiness. The shipments would clean up better if adequate coastwise shipping facilities were available. Arrivals of new grain hay have been only a small amount of wild oat hay, which was in poor shape and brought unsatisfactory prices. Old grain hay of ordinary quality is still coming in, and moves slowly. Cutting of grain hay is under way now in many districts, and most reports seem to indicate rather light production. There is said to be very little west of Tracy, and the crop in some places north of the Bay is failure, while in others it is light, but of good quality; and in some important districts it is said that most of the crop will be cut for grain.

No. 1 Wheat	$13.00@16.50
No. 2	12.00@14.50
Tame Oats	12.00@18.00
Wild Oats	12.00@14.00
Alfalfa, new crop	8.00@12.00
Stock Hay	6.50@ 8.50
Straw, per bale	.25@ .40

FEEDSTUFFS.

The Government is taking figures on a lot of bran for the Hawaiian Islands. Local buying is very quiet in all lines, with prices unchanged. (Wholesale prices, per ton, carload lots, San Francisco.)

Beet Pulp, per ton	$22.50@23.50
Alfalfa Meal, per ton	20.00@21.00
Alfalfa Molasses Meal per ton	21.00@22.00
Bran, per ton	24.50@25.50
Oil Cake	Nominal
Cocoanut Cake or Meal	23.00@25.00
Cracked Corn	40.50@41.50
Middlings	33.00@34.00
Rolled Barley	29.00@30.00
Tankage	45.00
Rolled Oats	29.50@31.00

VEGETABLES.

Eastern shipping business in green asparagus is about over, having been very satisfactory. There is still a good local demand, partly for the canneries, and choice stock brings very satisfactory prices. Rhubarb shipments also are over, and the market is weak. Summer squash is in good demand at an advance over the last quotation, and beans and peas hold up well. Corn is offered freely, and prices are rather easy for this season.

Cabbage, ctl.	$1.75@2.00
String Beans, lb.	5 @10 c
Summer Squash, box	1.00@1.25
Peppers, bell, lb	.25 @30c
Rhubarb, box, Bay	.40 @85c
Asparagus, box	1.00@2.00
Artichokes, doz.	.40 @50c
Lettuce, small, crate	75c
Eggplant, lb.	.15 @20c
Peas, sack	1.00@1.50
Tomatoes, lugs	1.50@2.00
Green Corn, doz	.10 @25 c

POTATOES AND ONIONS.

New onions are still rather scarce, consisting mostly of Bermuda seed stock, which is firmly held. Australians are slow and easy, while good storage and Oregon stock bring stiff prices. New potatoes show a wider range according to quality, and Oregons are higher.

New Potatoes, ctl.	$1.50@3.00
Oregon Burbanks	2.00@2.10
Delta Burbanks	Nominal
Onions, storage	1.75
Onions, Oregon	1.75
Australian	2.50@2.75
Bermuda seed	1.25
Garlic, per lb.	5@9 c

POULTRY.

California stock is now coming in large quantities from many producing districts, causing a decided slump in prices on all grades of chickens. Broilers and fryers have dropped very sharply in the last fortnight, and hens clean up slowly at lower prices. Roosters still do fairly well, but the values are easy. Ducks are lower, and so are Belgian hares, with rather light demand.

Broilers, 15 lbs. to doz and less, lb.	22@23c
do, over 15 lbs. to doz.	25@30c
Fryers	25@30c
Hens, extra, per lb.	19c
Small	17@18c
Smooth Young Roosters, per lb.	25@28c
Squabs, per doz.	2.00@4.00
Geese, per pair	2.25@3.00
Ducks, young, lb	17@18c
Old	16@17 c
Belgian Hares	10@11 c

BUTTER.

The general range of values shows little change. The general Eastward movement has slowed down, but there is still some inquiry, and a large Navy order for shipment East is being packed in Humboldt county, greatly curtailing local receipts. It is reported that stocks in cold storage in the East May 1 were 4,000,000 pounds less than a year ago.

	Thu.	Fri.	Sat.	Mon.	Tu.	Wed
Extras	24	24	24½	24	24	24½
Prime Firsts	23½	23½	23½	23½	23½	24
Firsts	23	23	23	23½	23½	23½

EGGS.

Fluctuations have been slight, but extras are a little higher than last week, as there has been a little demand for shipment, and much of the output at present is being taken for storage.

	Thu.	Fri.	Sat.	Mon.	Tu.	Wed.
Extras	21	21½	21	21½	22	22
Sel. Pullets	19	19½	19½	19½	19½	19½

CHEESE.

Monterey cheese has been marked up a little on lighter receipts, while grades quoted on the Exchange are unchanged.

Y. A.'s, fancy	17½c
Fancy Calif. Flats, per lb.	12½c
Monterey Cheese	16@17c

LARGE DEMAND RAISES PRICE OF BEANS.

The advance in beans, which has been anticipated for some time, has taken place this week, all the more popular varieties being marked up. Small whites took the lead in the advance, being very scarce in all markets, and the Eastern demand is strong. In the Portland market they have reached the record price of 8¼c per lb., and the local value is nearly up to the highest former mark. Pink beans also are moving well at advanced prices, and bayos are now participating in the general activity. Limas so far show no great strength, but receive more attention and have been marked up a little. In most varieties of beans, supplies in growers' hands are unusually light for this time of year, and while there is a fair supply of some kinds held by dealers, they hope to clean up before the new crop appears. Shipments from the State have been much larger than last year. From one warehouse there were shipped during the week 25,000 sacks. It is stated that one broker has an order for 1,000 tons of limas which he is endeavoring to fill.

DRIED FRUITS.

Packers have been doing conside able contracting of late, but ju now there is a lull in the movemer both at this end and in the East. O apricots are scarce and firm at slight advance, and new stock is b ing contracted at high prices, owi to the very short crop. Future fi also are high, though the top fi ures are considered extreme by so packers. Considerable buying, ho ever, has been done at these figure and the trade is anxious to get a that can be had. Prunes have bee receiving an unusual amount of a tention for the last few weeks, as sudden realization of the shortage spot stocks in the East, and t firmness with which the Coast offe ings were held, caused a demand f prompt shipment, while the prospe of a serious shortage brought on strong speculative movement, which packers made many contrac for fruit and also bought back mar contracts placed at lower figur with the trade. It is now believe that some are long on prunes, an buying has been largely interrupte for the present; though with t crop pretty well controlled and muc below normal, no decline is expecte Spot peaches are in limited suppl and for the most part in stron hands, while the new crop is agai slightly higher, as no heavy produ tion is expected and packers are co ering their requirements. The Ne York Journal of Commerce says:

"Future prunes are in an unse tled state, so far as market cond tions are concerned. Most packer are holding at the 5c. basis for 191 pack, and declare there is no possibil ity of the market going lower.

An estimate was received in th trade from a well known Coast con cern in which the new crop was plac ed at 130,000,000 pounds, with th possibility that it might run as hig as 150,000,000 pounds. Heretofore the general trade estimate has bee 110,000,000 pounds. The trade her was unable to decide whether or no Coast operators, because of improv ed outlook, were more inclined to re vise their views or whether there wa a deliberate effort to bear the mar ket. In the meantime, spot prune are active, with a good general de mand from jobbers, on the basis o 9c. for 40s, 8c. for 50s and 7½c. fo 60s.

"Concerning the raisin situation it is stated at the office of the asso

Special Livestock Market Report.

Drying pastures are sending heavy offerings of cattle and lambs. The latter have been coming also to escape foxtail, but the heaviest shipment is over this week. Not many sheep are coming. Cattle are weak and the market is being flooded with dairy calves. Some soft dairy hogs have been coming and the market is weak tending to lower prices.

WOOL.

The only movement of fleece wools is of the choice grades from north of a line through San Francisco and Sacramento. Some wool is being held around Davis by growers, one of the largest of whom is still holding three or four clips. The general market is strong with no advance. Foreign markets are strong with nominal advances.

ition that all orders of wholesale ocers are being confirmed, provided ey are within range of the legiti- ate needs of such houses. The ob- et of the association's present at- ude, it is claimed, is to discourage tside speculation and to effect a tribution through normal chan- ls into actual consumption. The licy is further to have the jobbers der only for a short time ahead, that their stocks may be continu- y replenished from fresh arrivals. eculative houses are still seeking obtain confirmation, but so far ve been unable to obtain any. ricots are firm, with a good dis- bution into consuming channels."

CITRUS FRUITS.

The eastern auctions are holding well on citrus fruits, which means at the balance of the navel crop ll be marketed at fair prices. At w York on Monday, May 8, the ctions averaged for navels from .70 to $3.10 per box; for valencias m $2.85 to $3.25; for bloods $1.35 $2.90; for seedling $1.50 to .60; for sweets $1.15 to $2.35; Michaels $1.30 to $2.75; lemons .70 to $2.70 per box. Other auc- n points paid about the same aver- e as the above. The California p of navels has been nearly all ipped and valencias will soon have clear market.

In San Francisco local trading in citrus lines has been of an ordi- ry routine nature for the past ek, with ample supplies and prices e same as for some time past.

HORSES.

Speculators buying horses for military use have been very active in California for some time, and are still buying many horses in the northern part of the state, though the available stock in many quarters has been well cleaned up. Such sales are reported at $100 for good unbroken cavalry horses. There is no demand whatever for such stock in the local market, though a few are being sold here for shipment; and there is also some call for cheap horses, largely from country buyers. (Approximate values in San Francisco, based on auction sales.)

SPECIAL DECIDUOUS MARKET REPORT.

By J. L. Nagle.

Sacramento, Cal., May 8, 1916.

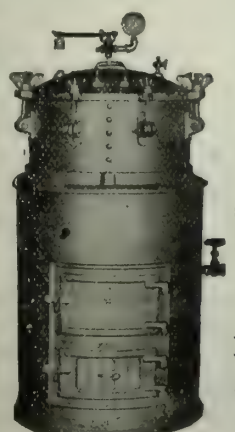
There has been practically no change in California crop conditions since our last report, with the exception of the Tokays in the upper San Joaquin and Sacramento Valleys, which were seriously affected to the extent of about 85 per cent in some districts and 30 per cent in others by the frost of Sunday morning. The American River district, Orangevale, Fair Oaks and Florin, were probably more seriously injured than any other district, although Lodi, Woodbridge and Acampo were affected in spots. Practically no damage has been done to the grapes or other fruits by frost in the Fresno district. There will be, however, a slight shortage due to excessive and continual north winds.

Eastern markets continue to pay satisfactory prices for cherries, which seems to indicate a forerunner of the condition of the season throughout.

The following prices have ruled for the week:

New York—Chapmans averaged $2.75; Tartarians, $3.55; Burbanks, $3.35; Rockports, $2.15; Knights Early, $2.50; Guignes, $2.35.

Philadelphia — Chapmans, $2.65; Tartarians, $2.70; Knights Early, $2.50.



Boston — Chapmans, $2.12; P. Guignes, $2.10; Tartarians, $2.17; Knights Early, $2.00.

Chicago—Chapmans, $2.35; Tartarians, $2.40; Rockports, $3.15; Knights Early, $2.10.

Orchard and Hotel CANNING OUIFIT NO. 2

OUTFIT NO. 2 INCLUDES:

- 1 18 x 18-inch Retort with Cover, Packing, etc.
- 1 Petcock
- 1 Choice of either Steam Gauge or Thermometer.
- 1 Galvanized Crate.
- 1 Triangle (to support crate).
- 1 Set No. 2 Crane Irons.
- 1 No. 7 Blast Furnace.
- 1 Tipping Copper.
- 2 Capping Steels (Reg. Sizes).
- 1 Thumb Nut Wrench.
- 2 Pair Can Tongs.
- 10 Feet Wire Solder.
- 1 Flux Brush.
- 1 4-ounce Bottle Liquid Flux.

- 1 Firebox.
- 1 Shaker Handle.
- 6 Canners' Knives.
- 1 Book of "National" Recipes.

Price, $85.00

California Almond Growers' Exchange
San Francisco, Cal.

Publisher's Department

The Jersey sale at the Rancho Dos Rios last Saturday was quite successful, and we are pleased to note that buyers from over the State were present to get this stock, for which they paid good prices in nearly every instance.

At no time in the history of the State has there been so much interest in pure-bred hogs as at this time. From all sections we hear of breeders preparing to enter their stock in competition at the State Fair this coming fall. Some of the finest hogs in the U. S. will be shown at that time.

Our "California Hog Book" is still receiving compliments from its critics. Here is one from the Modesto Herald: "The latest work of interest to California farmers issued from the press of the Pacific Rural Press is the 'California Hog Book' by W. S. Guilford. This book is devoted to a review of all conditions confronting the hog raisers in California and contains a great deal of valuable information and advice. It should be of great value to anyone interested in this industry, which brings good financial returns when properly taken care of. To our dairymen who raise hogs as a side line this book should be of especial value." Price $2 postpaid.

The Pacific Rural Press is generally recognized as being one of the most influential and authentic horticultural and agricultural journals in circulation, and an article in its columns is sure to attract attention of its thousands of readers.—Tehachapi Tomahawk.

Of the six agricultural books that we publish our latest, "Second Thousand Agricultural Questions Answered," is the largest seller at this time. This book should be handy to get at on every farm. It answers the questions that come up every day, and if you have the book you can refer to it and solve the difficulty at once. By its use many dollars may be saved every month. Price $1.50 postpaid.

MISCELLANEOUS.

EVERY SIZE WROUGHT IRON WATER PIPE and screw casing water pipe, guaranteed as good as new. Prices right. Send for catalogue. We beat no one; everybody gets a SQUARE DEAL. Weissbaum Pipe Works, 160 Eleventh Street, San Francisco.

GAS ENGINES—I can furnish rebuilt Fairbanks, Morse, Otto, Peerless, Samson, Union and other good makes in all sizes. All investigators buy and all buyers are delighted. Pay when satisfied. J. J. Pottinger, 189 2nd St., San Francisco.

IRRIGATION EQUIPMENT—For pumps, oil engines, gas engines, friction clutch pulleys, etc., write us. We can save you money. Commercial Iron Works, 481-497 Fifth St., San Francisco.

SECOND-HAND WATER PIPE and Screw Casing. New threads and couplings dipped in hot asphaltum. All guaranteed. Send us your inquiry. SHECTER PIPE WORKS, 306-8 Howard St., San Francisco.

FOR SALE—Used Ranch Tools, Windmills, pumps, engines, new galvanized tanks; 1000, $22.50; 2000, $32.50; guaranteed. Save half. Demmitt Company, 120 North Main, Los Angeles.

REBUILT GAS ENGINES from 3 to 50 h. p. Thoroughly overhauled and guaranteed. Write us you requirements. A FEW SPECIALS: 6 h. p. 2-Cycle Gas Engine, $125; 15 h. p. Field Gas Engine, $350; 35 h.p. Best Gas Engine, old but reliable, $200; 50 h.p. Otto Gas Engine, $900. Mechanical Installation Co., 181-89 Second St. Motors, Gas Engines bought, sold and exchanged.

"SMITHS' PAYS THE FREIGHT."—To reduce the high cost of living, send for our Wholesale to Consumer Catalog. SMITHS' CASH STORE, 106 Clay St., San Francisco.

OFFICE STATIONERY—Catalogues, general commercial printing. Good work, low prices, prompt service. Mail orders. G. C. Gallagher, 436 Sacramento St., S. F.

LIVING EXPENSES REDUCED THROUGH CO-OPERATIVE BUYING—Write for catalogue and particulars. Pacific Co-operative League, D236 Commercial St., S. F.

BUY ROASTED COFFEE WHOLESALE—Best, 10 pounds, $3.00 delivered. Order with remittance. WM. J. SCHROTH CO., 112-B Market St., San Francisco.

PATENTS THAT PROTECT are procured through Pacific Coast Patent Agency. Savings and Loan Building, Stockton, California. Established fifty years.

CONCRETE MIXERS—2 brand-new mixers at manufacturer's prices. Write at once. Commercial Iron Works, 481-497 Fifth St., San Francisco.

TREES AND PLANTS.

FOR SALE—Manzanillo Olive Trees, budded on Picholine seedlings. Younger and heavier bearers, longer lived and more vigorous trees than trees raised from cuttings. Geo. E. Rice, R. 1, Box 76, Reedley, Cal.

SWEET POTATO PLANTS—Yellow Jersey, Red Jersey, White Pacific. Strong plants; inspected. $2 per 1000, postpaid. R. M. Plympton, Arroyo Grande, Cal.

PEDIGREED BURBANK FRUITING-FODDER—Cactus Plants. 100, $7.50; 1000, $45; 10,000, $300. El Campo Co., 227 Story Bldg., Los Angeles.

FOR SALE—300,000 yellow Jersey sweet potato plants. Prices from $2 to 50c per thousand. For information, write Parker Bros., Hemet, Cal.

A-1 NAVEL, VALENCIA and LEMON trees, $15 per hundred, packed in moss. Less than 100 lots, 18c each. J. C. Johnson, Azusa, Cal.

FOR SALE—Spineless Cactus Plants. Prices right. B. C. Englert, Byron, Cal.

WELL BORING — Water guaranteed. Low prices. David Bahrs, Marysville.

SEEDS AND BULBS.

WE BUY ALFALFA SEED containing Dodder, Mustard and other noxious seeds. Send us sample of any high or low grade seed you may have; also of mustard,urr and sour clover seed, flax, etc. Signed Mercantile and Warehouse Co., Fifth and Poplar Streets, Oakland, Cal.

SEED BEANS—We have choice Red Mexican and Buckeyes grown on sand land, producing a heavy crop. Well cleaned and in good order. Write for prices to THE GRANGE COMPANY, Modesto, California.

LAND FOR SALE

FOR SALE—20 acres, 6 miles from Turlock, well equipped poultry ranch. Most of feed can be raised. Five acres to good alfalfa. Good house and barn. Three good horses and five cows. $3500 cash or $4000 with terms. A. Lavander, R. 3, Turlock.

FREE HOMES—SAFE INVESTMENTS without residence. SCHOOL, STATE, INDIAN, GOVERNMENT Lands. YOU have 9 rights, NOW worth $1,000 each. Booklet 16 FREE. Write JOSEPH CLARK, Sacramento.

EASTERN KANSAS FARM—160 acres, well improved. Trade for small California farm. J. L. Buck, Chowchilla, Cal.

FORTY ACRES improved, very level, no alkali, in crop; at price raw land. Might take some trade. John Lockridge, Chowchilla.

FOR RENT OR SALE—Land for Asparagus, Dairy or Beans. Address James M. Berry, Thornton, San Joaquin County.

WANTED.

FOUR MILKERS WANTED FOR PURE BRED HERD—Flat hand, dry-hand milkers, for Holsteins. Must be energetic, clean, intelligent men who will work for our interests. We want men who will stay and who take pride in their work and in our cows. None but good, clean milkers of good habits need apply. HENDERSON COMPANY, Sacramento Bank Building, Sacramento, California.

WANTED—About sixty young men and women to enter the Western Normal to prepare for teaching, or to secure a high school education in the shortest possible time. Western Normal graduates secure and hold good positions. Time and money saved. For information address Western Normal, J. K. Humphrey, Principal, Stockton, Cal., Box 704.

Announcing A Mid-Year Model

Mitchell $1325

Combining the Best from 257 Show Models

John W. Bate Saves 20%

And Thus Gives You 26 Extra Features

This is to tell you how factory efficiency has cut 10,000 costs on the Mitchell car.

How we build it for half what it would have cost, even in 1910.

How we build it for 20 per cent less than other factories can build it now.

And how, by those savings, we give you 26 extras which you don't find in other cars.

In 1903—when Mitchell cars were first built—we brought John W. Bate to Racine. He was even then the greatest expert in factory efficiency in the metal-working line.

Our vehicle factory was then 70 years old. It was a model efficiency plant. And we started then to make our motor car plant the most efficient of its kind in America.

10,000 Costs Reduced

In the 13 years since, Mr. Bate has reduced more than 10,000 motor car costs.

He built this whole plant—covering 45 acres—so cars could come through without the loss of a second. He equipped it with 2092 labor-saving machines—the most efficient machines that are known in this industry.

He has eliminated from the Mitchell almost every casting. In place of them he uses 184 drop forgings, which are three times as strong. Also 256 steel stampings, tough and stanch.

He has invested $5,000,000 so fine cars could be built here for less than anywhere else. No other factory which builds cars of this class can compare with it.

Not One Cent Wasted

Some motor car makers buy all their parts. Most makers buy the larger share. But 98 per cent of this Mitchell car is built in this model plant. Thus we save under others from 20 to 40 per cent.

Part of this saving is shown in our price. No other high-grade Six of the Mitchell size sells at the Mitchell price.

The rest of the saving pays for 26 extras. We give you 26 features which others don't offer. No car in our class has more than two of them. No car at any price has more than four.

Go see these extra features. You will want every one of them. And you will not, we think, buy a car which omits them.

257 Cars in One

This New Mitchell model came out April 15—from four to eight months later than other current models.

This model was completed after the New York Show. There our experts and designers examined 257 new models. And they picked out the best of the new styles in all of them—from ours and from others—in body design and equipment.

Thus the New Mitchell combines all the best things brought out at the New York show. Its lines and its luxuries—its new ideas in equipment—are the finest shown.

All this in addition to the 26 unique features which other cars don't offer.

Where Mitchell is First

In ease of riding the Mitchell car stands first. Any Mitchell dealer can prove that in five minutes. No other car in the world contains the Bate cantilever springs.

The Mitchell rides the roughest road as a boat rides waves. This comfort will astound you.

The Mitchell stands first as regards durability. Six Mitchell cars have averaged 164,372 miles each. In ordinary driving that is more than 30 years' service.

The Mitchell is the easiest car to drive. That's because of its oversize steering parts, fitted with ball bearings.

The Mitchell is long and roomy—127-inch wheelbase. It is powerful. In every way it gives greater value than other Sixes, because of our factory economies. And it includes 26 features—all costly and important—which other cars don't offer.

Let the nearest Mitchell dealer show these extras to you. He has this new model now. If you don't know him, ask us for his name.

Six cylinders—high-power, high-speed motor—127-inch wheelbase. Anti-skid tires on rear. Complete modern equipment, including motor-driven tire pump.

$1325 F. O. B. Racine for 5-Passenger Touring Car or 3-Passenger Roadster. 7-Passenger Body $35 Extra. New Mitchell Eight, $1450 f. o. b. Racine.

Mitchell-Lewis Motor Co.

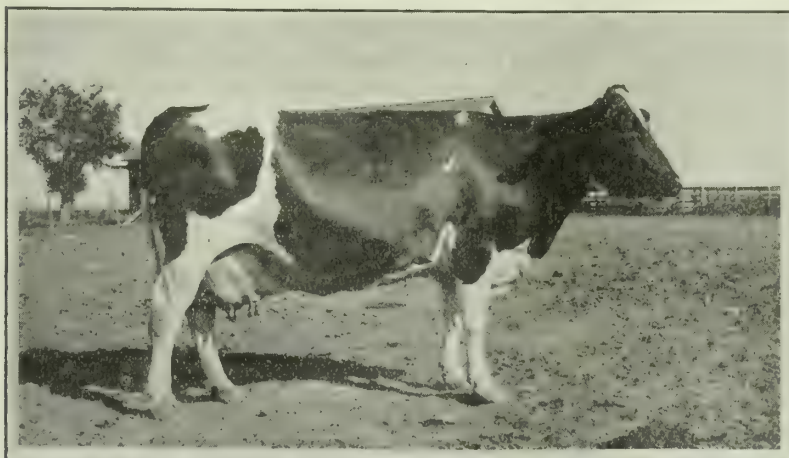
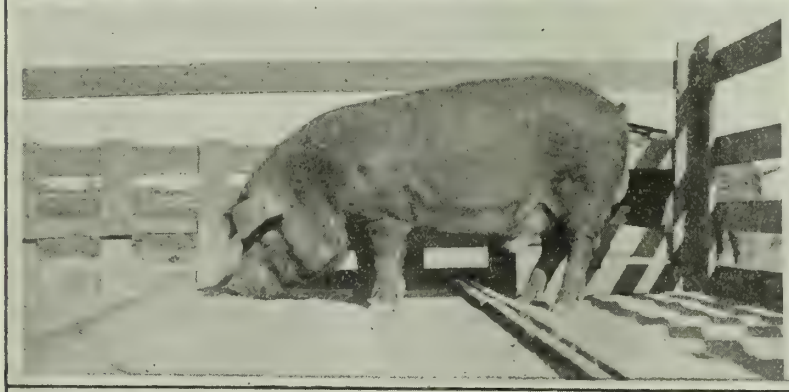
Livestock in the Sacramento Valley.

A survey of livestock development in one of California's interior empires indicates the permanent nature that great industry is assuming in its various branches.

LIVESTOCK in the Sacramento Valley is getting upon a more permanent basis. Such is the impression of one who has made an attempt at studying the present conditions from Sacramento to Red Bluff on both sides of the Sacramento river.



To the writer's mind this does not exempt the two branches of the livestock industry which have always been considered permanent—sheep and beef cattle, for the present prices of wool and meat are encouraging the stock man to look a long way into the future. And there can be no better evidence of permanency than that this condition exists.



Sheep Sensational.—Perhaps the most sensational thing about the livestock industry in the valley at this time is the sheep business. From north to south you hear it discussed, not only among men with large land holdings, but among the small alfalfa farmers as well. The price of lambs is, of course, the influencing factor; and but for the depleted supply of ewes and the exceptionally high price of the few obtainable, there would be a larger influx into the sheep business than ever before in the history of the valley. Perhaps there will be anyway.

To the alfalfa grower, adjacent to the range sheep man's winter quarters, the situation is doubly alluring, for he can relieve the range man in the fall of his older ewes with poor teeth and backs, and breed them to bucks of the mutton breeds, not only realizing a nice profit on the ram lambs he sells the following spring and on the enhanced value of the alfalfa-fattened ewe as well, but he has also laid a foundation of mutton-producing ewe lambs for future work.

That this method is not mere conjecture may be seen in Tehama county, where a few far-sighted men with alfalfa land are already making the proposition pay with as many as 10 ewes to the acre.

It is not necessary to relate here the changed atmosphere that has come over every range sheep district this year. It is the sheep man's heyday, but in the Sacramento valley you find more than satisfaction among the large flock masters. You find a disposition to improve both in breeding and methods—as one man put it "so that we won't have to handle more sheep to make larger profits and in order that we may make as much from three thousand sheep as we now make from three times that many." These men realize that cheap range is "pinching out." They are preparing for a sane future policy.

Purebred dairy cattle, swine and sheep like the above are becoming greater factors each year in forming permanent agriculture in the Sacramento Valley.

Beef Improving.—While not so spectacular as sheep, the beef cattle men are also experiencing a change of heart, and not only do you find new purebred herds being established and older ones being strengthened, but what is equally important, you find the man running cattle on cheap lands for the butcher, demanding purebred sires.

This condition is not coming about solely for immediate profits, but for the establishment of herds that will meet the changing conditions of the future, and again we believe that indicates permanency.

Permanent Dairying.—Like all other alfalfa-growing areas, dairy cattle and hogs are being considered the chief reliance for the smaller land owner. Like other irrigated districts in California, it has taken some time for these branches of the livestock industry to assume a permanent nature, but there are many circumstances which lead one to believe that the "in and outer's" day is about past in the Sacramento valley as far as dairy cattle and hogs are concerned, or at least that portion of it where alfalfa development has been completed.

In the valley at this time are three cow-testing associations. Each one is serving a mission based on permanent work for the future: the building up of dairy herds.

In the district served by the Gridley Cow-Testing Association, the disposition in past years was to sell cows when hay was high and buy cows when hay was low. No permanent improvement resulted; but in less than two years, the condition has changed. Not only is the yield per cow higher, but it promises to be increased still further because purebred bulls are rapidly transplanting the scrub. As a further evidence that dairying, and that always means hogs, has come to stay in this district, there have been 15 silos erected in the section during the last year and a half. Silos

California Weather Record.

The following rainfall and temperature record is furnished the PACIFIC RURAL PRESS by the United States Department of Agriculture Weather Bureau, at San Francisco, for the week ending at 5 p. m., May 16, 1916.

STATIONS	Rainfall Data: Past Week	Seasonal To Date	Normal To Date	Temperature Data: Max'm	Min'm
Eureka	0	38.53	43.88	54	40
Red Bluff	0	19.93	24.12	86	48
Sacramento	0	18.19	19.65	82	44
San Francisco	0	27.12	21.80	74	48
San Jose	0	16.30	16.41	78	38
Fresno	0	11.72	9.38	86	42
Independence	0	10.33	9.23	80	—
San Luis Obispo	0	26.85	19.99	74	40
Los Angeles	0	19.39	15.42	76	52
San Diego	0	12.54	9.83	70	54

THE WEEK

WE SURELY did some prophecy in our last issue when we said the rural credit bill would go through the House of Representatives on political rapids. But we claim no originality in such a prophecy. When a motor boat starts down stream in a presidential year with her tanks full of political distillate, and her batteries sparking like a broken high-tension wire, there is sure to be some speed—if no rocks intervene. In this case there could be no rocks, for they had been blasted by the platform dynamite of 1912—elephant, donkey and moose, working in rivalry to clear the streambed. The way it worked is shown by only five negative votes in the Senate, as mentioned last week, and only ten votes opposed to the bill in the House—which is even nearer unanimity. From the outline of the bill passed in the House, which comes by wire, there is no great departure from the general plan of the Senate bill (sketched in the Rural Press of March 18), but the House bill has many details which make the enactment broader in its favors to borrowers. It excludes unlimited liability of borrowers; it permits loans to 60 per cent of land value and 20 per cent on improvements, which the Senate refused to recognize as security; it gives a majority of a loan committee power which the Senate restricted to unanimous vote; and it specifies "agricultural value" as a basis of security instead of "actual earnings," which the Senate prescribed; it makes the minimum loan $100 instead of $200, and it makes delinquent interest payable at contract rate (not over 6 per cent), while the Senate prescribed 10 per cent for default payments. Such items in the House bill make it easier for borrowers than the Senate bill, and all such issues must be adjusted in the joint-committee, which will probably tackle the proposition immediately—for the calendar is rapidly moving to the national convention period.

FOUNDATIONS OF RURAL CREDIT.

THOSE who are disposed to express doubt of the desirability of rural credit provisions seem anxious to insist that credit is a "purely business proposition," whether it be rural or otherwise. We are rather inclined to grant that claim, providing we can agree with our opponents as to what a "pure business proposition" is. Is "ordinary banking" such a proposition? Well, do not our enemies recognize the fact that "ordinary banking" is not being done as it used to be? Have they not noticed that city banking is far more of a social institution than it used to be? Is not the up-to-date banker who goes glad-handing through the clubs, chambers of commerce, exchanges, etc., and gives his humanity more play by heading subscription lists for art-galleries, recreation grounds, or by practicing statesmanship as a delegate to a national political convention, doing his banking business very differently from the way his last generation predecessor did it—sitting behind his grilled protection "like an image made of mud, which they called the great god Buddh?" Is it not clear that "pure business," if it means exclusion of human interest and humane motives, is out of date? And is it not true that a business proposition is more apt to be pure, and profitable, too, if it reckons with the public as composed of men and women with souls and consciences and emotions? Surely, this is true; and the strangeness of it is that credit as a "pure business proposition," according to the definition which the objector has in his mind, was a purely American proposition and caused us to be laughed at by European bankers, who build their banks with picture galleries, reception rooms, kitchens and wine-cellars, because they know that ledgers and coin trays and vaults are only the skeleton of real banking, which sways human interests and wields dynasties. The change which is coming into banking the world over is recognition that swells, nobles and rulers are but a small fraction of the world's population, and that the real force to be catered to and encouraged lies in the advancement of the common people. Obviously, the attitude of bankers everywhere is changing and adapting itself to a new and financially sounder constituency than the old exclusive set with which banking was formerly largely done. It is therefore pure business for the modern banker to do as he is doing—continually getting closer in sympathy and interest to the industrial wealth-producers and serving their needs and desires financially. Why, therefore, should the editor of the Journal of the American Bankers' Association write in this way:

It would be a great relief to have rural credit divorced from the multiplicity of uplift and reform schemes with which it has no real connection. Just at present it is so loaded down with salvation enterprises that its creator would not recognize it. About everything from preparedness to unemployment is masquerading in the guise of rural credit.

It has evidently not yet dawned upon the writer of the above morsel that rural credit is really an all-pervading financial question, and that the proper adjustment of it underlies all the popular movements to better the conditions of humanity, which he suggests, and others far wider in their reach and influence. He perhaps does not know that rural credit arose as a salvation-enterprise, and that its creator, Frederick the Great of Prussia, enforced it to enable his devastated and impoverished country to feed his people, who were starving in unemployment because the war left them neither habitations, tools nor seed. Our contemporary should learn that rural credit arose because it was the only solution of the problems from which he now seeks divorce for it. And if he should reduce rural credit to the standards of old-fashioned American banking, what would he do with it? Modern bank policy and management are getting away from those old standards as fast as possible, and rural credit discussions are helping them to do it. Bankers are, in fact, getting into rural credit operations as fast as they can, just as European bankers did before them, and they are taking it with all its humanities, just as they are all other kinds of banking business today.

THE WILLOWS GET-TOGETHER.

THE irrigation assembly at Willows last week, of which an outline was given in our last issue, was an event most excellently planned, most rationally endowed with fundamental purposes and most successfully carried out. The instruction by observation-pilgrimage to Orland was limited somewhat by the north wind prevailing, which kept some of the residents under shelter, but the more hardy, including visiting editors and experts, went through on schedule. The latter are a windy sort anyway, and not frightened by a little extra activity in their own element. We can not praise too highly the insight and wisdom which planned the event. It is perfectly clear that the solution of the large irrigation problems of Glenn and Colusa counties must be sought through popular co-operative effort. Large corporate undertakings have failed—partly, because of lack of popular support; partly, perhaps, for other reasons; it does not now much matter why or what. The way to save what was good and valuable in the past and to ensure what is good and possible in the future, is to get all the land, all the water and all the people together. A few scores of people representing the honest interests in the district, from the top of the courthouse to the lowest rice-paddy on the "goose lands," recognized the fact that co-operative fervor and energy are the only cure for corporate disappointment and distress and took up enthusiastically the plan of organization and promotion proposed by D. W. Ross, which is now well started on its way toward realization. The event of May 11 was to popularize this organization-undertaking by good talk about the principles on which co-operative effort rests and by good demonstration of what beneficent co-operation of people, land and water has done at Orland and at other points in the district. The details and personalities of the event belong to the county papers, which will doubtless fully set them forth; the general significance of the event is the point of emphasis for the people of the State at large, to whom our announcement comes, and it is that aspect of the events which we would like to enforce.

JOY-RIDING AND FEASTING.

THERE were two easily recognizable manifestations of the breadth and depth of co-operative fervor which is now burning in the district. One was placing all the automobiles in

the region at the service of all the people. It was not a proposition to transport invited guests, but cordial invitation was extended to every resident who lacked conveyance; it was the plan that everyone who wished to see what water had wrought on arid soil would be carried to such edifying enjoyment. Groups of people afoot gathered at cross-roads and were taken into the capacious vehicles as they approached such assembly points. It was a grandly democratic idea, and so far as we could see it worked out as planned, for we never saw clearer facial expressions of good spirit and neighborly feeling—except, perhaps, as faces opened over the popular feast, to which, also, all were cordially invited.

And this feast was surely a wonder. There were seven tables, each carrying 102 plates: 714 openings for the first attack, and we do not know how many times those plates were turned over. At each onset there were surely a thousand present, eating or ministering—everything free and all welcome. This was the gift of the whole community to its own people—the ladies, in organizations and individually, creating this supreme manifestation of cordiality and the co-operative spirit. We have seen many rural communities getting together, but never a greater popular joy-break than at Willows.

ALTRUISTIC ORATORY.

AS THE feast progressed there was an outburst of altruistic oratory which we never heard surpassed, either in style or volume. The speakers were Superior Judge Finch of Glenn county; Col. Harris Weinstock, State Market Director; Max Thelan, president California State Railway Commission; Ellwood Mead, Professor of Rural Institutions, University of California; Merle B. Moon, president of the organization of bond-holders now owning the property of the promotion lights which failed; A. B. Humphrey, well known irrigation farmer of Sacramento and San Joaquin counties; James Mills, colossal orchard planter and Regent of the University. Of course, thousands of our readers know that these men can speak, for they have heard them. To us the remarkable thing was that not one of them said a word about the particular line of progressive work in which he was personally engaged, but all, with one accord, rose to the heights of broad interests of humanity toward which enlightened efforts for individual success and prosperity must advance. An impressionable listener, such as we confess ourselves to be, could not avoid being deeply moved by the genuineness of interest, sincerity of motive and breadth of altruistic purpose which all these speakers manifested. As we sat amid their entranced listeners, hearing also the dry north wind whistling around the enclosure, we could but feel moistened and refreshed by the gentle shower of the milk of human kindness which fell from their winged words. They all spoke of the joy, force and accomplishment of the co-operative spirit in a community; how it could reclaim deserts, spread abroad success and prosperity—filling waste places with profitable production and trade which would build homes, schools and churches, thus establishing communities with good name for industry, enlightenment, and the joy of living nobly and well. And all these things come most quickly and abundantly to a community in which the rights of all are conserved and opportunities for all, who deserve them, are opened by co-operative enterprise and effort for improvement and development.

ALTRUISM THE REAL THING.

WE HAVE to confess that we like altruistic oratory. In the Willows incident we enjoyed it because the speakers seemed to rise above their ordinary discourse and to commune with their higher selves. Though they are leaders in their particular crafts they said not: "See what we have done for you or can do for you," but "See what you can do for yourselves by exalting the community spirit. Look about you and see what came of projections for personal aggrandizement which overreached themselves; partly because their aim was wrong, partly because their foundation was inadequate, but chiefly, perhaps, because there was irreconcilable conflict between the interests of man and man. The remedy is co-operation—each one making his contribution to and drawing his reward from the fair distribution of rights and ownerships of water and land and fair assessment of the costs thereof to every man, according to his capital and labor, with no extortions or exactions tolerated from either."

This is the doctrine which was preached at the Willows feast, and it is a doctrine which not only the people of the Willows district, but the people of all the world, need. As the sound of the oratory died away, a higher note was ringing in our ears:

> Behold, how good and how pleasant it is for brethren to dwell together in unity.
>
> It is like the precious ointment upon the head, that ran down upon the beard, even Aaron's beard; that went down to the skirts of his garment;
>
> As the dew of Hermon and as the dew that descended upon the mountains of Zion.

Altruism, honest and sincere, is about the only thing which is godlike, and therefore powerful and enduring in the world. And yet, some seem to believe that it makes for weakness and dependence in mankind. Far from it; altruism makes for strength; it is the only force which can be counted upon to stand as preparedness against individual and national inhumanity and injustice.

Queries and Replies.

Querists must give name and address.

Millet After Alfalfa.

To the Editor: I am going to plow up some alfalfa and sow the ground to millet. Will you kindly let me know if the millet will do well on old alfalfa land, and if the millet is good for milk cows to make them produce butter fat?—I. S., Modesto.

To prepare land for a summer crop of any kind the alfalfa should be plowed under in the fall or early winter, disked well and allowed to lie to rot as much rough stuff as possible before spring planting. Planting on spring-broken alfalfa is apt to make the summer crop dry out badly unless you look sharp with the water. We do not know exactly what you mean by millet—there are several millets and none of those known to us is as good for cows as kaffir, milo, feterita, or soudan grass. If other growers favor millet for cow feed we would like to know what kind they are growing.

Medicine for Morning Glory.

To the Editor: I have 15 acres of peaches, with Egyptian corn between rows, and am troubled with morning glory. Is there any way to kill this pest without killing the corn? I have been told that iron sulphate would.—J. L. W., Clements.

Iron sulphate sprayed on the leaves of morning glory will kill them, but will not prevent new growth from the roots. Get what corn you can by running a flat-tooth weed-cutter under the surface once a week—never allowing the "glory" to show green. But peaches, Egyptian and morning glory are a pretty heavy load, and the "glory" is the only one which will like it.

Tamale Covers.

To the Editor: Are corn-husk tamale covers salable, and how are they prepared for the market?—Grower, San Jose.

There is quite a quantity of tamale covers used in this State, both in the larger towns and the greater cities, and they are produced both by small private parties and by factories of considerable capacity, for the trade. An intending producer should locate these by inquiry in his market town, and secure a contract if possible, for it is usually not wise to put time upon a special product of this kind without knowing beforehand who wants it and what the price will be. For tamale wrappers, a variety of corn with a thin paper-like husk is required. Two or three hundred pounds may be had to the acre, and some estimate that you can get about one ton of husks to six tons of corn. On harvesting for both corn and husks the ears are broken off from the stalk entire, and placed in convenient piles, around which the operators sit while breaking out the ears without great disturbance of the coverings, which are placed in neat bales of about sixty pounds each, in which they are sent to the buyer. The price is variable, and has ranged in different years from four to fifteen cents a pound. Therefore, it is desirable to know by the contract whether you will get enough to pay for your time.

Arrested Foliation.

To the Editor: What is the matter with my grapefruit trees? A few of them seem perfectly alive, yet have no leaves; one has begun to bear fruit without as much as a leaf in sight?—Reader.

To the Editor: I have three apple trees with some branches which do not leaf out, but still the twigs seem to be green and healthy. I have a Climax plum that seems to have the same trouble only it leaves out full, but the leaves are very small. What is the trouble and remedy?—I. W. P., Yuba City.

We do not know. We could put up a dozen perfectly good guesses, and use some very impressive words in stating them. We are only sure of two things: one is that the cause of the trouble is not where you see the trouble; that is, there is no tissue-invading disease which you can conquer by any kind of dope. The second point is that such growth should be cut back to a shoot which is starting normally, or cut back with the hope of starting such a shoot from one of the lower buds. Our observation is that, though the partially dormant shoots have green under-bark, they do not have sap-pressure enough to make healthy leaves, and such pressure must be accumulated or they will die. Such pressure is accumulated by reducing the length, and consequently the evaporation, and having fewer growing points to divide what sap there is. As for the cause, it may be in the soil or it may have been in the sky.

Citrus Spraying Advantages.

[Written for Pacific Rural Press.]

"If we can spray citrus trees as effectively for red and black scale as we can fumigate them it will be one of the greatest benefits to the citrus industry," says F. B. Browning, who has 85 acres of lemons and 70 of oranges in Orange county.

"Heretofore, fumigation has been our best hope, but my trials with spraying practically convince me in favor of the latter. In spite of all you can do, fumigation fails sometimes, and it is a great deal more expensive and slower. If spraying will do the work, we can go in and fix the first appearance of the bugs at very little cost and save the rest of the trees as well as avoiding the expense of spraying or fumigating them.

"In my work last season, principally on lemons, I had most gratifying results on trees which were simply dying back from the hordes of scales on them. Where I sprayed twice, I figure 85 to 90 per cent of a kill of red scale, and much better than that on the black. We fumigated season before last, but didn't kill 10 per cent. One tree simply plastered with red scale died back so we cut out half of the wood and the rest was nearly defoliated. But here they are (Feb. 16) coming out with blossoms ahead of the leaves and the new leaves coming on fine.

"Our scale-killing results were better on leaves and wood than on fruit. We can find scarcely any live red or black scale on the trees; but on the fruit, there are more live red scale than we like. However, even if we had killed them, most of the dead scales won't wash off and the fruit has to go into standards. Fruit with live scale must go into by-products."

The lemon orchard which was principally affected with scale, is laid out in two lines of five-acre blocks, the 80 acres running lengthwise along the base of the hills. The lines are separated by a drive, and many of the blocks are separated by eucalyptus trees. In the lower line, the lower half of several blocks are in oranges on account of the heavier soil. He is using Shurekil, which is a thoroughly emulsified oil spray.

In several of the blocks, the trees were black last fall from the plastering of black scales and the sooty fungus growing on their exudation. One fall spraying cleaned them out so that practically none could be found alive, and the fungus peeled off from the leaves, which became healthy dark green. Along the eucalyptus trees, there was a lot of red scale, and some of this is still alive.

The weather at time of spraying was damp and foggy. Mr. Browning believes from later spraying that bright weather makes spray more effective.

One block which bore a heavy crop last year and was badly covered with black scale, became infested with red scale in the fall. As black scale do not ordinarily kill the wood while red scale do, the latter are held responsible for the many small limbs killed and the many others which dropped their leaves. Perhaps the weakening due to heavy crop and last year's lack of fertilizer helped along. At any rate, having been sprayed in October and again in November, all the black and the young red scale were killed, and the February growth of leaves showed that most of the injurious scale were dead.

"We don't hope to kill all the scale," says Mr. Browning, "but we expect to hold them down so they won't hurt us. We will spray this spring all the lemons, which the scale prefer to oranges when both are handy; then we will spray the oranges. By that time, any old scale on the lemons, which have escaped, will have brought forth young, and we will spray them.

As the red scale produces three or four generations per year, and as the young are most susceptible, the trees should be watched for the time of maximum numbers of young scale and sprayed then.

An estimate places the possible Santa Barbara walnut crop at 50 per cent.

On receipt of $1.00 we will send a sample gallon can, all charges prepaid, to any express office in California."

Figures on the Fruit Embargo.

A San Francisco bank figures out what we stand to lose in exports to Great Britain if the present embargo is maintained to apply to the 1916 crop.

The situation in regard to the British embargo upon fruits is treated at length in the financial letter of the Anglo and London Paris National Bank of San Francisco.

"If all markets were free and ocean tonnage available, there would be universal confidence in a very prosperous year," the letter recites.

"While the stringency in tonnage seems to increase, all markets are as open as they were last year except that Great Britain has prohibited the importation, except from British possessions, of all fruits except Zante currants until October 31st. After that date fruits may be imported under special license to an amount not to exceed one-half of the importations of 1915.

"From the official figures of the exports of the following named fruits and information and comment from exporters in this State, we find the situation to be about as follows:

Dried Apricots.—We exported last year 25,747,690 pounds of dried apricots, all, of course, from California. Of these the United Kingdom took 7,062,390 pounds, which was not quite three tons less than the same market took in 1913. If we ship half the quantity we shipped last year we stand to lose the sale in that market of 1765 tons of an average total production in the State of over 13,000 tons.

Dried Peaches.—We exported last year 18,720,272 pounds of dried peaches as against 5,156,147 pounds in 1913. There are no official figures of the countries to which these peaches went, but an average of several trade estimates is about 6,000,000 pounds to the United Kingdom. Upon that basis Great Britain may take 3,000,000 pounds.

Prunes.—We exported last year 50,775,637 pounds of prunes, as against 94,344,157 pounds in 1913, Germany, from which we are cut off, being normally much our largest foreign customer for prunes. Of our exports last year the United Kingdom took but 15,677,907 pounds, of which the half whose sale we stand to lose is 7,838,953 pounds, or 3919 tons, which is no startling loss out of a total average production of our 72,000 tons, which, however, fluctuates rather wildly and is far below the average this year. If we sell to the United Kingdom our allotment of prunes we shall sell that country about 70 per cent of our sales in 1913 following the largest crop we ever produced.

Raisins.—In 1915 we exported 58,497,249 pounds of raisins, as aainst 16,594,394 pounds in 1913 and 21,688,429 pounds in 1914. There are no official figures of the foreign distribution of these exports, which have doubtless been stimulated by prices below the domestic market, but in the opinion of the trade our exports to the United Kingdom last year were about two-thirds of our total export of raisins. Upon that assumption, Great Britain could take from us over 19,000,000 pounds of raisins, which is in excess of our normal sales to that country.

Canned Fruits.—As canned fruits are likely to suffer most from the partial loss of the British market, we give the figures in full: In cases of two dozen cans:

	1913.	1914	1915
California product..	4,194,525	5,968,875	4,969,548
Exports from U. S...	1,877,363	2,131,741	2,394,768
Exports to U. K...	1,247,680	1,583,108	1,880,435

From the foregoing it will be seen that in 1915 the United Kingdom took 78 per cent of the total exports of canned fruits from the United States and over 34 per cent of the average production of California for 1914 and 1915. If the sales of 1913 to the United Kingdom be considered as normal, under the British order in council the United States stands to lose but 25 per cent of our normal early sales to Great Britain, for we can sell to the United Kingdom in 1916, 940,217 cases.

GRAPE SUCKERS THICK.

To the Editor: What about leaving the suckers, or water sprouts, on grape vines? My vines are 9 years old and are just alive with suckers. I have been advised by one party to let them grow, and about June 1st to tie them together over the top of vines to make shade.—A. V. W., Sacramento.

[You have so many grape sprouts either because you thinned out or cut back your fruit spurs too much, or because you have irrigated too early, or because there is already too much water in the soil.

Leave the suckers on to take the excess water until the grapes are well set, then thin off all the suckers which have not set fruit. Under your conditions, you will not need any shade, especially if you can water the vines.—Editors.]

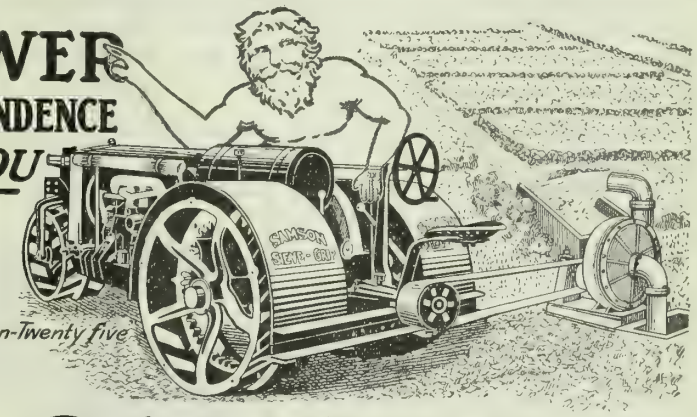
A Plain Statement of Fact

Mogul 8-16: $725 Cash f. o. b. Chicago

AT the present prices of gasoline and kerosene, no farmer can afford to use a gasoline tractor. Gasoline averages now over 100 per cent higher in price than kerosene and is likely to go higher rather than lower, in the opinions of men who know the oil business.

Again, it is neither safe nor economical to use kerosene in a tractor not specially designed to operate on kerosene. Merely changing the fuel mixer is not enough; the design of the whole motor must be changed.



Kerosene and gasoline tractors of equal power sell for about the same price and use practically the same amounts of fuel. On that basis a **Mogul 8-16** tractor saves each year, in fuel bills alone, about a third of its price. The figures prove the truth of this statement.

If you are considering the purchase of a tractor this year, give these facts careful study, from every point of view, before you spend your money.

Mogul and **Titan** tractors are designed specially to operate on kerosene and to give their users the full benefit of this advantage. There are four sizes—**Mogul 8-16** and **12-25, Titan 15-30** and **30-60.** Write us for full information before you buy any tractor.

California Garden Flowers, $1.50 Postaid Pacific Rural Press

Easy Contour Garden Irrigation.

[Written for Pacific Rural Press by H. L. Wolfsen, Colfax.]

To make gardening on a sloping piece of ground a pleasure as well as profitable, the work must be made as easy as possible.

After the soil is prepared, stakes should be placed where the contour ditch will be made. To do this, a carpenter's level is fastened to a board which has two legs of equal length. A half-inch is then added to the foot of one leg which will insure the right amount of fall to the ditch.

Spirit level on frame, to make easy the laying out of contour irrigation.

Contour so as to wind back and forth down the slope. It will depend upon the kind of vegetables grown how far the ditches should be apart. At the turns which will be quite steep, stones may be placed to prevent washing. The ditches should not be more than twenty or thirty feet long before they turn, or else the rows will be too far apart. The amount of water to irrigate with will determine how far the patch should extend.

When the ditch is being made, scrape the upper edge smooth, placing all of the soil which is taken out on the lower side and smoothing it, ready for the seeds, or young plants from the hot-beds. Water should be run in the ditch in a moderately large stream at first until it reaches the end of the ditch, and then in a small stream until the moisture shows past the seed row or small plants. Then the water can be stopped and at the proper time cultivate the lower side of the ditch with a rake. The top of the rows will not need to be cultivated unless the water has been on too long and made the soil soggy.

Once the garden is made it is very little work to keep in a tip-top condition. I have been using this method successfully for the last couple of years.

TEPARY MARKET POOR.

To the Editor: Teparies have been tried here the past two years. They do much better than any other bean. They produce 50 to 100 per cent more than blackeyes, which are the only other variety not attacked by weevils. Bean buyers at Turlock advised me not to grow them. Farmers here expect to plant 7,000 or 8,000 pounds. Is there any market or can one be developed?—J. T. B., Denair.

To the Editor: Tepary beans do exceptionally well in this section, but there is some doubt as to their salability. Teparies and blackeyes are the only varieties not attacked by weevil.—W. J. B., Atwater.

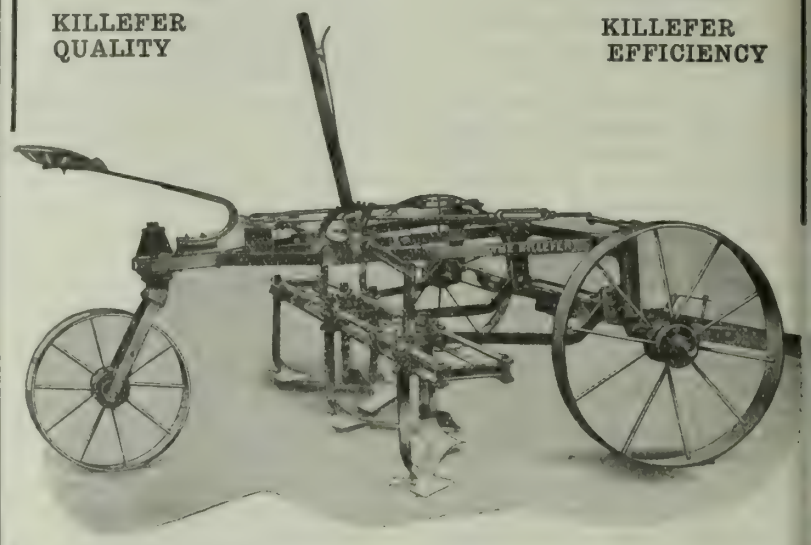
[Bean dealers advise against too heavy planting of the tepary until it can be introduced to the trade in a much more general way than has so far been possible.

From a market standpoint, it is a competitor of the "small white," being smaller in size and not quite so good in color. The small white is, of course, a standard bean in all markets and dealers argue that there is no use of introducing a new bean, if inferior to the small white, when they can secure plenty of small whites for the demand. The crop failures in the large small-white growing sections last year made it possible to introduce a few small lots of teparies at about 2 cents a pound under small white quotations.

If it were a bean of distinctive quality, or if it did not compete with such a popular variety, it would be introduced much more rapidly than it can be under present conditions. From a producer's standpoint, it undoubtedly offers inducements to many who cannot grow small whites, but no one can foresee the marketing possibilities at this time.—Editors.]

CEMENT PRICES.

To the Editor: You printed in the issue of Mar. 25 that cement costs $23.80 per ton. Is this correct?—J. N. F., Ferndale.



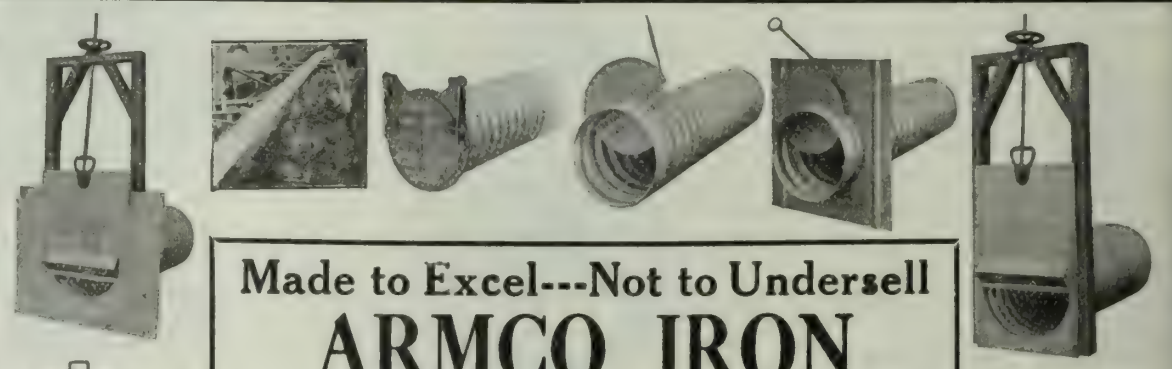
[Cement in wagonload lots is (Apr. 10) quoted at $2.55 per barrel of four sacks of 94 pounds each laid aboard the cars in San Francisco. Ten cents each is allowed for return of the sacks in good condition. This figures out $13.60 per ton less the rebate for sacks and plus the freight from San Francisco. Quotations are made by the barrel; shipments are made in sacks.—Editors.]

Assemblyman H. E. McPherson of Santa Cruz, author of the State Marketing law, died May 14.

Model Bean Cultivator

KILLEFER QUALITY

KILLEFER EFFICIENCY



This Cultivator, like most of our implements, has been developed at the request of Dealers and Ranchers for a strong, simply controlled cultivator, capable of doing their work deeper and better than possible with the light Eastern-made tools. The frame is one piece of high carbon steel without joints to work loose or sag and holds the wheels always true and in line with the rest of the machine. The double frame bar gives ample clearance between the standards and eliminates the tendency to clog in trashy ground. This frame bar has a double lifting device, which holds it rigidly on both sides. A man's weight on the extreme end will not spring it out of line. The seat is set far enough back to give an unobstructed view of the rows and the foot control is very easy on the driver.

An important item for the Bean Growers' consideration is that all parts and repairs are easily and quickly obtained without the delay of sending East for them.

The Killefer Manufacturing Co.

FOUR KINDS OF AGRICULTURAL LIME.

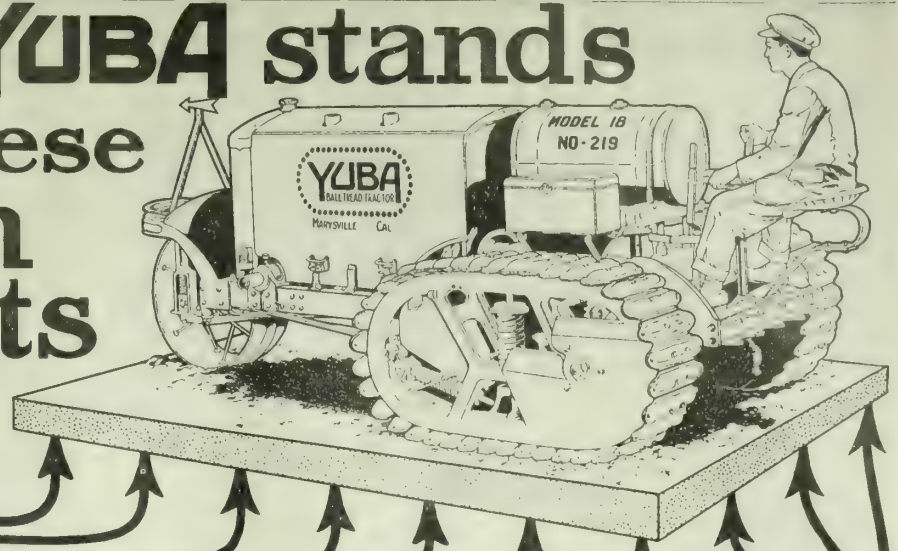
To the Editor: Please give meaning of "hydrated" and "agricultural" lime and the relative value of each for spreading on land to sweeten and improve orchard land that may need lime.—A. E. B., Healdsburg.

[There are four forms of agricultural lime which may be used to sweeten and lighten sour and heavy land: (1) quicklime (calcium oxide) (burnt lime); (2) hydrated lime (water-slaked), which is quicklime slaked with water; (3) air-slaked, which is quicklime slaked by exposure to ordinary air conditions, but not to water; (4) ground limestone.

Quicklime is dangerous agriculturally and it destroys humus. Hydrated lime is not dangerous if used at the rate of two tons or less per acre; it has equal value to quicklime and is preferred where heavy soils are to be lightened. In loamy or lighter sour soils, air-slaked burnt lime or ground limestone is preferred in double the quantity that would be used in hydrated form.]

PERSIMMONS DROPPING.

To the Editor: Last year I irrigated my persimmons but little. There was a light crop and all but two fell off. This year tree is loaded with fruit and I have begun to irrigate and the fruit is falling off rapidly, and unless I can check it will meet with similar fate as last year. Will you kindly advise me what to do or what not to do? I am 3 blocks from the ocean; the tree seems to have a good location.—[Answered by Prof. I. J. Condit, University of California.]



The non-fruiting of the Japanese persimmon is common both in this country and Japan. One Japanese writer makes the statement that the dropping of the fruit is caused by the rapid growth of the roots and shoots as well as by want of some nutriments. They, therefore, attempt to retard the growth in different ways. In Florida the non-bearing of the trees is probably due to lack of pollination. It has been amply demonstrated in Florida during the last few seasons that the presence of trees bearing staminate flowers is necessary to the setting of fruit. You are probably aware that the persimmon tree bears both male and female flowers, sometimes on one tree, but usually on different trees. Some of our best varieties, namely, the Hachiya and Tanenashi, bear only female or pistillate flowers. Here in California these two varieties ordinarily set fruit without pollination and are, as a result, seedless. I know that growers in Orange county have some difficulty with the dropping of the young fruits, but ordinarily a sufficient quantity of fruit set to insure a good crop. I would advise you to withhold water until the fruits are well set.

SPRAY FOR APPLE APHIS AND WORMS.

To the Editor: Green aphids are on my apple trees. It is about time to spray with arsenate of lead: can I mix this with blackleaf 40 without injuring the fruit or leaves? What proportion and where can I get it?—A. J. Y., Live Oak.

[A pint of blackleaf 40 added to 200 gallons of your codling moth arsenate of lead spray will get the bugs if it touches them. It will not hurt leaves or fruit and can be bought at seed stores or general stores. Add a gallon of liquid cresol soap per 200 gallons.—Ed.]

The YUBA stands on these Ten Points

1 **Dependable**—Built of the finest material to a thoroughly tried out design.

2 **Dust Proof**—Equipped with enclosed transmission and an efficient clarifier.

3 **Vibration at a Minimum**—Reduces the wear and tear throughout the machine.

4 **Compact and Sturdy**—Small enough for the orchard and powerful enough for the farm.

5 **Adaptable**—Equipped with narrow or wide tread—low speed or high speed gears.

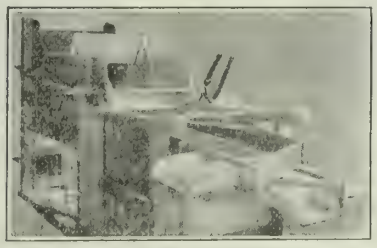
6 **Easy Control**—Easiest of all Tractors to drive—Turns in its own length.

7 **Built for a Long Life**—To work season after season at a high efficiency.

8 **Friction at a Minimum**—Twenty-five Hyatt Roller Bearings in each machine.

9 **Simple in Operation**—The continued attention of an expert mechanic is unnecessary.

10 **Backed by Yuba Service** and the Yuba Policy of Repairs at a Very Nominal Price.



The Catalogue explains why—send for it.

MICA AXLE GREASE

1916 SMYRNA FIGS

Mr. Grower, how many will your trees produce this season? They have brought as high as ten cents per pound in the sweat-box on account of the war interfering with importations. You have done your pruning, plowing, irrigating and cultivating, but this expense will be wasted, unless you secure a sufficient supply of **PROFICHI FIGS** of the right varieties. The Mamme crop was short this season and the **PROFICHI** crop will be short as a consequence. I have a larger Capri orchard than my Smyrna trees require and will have a surplus of **PROFICHI FIGS** for sale. After spending your time and labor to secure a crop, can you afford to lose a $200 a ton crop by neglecting to secure the necessary **PROFICHI FIGS?** Limited quantity, June delivery, for sale. Order now.

Mechanical Power on the Farm.

WINDMILL PUMPS TWO WELLS.

[Written for Pacific Rural Press by Wm. Curtis Clark, Oakland.]

The windmill is a good old stand-by which is so common that it is not often considered for other than house and barn supply purposes.

It may be made to provide a very useful and cheap means of garden irrigation, and in the course of the season furnish a surprising amount of water.

This may be done by utilizing both the up and down strokes of the mill, thereby doubling the capacity in this manner:

Bore a second well about eight feet away. Midway between the well centers put a 4x6 post in the ground well anchored. Cut a slot in the top to receive a rocker beam 2x3 in., which balances center in the slot, secured by a pin-bolt.

A cylinder equipment is placed in the second well and connected by rod to the end of the rocker arm. The two cylinders are similar in bore and stroke.

This equipment will give a continuous flow without allowing the mill to idle on the down stroke as is the case with single wells.

This outfit will grow a patch of alfalfa for the calf lot or chickens, flowers and lawn, and vegetables in garden and a few fruit trees. It works while you sleep, provided the wind blows; and costs nothing to run.

I have used the new type of mills made by a noted Chicago firm. The gears run in an oil bath which is renewed annually with a fresh gallon of oil. It turns with a breath of air and requires no attention.

It is well to place the cylinders below the water, which cuts out suction lift and keeps them self-primed. Put in a pipe union at the top of the casing, which will allow the cylinder to be taken out for washer renewals as well as furnishing a convenient shoulder for supporting the weight in a clamp across the top of the casing.

ROSIN FOR WORN CYLINDERS. VINEGAR FOR CARBON.

To the Editor: I have a 15 h.p. stationary gas engine with the cylinder worn enough to permit the exhaust to blow up a little into the oil cup. New piston rings do not prevent it. A locomotive engineer told me that one part powdered rosin to two parts powdered graphite mixed with oil and poured in the cylinder, while turning the engine over slowly, will stop the trouble and make the engine run like new. I am afraid that if the rosin and graphite will fill in the worn parts of cylinder, it may also clog up the piston rings. He also claims that vinegar poured into the mixing chamber will remove all carbon.—J. P., Pleasant Grove.

[Answered by Prof. J. B. Davidson, University Farm, Davis.]

[The use of powdered rosin in a gas engine cylinder is inadvisable. It will not stand the high temperatures prevailing in the cylinder, and is sure to give trouble. A little graphite can be used with success, and it has a tendency to cause rough surfaces to wear smooth. If the cylinder walls are badly scored, the only thing that can be used to make it gas-tight is to have the cylinder re-bored and fitted with a new piston and rings. If the cylinder is smooth, new rings properly fitted ought to make it gas-tight.

The use of vinegar as a carbon remover is not to be recommended. Although the acetic acid is very mild, it will not have a beneficial effect on the metal.]

MOLE DITCHING PEAT LAND.

[Written for Pacific Rural Press.]

Mole ditching is a new practice in the Delta lands along the Sacramento and San Joaquin rivers which holds out much promise in solving both drainage and irrigating problems in the peat lands of those districts.

It has been the practice to drain these lands in the wet season with drain ditches, dug several feet deep and ending at the river levee where a large pumping plant pumped the water over the levee into the river. As the dry season approaches irrigation is provided with the same ditches and pumping equipment, in this case the water being pumped from the river into the drain ditches, whence it sub-irrigates the growing crops.

While satisfactory to a degree, the practice does not allow quick or even drainage, and the same applies to irrigation. When draining is started, the land immediately adjacent to the ditches naturally drains first, gradually lowering the sloping water table to the center between ditches. The reverse is true when irrigating. The water from the ditches naturally subs on an angle, the land adjoining the ditch being waterlogged before the center is moistened.

To improve this system various methods have been tried. Tiling has been found satisfactory, but the cost is about $40 an acre. To improve this, a machine has been built which burrows a hole underground.

The machine has a pointed cone made of iron which works much like a sub-soiler, only it leaves the hole open underground. The depth at which it is run varies from 24 to 36 inches according to the crop to be grown. The cone or "mole" is fast to the lower end of a heavy broad vertical strap iron, which is fastened at the top end to a heavy beam and is also braced from the lower end to the beam. The teams are hitched to this beam.

Cost.—Experience so far shows that the cost of doing the work, where the holes are run 50 feet apart, is about 20 cents per acre; and that the holes will remain serviceable at least two years and possibly a good deal longer.

Don't Let Rust Eat Up Your Car. Paint it Yourself for $3.00

It's an easy job—requires no experience. A few hours work makes your car LOOK LIKE NEW. Repainting adds a year or more service to it and INCREASES ITS SELLING VALUE.

Pee Gee Auto Painting Outfit

Contains everything necessary to repaint a Ford or similar sized car, including top. Simple directions on each can.

QUALITY GUARANTEED.

Complete $3.00

At hardware, paint and drug dealers. If your dealer cannot supply you, we will deliver on receipt of $3.00.

HOME 10348 BROADWAY 2488
SALES DEPARTMENT

Los Angeles March 6th., 1916.

Layne & Bowler Corporation,
900-910 Santa Fe Avenue.
City
Gentlemen:-

We have in use three of your Layne - Bowler pumps. They have given us good satisfaction in all of our Water Companies where used. One of these has been in since 1912.

You are at liberty to show any of our plants in operation to any of your prospective purchasers.

Yours truly,
JANSS INVESTMENT COMPANY
By Harold Janss
Secretary.

Layne & Bowler turbine centrifugal pumps have for years been recognized by pumping authorities as the type of pump affording the greatest simplicity combined with the least investment for a given pumping capacity. They have eliminated the necessity of great cumbersome machinery and the attendant excessive repair expense. Our pumps without question represent the acme of inventive genius. "Let the World's largest water developers solve your pumping problems." Pumps for absolutely every requirement.

Write for Catalog No. 25.

Belting That Must Make Good

When you buy a rubber belt you should know what service it will give you or have the belt service guaranteed by a responsible firm who will make good in case the belt falls down. Every belt-buyer should know how to judge a rubber belt, and we would like to send you a **free sample** of **Test Special** together with our folder that will tell you just how to judge a rubber belt so that you may know just what service you will get from any belt you buy.

Fill out the coupon and mail it to us and we will recommend a belt that we will unqualifiedly guarantee to do your work satisfactorily. We have had seventy years' manufacturing and selling experience.

According to Frank Lyons, Farm Adviser of San Joaquin county, who is aiding in the experimental work with these ditchers, the drain ditches are being placed 200 yards apart at this time, but it has not yet been decided which is the best distance. While they are perfectly satisfactory in peat soils, he doubts their serv iceability in other soils.

ROTARY PUMPS.

To the Editor: Is the valveless rotary pump called the "Wonder" properly constructed for alfalfa irrigation? Are there other reasons why it would be better than a centrifugal because of its large range of capacity? I will pump from a creek, and can get more water some times than others.—L. F. E., St. Helena.

[Answered by Prof. J. B. Davidson, University Farm, Davis.]

[The rotary pump has one advantage, in that it will operate through a wider range of speed than a centrifugal. Rotary pumps as a rule are not durable, and as soon as wear takes place there is considerable slippage past the revolving piston or the working part corresponding to the piston. The wear is accelerated when there is grit in the water, and this type of pump is not to be recommended under this condition.

It would seem that the selection of a rotary pump will depend primarily upon the conditions involved.]

RICE PLANTED AT $1.75 PER ACRE.

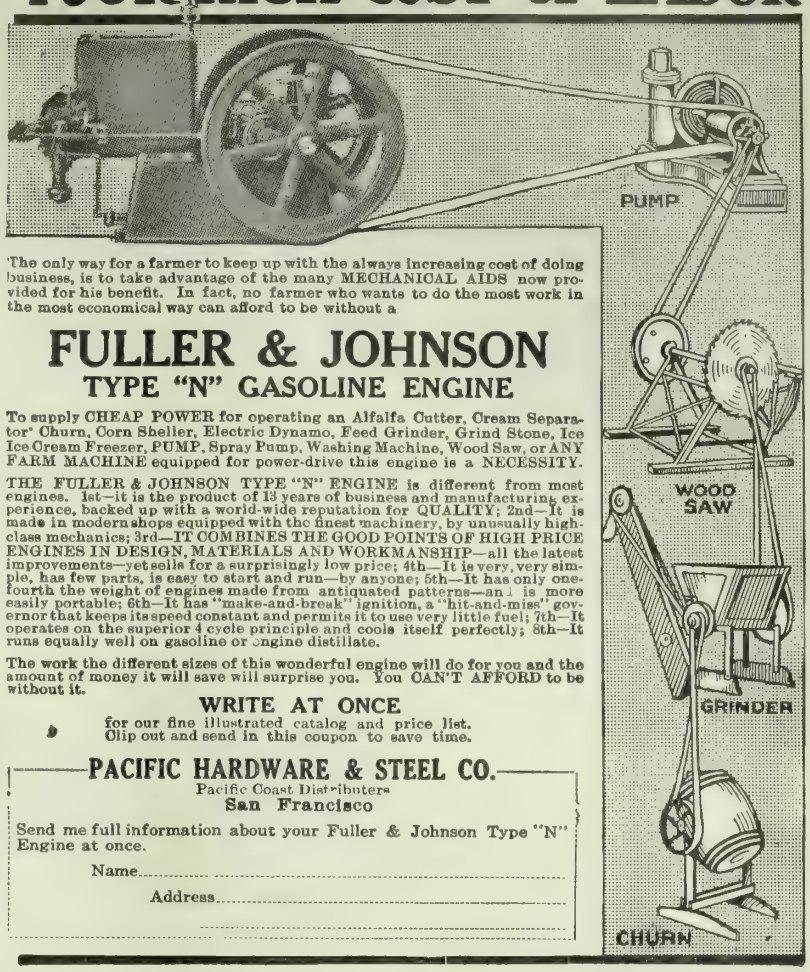
[Written for Pacific Rural Press.]

Fast work is a necessity in preparing land for rice. It must be planted at the earliest moment after ground is dry enough to work. In fact we have seen farmers plowing for rice with water running in the furrows after them. Christensen and Burmester of Sacramento county did not abuse their 900 acres this way, but waited till the land was in better shape, then used a 45 h.p. tractor 24 hours per day pulling a 12-foot double disk followed by a 12-foot seeder which was followed by a harrow. The gentlemen claim that they prepared and planted the 900 acres in 16 days at a cost of $1.75 per acre.

POWER NOTES.

The Samson Iron Works are urging national standardization of tractor horse power. Accurate tests applicable to all machines would have to be devised. There is considerable variation nowadays.

California led in number of automobiles per capita in 1914, but Iowa beat us to it in 1915, the figures for 1915 being 1 to 18 and 1 to 16 respectively.



Three eight-hour shifts with a tractor breaking sod was the system last month of H. D. Lemans of Plumas county.

Benzol, of which two gallons can be obtained per ton of coal in burning it to coke, is being used satisfactorily in Europe for internal combustion engines.

Farm women are using many electric or engine driven washing machines in Mendocino county according to Mrs. J. F. Raber, and such machines are a great advantage in making farm life pleasant.

A Hudson Super-Six stock car chassis recently made 102.5 miles per hour under official supervision at the Daytona, Fla., beach course. Each of six one-mile runs was made in less than 36 seconds.

LET·THIS·ENGINE·REDUCE YOUR·HIGH·COST·OF·LABOR

The only way for a farmer to keep up with the always increasing cost of doing business, is to take advantage of the many MECHANICAL AIDS now provided for his benefit. In fact, no farmer who wants to do the most work in the most economical way can afford to be without a

FULLER & JOHNSON
TYPE "N" GASOLINE ENGINE

To supply CHEAP POWER for operating an Alfalfa Cutter, Cream Separator Churn, Corn Sheller, Electric Dynamo, Feed Grinder, Grind Stone, Ice Ice Cream Freezer, PUMP, Spray Pump, Washing Machine, Wood Saw, or ANY FARM MACHINE equipped for power-drive this engine is a NECESSITY.

THE FULLER & JOHNSON TYPE "N" ENGINE is different from most engines. 1st—it is the product of 13 years of business and manufacturing experience, backed up with a world-wide reputation for QUALITY; 2nd—It is made in modern shops equipped with the finest machinery, by unusually high-class mechanics; 3rd—IT COMBINES THE GOOD POINTS OF HIGH PRICE ENGINES IN DESIGN, MATERIALS AND WORKMANSHIP—all the latest improvements—yet sells for a surprisingly low price; 4th—It is very, very simple, has few parts, is easy to start and run—by anyone; 5th—It has only one-fourth the weight of engines made from antiquated patterns—an.. is more easily portable; 6th—It has "make-and-break" ignition, a "hit-and-miss" governor that keeps its speed constant and permits it to use very little fuel; 7th—It operates on the superior 4 cycle principle and cools itself perfectly; 8th—It runs equally well on gasoline or engine distillate.

The work the different sizes of this wonderful engine will do for you and the amount of money it will save will surprise you. You CAN'T AFFORD to be without it.

Smooth Lock Seam Sleeve

Here is an exclusive Madewell feature that appeals to every user of Surface Pipe. Seamed inside with perfectly smooth surface. Much stronger than the old-fashioned lapped and riveted seam used by others.

Madewell Surface Pipe

is recognized in established surface pipe districts as having the strongest, smoothest, and most practical construction.

Our Long Lock Seam is the best seam possible to make—and in addition is carefully soldered the entire length so that it stays water-tight. **Strength and Smooth Finish** are the big things to consider when you invest in surface pipe.

Send for Free Booklet—which tells just how Madewell Pipe is constructed

Robinson Hardware Co. **Box B** **Gilroy, Cal.**

General Agricultural Review.

CITRUS AND SEMI-TROPICAL.

Valencias around Dinuba are mostly picked.

The Whittier Extension Co. scrapes the scale from their three-year lemon trees, having found this cheaper than fumigating and spraying.

Lindsay Valencia picking has been 470 carloads to May 12, rather slow on account of Southern navel competition. Navel prospects are good so far.

About 500 attended the recent meeting of the Cal. Avocado Growers' Ass'n. in Los Angeles. Dr. H. J. Webber was elected president and T. U. Barber vice-president.

The Hart and Barber Avocado Co. expect to set out 30 or 40 acres of hill land near Puente with avocados. Most of their sales this year have been in Los Angeles county, though they shipped some to Sacramento county and a carload to San Diego county.

DECIDUOUS FRUITS.

Vacaville is shipping apricots.

Hunt Bros.' Exeter cannery will not run this year.

Apricot pits are being bought in Santa Clara Valley at $45.

All varieties of peaches are reported fine crops in Kings county with 7,000 acres bearing.

Refrigerator car shipments of cherries to Los Angeles from Stockton were made beginning May 14.

An association of fruit shipping companies called the Pacific Fruit Distributors was recently incorporated at Fresno.

A heavy crop of apricots is maturing on the H. S. Reed orchard near El Centro, described in Pacific Rural Press this spring.

Several North Yakima (Wash.) fruit sections were badly frosted both May 7 and 11, destroying most of the crop of some orchards.

Such a heavy drop of Oregon pears and prunes has occurred that according to Prof. C. I. Lewis, a commercial crop can scarcely be expected.

San Joaquin valley orchards are in good condition with regard to insect pests according to R. L. Nougaret of the U. S. Dept. Agr.

Apples in cold storage were 92 per cent more on May 1, 1916. than May 1, 1915, according to U. S. Dept. Agr. Boxed apples were 31.1 per cent in excess of a year ago.

For Visalia Orange Cling peaches $15 a ton was offered two months ago, $22.50 two weeks ago, and $25 a week ago. The Ass'n is holding for $32.50.

The first peaches to San Francisco left Visalia May 10, being shipped by the Redbanks Orchard Co. Many apricots were included. In 1915 the first shipment was May 16; in 1914, May 12.

Col. J. J. Borree planted 35 acres, mostly apricots, near Hayward three years ago, blasting the soil, though there is no hardpan; and he is convinced that much better growth resulted than if he had not blasted.

Buyers have been offering Ventura apricot growers $42.50 for pits; and the Ventura County Cured Fruit Ass'n is said to have refused $40 per ton for canning apricots, believing they can do better than that by drying them.

NUTS AND OLIVES.

The Cal. Almond Growers' Exchange has made a net gain of 201 members this season, totaling well over 1,000 growers.

Trueman Cole of Montebello has a good stand of grafted walnut trees getting ready for next planting season.

There has been no loss of membership from the California Almond Growers' Exchange in Butte or Sutter counties.

Officers of the California Almond Growers' Exchange are looking into the possibilties of having a national almond day in 1916.

J. W. Anderson of Davis claims a yield of 1 ton per acre of 100 almond trees six years old. They are a variety he has developed.

Carpinteria walnut setting was very much lighter this year than last. The larger nuts that will result will bring higher prices per pound.

Of the 201 new members of the California Almond Growers' Exchange, two alone produce as much as was lost when a few Guinda growers withdrew.

The Solano County Almond Growers' Ass'n was organized at Suisun May 13 to market through the Cal. Almond Growers' Exchange. T. H. Loney is president, W. L. Clayton vice-president, and A. L. Scarlett secretary.

The Live Oak and Pennington Almond Growers' Association on April 29 elected E. A. Boynton president and delegate to the State Exchange and C. P. Henry Secretary. The members emphatically condemned the guarantee made by speculators to cut any price that may be named by the Exchange in Eastern markets, with withdrawal strings of course.

GRAPES AND SMALL FRUITS.

The alarming reports of frost damage to grapes last week seem to have been overdrawn.

Cut off the frosted parts of grapevines, advises Sonoma county horticultural commissioner O. E. Bremner.

Concord grapes grafted into a fig tree and producing fruit this season are reported as the work of H. R. Hobson, Long Beach.

Watsonville strawberry growers who do not sell to the combine alleged to have been formed in San Francisco are complaining of the price-breaking tactics of the latter.

Three Klondike strawberry plants a year old, containing 587 berries and some blossoms, are located in the garden of C. A. S. Higley, Long Beach. The largest plant is over 6 feet in circumference.

GRAINS AND FIELD CROPS.

Delta potatoes were considerably frosted.

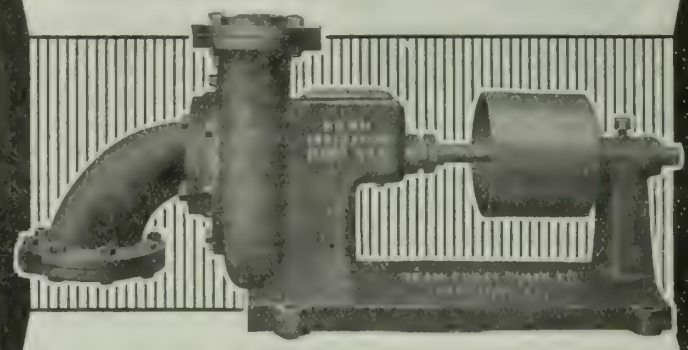
Sugar cane growing in Tulare county is being widely experimented.

Jute for eleven million grain bags reached San Francisco from India this week. Two more cargos are en route.

The U. S. Dept. Agr. is warning growers against "miraculous" varieties of wheat.

A short potato crop is predicted by E. H. Grubb of Colorado. Neither Col., Cal., nor Ida. will have as large a crop as usual.

Dry weather in Antelope valley is causing grain to be cut for hay. More non-saccharine sorghums than usual are being planted.



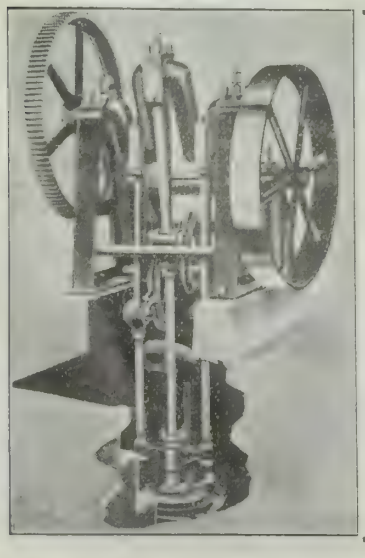
There were 53,000 tons of barley in warehouses of central Cal. in early

Get All the Water

Lack of water is not always the fault of the well—it is often the fault of the pump. No matter how good a well you have, if your pump is not right, if air leaks in around the shaft or if you have to tighten up the stuffing box till there's excessive friction, or if for any other reason your pump does not do efficient work—you cannot get the quantity of water your well should yield.

BEAN CENTRIFUGAL PUMPS

are built to get **ALL** the water.



The water-sealed stuffing-box prevents leakage of air and practically eliminates friction at this point. The automatic water-balance prevents end-thrust and does away with a lot more friction. And in many other ways Bean Centrifugal Pumps are built for downright efficient service.

Feathers in Our Bonnet

Supplied by satisfied users of Savage Tires.

16,000 miles over bad roads.

I have, to this date, gotten almost 16,000 miles, and taking into consideration the bad roads I travel, and using chains, I do not think that I will ever be able to better myself.

RUSSELL KENT.

20,000 miles—will use no others.

Having used two Savage Tires on my car, each of which tires have given me a mileage of better than 20,000 miles, I have decided to use nothing else. W. B. MARTIN.

They will likely give you the same or better service.

Ask for the name of a distributor near you.

SAVAGE TIRES

BRANCH STORES:

San Francisco, 1125-27-29 Van Ness Ave.

Los Angeles, 700 W. 7th St.

San Diego, 936 2nd St.

May as against 40,000 tons at this time last year and 20,000 in 1914.

For corn ear worms, dust the silks with a mixture of arsenate of lead and air-slaked lime half and half, from a porous bag, but don't breathe the dust.

Shipment of green cantaloupes from Brawley was checked by horticultural commissioner F. W. Waite seizing a few en route to the East this week.

The Utah-Idaho Sugar Co. holds a controlling interest in the new Nevada Sugar Co. which will probably operate a factory on the Truckee-Carson project.

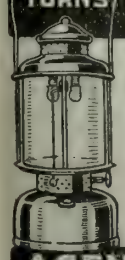
Kings county grain acreage is less by 20,000 than last year according to L. P. Denney, but a smaller per centage will be cut for hay "because hay does not pay."

MISCELLANEOUS.

The Imperial Irrigation district resolved to build a canal to bring water to the West Side from Volcano lake, provided the mutual companies would loan the funds on the security of 1917 water rentals.

Pollard and Martin of North Whittier Heights have sold all their Valencia nursery stock. They shipped one carload of trees to Santa Barbara, and 5,000 grapefruit trees to Dana, Texas.

"Demonstration, County Farm Bureau" is a sign which greets Stanislaus county travelers. Definite half-acre experiments are being worked with alfalfa under various treatments on the various soils of the county. Untreated half acres are left alongside the treated ones.



Prizes up to $2600 are offered by the Nat'l Highways Ass'n, Washington, D. C., for photographs of roads showing good or bad conditions, pictorial interest, and photographic excellence. Anyone can compete and Theodore Roosevelt will be one of the judges.

The regents of the University of Cal., on May 9th, appointed Frank Adams professor of irrigation investigation and will pay half his salary while the U. S. Dept. Agr. will pay the other half. W. C. Roberts was appointed assistant in soil chemistry; F. W. Albro assistant in nutrition; and W. T. Pope instructor in botany at Davis. Plans for the citrus experiment station buildings, to cost $125,000, were approved and bids will be asked at once.

CURED FRUIT EXCHANGE QUITS.

The California Cured Fruit Exchange directors on May 9 instructed its Secretary-Cashier to notify the trade that it will not handle the 1916 crop. The local associations of which it was composed will continue as such for the present, hoping that before long a new co-operative Statewide dried fruit marketing concern may be formed by representatives from all of them, eliminating the weaknesses and embodying the strong points. The criminal case against the former cashier, who is awaiting trial for the alleged defalcations which have wrecked the Exchange, will be pressed to the end. The civil action will also be carried through and all accounts closed as soon as possible.

TURNS NIGHT INTO DAY FOR ⅓¢ AN HOUR

Banish the common, dirty lantern and use this bright, brilliant, penetrating 300-candle power light. Can't explode. Wind and bug-proof. Clean, odorless, noiseless. Easily lit. Fine for ranchers, night irrigators, etc. Nickel finish. Used as lamp also. Write for Circular "P." Star Oil Gas Burner Co., Box 296, Sta. C., Los Angeles.

Don't say Caterpillar unless you mean Holt!

for a cheaper harvest

For harvesting as well as for plowing, hauling, and other tractive work, the Caterpillar proves itself more profitable than any other tractive power. It gives steady service under the most severe conditions. It works without delays—saves trouble, saves labor, saves expense in your harvest. You can't work horses or mules as cheaply; other tractors won't give as carefree efficient service.

You needn't mind the grades nor the condition of the soil—the Caterpillar has plenty of surplus power for the hills and its track prevents slippage or loss of power in soft or ashy ground. After harvest, it's ready for other work—plowing, hauling or clearing.

If you want to get maximum profits, buy an outfit that will earn them—a Caterpillar Tractor, and a Holt Combined Harvester. Investigate these machines now—ask for our new 1916 Harvester Catalog, or Folder C 337 on our Caterpillar line. A postal request brings them.

The Holt Mfg. Company

SPOKANE, WASH. PORTLAND, ORE.

The Caterpillar Tractor and Holt Harvesters were awarded the Grand Prize —highest possible award —at the San Francisco Exposition.

Why Not Buy the Proven Sire?

[Written for Pacific Rural Press.]

We recently saw a purebred dairy bull sold at public auction for less than the price that dairymen have been paying for his sons. He was a striking individual only six years old and with a world of service in front of him. His worth as a sire was demonstrated in the same ring by his heifers who had every indication of being heavy producers and who sold for good prices. Surely he was worth many times what a younger bull was, for he was tested and the youngster was not.

Previous to that we met a dairyman who sold a four-year dairy bull for the same price that he paid for it and he was congratulating himself that he had not lost any money. The man who bought that bull was fortunate, for the bull's heifers were outstanding producers.

We know a hog breeder that purchased one of the best herd boars in the State for his breed from another prominent breeder who could not use him longer. "I couldn't afford to buy such a boar if he was young," he explains, and yet he was sensible enough to pay a fair price for him and is rapidly establishing a high reputation for his herd on the strength of the old boar.

It is no unusual thing for a breeder to tell you that he sold the best sire he ever owned, before he realized his real worth. Why not pay more for the proven sire and less for the ordinary kind, is a question that every breeder might well ask himself.

STOCK BEETS FOR SILAGE.

To the Editor: Is there any reason why corn and stock beets would not make good silage put intogether? My cows will not eat it. I cannot locate the trouble. I wish you might outline the different mixtures one should make in filling the silo.—W. F. R., Bishop.

[Answered by Professor F. W. Woll, University Farm, Davis.]

[There would be nothing gained by placing stock beets in a silo, as they can be readily kept until needed, with very little loss of feed materials. There would also be practical difficulties in the way of siloing corn and stock beets together. Stock beets alone contain too much water to be made into silage, even if it were possible to preserve them this way. Root crops are, therefore, either left in the ground in most parts of California until wanted, or, especially in cold climates, are placed in shallow piles in the field or in root cellars, to be kept for winter feeding.

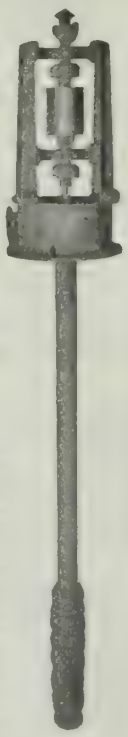
If the corn is cut when nearly mature, and is placed in an air-tight silo and carefully packed, the silage will be of a pleasant aromatic, acid flavor, and will be very palatable to farm animals. If cows have never eaten silage before, or have been fed good green feed, they may not take to it readily at first, but will soon learn to eat it, and after a while will prefer it to any feed, except perhaps pasture. Cows will, however, as a rule eat silage placed before them even when they have excellent pasture or green feed. If they do not seem disposed to eat the silage, omit green feed for a couple of days.

The common silage crops in this State are Indian corn, sweet sorghum, milo, Egyptian corn, kafir, feterita, volunteer grains, and alfalfa (mainly first crops); see Circular 138 of this College, a copy of which may be secured, so long as the supply on hand lasts, by addressing Director of Experiment Station, Berkeley, California.]

CONCENTRATES WITH ALFALFA FOR DAIRY COWS.

[Written for Pacific Rural Press.]

Among the dairymen in Butte county who have experimented with rice bran and polish as a dairy cow feed is S. A. Mealey of Gridley, who fed both the bran and polish in connection with beet pulp and alfalfa hay last winter.



While feeding one of his cows 10 pounds a day of equal parts bran, polish, and beet pulp, she gave 70 pounds a day for a considerable period. Later the beet pulp was omitted and her production immediately fell off to 54 pounds daily.

Mr. Mealey's herd is entered in the local cow-testing association and is one of the few herds in Butte county that contains any purebreds. For some time he has been using a registered Holstein bull on his grade herd and during the winter has purchased 10 registered Holstein heifers that will freshen this spring.

To head this herd, he has purchased a bull calf sired by Colantha Sir Pontiac Aaggie; and he intends to purchase 15 more registered heifers this year.

Soak the new horse collar in water for a day before using it. The collar will then adjust itself to the horse's shoulders.

No Pit
is required with the
Krogh Deep Well Turbine Pumps

For bored or drilled wells from 10 inch inside diameter up; and for capacities of 250 to 3000 gallons per minute. Built for pumping from any depth to and including 250 feet. They are absolutely water balanced and are self-aligning. More water can be obtained from such wells than with any other type. Built in belted or direct motor driven types. If interested, write for Bulletin.

Krogh Manufacturing Company

Seeing the Difference
between the
DE LAVAL
and other
Cream Separators

THE difference between a modern De Laval and any other cream separator is apparent at first sight. And if you will take five minutes to compare the separating bowl construction, the size, material and finish of the working parts, particularly those subject to wear, the manner of oiling, and everything which enters into the design and construction of a separator as a simple durable machine, you will still further *see the difference.*

Then if you go a step farther and turn the cranks of the two machines side by side for fifteen minutes, running milk or water through the bowl, you will see still more difference.

And if you will run the two machines side by side in practical use, as any De Laval agent will be glad to have you do, the De Laval one day and the other machine the next, for a couple of weeks, you will see still greater difference in the work of the two machines.

Every De Laval agent considers it a privilege to show the difference between the De Laval and other separators and to afford every prospective buyer the opportunity to try out and prove the difference to his own satisfaction, if on first examination he feels the slightest doubt about it. If you don't know the nearest De Laval agent write to the nearest office as below.

GRANDSONS OF TILLY ALCARTRA
At Prices within Reach of Every Breeder and Dairyman.

A Grandson of Tilly Alcartra.

We have several splendid grandsons of this now famous cow, which we can deliver to you at prices which will suit the pocketbooks of every dairyman wishing to improve the quality of his herd, whether it be a grade or pure-bred herd. These bulls are sired by our herd bull, Prince Alcartra Korndyke and out of A. R. O. cows, and are the only living grandsons of a cow having a record of over 30,000 pounds of milk in a year. Such an opportunity for increasing production has never been offered **DAIRYMEN AND BREEDERS** in California, price and quality considered. Buy one of these bulls and solve your low production problem. Write

Marketing Grain as Pork.

To the Editor: In regard to conerting 20 acres of feterita and five f barley into pork at a profit: if the orn goes two tons per acre and the arley 15 sacks, how many hogs 80 100 pounds will eat the crop in 0 days? Would you advise threshng or hogging down the barley? By elling the corn at $28 to $30, I gure a net profit of $20 per ton.—. F. C., Lemoore.

Answered by Prof. J. I. Thompson, University Farm, Davis.]

[This amount of feed should arry about 175 pigs 90 days, proided they weigh approximately 100 os. to begin with. However, if the orn yields about a ton and the barey fifteen sacks, 100 pigs of the ame weight would be sufficient. his would depend, however, on the ge of the pigs. If they are a year ld or older and weigh only 100 lbs. hey can consume more than 500 os. in this time. If they are young igs and weigh about the same, they ould consume a little less than 500 os. during the 90 days. In the ame proportion the older hogs that re thin and weigh only 100 lbs. ould gain more rapidly when laced on abundant feed such as his, than would young pigs that had een grown along regularly up to his time. Taking average gains for verage amounts of feed, you would eed to get 7c to 7½c for these hogs o return you $28.00 to $30.00 for he grain. At the time these hogs ould be ready the market is liable to be lower than at most any other time of the year, and it is doubtful if they would net you as much as 7½c. Of course if you can buy them for quite a low price, your chances for some profit on the original weights would be that much in favor of the feeding proposition.

While it hardly seems practical to attempt to thresh so small an amount of barley, unless the cost would be unusual it would probably pay because of the extra feeding value that can be obtained.

It is also a question whether you can hog-down the feterita as economically as you can harvest and feed it. The cost of harvesting is relatively high, but it is not well digested unless ground.

MARES WITH COLTS.

[Written for Pacific Rural Press.]

Feed mares bran and oats before and after foaling and two or three times a week while working, to keep their bowels loose, is the advice of F. L. Dickman, who has charge of the Santa Anita ranch draft Percherons in Los Angeles county. Let the mares rest two weeks after foaling; then they can work until a week before foaling again.

The main mistake of farmers is that they don't feed enough the first year. Colts never make it up if starved then. Better keep them in while the mares work; for the travel tires them, the milk is hot, and makes them feverish. Let the colts eat with their mothers as soon as they will, and wean them at 6 months, or sooner if the mares are in poor condition. Nursing is harder on the mares than carrying foal, and should not be prolonged far into the period while the next colt is developing.

A filly should not be bred under two years old and not then if undersized. The strain of reproduction and nursing will permanently stop her growth and reduce not only her value but also the selling price of her offspring.

FEEDING SWEET CLOVER.

To the Editor: I would like to know the feeding value of sweet clover, when it should be planted, how much seed per acre, how to feed it; can it be siloed.—Mrs. K. P. O., Turlock.

[Answered by Professor F. W. Woll, University Farm, Davis, Cal.]

[Sweet clover is nearly equal to alfalfa in feeding value when cut early, before the blooming period. Cattle do not care for sweet clover at first as it contains a bitter principle, but they soon grow fond of it, if cut at an early stage, before it is coarse and woody. Its culture is not to be recommended, however, in regions where alfalfa can be successfully grown. Copies of Farmers' Bulletin 485 on Sweet Clover, can probably be obtained on application to the Secretary of Agriculture, Washington, D. C. This bulletin contains full information as to methods of growing and feeding sweet clover. I do not know of anybody who has made silage of this crop, but it will very likely make at least a fair quality of silage if cut before bloom or at beginning bloom, when it will not contain an excessive proportion of water or woody fiber.]

THEY HAVE GRAND CHAMPIONS BEHIND THEM.

With the Live Stock Men.

DAIRYING AND DAIRYMEN.

B. F. Anderson of Stanislaus county recently shipped a purebred Holstein bull calf to Elko, Nev.

Alba Sadie Cornucopia Creetia, owned by Mrs. Anita Baldwin, made 101.333 pounds fat in 30 days.

Flax for winter cow feed is said to have given good results two years for A. J. Vierra of Kings county.

Geo. Kounias of Modesto has a Holstein heifer that gave 1½ pounds fat daily six months after freshening.

The Moss Rose Creamery of Salinas has just installed what is said to be the first market-milk pasteurizer in Monterey county.

Wisconsin is following California in establishment of a system whereby the State tests herds with tuberculin if reactors will be segregated.

E. S. Sattison of the Lindsay Guernsey Farm recently bought four cows from I. J. Scott of Pomona. All were sired by Mr. Scott's imported Glenwood bull.

President M. D. Munn was recently re-elected by the A. J. C. C.; J. P. Hutchinson, of New Jersey, treasurer; M. W. Potter vice-president, and R. M. Gow secretary.

A Humboldt dairyman recently found he was losing money feeding clover, alfalfa, bran, and cocoanut meal—all high protein feeds—without giving other carbohydrate feeds.

The A. J. C. C. which met in New York May 3, claims that more Jerseys qualified in the past year on annual tests for the Register of Merit, than have the cows of any other breed.

At the picnic May 13, of the members and patrons of the Dairymen's Co-operative Creamery of Tulare, Prof. Elwood Mead spoke on the Australian government control of the butter market.

A 24-year cow owned by Henry Baty of Tulare, now with her tenth consecutive heifer calf two months old, is giving three gallons of milk per day, according to the Visalia Delta. She is a high grade Jersey.

From April 6 to 12 reports of 556 Holsteins were accepted to entry in Advanced Register. Over half were with first or second calves. They averaged for 7 days 14.551 pounds fat from 400.1 pounds milk.

During the past two months, official tests have been conducted by University representatives for 32 California Holstein breeders, 11 Jersey breeders, 7 Guernsey breeders, and one of Dairy Shorthorns.

Two living calves and 2,005 lbs. of 85 per cent butter from 33,292.5 lbs. of milk between Jan. 7, 1914, and March 4, 1916, is the contribution from the Jersey cow Temisia's Owl's Rose 215973 owned by R. A. Sibley of Mass.

At the dispersal sale June 28 of the Chas. Jay Welch Holstein herd near Los Banos, a number of females bred to a son of King Segis Pontiac will be sold. King Segis Pontiac was out of the first "37-pound" cow, Pontiac Clothilde De Kol 2nd.

The 31st annual meeting of the Holstein-Friesian Ass'n of America will be held in Detroit, Mich., June 7. The question of providing 305 and 270 day classes in the Advanced Register and apportioning part of prize money to such classes will be decided.

The Milk Producers' Ass'n of San Francisco is the first co-operative ass'n to have the State appoint a member of its board of directors. Dr. Elwood Mead is the man, nominated by the Market Director as suggested by the association; and appointed by the Governor.

At the convention of milk producers in Washington, D. C., May 5 and 6, all the great dairy states were represented. They passed resolutions calling on the U. S. Dept. Agr. to detail men to exclusive study of abortion. They urged breeders to weed out tuberculin reactors, and that State and Federal authorities allow reasonable compensation for all reactors slaughtered.

SWINE BREEDERS AND STOCK.

The American Berkshire Ass'n will add $300 to Cal. State Fair premiums.

The American Berkshire Congress will be held at Sacramento during the State Fair.

Duroc breeders of Stanislaus county will meet May 20 to organize a purebred breed association.

The State Fair futurities for both Poland-Chinas and Durocs have more than the required number of entries.

The Cal. Swine Breeders' Ass'n has asked the State Fair officials to be ready to handle 1000 hogs at this next Fair.

Cattle Eat up Salty Forage Clean

Salting Hay When Stacking, an Excellent Plan.

(From Pacific Rural Press)

Two crops of fodder per year, which the stock eat up clean, are grown by a settler on the Natomas Consolidated project in Sacramento county. He grows purebred Duroc hogs and Shetland ponies, and claims that his oat hay cut early in May yields 3½ tons per acre. Immediately after it is cut, corn is planted; and if this doesn't mature it is cut as fodder when the kernels have dented. The ears are taken off and the stalks stacked in the yard with a large amount of salt which induces the stock to eat it more completely than otherwise. His neighbor, Mr. Jensen, salts his threshed wheat straw, which the cattle eat clean.

"An ounce of salt a day in the rations is all right for cows," says G. L. Stearns, formerly of the Vina Ranch. This is probably not enough, so there ought to be some stock salt in the yards for cows to eat at pleasure. Sometimes in feeding cows for official test, as much as 3 ounces per day is mixed in the feed. This makes the cows thirsty and they drink more water and produce more milk. But it is necessary to be very careful in feeding salt in the rations, for it is apt to give them the scours and is also likely to cloy their appetite so that they will not eat enough to make a record yield of milk.

The amount put into hay in stacking depends on the amount of hay each animal is expected to eat. Twenty pounds per ton in general may be all right if the stock has plenty of other food. But a cow which has nothing but hay will eat 5 tons per year if she weighs 1200 pounds, according to Mr. Stearns. At the rate of 20 pounds per ton, this would force the cow to eat a trifle over 4 ounces per day, which is altogether too much.

When it seems that there is danger of too much salt in the feed, a satisfactory test may be made by offering salt separately; and if the cow doesn't eat it, less of the salty feed may be given until she will.

CROLEY'S CALF FEED with skim-milk will raise fine dairy heifers cheaply. Geo. H. Coley Co., Inc., 631-637 Brannan St., San Francisco.

D. O. LIVELY, 216 Hobart Building, San Francisco, buys and sells live stock—any kind—any quantity.

DUROCS AND GUERNSEY BULL CALVES—Gilts bred to 900-lb. boar. Ed. E. Johnson, Turlock, Cal.

H. Marsh, Poland-China breeder near Modesto, had four sows farrow last week with 8, 9, 10, and 12 strong pigs respectively. He accounts for the large strong litters by the care and feeding of the sows before and during farrowing.

The River Bend Farm futurity litter for the State Fair next September is attracting much attention. The Farm is finding good demand for pigs from their herd boar, River Bend High Model, which weighed 475 pounds at one year old.

Haden Smith, Duroc breeder of Woodland, reports the following sales: 3 bred sows to Jack London, Sonoma; 1 bred sow and 1 service boar to J. H. White, Sacramento; and service boars to J. J. Morris, Colusa; Baird Bros., Woodland; Louis Farnsworth, Colusa; Mrs. W. L. Hale, Davis; J. T. Donaldson, Modesto.

Geo. A. Smith of Corcoran has recently sold purebred Poland-China boars to Mrs. Maggie McDermott, Maxwell; S. V. Hawley, Hanford; Mrs. G. Muscio, Santa Maria; R. L. Vorhies, Holtville; W. K. Tucker, Coalinga; T. H. Jack, Parlier; Brown Bros., Paso Robles; Joseph Hill, Lovelock, Nevada; and Edward Haven, San Jose.

E. F. Curtis of Napa reports the following spring Duroc sales: One boar and 2 gilts to R. A. Holdridge, Dixon; 1 bred sow to E. Puigh, Eureka; 2 gilts to G. D. Walton, Red Bluff; 10 head to H. J. Middletown, Napa; 18 head to L. Cullen, Yountville; 18 head to C. E. Durrell, Napa; 1 gilt to D. McNair, Napa; 1 boar to Mrs. Hall, Napa; and one gilt to A. B. Johnson, Newport Beach, Los Angeles.

BEEF CATTLE AND BREEDERS.

The Howard ranch near Biggs has been sold to become a stock ranch.

S. J. Vincent of Porterville bought a purebred Durham bull from J. E. Ball of Woodland.

The University Farm at Davis recently secured two very choice registered Shorthorn heifers from the Paicines Ranch at Hollister.

Porterville district has beaten its high record for beef cattle shipments. This season it was already over $500,000 worth May 6.

Wm. Bemmerly of Woodland recently sold 21 registered Hereford heifers and bulls to J. A. Niles and Vincent Bros. of Porterville.

The Central Stockmen's Ass'n will meet in Salinas July 12 and 13. All cattlemen's organizations in the State are invited to send delegates.

R. R. Cartwright has moved his purebred herd of Red Polled cattle from Calaveras county onto his newly acquired ranch near Peters, San Joaquin county.

W. S. Guilford of Willows states that he soon expects to import a herd of registered Shorthorns from Illinois for foundation purposes on the Butte City Ranch in Glenn county.

Straight horse bits in cattle's mouths to prevent their bloating on alfalfa pasture, are said to be very successful with P. J. Conway, Harry Warren, and other Lyon county (Nev.) ranchers. The cattle can't eat so fast.

Thornton S. Glide shipped two purebred Shorthorn bulls from his ranch at Davis to the Hawaiian Islands during the past week. Mr. Glide now has his cattle off the mountain range, on the tule pastures. He still has a small bunch of fine yearling bulls.

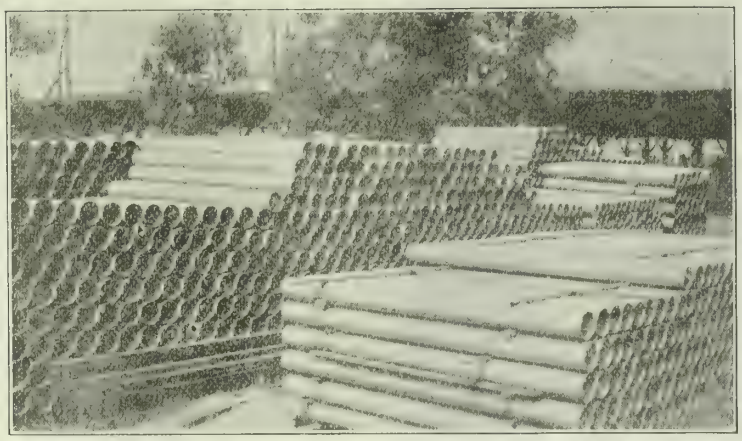
HORSES AND SHEEP.

Salinas valley lambs have sold as high as $5.65 this season.

Herman Skow, a Percheron stallion owner near Roseville, is using a Caterpillar to handle his 3,200-acre grain crop.

A bulletin on Sheep Scab may be obtained free by addressing Editor of Publications, U. S. Dept. Agr., Washington, D. C.

The University Farm at Davis has purchased three registered Percheron mares and a registered stallion from the Paicines Ranch at Hollister.



Ed. Bourdieu of Stone Canyon, Monterey county, reports having recently sheared over 32,000 pounds of wool from 4,000 sheep, having sold 2000 lambs this spring.

About 100 cars of sheep and 65 cars of cattle are being moved from Rocklin and White Rock districts by rail to the forest reserve ranges around Truckee.

MISCELLANEOUS.

The Napa County Livestock Ass'n on May 12 elected Homer Hewins of Calistoga president, W. L. Mitchell of Napa vice-president, and W. W. Everett of Rutherford secretary.

Livestock in the Sacramento Valley.

(Continued from page 609.)

cost money, and not only show a disposition to pursue better methods, but confidence as well.

Further north on the east side of the river, one finds renewed confidence in the purebred industry manifested at the great Vina ranch of the Stanford University. Here one of the oldest and largest herds of Holstein cattle in the West is maintained. For the first time authenticated testing is being done in this herd and the policy from now on will be to test every cow. A story of progress could be based on this great ranch alone, if space permitted.

Dairy and Hogs. — Swinging around the northern end of the valley into the west side, and not including Tehama county where sheep and hogs are commanding unusual attention, one finds the government's irrigation project at Orland; a natural location for alfalfa and rapidly assuming permanent aspects in dairy cows and hogs.

A cow testing association has recently been formed; and by the importation of well-bred Jersey cows and purebred bulls the average profit per cow is attaining heights which makes hay-selling look very unattractive.

In the lower end of Glenn county conditions are mending rapidly, the livestock interest here being chiefly manifested in purebred hogs at the present time. During the past year the Berkshire has made great strides in the district, and in a remarkably short time the district has jumped from seclusion in hogs to a top place in the ranks of leading Berkshire counties of the State.

Holstein Development. — Perhaps the most hopeful sign of the times in Colusa county is the development of a great Holstein herd on the former grain ranch of the J. S. Gibson Co. at Williams.

Here also, one finds material for an entire story on development, for it is a story of transformation of the grain ranch into diversified endeavor.

Started five years ago, this herd has been constructively handled; and during the past year authenticated testing has been started with surprisingly good results. Not only is the herd worthy of respect on account of the herd sire being a son of the world famous cow Tilly Alcartra, but also because of the high producing individuals to be found on the ranch. Its result will be far-reaching in Colusa county as in other counties of the State.

The permanence of livestock in Yolo county is too well established to require tabulation here. Many of the greatest herds and flocks in the West have been and still are maintained there, and their owners are equally alive to the future opportunities as they have been in the past.

No effort has been made to completely describe the entire livestock industry in Sacramento Valley. Space forbids that. But what is found in the districts mentioned is being reflected in all other parts as well. It is not so much an awakening to livestock in most cases as it is a settling down to constructive methods.

ARE LIVESTOCK LOANS SAFE?

To the Editor: In your issue of Feb. 12 you have an article headed "The Law Does Not Favor Bank Loans." As we are handling cows and selling largely on time and taking mortgage for the same, we would like more definite information on live stock mortgages in California and would deem it an accommodation if you would tell us where to get the law from which your item is taken.—F. B., Lakeside.

[As long as you are selling stock which is your own, and taking a mortgage on it for the balance, you are perfectly safe with the present laws.

If, on the other hand, you were to loan money to a buyer who in turn purchased stock with that money, and gave you a chattel mortgage as security, such a mortgage would not allow you to take possession of the stock if they were moved from the ranch they were on at the time of making the loan.

This is not so clearly stated in the Bank Act of the State of California, copy of which may be had by application to the State Banking Department at either Sacramento or San Francisco, but it is the way the law has been interpreted by several leading attorneys in this State, whose opinions have been secured by men who were anxious to make loans on

Importation of Eastern Stock

I will make a trip East in the month of **June** to purchase several carloads of **Live Stock** for California breeders.
My large acquaintance with Eastern breeders enables me to buy high-class animals at moderate prices.
This is an excellent opportunity for those desirous of either improving or adding to their herds. **Orders solicited.**

U. S. Gov. experts report that oils correctly refined from asphalt-base crude "distill without decomposition" (do not break up and lose their lubricating value under cylinder heat) and "are much better adapted to motor cylinders, as far as their carbon-forming proclivities are concerned, than are paraffine-base Pennsylvania oils."

Motorists who use Zerolene, an oil scientifically refined from asphalt-base crude, back up the experts with reports such as these: "Covered over 16,000 miles without adjusting valves or cleaning out carbon."—"The carbon taken out of this car in 50,000 miles amounted to less than an ounce." Zerolene is for sale at dealers everywhere and at service stations and agencies of the Standard Oil Company

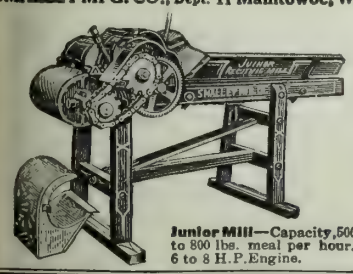
Get this FREE BOOK

See how thousands of farmers cut feeding cost in half, save 1-5 to 1-4 power cost, and 1-2 labor cost of silo-filling and put better feed and greater tonnage in their silos in less time than ever before possible.



Smalley Silo Filler

Patented re-cutting attachment makes dandy Alfalfa Chop for fattening cattle, sheep, hogs and poultry. *Handles leaves, stems and all without waste or injuring color of the hay.* Sell your No. 1 hay and mill the *off-grades* for feeding. Make combination feeds from clover, rice straw, bean straw, pea vines, oats and rye, or dried cornstalks. Capacities 1200 to 2700 lbs. per hour. Re-cutting attachment on Junior Mill makes 500 to 800 pounds of meal per hour with 6 to 8 H. P. engines.

Powerful, whirling, bevel-edge blades slice like a lawn mower, fine even and uniform. Better silage and greater tonnage in the silo. Grip Hook Feed Table feeds automatically, saving expense of two or three men depending on size. Blower built independent of cutter so you increase or decrease fan speed without changing speed of knife shaft. Patented low-speed, one-pulley, chain drive saves 1-5 to 1-4 power cost, cuts out unnecessary wear on belt. Extension table on hopper makes faster, cleaner job.

livestock, but who do not want to go into the livestock brokerage business.—Editors.]

VETERINARY QUERIES.

[Answered by Dr. H. B. Wintringham, Petaluma, Cal.]

VACCINE FOR CALF SCOURS. SEPTICEMIA IS BLOOD POISON.

To the Editor: Where can I get vaccine to give young calves for scours? Three promising calves have taken scours within 12 hours after birth and died in two or three days. They have had only their mothers' milk. Has this new disease septicemia anything to do with it?—T. T., Yuba Co.

[The Cutter Laboratory, Berkeley, supplies this vaccine. Septicemia is no new disease, but a name applied to blood poison.]

CALVES DIE SUDDENLY.

To the Editor: My calves are dying when six weeks to two months old. They show no signs of sickness, die suddenly. By examining their stomachs I find a half pound of clabber milk. It resembles a piece of bread, only it is rubberlike. I have been feeding them fresh milk from the separator.—Subscriber, Arcata.

[This is acute indigestion. It is probably caused by overfeeding. Feed oftener in smaller quantities.]

VACCINE FOR INFLUENZA.

To the Editor: An eight-year-old mare has been fed dry alfalfa hay all winter, then turned onto green alfalfa; about two weeks developed trouble located in the throat—she is unable to swallow any food, but can take a small amount of water; also, she froths quite freely at the mouth and occasionally has a thick yellow-colored discharge from the nose. Is it contagious?—G. P. A., Colusa.

[This is influenza and a highly contagious disease. Call in your veterinarian and have him give the vaccine treatment.]

COW MOANS WHILE EATING.

To the Editor: A cow came fresh a month ago. She is very thin, eats for a while, stops, chews awhile, and eats again. Sometimes she moans as if in pain when she starts to chew.—M. C., Walnut Creek.

[This cow probably retained part of her afterbirth. Douche the womb with a 1-1000 solution potassium permanganate.]

COWS AND HOGS ON GRANGE FARM.

[Written for Pacific Rural Press by Susan Swaysgood.]

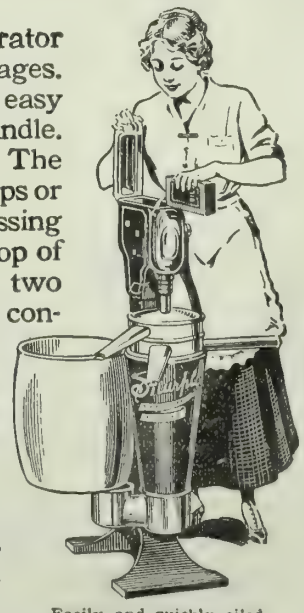
"Doing things" appears to me the right words to use in connection with the Grange Stock and Poultry Farm. This farm is situated in the beautiful Napa Valley east of Yountville and has nearly six hundred acres of hill and valley land in which to "do things." The stock, consisting of about thirty or more good grade cows, is being bred to a very fine pedigreed bull.

The Duroc swine herd is sired by Monarch of the Nook, a splendid animal weighing seven hundred pounds in medium flesh. He is out of Golden Rod and Pacific Queen. Monarch of the Nook sired the first prize boar under one year at the Oregon state fair in 1914, the second prize gilt under six months at Oregon state fair in 1913, and the reserve champion of the P. P. I. E., 1915. This boar recently sired a litter of nineteen pigs, eighteen of which lived. Among the many sows are Perfect Princess and Red Perfection, who was bred to I Am A Colonel.

In starting this farm, Mr. Grange's idea is to have the best money will buy, then breed scientifically and progress along the road to success.

Get all your Cows Earn

Every milch cow in your herd earned a nice profit for you that your separator *failed to deliver.* Where did the money go? Let us show you.



Every separator (except the New Sharples) loses cream if not turned at the exact speed marked on its crank. Experiment Stations and independent researches have brought out the surprising fact that 19 out of every 20 separator users turn their machines under speed and thus lose $2.40 to $12 per cow per year. (See Purdue Bulletin No. 116).

The New Sharples skims clean whether turned *fast* or *slow.* It will get you this extra profit your cows make for you, but which your fixed-feed Separator throws away.

THE NEW SHARPLES SUCTION-FEED

Separator feeds the milk into the bowl in exact proportion to the separating force. At 45 revolutions it skims clean; at 55 revolutions it skims clean; and at 35 revolutions it skims equally clean and always with *even quality cream.* No other separator has these two valuable features—*clean skimming* and *unchanging density of cream at varying speeds.*

The Suction-feed Separator has other important advantages. The hollow tubular bowl is easy to clean and easy to handle. There are no discs to wash. The oiling is automatic; no oil-caps or oil-holes; no dripping or mussing of oil; no oil waste. The top of the large supply-can is only two feet from the floor—a great convenience in filling.

Easily and quickly oiled. Once a month is sufficient.

These are some of the reasons why you should have a New Sharples and *get all the cream money all the time.*

Read the full story in our new book, ***"Velvet" for Dairymen*** which also explains our free trial plan. We will gladly send you a copy. Ask for it—*now.* Address Dept. **31.**

Farm Poultry for Profit.

WHILE CHICKS AND TURKS ARE GROWING.

[Written for Pacific Rural Press by Susan Swaysgood, Pomona.]

Last year and again this season I have had enquiries as to "what ails young turks?" The feet and legs dry and toes turn up making it difficult for the turks to walk.

Now unless a full description of feeding and brooding is given it is very hard to advise in these cases, and it involves more writing than can be allowed in a short letter.

I find, however, that most heated brooders have a tendency to dry up the tissues of a turk's legs and feet quicker than is the case with chicks, though it will sometimes do this with chicks. But aside from the heated brooders there is a tendency to cramps, rheumatism, and fish-skin disease in both turkey poults and chicks. In the latter case the skin resembles a chicken with scaly leg except that there is no insect at work and the trouble comes from some functional disturbance.

For this trouble a daily rubbing, or rather painting the surface with an ointment of five parts plain vaseline to one part "oleate of zinc" will soften the skin and take away the tendency to curl up. Another remedy is to dip the legs in sheep dip made rather strong, of course keeping the feathers out of it, and feed more green feed; if the birds do not eat it readily chop fine and mix with the dry mash, when they will usually pick out the little pieces of greens and eat readily. But the local application is most to be depended on and should not be neglected. For cramps or rheumatism make a good bed of fine cut hay or straw on top of the sand or board floors. You will find this will prevent and cure, too.

Leg weakness that sometimes attacks chicks of the large breeds is quite distinct from these things, and must not be mixed up with them. Leg weakness is usually caused by too heavy feeding of starchy foods, so that the body grows too heavy for the strength of the bone. The thing to do is to cut out some of the carbonaceous food and feed more bone and green feed until one part of the chick's anatomy is as strong as the other and rub the legs with tincture of arnica. I have seen odd cockerels that grew so fast the legs got weak and they spraddled all over. For these there is nothing but the hatchet before they get poor, as they would never make breeders. Plenty of ground bone or meat meal in the feed will adjust matters if corn and corn meal is kept away from the chicks. But the feeding of these chicks requires care, as they never can stand fat-forming foods like the smaller breeds.

And there is trouble that attacks small breed chicks, mostly Leghorns, through a too starchy diet; that is, the wing feathers grow too rapidly for all around development. When this occurs, cut off some of the cornmeal and feed a little more meat and bone; also cut the tips off the wing feathers and they will stop growing for a while. If the feed is well balanced the feathers grow evenly all over the body just as nature intended them to. Too much mash is answerable for a lot of things that chicks are troubled with; there must be a certain amount of whole or hard grain to keep things balanced. Then the mineral that comes from the green feed is a great help in keeping chicks healthy and their growth all around instead of being too much in one way. Too much growth in feathers is always at a loss of growth in some other way, either in bone or muscle.

SALT FOR CHICKS.

[Written for Pacific Rural Press by Susan Swaysgood, Pomona.]

A young man told me his chicks were toe picking and I told him to give them a dose of salt and water, a teaspoonful of salt to a quart of water. Instead of a dose, he gave continued treatment all day and killed quite a number of chicks besides making others very sick.

If anyone told me to "take a pill" it strikes me forcibly that I would just take "a pill"—not keep taking pills all day.

The Oregon Agricultural College has a White Leghorn that is supposed to have b[roke] the world's record for the numbe[r] of eggs produced during a 5-year period. This hen, named "Oregona," recently completed her fifth year, with a record of 987 eggs, and during the first 13 days of her sixth year, she brought the record up to 1000 eggs.

The addition of ground or broken shell to the poultry ration has been known to increase the egg production nearly tenfold.

RAISING AND FEEDING WINTER EGG-LAYERS.

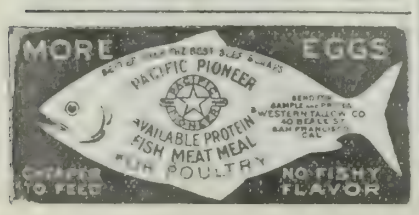
[Written for Pacific Rural Press by W. M. Baker, Grimes.]

For the lady from Exeter who wants to know how to make hens lay in winter I will tell you how my wife and I did it. Our 160 hens cleared us $30 per month the year through and our heaviest egg checks were in December, January, and February.

The first essential, according to our experience, is to have the chicks hatched during the first half of March, as that will bring them to a laying age in September or October, after the hot weather of summer is past and before the cold weather of fall starts. Our breed, White Leghorns, will lay at six months if forced, but it does not pay, as they are too young to keep it up. If you hatch them so as to come to maturity after cold weather starts, they will not begin to lay until the following spring, but if they start laying before the cold weather starts they will keep it up all winter if properly handled.

The First Mistake That Was Ever Made

EVE made the first mistake when she plucked the forbidden fruit and from that time till now, mistakes, big and little, have occurred.



One of the mistakes that countless ranchers are guilty of is the selection of poor pumps and gas engines.

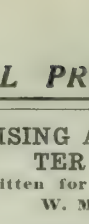
The only way of being absolutely sure of not making a mistake is to go to WILLIAM GREGORY & SONS, and buy R. & V. Engines and Gregory Pumps.

This well-known concern also handles machinery supplies, lubricating oil, Moline automobiles and accessories, tires, tractors, sprayers, outfits, etc. Fine up-to-date machine shop in connection.

William Gregory & Sons

602 N. Main St., Los Angeles

Lasting Protection for Every Roof



You will save many dollars in repair bills when you protect your home, barn, poultry house, and other buildings with

Pronounced "RU" as in RUBY
RU-BER-OID ROOFING
COSTS MORE - WEARS LONGER

—the roofing that has *proved* its durability by more than 20 years of constant service on every kind of building.

RU-BER-OID Roofing has never varied in high quality. It contains no paper, wood fibre, sand, coal tar or asphaltum oils. It cannot crack or rot.

Leading retailers everywhere sell RU-BER-OID, in attractive gray and Colored RU-BER-OID (Ka-lor-oid), in permanent Tile Red and Copper Green.

Look for the RU-BER-OID Man on every roll of the genuine. The United States Appellate Court has enjoined imitators from using the word "Rubberoid or any similar name as the trade name or brand" of their roofing.

Send For A Sample Of Calmade Graduated Poultry Fence

10 inches graduated in mesh from 1½ inch to 2½ inches then 29 inches of 2¾ inch mesh, topped by 4½ inch mesh for the height of the fence.

The Fence Without a Sky Line

It is the most economical as well as the most practical of all poultry fences. It costs no more to buy than the old style poultry netting and costs much less to put up.

It is the only fence made with a bottom mesh smaller than one inch. It will turn the smallest chickens. Because of the straight line, continuous weave of "CALMADE GRADUATED" Fence, baby chicks won't hang in it, large fowls can't climb it.

"CALMADE GRADUATED" Fence will not slip at the joints nor unravel when cut. Uniform in weave and width. It unrolls flat as a board—it is easily put up and stretches without bulge, kink or bend on posts 16 feet apart. Learn all about these advantages and let your next fence be a "CALMADE GRADUATED." Write at once for free samples of wire used, free illustrated folder and name of nearest dealer.

CHICKENS, DUCKS, GEESE, GUINEAS, PEA FOWL. Address Wm. A. French, 545 W. Park St., Stockton, Cal.

SINGLE COMB Rhode Island Reds. Eggs and stock for sale. Dirk Dairy Farm, Lemoore, Cal.

They should have roosting houses as tight as possible on three sides and as open as possible on the other, so as to have plenty of fresh air and no drafts. Needless to say these houses should be kept clean and free from lice, and the hens should have a box of dry dust to wallow in to keep the body lice off. Unless you provide it in winter, they will find none. The run should be well drained and the hens have cover to go under in stormy weather. A hen with wet, cold feet will not lay eggs. Green feed must be provided, or the hens will not lay. We bought cabbage and fed two heads a day to 160 hens. This cost us at that time 50c per dozen and it was a good investment. In the morning we fed in winter, yellow corn, wheat, rolled oats, and rolled barley mixed dry; at noon yellow corn and at night a mash which we make by soaking rolled oats or rolled barley 24 hours, quite sloppy but mixed with shorts until it was quite dry and crumbly. In this mash we put a quart of meat scraps and a handful of granulated charcoal. For our 160 hens this mash just filled a 5 gallon coal oil can. We fed it hot in winter and cold in summer and at night for two reasons. Fed hot at night it sent the hen to the roost with a well-filled crop of hot feed and we imagined it kept them warm at night. Then, too, mash is more or less loosening to the bowels and it is better to have the droppings on the dropping boards than in the nest.

Telling Their Age. — When your chicks are hatched take a sharp knife and slit one certain web in their feet so you can look at your hen and tell how old she is. Do this before they eat for the first time, and it will not bleed. Never keep a hen through her second molt. Individual hens will sometimes lay when they are two years or older, but as a flock they will not lay much.

We kept shells, grit, fresh water and hopper feeders filled with bran before our hens at all times. Our March hatched chicks did not molt the first year and molted early the second year. They never got a chance to molt the third year.

POULTRY NOTES.

A very little salt in dry or moist mash is absolutely necessary, but fowls are injured by an excess of salt.

Fowls sleeping in draughty roosting quarters are certain to take cold, and colds lead to many other troubles.

RHODE ISLAND REDS — Blue Ribbon winners. Hatching eggs and baby chicks. Breeding stock at reduced prices. Wm. Larm, 3915 39th Ave., Fruitvale, Cal.

BARRED ROCK AND R. I. RED CHICKS—$11 per 100. Good chicks. Safe delivery. G. L. Hawley Madera, Cal.

MRS. BEST'S LETTER.

My dear Friends:

I wonder how many of you have boys or girls graduating this spring from either the grades or from high school! Those of you who have are no doubt in the midst of much conversation as to suitable clothes. The boys are easily taken care of—a good looking suit of dark blue will be exactly what the graduating calls for and it will be the finest kind of a suit to use later for dress.

But with the girl it is not so easy to decide, as there are such wealths of materials and so many different styles in which the dress might be made.

I am so glad to see the schools of the cities taking a stand on simple dresses for graduation. One of the high schools around the bay has limited the members of the graduating class to five dollars expense on the dress. Of course that means for material, for the making is supposed to be done either in the sewing department of the school or at home.

The materials used range from linen or cotton weaves that closely resemble linen at about one-third the price, to swisses and nets and laces. One of the stores is showing a big line of wide embroidery flouncing that makes very pretty dresses for slender girls, but would not be so good for girls of heavier build. Most of the skirts are made very full and trimmed with ruchings or large tucks and they need tolerably full petticoats under them.

A pretty girdle adds greatly to the appearance, and while you will want white for the great event, an extra one of a favorite color helps make a variety in one's dressing. Low shoes are usually worn and can be either white or black. There are some very good-looking white canvas pumps in the stores at very reasonable prices. For other occasions, colored stockings with white pumps are considered very smart and the color should harmonize with the belt or tie.

There are some very good silk hose on the market now, with cotton or lisle feet, that are guaranteed for a definite length of time.

Graduation is such an important event in a child's life that it seems worth while to make an effort to give them what will make them happy, and suitable clothes certainly help to that end. Yours devotedly,

Rosabella Best.

ELIMINATION DAY.

A new holiday on the calendar, to come the first of February, May, August and November, is proposed for women and is to be known as Elimination Day.

On the first days of these months, go through the entire house, with a critical eye, looking at all ornaments, pictures, calendars, etc., and at the contents of bureau drawers. Let all things that are not necessary for either use or beauty, be discarded. You will be surprised how many useless articles we all have and what a lot of extra work they cause us.

What is your preparedness against fire?

FLORAL DEPARTMENT.

[By Geo. N. Tyler.]

You can still put in cuttings of chrysanthemums as described in a former article. Fall growing varieties can be put in as late as middle of June and still get large and single stem flowers.

Watering the Garden.—Do all your watering in the forenoon if possible. My reasons are these: In the morning the air, soil and water are nearly of the same temperature, and the plants do not receive any check. If you water in the late afternoon the soil and air are from ten to twenty degrees warmer than the water, consequently you chill your plants. This is one of the main causes of mildew on roses. I do not believe in this daily sprinkling with the hose, for the water does not penetrate the soil for more than an inch or two, and the hot sun draws out all the moisture and makes a hard crust on the top of the soil. When watering let the sprinkler run for an hour in a place, and keep moving it around till you have watered your whole garden, then as soon as the soil is dry enough to work, cultivate and rake fine; this coatin of dry soil acts as a mulch, and you do not have to use near as much water. By surface watering you draw the roots to the top, and as soon as the soil dries out or bakes the plants wilt, while cultivation means deep root action and your plants will stand a dry spell without any ill effects.

Sweet Peas.—Keep the sweet peas picked off and do not let them go to seed, for one seed pod formed has more ill effect than bearing one hundred flowers. Now is a good time to give them a mulch of stable litter or leaves. It tends to keep the roots cool and conserves moisture. Spray the foliage from both sides, as it keeps down red spider, and you will be surprised at the amount of moisture the foliage will absorb. Clippings from the lawn also make a good mulch.

Violets.—Keep the violet runners picked off and give them a weekly watering, so they will be in a growing condition all the time. It does not do to let them dry out during the summer, or you will not have much bloom till way along in the winter. By keeping them growing you will begin picking by October. Never under any consideration use lime around violets or strawberries. The home course of floriculture of the U. C. advocates the use of lime to make the soil friable, which is all right for most plants, but not for violets or strawberries. Try it on a part of a bed and you will soon see the ill effects. The main thing in violets is to keep the roots cool. You can do this with a mulch of cow manure or leaves.

Bulbs.—All bulbous stock, where the foliage has turned yellow, should be cut off close to the ground and the soil kept dry. If not, take them up and let them ripen in the sun for a few hours, and then spread them out in the shade for a day or two. They can then be packed in dry earth or sand and put down cellar till planting time in the fall.

WALNUT HULL KETCHUP.

Miss M. Girling, an English lady, says that the hulls of husks of walnuts make much better ketchup than mushrooms. They should be placed in tubs, sprinkled with salt, and frequently stirred. The liquor that comes from them must then be strained and boiled with spices. When put into bottles it will keep for years.

An old cook book gives a recipe for "Ketchup of the finest sort," made from the "expressed juice of walnuts"; and afterwards refers to that from the outside shell as not equal as regards color or flavor. The flavorings to be used are 2 lbs. shallots, 1 oz. cloves, 1 oz. mace, 1 oz. pepper, one clove of garlic to a gallon of juice. These to be added when the liquor is boiling, and "then simmered till the shallots sink." The ketchup is said to keep twenty years, but is not fit for use till the end of the first year.

Do not repair another's fence till you have seen your own.

FRENCH MUSTARD.

Will you give me a recipe for French mustard?—Mrs. F. M. V.

Stir a tablespoon of salad oil into four tablespoonfuls of English mustard. When well rubbed in, add a teaspoonful each of sugar, paprika and onion juice, then add enough scalding vinegar to make a smooth paste. Beat till very smooth, put in a double boiler and cook 15 minutes, closely covered. Put away in corked bottles.

STOVE BLACKING MIXTURE.

Mix half a cake of stove blacking with an equal quantity of alcohol turpentine and benzine, a small glassful of each. When the stove is cool, apply this mixture with a woolen cloth and when dry, use the brush freely. A higher and more lasting shine can be given, if rubbed again with a dry woolen rag.

A sticking cake may be quickly removed from the baking pan by placing it for a moment on a wet cloth.

WHO'S AFRAID IN THE DARK?

"Not I," said the owl,
And he gave a great scowl
And wiped his eye
And fluffed his jowl,
"To whoo."
Said the dog, "I bark
Out loud in the dark,
Bow wow."
Said the cat, "Miaow;
I'll scratch and who
Dare say that I do
Feel afraid?
Miaow."

"Afraid," said the mouse,
"Of the dark in a house?
Hear me scatter
Whatever's the matter.
Squeak."
Then the toad in his hole
And the mole in the ground,
They both shook their heads
And passed the word round.
And the bird in the tree,
And the fish and the bee,
They declared, all three,
That you never did see
One of them afraid
In the dark.
ut the little girl who had gone to bed
ust raised the bedclothes and covered her head.

KEEPING HIS PROMISE.

It was a beautiful Saturday afternoon in spring. Harry was playing in the yard with his new express wagon when mamma called him.

"I want you to take this parcel to Aunt Kate," she said.

"I'll put it in my wagon and take it," answered Harry, and started off.

On his way down the road he passed the house where Jamie Lane lived. And there was Jamie sitting on the front steps with his gray kitten in his arms. He was a very small, thin little boy, and lame.

"O Harry," he called out, "Have you a new wagon?"

"Yes, isn't it a beauty?" said Harry, coming to Jamie's gate.

"I wish you would stay and play with me," and Jamie looked wistfully at the new wagon.

"Why, yes; I will. I have to take this parcel to Aunt Kate; then I'll hurry back."

Harry soon reached his aunt's house. He gave her the note, and was going away when she said: "Your uncle is getting the carriage ready to drive me to town. Don't you want to go with us?"

"Oh, I guess I do!" exclaimed Harry, eagerly.

"Well, then, run home and tell your mother, because we won't be back until late."

"I'll go as quickly as I can, so you won't have to wait for me," and Harry was off like a flash.

He was quite excited, for going to town with Uncle and Aunt meant ice-cream and cake, and lots of nice things.

He was so busy thinking of them that he would have gone past Jamie on the steps if the little fellow had not called out, "Oh, I'm so glad you are back!"

Harry suddenly stood still. He had forgotten all about Jamie. But of course he couldn't play with him now!

Jamie had gently put down his kitty and was hobbling out to the gate.

"My, that's a splendid wagon!" he said.

"Say—I"—began Harry, but the words he wanted to say wouldn't come. As he looked at Jamie's poor little thin face, he felt suddenly ashamed. How could he have been so mean as to forget his promise to play with him.

He swallowed hard. It wasn't easy to give up that trip to town.

"Say, Jamie, I've got to go back and tell Aunt Kate something I ought to have told her when I was there. I'll not be long, and I'll leave my wagon here till I come back."

"Of course," said Aunt Kate, after Harry had explained about Jamie. "You must keep your promise to play with him. I would take him with us, too, but he is not strong enough to stand such a long drive."

Harry tried not to mind very much when, a half-hour later, he saw his uncle and aunt drive down the road. His aunt waved her hand to them.

But he did not think of them very long, for he got so interested in making his friend have a good time. And when it was time for him to go home, he was very happy when Jamie's mamma said: "My! You must be a good playfellow. I haven't seen Jamie look so bright for a long time."

"I'm coming to play with him often. You see, I can easily wheel him about in this wagon."

When Mamma asked him where he had been all afternoon, he told her that he had been playing with Jamie, but he did not say anything about Aunt Kate having invited him to drive to town. — Western Advocate.

GOOD SENSE.

Among some skaters was a boy so small and so evidently a beginner that his frequent mishaps awakened the pity of a tender-hearted, if not wise spectator.

"Why, sonny, you are getting all bumped up," she said. "I wouldn't stay on the ice and keep falling down so. I'd just come off and watch the others."

The tears of the last downfall were still rolling over the rosy cheeks, but the child looked from his adviser to the shining steel on his feet, and answered,—

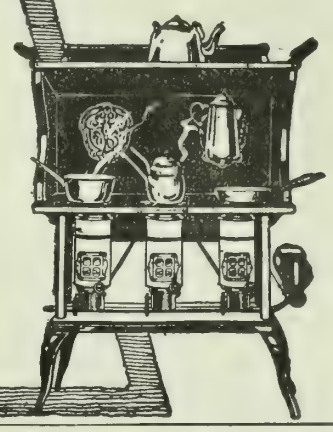
"I didn't get some new skates to give up with; I got 'em to learn how with."—The Presbyterian.

Use good screens all over the house, especially at the tops of windows.

Cook in a cool kitchen

All the heat is concentrated where it is needed —keeps you cool and makes for better cooking

NEW PERFECTION OIL COOK-STOVE



Why not cook with a modern oil stove this summer and be comfortable? Bakes, broils, roasts, toasts. More efficient than your wood or coal stove, and costs less to operate.

Better cooking because the long blue chimneys give steadier, more evenly distributed heat, under perfect control—like gas. No smoke or smell. In 1, 2, 3 and 4-burner sizes, ovens separate. Also cabinet models with Fireless Cooking Ovens.

Pacific Rural Press Market Report

PRICES QUOTED AS PAID TO PRODUCERS.

San Francisco, May 17, 1916.

WHEAT.

The Eastern market shows constant fluctuations, on varying advices as to crop prospects and export conditions, but values on the Coast show little change. Holdings in the north are still rather large, owing to scarcity of ships for export business. This market is very quiet.

Cal. Club, ctl.	$1.60 @1.65
Northern Bluestem	1.87½ @1.90
Northern Red	1.85 @1.95

BARLEY.

The new crop is still very uncertain, but the local trade is holding values on about the same basis as before, future business being very quiet. There is a fair spot demand for feed, and a cargo has just left for export.

Shipping, ctl.	$1.37½ @1.40
Choice Feed, ctl.	1.32½ @1.35

OATS.

Supplies are light, especially of white oats, and some good-sized purchases have caused a further advance in this variety. The demand in this market is light, but there has been more inquiry in the north, where most of the stock is held.

Red Feed	$1.35@1.37½
White	1.55@1.60

CORN.

The movement of Eastern yellow in this market is of small consequence, except on orders for milling concerns. Egyptian is a little lower, with a great deal of inferior stock offered, and prices on Milo and Kaffir in various quarters show a much wider range than is quoted here. Any large shipments here would probably break the market, as the demand is limited.

Eastern Yellow, ctl.	$1.80@1.85
Milo Maize	1.40@1.45
Kaffir	1.60@1.65
Egyptian	1.45@1.50

BEANS.

Beans continue to advance, small whites being again higher, while bayos, pinks, limas and reds have all been marked up a little. Blackeyes are the only variety that has not responded to the increasing demand. The Eastern trade has been getting actively in the market in the last few weeks, and stocks of most varieties are moving off rapidly, though dealers still have fair supplies in several lines. They expect a close cleanup, however, in everything else on the list.

(On wharf, San Francisco.)

Bayos, per ctl.	$4.90@5.00
Blackeyes	2.90@3.00
Cranberry Beans	4.75@4.85
Horse Beans	3.00@3.25
Small Whites (south)	6.50@6.60
Large Whites	6.20@6.30
Pinks	5.00@5.10
Limas (south)	4.60@4.70
Red Kidney	6.50@6.75
Mexican Reds	4.75@4.90
Tepary Beans	4.00

SEEDS.

Melilotus Alba, lb	23 c
Melilotus Indica	6 c
Bur Clover	11 c
Oregon Vetch	5 c
Soy Beans	6 c
Canada Peas	5¼ @ 6 c
Alfalfa, per lb.	22 @24 c
Sudan Grass	35 @40 c

HAY.

Arrivals are lighter than for several weeks, but still excessive for this season, causing a great deal of weakness in values. This movement is rapidly cleaning up the remaining old-crop stocks in the country. Prices are maintained only on fancy wheat and red oat hay, and a sharp drop is noted for new crop wild oat and barley hay, a good deal of which is arriving. Much of the new volunteer hay shows signs of heating in the bales, being imperfectly cured, and accordingly does not bring as good prices as it should. Offerings of new alfalfa also are heavy, and as there is now little demand from outside points they move slowly. New oat hay is quoted in some sections at $9 to $10 per ton, but local values are not yet established. Dealers say many growers are cutting grain for hay, and until the extent of the crop is better known it will be impossible to make very definite prices for the new crop.

No. 1 Wheat	$13.00@16.50
No. 2	12.00@14.50
Tame Oats	12.00@18.00
Wild Oats, new	8.00@11.00
Barley, new	9.00@12.00
Alfalfa, new crop	8.00@12.00
Stock Hay	6.50@ 8.50
Straw, per bale	.25@ .40

FEEDSTUFFS.

Bran and middlings are a little higher, as the mills have been running on a rather small scale of late, and stocks are getting low. Some red bran, however, is offered at concessions. Other lines of feed are quiet and unchanged.

(Wholesale prices, per ton, carload lots, San Francisco.)

Beet Pulp, per ton	$22.50@23.50
Alfalfa Meal, per ton.	20.00@21.00
Alfalfa Molasses Meal per ton	21.00@22.00
Bran, per ton	26.00@27.00
Oil Cake	Nominal
Cocoanut Cake or Meal	23.00@25.00
Cracked Corn	40.50@41.50
Middlings	34.00@35.00
Rolled Barley	29.00@30.00
Tankage	45.00
Rolled Oats	29.50@31.00

VEGETABLES.

Many items on the vegetable list are easing off now, with more liberal offerings, though values are still rather high. String beans are in good supply and lower, while good peas are very scarce, and fancy stock from the Ocean Shore district brings up to 5c. Summer squash is much easier, and bell peppers are dropping, while eggplant remains fairly steady. Rhubarb is easy, while asparagus is inclined to firmness, with fancy lots held higher. Lettuce also is firm. Good tomatoes are now appearing from several sections, and bring better values than last week; and green corn also shows some firmness.

Cabbage, ctl.	$1.75@2.00
String Beans, lb.	4 @8 c
Summer Squash, box	75 @90 c
Peppers, bell, lb.	20 @25 c
Rhubarb, box, Bay	40 @75 c
Asparagus, box	1.00@2.25
Artichokes, doz.	40 @50 c
Lettuce, small, crate	.75@1.00
Eggplant, lb.	15 @17½c
Peas, sack	2.00@2.50
Tomatoes, lugs	2.00@2.25
Green Corn, doz.	35 @40 c

POTATOES AND ONIONS.

Old Delta stock in both lines is about cleaned up. New potatoes are sharply advanced, as the frost is said to have done a lot of damage, and good stock is decidedly scarce. Oregons are easier. Australian onions continue to weaken. Bermudas are cleaning up, and new reds are offered at lower prices than have lately prevailed.

New Potatoes, ctl.	$2.50@3.00
Oregon Burbanks	1.55@2.00
Onions, red	1.60@1.65
Australian	2.50
Garlic, per lb.	5 @ 9 c

POULTRY.

Supplies of chickens are coming in freely from nearby points, and while shipments from the East are limited, there is not enough demand to keep the market cleaned up, and prices continue easy. Large broilers have declined a little, all other chickens standing about as before. No young ducks are appearing, and old stock is quite easy. Belgian hares find slightly better demand but are not especially strong.

Broilers, 15 lbs. to doz and less, lb.	22@23
do, over 15 lbs. to doz.	25@28
Fryers	25@30
Hens, extra, per lb.	19

Geese, per pair	2.25@3.0
Ducks, young	Nomina
Old	15
Belgian Hares	10@11

BUTTER.

Butter is still being shipped out of the state in large quantities, three cars having been made up for the East a few days ago, and another since, while about two carloads are being sent to Manila. Local dealers have been predicting a cessation of shipments for some time, but the movement seems no nearer an end than it was several weeks ago. Prices are a little firmer than last week.

	Thu.	Fri.	Sat.	Mon.	Tu.	Wed.
Extras	24½	25	24½	24½	25	25
Prime Firsts	24	24	24	24	24	24
Firsts	23½	23½	23½	23½	23½	23½

EGGS.

Prices have advanced slightly, and the present tendency is upward, as stock is arriving rather slowly and is readily disposed of. The first lot of Chinese eggs for the season arrived a few days ago, but has had no noticeable influence on the market.

	Thu.	Fri.	Sat.	Mon.	Tu.	Wed.
Extras	22½	22½	22	22½	22½	22
Sel. Pullets	19½	20	19½	19½	20	20½

CHEESE.

Fancy flats are quoted slightly higher, as arrivals have been moving off well. Monterey cheese also is firm, but few sales are made above the appearing quotations.

DECIDUOUS FRUITS.

Black and red loganberries, as well as currants, have been added to the berry list, and all are easing off a little in price, with a rather light demand, though offerings are by no means heavy. Gooseberries are much easier, while blackberries are higher. Apples are moving off well, and dealers still hope for a cleanup, though stocks are much larger than last year. Cherries in general are lower, though the drop is mostly on the better class of fruit. Apricots are firmly held at the old level, and a few crates of peaches have been sold at higher prices, but larger offerings in the next few days will surely cause a drop. A few cherry plums have appeared, but find little sale. A good many figs are offered, and move readily at satisfactory values. Melons are already coming in in considerable quantity, and nutmegs are held at stiff prices, watermelons also being rather high with little demand.

Currants, drawer	75c@$1.00
Loganberries, red, drawer	30@40c
Black	20@25c
Gooseberries, lb.	4@ 5c

Figs, box, black	2.00@3.50

Special Deciduous Market Report.

By J. L. Nagle.

Sacramento, Cal., May 15, 1916.

For your information, have to advise that the Malaga crop in the Fresno district, where most of the tonnage comes from, is not in excess of 85 per cent of normal. California, and especially the lower San Joaquin Valley, has experienced continuous north winds during the past two months that have prevented in a great measure the proper pollenization of the Malaga and Muscat grapes.

Up until Sunday morning, May 7th, a full crop of Tokays was predicted, but early on the above morning the Sacramento Valley and the district around Lodi, Woodbridge, Acampo and Florin were visited by the most severe frost in the history of this section of the country, with the result that the American River district, Mayhews, Mills and Routiers have been damaged about 90 per cent, Folsom Orangevale and Fair Oaks about 50 per cent, Florin 50 to 60 per cent, Acampo 50 to 60 per cent, Woodbridge about 40 per cent and Lodi in some sections 25 per cent, in others 75 per cent. As near as can be estimated at this writing it would appear that the Tokay crop has been cut down about 50 per cent, but as the vines had set considerably heavier than last season we do not think that the shipments will be 50 per cent less than last year—probably 25 per cent.

Nearly all varieties of peaches are normal, and plums, especially the blue varieties, are about 75 to 85 per cent. Early cherries have all been shipped and Black Oregons are normal.

The apricot crop is lighter than last season and of much better quality, but if market conditions justify we look for as heavy a tonnage East as last season, with a less amount dried.

Pears set heavy, but experienced an unusual drop last month. On the Sacramento River about 20 per cent are scabby; in other districts the fruit is clean, but the crop is not over 75 per cent.

This is as close an estimate of the deciduous crop as I am able to give you at this writing.

It may be of further interest for you to know that the crop in general is about two weeks in advance of last season and on account of the long dry spell the quality is exceptionally fine and we look for average sized fruit.

The following prices have ruled for the week:

New York — Tartarians averaged $2.32; Chapman, $1.57; Rockports $1.30; Purple Guigne $1.45; Royal Annes $2.36; Knights Early $1.20; Burbanks $2.10.

Chicago—Tartarian $2.26; Rockports $1.30; Chapmans $1.78; Royal Annes $1.80; Knights Early $1.52.

Special Livestock Market Report.

Cattle are weaker both here and at Portland. The heaviest supply is of the heavyweights, so they do not get the premium due their superior quality. Baby beef is not enough known to command the premium likely when it is more generally grown. They make cheaper gains than older stock. Pulp and grain-fed steers at Portland sold May 15 at $8.85 to $9. California grass cattle now coming to market are of poorer quality on account of drying feed.

Hogs are marked up, and selling strong.

Sheep are scarce here and will continue so all the rest of the season. Early lambs are most all sold. The rest are going to the mountains with their mothers. Buyers still want sheep, but growers may well keep all breeding ewes.

Wool continues very strong the world over, at the same prices as last week, with a tendency to higher prices for long staple free wools. California country stocks pretty well cleaned up.

DRIED FRUITS.

A local packer sums up the situa-n by saying, "The growers don't nt to sell, and the jobbers don't nt to buy, so we are taking it sy." There has, as far as can be rned, been very little done in this rket for the last fortnight, and ile there are many indications that tter values may be realized later than can be obtained now, packers ve covered their early needs and e content to await further develop-nts, as are also the growers, as nditions are so uncertain that ither feel warranted in making any finite move. The fact that stock practically all varieties is going to very light, however, is now well tablished, and a renewed buying vement is expected before long. significant fact is the upward vement of peach prices for can-ng. Spot stock is well out of grow-s' hands and moving rapidly into nsumption.

CITRUS FRUITS.

Citrus fruits are still commanding good pices on the Eastern auctions. At New York on Monday, May 15th, navels averaged from $1.80 to $3.15 per box; valencias from $2 to $3.25; bloods from $2.20 to $2.65; seedlings from $1.85 to $2.75; sweets $1.85 to $2.75; St. Mikes $2.70 to $2.85; lemons $2.30 to $2.80. Other auction points showed about the same prices. Shipments of navels from California will soon close for the season. Already central California is sending large shipments of valencias and heavy shipping of this variety from the south will commence in a couple of weeks.

Most citrus goods have found a very fair demand in the San Francisco market for the last week, but with plenty of stock values are unchanged.

GROWERS' INFORMATION BUREAU BULLETIN.

San Jose, May 15, 1916.

Prunes: Reported improved prune crops Santa Clara nullified by frost. Crop in California 65 per cent of last year; in France, not heavy. Northwestern prunes severely frosted. Prices lowered, probably by artificial manipulation. Large short interests not yet covered. Growers still holding; and should.

Apricots: Same estimate—60 per cent last year's 18,000 ton crop. $45 to $50 offered Santa Clara fruit on trees for green shipment. Hemet sold $40 green—not much will be dried. 11 cents offered Santa Clara dried—very few sales. Pits, $47.50 to $50.

Contract forms for selling Ass'n ready for signatures.

Publisher's Department

George W. Herbert, the Chicago representative of this paper, also secretary of the Standard Farm Papers, of which organization the Rural Press is a member, was a welcome visitor during the past week. The Standard Farm Papers as an organization is working for quality and known circulation. All the papers of the association are members of the Audit Bureau of Circulation. The Rural Press has good company in its effort in building a clean, strong journal to ably represent agriculture in all its branches.

In renewing her subscription, Mrs. Lizzie Armstrong Jones of Cloverdale mentions that the Rural Press has been coming into her family for forty years.

California's Duty to the Peach.

Eighth of a series of sketches in which the Editor presents suggestions drawn from long experience, of what Californians should think and do for the advancement of California Agriculture.

IN VIEW of the uniqueness and picturesqueness of their notable achievements with some other fruits, Californians of this generation are apt to forget that it was chiefly the behavior of the peach which suggested to the pioneers the superlative suitability of California for fruit-growing; that it was the early-bearing, great size and rare beauty of the peach which sustained the loud cry which the pioneers made to the world of the wonderful fruit-resources of their new country, and that it was the money from the peach which financed many of the pioneer undertakings with other fruits. For its brilliant demonstration of distinctive State value for fruit in those early days of doubt, as well as for its continued contribution to the building of a State fruit industry, which now tops the United States and every country of the world save France, it is the primal duty of Californians to hold the peach in appreciation and grateful remembrance.

Beginnings with the Peach.—The peach was brought to California by the founders of the missions, and flourishing trees were found by visitors in 1792, and the peach was early taken to outside plantations—for it is recorded that in 1805 "the individual Manuel Higuera has permission to make as much as one barrel of peach brandy." Peaches continued at the missions until the coming of Americans, for the traveler Bryant found peach trees in 1846, but he says the fruit was indifferent, and General Bidwell, who wrote later of what fruits he saw at the missions in the '40's, does not consider the peach worth mentioning. It seems clear, then, that the new era of the peach in California inherited practically nothing from the old regime.

The American pioneers had early thoughts of the peach. Many of them came from states where the peach had previously done well, but, according to the common belief of the time, the climate had been changed by the removal of forests in clearing for farms. Whatever may be thought now of that theory, the fact was that the peach was too often losing its fruit in the old homes, through bud-freezing; and the reports of the salubrity of California suggested reveling again in the deliciousness of the peach, and the few pioneers who crossed the plains to California homes before the gold discovery planted peach pits.

The same is true in much greater degree of the argonauts of '49 and '50. Hundreds of them came hunting gold, but bringing peach pits in their kits, and hundreds more had peach pits sent to them by overland and steamer mails. Other fruit seeds came also, but none in such abundance as the peach, and no seedlings showed such joy of growth as the peach, as it embowered the cabins in foothill mining camps, and bore glorious fruit abundantly, with incredible precocity. In many cases, as gold failed in the soil and the diggings were abandoned, the gold of the peach gleamed above the deserted cabins and was gathered by chirping squirrels and screaming blue jays. Some of these trees, which happened to possess soil into which subterranean water moved in the right amount, survived neglect, assumed rough bark and other aspects of forest growth, and some of them stand, even to this day, as demonstration of the longevity of the peach in California when it finds favorable soil and moisture supply.

Though this does not illustrate commercial peach drying, its symbolism is sweet even to the business men who are handling peaches in the large way characteristic of the present-day industry.

The Peach as a Business Basis.—But delightful as it would be to picture the lusciousness of the California peach to those fresh from continent-crossing, or to those who had undergone months of mining-camp fare of bacon, beans and flapjacks, and sweet as it would be to the emotions to recall the symbolry of the peach in its full meaning to the heart-sick throng in this woman-less paradise in those early days, we can tarry for no such dalliance, either romantic or gastronomic. Our present business with the peach is its business with us in the upbuilding of California. And even in this line we hold ourselves resolutely in check, for the pioneer tales of early peach sales, the price paid for single fruits and the gold product of single trees are very tempting to the pen. However, as showing even in the enjoyment of the peach the ever-present impulse to grow peaches, it is well to state that in the early time there was an agreed price of one dollar for a peach with a rebate of twenty-five cents for the return of the pit. But this was after the market had steadied a little. Single peaches were sold at Coloma in 1854 for $3 each and a tree-full brought $1,350. This, however, was partly due to distance from valley points where larger plantings had been made, so that in the same year G. G. Briggs sold, from his orchard near Marysville, $2,800 worth of peaches from fifty trees brought from New York State in 1852—the rate being $1.50 per dozen on the trees. This was perhaps one of the earliest instances of wholesaling fruit, the buyer doing the picking. In 1855 Mr. Briggs imported 7,000 peach trees, and planted also other fruits for several years until he had a thousand acres in fruit in 1858, of which the peach was chief. By that time there were many other orchards scattered from the regions around the Bay of San Francisco to the foothills.

To establish the supremacy of the peach it is not necessary to rummage the reminiscences of those early days. The report of the State Surveyor General for the year 1856 gives data from which the following list of fruit trees growing in California at that date is compiled:

Peach	574,652	Orange	4,351
Apple	263,872	Fig	3,971
Pear	26,146	Nectarine	1,367
Cherry	14,413	Pomegranate	1,354
Apricot	11,044	Walnut	957
Plum	9,235	Olive	567
Quince	4,278	Lemon	60

There were also recorded in that year 1,311,356 grape vines. As

California Weather Record.

The following rainfall and temperature record is furnished the PACIFIC RURAL PRESS by the United States Department of Agriculture Weather Bureau, at San Francisco, for the week ending at 5 p. m., May 23, 1916.

STATIONS	Rainfall Data: Past Week	Seasonal To Date	Normal To Date	Temperature Data: Max'm	Min'm
Eureka	.45	38.98	44.35	56	42
Red Bluff	.18	20.11	24.33	80	48
Sacramento	.04	18.23	19.79	78	78
San Francisco	0	27.12	21.94	66	48
San Jose	.01	16.31	16.55	72	40
Fresno	0	11.72	9.45	82	48
Independence	—	———	8.32	82	—
San Luis Obispo	0	26.85	20.14	78	40
Los Angeles	.02	19.91	15.49	72	52
San Diego	.01	12.55	9.90	66	56

THE WEEK

ALTHOUGH we have had too much frost and wind and too little rain during the calendar spring time which is now closing, there is a gratifying amount of bouyancy and activity in California affairs. The season after the Exposition has not brought the degree of reaction and weariness in enterprise which world-pessimists preached to us. In fact recent visitors profess surprise that we could build so well along the ridge of optimism which that world-event rolled up in California and her future. A breezy expert and commentator from the Atlantic coast, where they hold a sort of world-court of exuberation in continuous session, blew into San Francisco the other day, and is reported as saying: "San Francisco is the only exposition city on record that has not suffered a period of severe depression after the close of its display," and credits California with "marvellous growth" since his last visit twenty-five years ago.

It is true that there is considerable doing in plans for development. Quite a number of large transactions in unimproved farm lands are being recorded, and subdivision enterprises are intended, on a better basis of fairness and worth than has recently prevailed, we hope. There cannot be anything surer than good California land at a fair valuation, and nothing better than honest trade therein, in parcels reasonably prepared for wisely-planned production enterprises. Financial and commercial conditions east of the Rocky Mountains are qualifying many thousands, who have been waiting for a chance to break away for California, to come through and establish themselves in this favored land. To this end, all that California farmers are doing to get together on producing and marketing policies, and to build up live stock and general agricultural productions as well as fruit specialties, is having a marked influence not only in publicity, but in increased confidence in local conditions.

ACTIVITY IN FRUITS.

ALL reports from the producing districts indicate the activity of fruit buyers and a high range of values offered by them, as well as a fullness of confidence among growers who are organized for co-operative sale on their own account. The total production will be small as a rule, but there may be partial compensation in prices and reduced payrolls for those who have fruit to sell. It is sad to think of those who have lost by frost and possibly by too high winds which have prevailed here and there—but the fruit which is gathered promises to be of size and quality which will help to sell larger crops in later years. There is good confidence among canners, and embargos do not seem to frighten them. We read of one concern which intends to "put up the biggest peach, pear and tomato pack in its history"; and of one group of canneries which promises a record-breaking run on peaches, pears, plums and other fruit and tomatoes. This is the proper spirit, and things seem to warrant it. As for wine grapes, which coast valley buyers are searching the interior valleys for, Andrea Sbarboro says: "There is a market for three times as much wine as is being produced in California now, and that there are more orders in California for wine to be exported to Europe than can be filled."

RALLYING FRUIT GROWERS.

THOSE of our readers who are so sad for fear that public help to farmers will "crick" their backs and spring their knees, have some more sorrow coming. The fruit growers of Idaho and Washington decided some time ago to train under the guidance of the Washington Division of Markets, and now they are being followed by the Oregon growers. It is announced that the extension division of the Oregon Agricultural College are preparing to carry on a vigorous organization campaign among the fruit growers of Oregon to improve marketing methods. C. E. Bassett of the Federal office of markets, one of the originators of the plan, will spend some time in the State working with the college staff, and meetings will be held in various fruit districts of the State.

Even if it should give more sadness to our friends who grieve lest our farmers be no longer valiant and independent as they have always been (in 4th of July orations), we have to cite the case of an apricot grower who has become so weak that he has offered to donate his time, energy and machine to sign up apricot growers to the Prune and Apricot Association, about which we have had so much to say recently, and which is being promoted by our State Market Director; and it is expected that other growers will volunteer similar services.

Meantime, there is being held in San Jose, as we go to press with this issue, a meeting of apricot growers of the San Francisco Bay region called by the Growers' Information Bureau at the request of apricot growers, who expect to sell their fruit to canners and green fruit shippers this year. They understand that certain elements have united in an attempt to purchase their share of the 1916 apricot crop at low prices. How sad all this is! It would be so much more valiant for these growers to stand apart independently, and be picked off singly by a lot of sniping buyers!

ANTICIPATING PEACE.

THE dove of peace (not of the Bryan type) seems surely to be preening herself for European flight. The world at large has been disgusted with war since the present most unreasonable conflict broke out, and Europe is heart-sick over it. So far as it was undertaken to demonstrate the world-beating power of any belligerent, it has already fully and righteously failed—so why kill a million more men over that dead issue? It is not in the right of things that one nation should rule the world, and even belligerents are seeing now what other nations have seen from the beginning. The world sky is full of tokens that the war will cease before this year's California fruit crop is fully gathered in. Therefore, there is good reason to expect to get full value for every pound of it that America can spare for Europe. And this is not a California notion. A report of one of our great national staples, just at hand, says this: "Already cotton is discounting peace, for the trade firmly believes that peace is in prospect; and some expect that it may come before the new crop is on the market. There is likely to be a very strong and active cotton market. Many expect cotton will reach the neighborhood of twenty cents a pound when the powers' representatives finally sit at the peace table." It will be a glad day, and it is coming soon, when Europe calls for something better from us than munitions, and we have accumulated a producing force which will compass many better things. On all accounts, peace will be fine. As we go to press the cable says that Woodrow Wilson of the United States and Alfonso of Spain are now getting ready to pacify Europe. As we believe that will now be easy, we suggest that they include Mexico so that they may have a job worth their while.

STATE DAIRY ASSOCIATION.

WE ARE very glad to talk of the project suggested in the following communication:

To the Editor: The Humboldt County Dairymen's Association would like to have your views upon a State organization of dairymen. The Humboldt Association desire to have the opinion of the dairy interest concerning such a movement, and would like to secure a representative gathering of dairymen at Ferndale during the convention of California Creamery Operators' Association in September. The Humboldt County Dairymen's Association has been organized for several years, and has been a success from the beginning.—R. H. Flowers, Secretary, Ferndale.

This is a good proposition, and it starts in a good way from a good source. A successful local association calls for affiliation with other local associations now existing, and with other dairy farmers generally, who desire to come together for mutual benefit and for the advantage of the farm end of the great dairy-producing industry of the State. It is a proper and timely thing for Humboldt dairy farmers to take such an initiative, and everything we can do to assist in such a movement will be actively undertaken. Meeting at the same time and place chosen by the Operators for their convention is also a good thing, for the Operators' proceedings are interesting and edifying, and to see Humboldt dairying should warrant every cow-owner, who can, to invest the time and outlay. There will surely be a widely representative group of dairy farmers present to take the first steps in organization in September, and to call a State Convention at some more central point later in the autumn and preferably before the November election. October is perhaps as near a slack month as California dairymen experience, and a late October date would give time enough to have the call for the convention fully understood and to do some effective talking to the intending statesmen whose names will be used at the November elections. There have been a lot of things done at recent legislatures which affect the dairy farmer, and about the only party in interest which has had nothing to say about it has been the man who owns the cow. Unless the dairy farmers take up the Humboldt proposition and come together in some effective form, their interests will be the football for the Legislature of 1917—just as they have served in the recent past. We count it the duty of all local dairy associations to advise Mr. Flowers that they will be represented at the September meeting, to set up such an organization as he proposes and to stay with it for the sake of the land and the cow and the owners thereof. Recent legislation on dairy lines has probably been all intended to serve the public interest through the consumer, but if all the pressure on any subject is on one side some one may unjustly get pushed over by the bulge on the other side. It is for the dairymen in the broadest public interest to make their claims heard, and if they do not do it themselves, there is apt to be scant vocalization on the subject.

WHAT DAIRY ASSOCIATIONS HAVE DONE

WE HAVE personally participated in the organization and activity of two State Dairymen's Associations in California, and have thus grown into confidence in their desirability and efficiency. The first was organized in 1876 because of the menace of locally-made bogus butter. The inventors of beef-fat-butter-milk butter made an early stand in San Francisco. If we remember correctly they struck out for California about 1875, after they had cleaned up enough royalties, etc., in Chicago—partly because of the salubrious climate, partly because they thought there was plenty of pure gold to be had here, in exchange for bogus gold. A most energetic drive was made

n them at once by the dairy merchants of San rancisco of that day and those who were disposed o invest in rights to manufacture were frightened ut of the enterprise. However, the menace contin- ed, both in the form of prospects of local manu- acture and shipments from Chicago, and a gen- ral convention of dairy farmers was called. here was a large attendance of them from along he coast and coast valleys, from Del Norte to San uis Obispo county, as we remember, but possibly rom beyond; also from beside the rivers in the elta region. This was practically the exclusive rea doing commercial dairying in that day—ex- ept a few mountain valleys which shipped largely o interior points of sale. It was for this conven- on that the late Judge John A. Stanly, himself dairyman in the Napa valley, drafted the first alifornia law against bogus butter, which re- uired branding of packages "Oleomargarine," nd required all dealers and public feeders to dis- lay signs: "Oleomargarine sold here," and to in- orm all purchasers that they were not being sold enuine butter. This law was passed, if we re- ember correctly, by the Legislature of 1877, nd it protected California well until national egislation began to take effect. This first Cali- ornia State Dairymen's Association continued to old conventions for several years, discussing gen- ral dairy resources, practices and policies, but s great work was the protective achievement entioned.

The second State dairy effort realized an active nd effective existence in the '90's. Its chief pur- oses were to improve the California product, and o exploit new markets for the greatly increased utput which the newly-opened alfalfa districts ere seen to be capable of. The population of alifornia was then much smaller than now, and uch demand as there was had to be divided with he imported creamery product which had the ad- antage of higher average quality and uniformity. t was seen that regular systematic work had to e done for the improvement of the California roduct, that dairy instruction was required and hat other essentials of safe expansion be pro- ided. The association successfully insisted that his should be done by the State; the Legislature stablished the California State Dairy Bureau; he University began its series of annual State Dairy Schools, and the association which secured hem, resting from its labors, fell into the tomb which already enclosed the remains of its prede- essor which flourished twenty years before. The California Creamery Operators' Association then ame into existence and lives lustily to this day, nd renders good public service, but it has never ndertaken to be a dairy farmers' organization.

The third attempt at State organization in the nterest of dairy farmers was undertaken three r four years ago, but it never attained much sup- ort, and passed away through taking its tubercu- osis too acutely. The field is now clear for a roadly planned and stalwart association, State- wide and influential, such as our Humboldt county riends call for, and we hope the dairy farmers will give heed to their cry. The subject is open or discussion.

Chestnut Growing.

To the Editor: I am anxious to get information about the growing of chestnuts in this country. I have been recommended to plant an orchard of Paragon chestnuts, and I would be very much obliged to you if you can furnish me with any in- formation in this line.—A. L., Weaverville.

The Paragon chestnut is reported to be satis- factory in the northwest quarter of California, and presumably would succeed in your district. Chestnut growing is, however, sometimes disap- pointing because, although the trees grow very well, they sometimes defer bearing until they at- tain considerable age. This is not always the case, but, considering the disappointments which have been experienced, the planting must be con- sidered to some extent experimental unless you can find trees in your immediate vicinity which are behaving themselves properly. There is very little information available on this subject, as chestnut growing has never reached much com- mercial standing in California, though good sam- ples have been produced in many districts, both in the hills and valleys.

Queries and Replies---by the Editor.

Querists Must Give Name and Address

Leaf-Edge Failure of Almonds.

To the Editor: We have planted this winter almonds on bitter seedling roots, and now some trees are showing yellowing and browning of the tips and edges of the leaves on the small twigs which have just put out. I send you samples of these. In some cases the new growth has all turned brown and died. The man who is doing the cultivating says there is also a spider web on these same trees and thinks that possibly there is red spider on the trees.—B. S., Snelling.

There is no definite indication of the presence of any pest or disease. The yellowing of the edges of the little leaves is probably due to in- sufficient root action. You should ascertain by digging whether the soil in which the tree is try- ing to establish itself is amply moist but not wet. If the soil has only "color of moisture," some irri- gation should be given at once. Owing to the absence of spring rains many young trees will probably be lost through too dry soil in which they cannot root well. Common "spider-web" is not a sign of red spider. It is a very small mite and does not make such a web. It is too early for noticeable injury by this mite. Sulphur the foliage about twice a month and it can never get a start.

Grafting Old Olives.

To the Editor: A California friend of mine writes that I can buy a place with old trees of a very small olive, not valuable in itself but good for grafting over to larger varieties, and soon get fruit. Is that reasonable?—T. A., Chicago.

The olive to which your California correspond- ent refers is undoubtedly the Redding Picholine, which is commercially of little account, and the only value in the trees must be through their grafting over to satisfactory commercial variety. How valuable they are for this purpose depends upon how thrifty the growth is, whether the soil on which they stand is suitable and the water supply assured and not too expensive. Grafting over large trees is perfectly practicable, but some- times disappointing in the failure of the grafts. unless set by an experienced grafter. The olive is rather more difficult to graft than ordinary de- ciduous fruit trees. There will, therefore, be some irregularity in the stand probably. If things go right, some fruit might come in the second year after grafting, and quite a crop the third year. But the proposition is like buying into trouble, especially while you are absent from the State and not able to keep a watchful eye upon things.

Cutworms or Army Worms?

To the Editor: Has anything been found which will destroy the army worm? This worm is doing much damage to grape vines. I have sprayed with arsenate of lead and Paris green without beneficial results.—P. F., Cloverdale.

You probably have to deal with the "climbing cut worm," which is often called the "army worm." They go to the ground in the day time, and it is better to give them poison on the ground than to try to poison the whole foliage. This is done with poisoned bran, as has often been de- scribed on these pages, as follows:

Take bran, 10 lbs.; white arsenic, ½ lb.; mo- lasses, ½ gal.; water, 2 gals.

Mix arsenic and bran dry. Stir molasses and water together and then mix into brain, making a moist paste. For cutworms and grasshoppers, dis- tribute a handful near the base of each vine or tree. Insects will only eat it when moist. When distributed by handfuls it may be gathered up and moistened again.

It should not be used too freely, especially on young vines. It will, of course, endanger poultry and animals. As late as this, with the vine growth spreading to the ground, it is not so easy to poison them this way as when the growth is starting and there is only the old stump to crawl up on. Then, too, the injury to the vine is less now, for it can usually spare some foliage without noticeable injury. Unless you have an abnormal number of these worms at work it hardly seems necessary to fight them so late as this.

"Mexican Dahlia."

To the Editor; I have in my garden a giant dahlia, given me by a friend who calls it a Mexi- can dahlia. It grows 25 feet in height, has large lavender flowers with yellow center, blooming in November. Can you tell me its proper name, and where it originates?—J. F. S., Martinez.

Inasmuch as there are about a dozen species of dahlias indigenous in Mexico, and as the florists' varieties have been developed from these, the name "Mexican dahlia" does not mean much in a definite way—though there is a dahlia Mexicana, a botanical species, but it does not meet your specifications. If your flowers are flat and erect your species is probably excelsa; if they are nod- ding and bell-shaped it may be imperialis. The colors you mention belong properly to excelsa. Both the species are arborescent and tree-like; and reach a height of 20 feet or more in the open air in California.

Manure: Wet or Dry?

To the Editor: Some time ago there appeared an article on preserving manure, and two ways were suggested. One was to sprinkle occasionally and turn it over, keeping it in a sheltered bin. Another way was to dry it while fresh and stack it up, thus preventing fermentation. In your last issue there is an article in which it is stated that manure being dried out in the sun is spoiled for a fertilizer. I had settled down to drying mine as I shall not be able to provide a covered bin. Which of these theories is right?—Subscriber.

Manure, which is quickly dried, or quickly put under water, is preserved from fermentation, and therefore does not change in composition. It does not matter whether it is dried in the shade or in the sun. During its dry condition it does not lose any fertilizing value and does not gain any, through change in condition which may render its substances more available to plants. As soon as it becomes moist, fermentation begins, and this may be cool and slow, or it may be hot and rapid. The former improves the manure; the latter may be active enough to practically destroy it. This depends on the amount of moisture added. Roughly, it may be said that the more water and the less air admitted to the mass, the slower and better is the decaying process, so long as there is no leaching; the less water and more air, the more destructive the process. Theoretically it is possible to make the manure so dry, and then compact it so thoroughly by treading or tamping, that no notable change would take place until it is covered into the soil where its decay would take place. But, practically, it would be dan- gerous to make it ordinarily dry and then put it in a loose stack, because there would probably be air and moisture enough to favor rapid and destructive fermentation. Therefore, your plan of drying and then stacking is but doubtfully good. It would be safer to spread it and let it keep dry in the yard or corral, or to spread on the soil surface, and cover it into the soil, after rain or irrigation. Dur- ing the rainy season it is better to spread currently and not let it accumulate in piles, because the rains would cause rapid fer- mentation or leach out the soluble matters, or both. Piles are, therefore, bad, both for the manure and for people also, because they are the breeding-place for disease-distributing flies. Fly- tight bins may be necessary in villages and sub- urban places, but on farms preventing accumula- tion by frequent spreading is best—remembering that it loses practically nothing so long as it re- mains dry, as it will during the dry season in California; and when it rains it is leached into the soil which is to be enriched by it.

Composting is a process of alternately watering and shoveling-over, which promotes quicker fer- mentation without allowing too much heat to gen- erate, and in this way destructive processes are checked. It is a rational process, but it costs too much except for garden use, on which the cost may be a good investment, either for profit or satisfaction, as the case may be.

California's Duty to the Peach.

(Continued from page 633.)

grape vines were planted exceedingly close in those days it is evident that grapes occupied but a small fraction of the acreage of land given to the peach.

The pioneers used the peach to win money with which to plant other fruits, not only because the fruit sold so well, but because of its early bearing and its ease of propagation. Thus the peach is shown to be the basis upon which the first California business of fruit growing was established.

Enduring Popularity of the Peach.—But the peach was not alone the foundation; it rose aloft in the superstructure. Only once during the last 66 years has the peach been displaced from the apex of the deciduous fruit pyramid. In the early nineties, the idea gained ground that the prune was the easiest fruit-thing in the state; that all one had to do was to stick in the trees on any old grain land, let them grow at will and then go around in a few years and scoop up and sack the cured fruit from the ground! The nurseries scented the demand and propagated so many that, though high-priced at first, trees were finally sold almost at a nickel each. Grain farmers planted them all over their fields and corrals, and were peeved because they could not carry the rows right over the roofs of their old barns and warehouses. Real estaters ran their rows back and forth, through the tule ponds and over the alkali plains and pictured their subdivisions all green above and all purple below with the self-curing fruit. It was this crazy prune planting which gave the statisticians in 1895 figures for the prune which exceeded those of the peach. But this prune-bubble never scored in any other way. The boom-planted prune trees, never properly located, planted nor cultivated, largely were killed by the drouth of 1898, and by 1908 the peach had returned to its old deciduous-tree leadership and has not since yielded its place, to the present day. The figures by Mr. Weldon (printed in the Pacific Rural Press of May 6, 1916,) show that the peach has an acreage of 144,888, while all the prunes and plums combined reach an acreage of 138,385.

And yet the peach is not the leading fruit of California. The grape now has an acreage about twice that of the peach, and the orange acreage is 168,453—leading the peach by 23,565 acres and in value of acre-product far exceeding the peach. But we are only discussing the relations of deciduous fruits to each other. The orange is in another class, horticulturally, socially and financially , and yet it is interesting to remember that while the peach was working for the establishment of the fruit industries in the early days, the orange was little more than a curiosity and even less of that than was the pomegranate.

Why Has the Peach Maintained Supremacy?—The continued prominence of the peach is not alone due to early and free-bearing of the tree and to the size, beauty and deliciousness of the fruit, which were the chief factors in its early popularity. General recognition of its goodness and beauty started the peach on its career, but its continuance is due to the ideals of suitability of peach varieties for definite commercial uses. In California a peach is not only a peach; it is more. Discriminating knowledge of peach varieties from the points of view of peach products probably exists nowhere else in the world as it does in California. Elsewhere the chief point seems to be to get a peach. In California that is the very easiest thing and the chief point is to get a peacn with particular characters of ripening-date, form, internal colors, texture of flesh, etc., to serve some particular trade or manufacturing purpose.

This discriminating study of the peach began at quite an early day. We do not know when or by whom the first formal announcement was made, but these words written by W. Wadsworth in the California Culturist in June, 1860, will serve to establish the early dawning of the idea. He wrote: "There are peaches which possess the quality of a high peach flavor combined with dryness and toughness of the pulp—qualities not desirable when the fruit is eaten in a fresh state. The juicy, melting peach is not the peach for drying and it is the indiscriminating use for drying of any or all peaches that cannot be otherwise disposed of that often renders the process so difficult," etc.

One can read between these few lines three interesting facts, viz.: That California growers, even more than half a century ago, were learning some fine points from experience; that a particular kind of peach was necessary for a particular purpose; that the drying of fruit was not merely saving waste but that it should be making a primary product for which fruit, particularly suitable, should be especially grown, so that if one avenue of trade should be closed another type of product could be undertaken. This conception of the suitability of peach varieties is fundamental in California achievements with all this fruit, and though it was early discovered and acted upon, it required two or three decades to reach the breadth and definiteness which now enter into the plans of wise peach planters. And this was reached not by professional pomologists or plant breeders, but by alert and discriminating fruit growers, fruit canners and fruit shippers—always looking out for characters which determined suitability for particular uses. They had not only opportunities for selection from the scores of named varieties, with which our pioneer nurseries and orchards were planted, but there were everywhere chance seedlings, growing from pits planted by early settlers, as has already been described. And not only was there regard for the characters of the fruits; the thrift of the trees was seen to be essential. Early in the '50's resistance to "curl-leaf" was an accepted criterion in selection. At this time also there were "committees on seedling fruits" at the fruit fairs, and in one instance such a committee submitted descriptive outlines of more than twenty seedling peaches, but none of them are now grown. The law of the "survival of the fittest" has always inexorably prevailed.

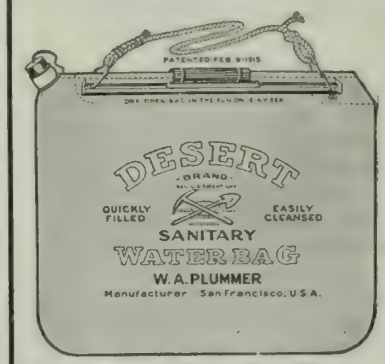
Ideals of Form and Characters.—One might cite descriptions and account for the present prominence of all the peach varieties largely grown in California on the ground of specific commercial suitability, but it would be more intelligent perhaps to attempt a few definitions which will show concretely that California planting requires not only a good peach but a peach which shall be good for something. Eastern propagators, now and then, cause our planters to lose money by inducing them to invest in eastern standards of general peachiness. A few definitions of specific desirability, from a California point of view, will be such as these:

Size: Medium large, capable of regulation by thinning. Tendency to over-size or to under-size under good growing conditions are both defects.

Form: Globular; not oblong or swollen with unequal halves; suture absent or very shallow; apex rounded and free from pointed projections; stem cavity shallow.

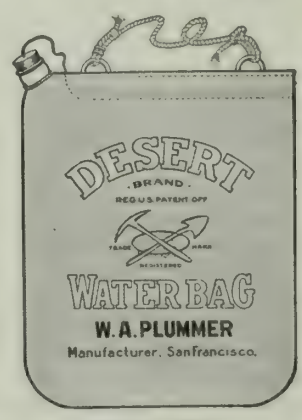
Color: Skin colors preferably light; deep colors are apt to extend into flesh, which, for canning, should be solid yellow or white, untinged with red. Deep colors also darken on drying and make unpeeled dried peaches of mottled exterior aspect.

Skin: Not easily broken or torn; minimum fuzziness.



Flesh: Firm, fine-textured, not coarse or stringy; not over-juicy; processing without mushing or clouding syrup.

Flavor: Rich and free from bitterness or wildness; sound and true peachiness; mild rather than high.



Pit: Small and not broadly flanged; close-knit, non-splitting.

Cavity: Small, enclosing pit tightly without vacant spaces; free from red or red with least extensions into adjacent flesh. Such color preferably absent for canning, but may be used to advantage in careful drying which does not induce blackening.

1916 SMYRNA FIGS

Mr. Grower, how many will your trees produce this season? They have brought as high as ten cents per pound in the sweat-box on account of the war interfering with importations. You have done your pruning, plowing, irrigating and cultivating, but this expense will be wasted, unless you secure a sufficient supply of PROFICHI FIGS of the right varieties. The Mamme crop was short this season and the PROFICHI crop will be short as a consequence. I have a larger Capri orchard than my Smyrna trees require and will have a surplus of PROFICHI FIGS for sale. After spending your time and labor to secure a crop, can you afford to lose a $200 a ton crop by neglecting to secure the necessary PROFICHI FIGS? Limited quantity, June delivery, for sale. Order now.

THOMAS H. LYNCH, BOX 21, R. R. 8, FRESNO.

These, then, are a few of the characters which constitute suitability in California mid-season peach. All popular varieties do not embody them all, but, to be profitable, a peach must not depart too far from them, and wide departure from any of them may make any new variety of doubtful value, except for local sale. Other important characters are habit and health of the tree, relative ripening season, etc., but we have no space for these. The point we wish to make is that it is not safe to plant a variety simply because it is a peach tree—nor because it may be counted a "glorious peach," artistically or gastronomically.

Commercial Achievements.—There are many results following the sixty years of definite study of the commercial suitability of peach varieties which California growers have pursued. Such study has educated the perceptions and reasoning powers of all who have taken part in it. It has developed an industry of distinctive character, capacity and endurance. The latter is easier to measure and measurements of the commercial product are therefore cited, the figures being taken from Howard C. Rowley, editor of the California Fruit News. Mr. Rowley is our leading authority on the amounts of fruit products, and the figures are for the crop of 1914:

Canned peaches.... 2,009,325 cases
Dried peaches .....74,000,000 lbs.
Fresh shipments... 2,144 carloads

The value of the peach crop which enters into such processes of manufacture and trade is placed by the U. S. Census of 1910 at $8,563,427. This is the "farm value"—that is, the value of the fruit as it leaves the orchard on its way to packing houses, canneries, or drying trays. This estimate is probably as nearly correct now as it was five years ago, for, though the product has gained in volume, it has lost in selling value during recent years.

The Great Advantage of the Peach.—Probably the greatest advantage which the California peach industry has, in its present fullness of knowledge and organization, lies in the superiority of the peach over all other deciduous fruits in beauty, fragrance and deliciousness. No fruit is so easy to glorify and promote for trade purposes as the peach, not only because its charms are so great, but because they are already universally known. No one has to be educated to the lusciousness and desirability of the peach. These ideas seem not only inborn to natives of the temperate zones, but their symbolry is employed to express emotions which are beyond words, and everyone understands the emotion which seeks such imagery. Have you not seen the flush of joy mantle the pale cheek of the proud mother as privileged visitors peep beneath the enveloping down and exclaim: "Oh, isn't he a peach!" And when this babe grows to early manhood and soulful ecstasy teaches him adoration beyond plain words, what token does he choose to most fitly convey his emotion to her waiting ear? Does he exclaim: My olive, fig, prune, pear, or lemon? Oh, no! Without suggestion, without experience perhaps (in some cases) does he not cry out: "Oh, my peach!"—and she knows the rest without a word, for, since creation, it has been the way of a man to desire a peach for his own. And thus our little life is rounded with a peach!

The Great Duty of the Peach-Grower.—Endowed by nature with conditions which make for superiority in size, beauty and suitability for imperishable products; capitalized by more than half a century's attainments in peach wisdom, in culture and manufacture and the organization of a peach industry which no country on earth can match; advantaged by world-wide knowledge and appreciation of the peach as the acme of deliciousness in food, what is the crowning duty of the California peach-grower at this moment? Is it not to protect his right in the peach and its products, and to secure his just return from peach production, that the industry may grow and prosper and give the world the joy of the peach all the year and in all regions where nature forbids the production of it? Is it not his duty also to conduct the industry with such wise and liberal promotion policies that people everywhere, who already know the peach, shall know also that they may enjoy it, at cost which they can afford, if proper distribution methods can be enforced? To these ends it is of incalculable importance that California peach-growers have organized a forceful and competent co-operation known as "California Peach Growers," of the progress of which we have kept our readers continually informed and which we shall continue to expound and exhort. It is now in active operation with headquarters in Fresno and opportunities are still open for pledges of acreage, funds and support from all peach-growers. In the success of this organization is vested the immediate prospect of increasing progress and prosperity to the peach-growers of California, and it is the personal and patriotic duty of every grower to advance its undertakings.

THE BOSS TREE PROTECTOR

Made of Yucca Palm. Is cheap, durable and quickly put on the tree. It prevents rabbits from destroying your trees. A sure protection against frosts, sunburn, grasshoppers, or dry winds. Can be easily removed, will last for years. Send for samples.

Blasted Out with GIANT

You know the difficulty of getting the *roots* of stumps out with pullers, by burning, or by using explosives that merely shatter. You need explosives that not only shatter but also lift and heave—that tear the roots and make clearing easy. You can save work, time and money by using

GIANT FARM POWDERS
STUMPING — AGRICULTURAL

—made by a Pacific Coast company, with 50 years' experience, especially to meet Western agricultural conditions.

"Your powders *shoot the roots* and spread wide in the ground instead of going down. They are the best we have used," says G. S. McCartney, Russellville, Ore.

There are two Giant Farm Powders—Eureka Stumping Powder, for dry work, and Giant Stumping Powder, for wet work. Test them alongside of any others. Write us and we will have our nearest distributor supply you—at lowest market prices—with a trial case that will prove to you the economy of using Giant Farm Powders.

Five Valuable Books Free

We issue five handsome, illustrated books to help you to blast cheaper and better. Any or all of these books—written by western men for western farmers—sent on request. *Mark and mail the coupon.*

Summer Pruning Apricots.

[Written for Pacific Rural Press.]

The present season's light apricot crop is due in many orchards to weakened fruit buds. The object of summer pruning is to increase fruit buds where they have been lacking, and to strengthen all of them so they will set and mature fruit.

A Hemet apricot grower said he did not like to summer prune even as early as August, because of the second growth which a professor had said was a favorable host to carry apricot rust over winter "where rust is prevalent." As rust is said not to be prevalent in his district, perhaps he did not need to worry.

This grower had read in Wickson's Fruits that summer pruning may promote bearing. He tried it on his Royals in August four years ago; but new growth put forth, so the past two or three years he pruned in Sept. and Oct. This, probably aided by irrigation into Nov., kept the leaves on until Christmas and prevented spraying for shot-hole until January, which is considered too late. But the trees haven't borne yet, though they have grown well and are over six years old.

Buds Formed Early.—Fall pruning to keep leaves on late is supposed to strengthen fruit buds, but does not help form more of them. They are formed from June on; but probably do not mature if formed after August. June or even July pruning will be followed by growth on which fruit buds will mature and bear the next season, especially if cultivation and irrigation are not neglected. It also helps set strong fruit buds on old spurs.

In June pruning, it will be desirable to thin out the branches, leaving only those which will be desirable next season and cut them back. The most vigorous ones may be cut least in order to avoid excessive new shoots and yet divert sap into fruit bud formation and development. When new shoots have started from the cut, they may be thinned to one or two and these cut back again, perhaps in Sept. This will give fruit bud development another boost.

J. B. Neff of Orange county suggests that the ground be somewhat dried out by lack of cultivation and irrigation to induce temporary partial dormancy during the June or July pruning. Then irrigation and cultivation directly afterward will promote the object sought.

To Strengthen Weak Buds.—In most cases, there are plenty of fruit buds on spurs of previous season's growth; but often their weakness is indicated by dropping before bloom or by dropping the newly formed fruit. These need strengthening, which may be obtained by late summer pruning.

Among the strong advocates of August-Sept. pruning are A. E. Goodrich and Son of Hemet Valley. Having had several years' experimenting with summer and fall pruning, they plan it for their entire 21 acres this season, except the trees under four years old, which are being pruned for wood-growth and structure. The method is about the same as for winter pruning.

They pruned three acres of young trees in late July last year. The results indicated that was three weeks too early. They will begin on the old trees (planted in 1893) about August this year and finish the younger ones within the month.

Young trees pruned in February, 1915, sent out strong shoots, which were cut back to a foot length in August. These were blooming near their tips in February, 1916.

They were expected to send out laterals in 1916 below the blooms, and along the larger limbs. The laterals are expected to fruit in 1917.

Don't Overdo It.—Care in summer pruning is necessary to avoid removal of so much leaf surface as to sunburn the bark or overbalance the good effect of the pruning. Some people have well nigh killed their orchards in this way.

H. S. Reed, one of the successful apricot growers of Imperial county, believes in topping the summer growth lightly six to ten inches with a pole pruner, a month or six weeks after picking the fruit in May. He says it forces fruit spurs from blind eyes on the body of the tree. Too heavy summer pruning would allow sun heat to cook the bark.

PAY FOR CHOICEST PEAR AND PRUNE LAND

When Orchard Comes Into Bearing.

20 to 40 acres of proven pear and prune land in Bear River Gardens. River sediment soil, sub-irrigated. On the Electric Railroad near Sacramento. 10 per cent to 15 per cent down and no further payment on principal for 7 years, providing you develop. Then six yearly payments.

TOP OF TRANSPLANTED WALNUT DIED BACK.

To the Editor: I set out a walnut tree in March—Placentia grafted on black. It was set 15 inches deep in a sandy loam. It grew at the botton, but the top died.—P. S. H., Los Angeles.

[If the bottom growth is of black walnut leaves, the graft was probably poorly made. If a Placentia bud is breaking out, the roots were probably badly dried before or after planting or they may have been in waterlogged soil until late spring.—Ed.]

MILO IN ORCHARD.

[Written for Pacific Rural Press.]

Milo maize can be planted any time after the middle of May and not later than July 1 in the Orland district of the Sacramento Valley, according to Mr. Kinkley, of Orland, who has been growing it between the rows of his young walnut orchard for several years.

May planting is preferable as the grain has a better chance to mature; but sometimes Mr. Kinkley has first grown a crop of oat hay on the ground; and this delayed planting till July. In that event he irrigates the land before planting and usually once afterward.

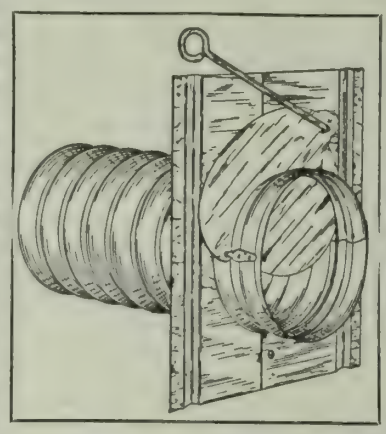
When possible he prefers a good seed bed to start with, as that saves later cultivation. Later planted milo does not need so much cultivation as the earlier sowed crops.

In 1915, on 25 acres intercropped in this manner he secured between two and a half and three tons of milo per acre. Four feet on each side of the tree rows is left unplanted. So far Mr. Kinkley has been unable to see any bad results to his trees on account of the intercropping. He uses a good deal of the milo in feeding hogs and the balance is sold.

Kings county horticultural commissioner F. K. Howard reports 100-per-cent grape crop, uninjured by frost.

Strawberries set out near Gilroy last December are bearing now.

WHICH?



Temporary Gates or Permanent Gates

Involving a relatively small initial cost.

Giving satisfactory service for a short time only, with an unnecessary expenditure of time and labor. Then

Ceasing to render any kind of service or satisfaction whatever, but causing no end of trouble and annoyance by leaking, rotting or cracking.

Costing more in the end for repairs and replacements than lasting and efficient gates would have cost in the first place.

"Armco" Iron Irrigation Gate

Especially adapted for use in alfalfa checking Water-tight. Permanent.

Involving a slightly greater outlay.

Rendering excellent service at all times, season after season, with a minimum expenditure of time and labor.

Remaining at all times absolutely water-tight, in a first-class condition, and a source of satisfaction and proof of good judgment on behalf of the purchaser.

Proving that in Permanence there is Real Economy. First Cost — Total Cost.

Baled Hay at Lowest Cost

THE price of hay, and the profit in it for the grower, depends upon the condition in which the hay is marketed. Hay of the same quality, in tight, smooth bales, brings a higher price than when shipped in loose, ragged bales.

International Hay Presses, with their powerful toggle-joint plungers, produce tight, solid bales. The roller tucker makes the bales smooth. The bale chamber tension produces bales of uniform size. The presses work fast, the different sizes and styles baling from 6 to 35 tons per day.

The line consists of one and two-horse presses, motor presses, belted jack presses and fast power presses. The one-horse press is made in 14 x 18 size only—all others in 14 x 18, 16 x 18, and 17 x 22 sizes, the accepted standard. The capacities vary from a small horse power press for the man who wishes to bale a little hay, to the largest, fastest custom power presses ever required.

An attractive mailing folder, in colors, shows **International Hay Presses** as they are, and gives complete specifications. Write for it.

The Mid-Year Six
257 Cars in One

Mitchell

$1325 f. o. b. Racine
With 26 Extra Features

A Tribute to John W. Bate

The Efficiency Expert—Paid by 37 Noted Engineers

The New Mitchell car with its 26 extra features, is due to John W. Bate

He built this model five-million-dollar plant, and equipped it with thousands of cost-saving machines. He has cut our factory costs in two.

No other factory has ever been able to produce such a car at this price. No other car at any price offers a like equipment.

The Engineers' Car

Mr. Bate's efficiency, in a thousand ways, shows in the car itself.

He has stood for lighter, stronger parts. He has displaced heavy, brittle castings by the score. This New Mitchell contains 440 drop forgings and tough steel stampings.

He has made a light car supremely stanch. We know of six Mitchells which have averaged 164,372 miles each. That's over 30 years of ordinary service.

He has won the applause of great engineers, all the country over.

We have a list of 37 engineers—men of nation-wide fame—who selected the Mitchell for their personal car. These noted experts found nothing to compare with it. Ask us to mail you the list.

73 New Ideas

This year, for the first time, we bring out a Mid-Year Mitchell.

We designed the body and equipment after the New York Show. It is built to embody all the best features brought out in 257 Show models.

$1325 F. o. b. Racine
For 5-Passenger Touring Car or 3-Passenger Roadster
7-Passenger Body $35 Extra

High-speed, economical Six; 48-horsepower; 127-inch wheelbase; complete equipment, including 26 extra features.

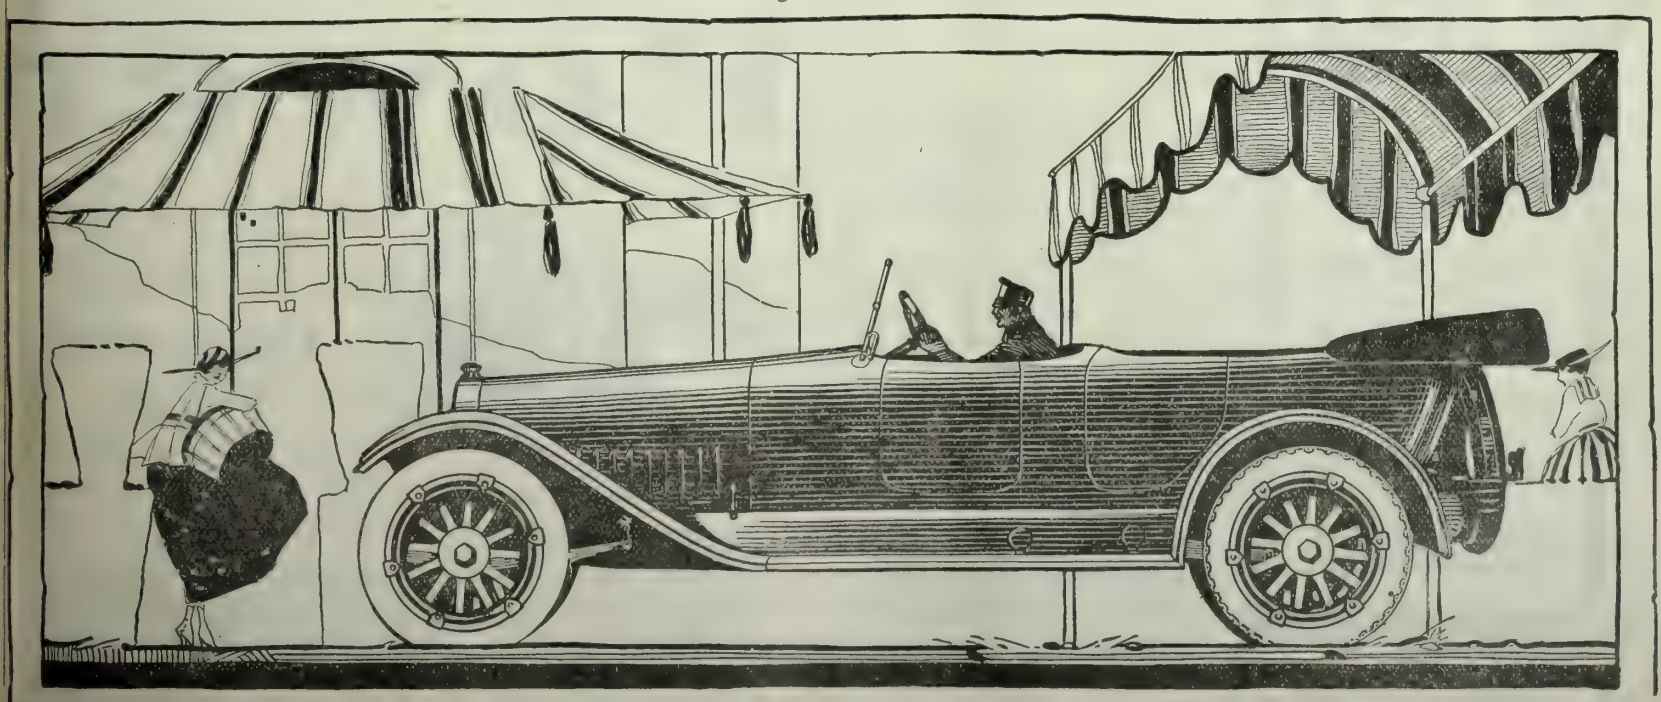
This touring car design—at the New York show—was voted the handsomest ever created. And 73 new ideas—the very latest attractions—are embodied in it.

26 Unique Features

You will find in this New Mitchell 26 features which other cars don't have. That is, few cars have even two of them, and no car more than four.

These are extras, due to John W. Bate's efficiency. All are paid for out of factory savings.

By extras we mean a power tire pump, reversible headlights, Bate cantilever springs, etc. There are 26 such things—all costly and desired—which are almost exclusive to Mitchell.



The Car to Keep

When you buy a fine car—a car to keep—it is bound to be a Mitchell. When you see this car, note its extras, read its records, you'll say, "That's what I've waited for."

The concern which builds it has been known to you all your life. It has spent 13 years, under John W. Bate, in developing this marvelous car.

If you don't know the nearest Mitchell dealer, ask us for his name.

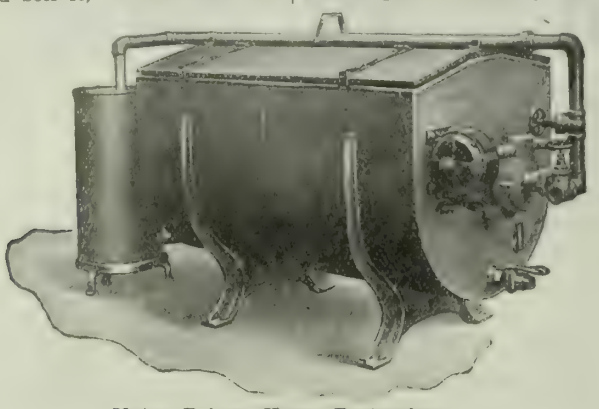
Mechanical Power on the Farm.



MOTOR-DRIVEN PASTEURIZER.

[Written for Pacific Rural Press.]

The new State Dairy law does not require dairymen to either pasteurize their milk or cream, or to tuberculin-test their cows if the product is sold in bulk to butter factories or to the wholesale trade, or if it is made into cheese.

But many will want to sell milk or cream at retail locally, or make butter and sell it, but will not test their cows with tuberculin. These must pasteurize their milk except where the cities require pasteurization, at a specified place. It must be held 25 minutes at not less than 140 degrees nor more than 145 degrees, if to be used as human food. It must be cooled rapidly to 50 degrees or lower. A self-registering thermometer must be used, and the records kept on file for inspection for two months. The milk must be marked with the day of the week when pasteurized and be delivered to consumers within 48 hours. It must not be repasteurized if for human consumption.

The illustration shows a Reid pasteurizer run by a ¾ h.p. Westinghouse single-phase induction motor direct connected to the worm drive of the spiral coil. It gives the constant speed necessary for efficient pasteurization.

Motor Driven Home Pasteurizer.

The pasteurizer consists of a vat containing a spiral coil of heavy copper tubing. Ends of coil revolve in gland type of stuffing boxes. Water is heated in a separate tank and piped through the coil while it revolves, and back through the heater. Then cold water is run through, and the milk is quickly cooled to 50 degrees or less.

TRACTOR WORKS 540 ACRES.

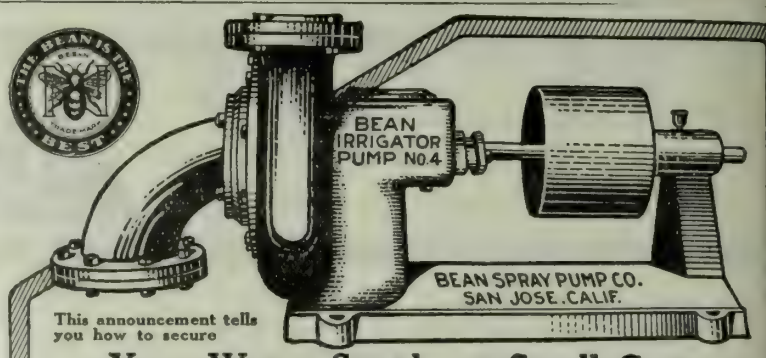
[Written for Pacific Rural Press.]

Using 18 to 20 gallons distillate per 8 hour day to plow 20 acres of walnut orchard near Los Angeles with a 30 h.p. Best tractor, C. C. Sidwell said last spring that the machine hadn't been laid up during work hours for six weeks of continuous use. He was plowing a strip about 7 feet wide with an eight-disk gang plow, about four inches deep in rather sandy land. "I could go a good bit deeper," said he "but don't want to injure the roots." It took about 6 minutes per round on the 500 foot rows.

A single furrow had been plowed on each side of the trees—then about 2½ rounds with the tractor would finish the row.

The machine turned beautifully at the ends, the track on one side being slowed up on the turn. On the last two times through, the turn would be too short for the plow; so he would run to the next row and finish the last on the return trips. On short turns the rear wheel of the plow was lifted by a lever so the disks would stay in the ground. Mr. Sidwell is working 540 acres, using the tractor for practically all the power work.

GRIND FEED FOR HOGS.



[Written for Pacific Rural Press.]

A feed grinder and self-feeder are both important to the man who would grow good hogs economically. Such is the belief of R. J. Miller, owner of the Llewellyn Ranch near Lathrop.

The feed grinder is placed where it can be run from the same engine that runs his water pump. All of the corn, barley, and non-saccharine sorghum that he feeds to his hogs is first ground.

In feeding his hogs, which are registered Poland-Chinas, he uses self-feeders, home-made but cheap and efficient. By having one of these in every lot, together with fresh drinking water and alfalfa pasture, his hogs keep in fine growing condition all of the time, with minimum labor.

Mr. Miller has 150 acres, only a small portion of which is now in alfalfa, the balance being planted to such crops as barley, sorghums, and this year a field planted to Indian corn. His intention is to feed everything grown on the place, believing that to be more profitable than selling the raw products.

This announcement tells you how to secure

Your Water Supply at Small Cost

At last—a high-grade, efficient, dependable centrifugal pump at a low price. The **Bean Irrigator** introduces a new standard of pump values. Though the price is as low as the lowest—the pump is "**Bean quality**" through and through. If you're interested in irrigation you should learn about

Bean Centrifugal Pumps

For Downright Good Service They are Absolutely in a Class by Themselves

The Bean Automatic Water Balance eliminates end-thrust, thus saving much trouble.

The Bean Water Sealed Stuffing Box makes excessive tightening of the stuffing box glands unnecessary. The shaft where it enters the pump is entirely surrounded by water, which forms a perfectly air-tight seal with very little friction.

Bean Runners are Enclosed, accurately machined and perfectly balanced. This means greatest possible efficiency.

SEND FOR BEAN CATALOG 28-B

BOY RUNS PUMPING PLANT.

[Written for Pacific Rural Press.]

A little pumping plant, forerunner of the thousands that may eventually water an estimated 600,000 acres now mostly covered with sagebrush and cactus, is that operated by Harold True, 15-year-son of T. J. True, a homesteader near Lancaster, Antelope Valley.

To save expense on the 4 h.p. Stover engine, he mixes "tops" and distillate equally for engine fuel. The tops cost 6¼ cents at the time the plant was seen, and the distillate $10 per 100 gallons. A larger engine would work tops alone, said Mr. True. The little engine uses about three gallons of the mixture per hour to pump three miner's inches from a 6½-inch well in which the water is 100 feet below the surface. A 2½ horsepower engine would do the work, but the larger one is considered more economical because it wears less. A Luitweiler double action plunger pump was throwing a steady stream without saying much about it. The well is 245 feet deep; water was first struck at 120 feet, but rose to the 100-foot level. The only trouble is that the small stream irrigates only five or six arces, so a larger pump will be installed, for the well can supply 15 or 20 inches. A reservoir, packed with adobe and tramped by horses, will permit continual running of the plant without irrigating night and day. The water, even in winter, is 68 to 70 degrees, an important advantage in favor of pumping.

POWER NOTES.

Total number of automobiles registered in U. S. in 1915 was 2,423,788.

The Government has bought the patent of Dr. Rittman by which as much as 45 per cent of crude oil may be made into gasoline. This means that everyone may use the process.

A little engine mounted on the side of the harvester produces constant power even in slippery places where a bull wheel would slide if geared to run the machine. Its location on the side rather than on top will avoid soaking the machine with oil which increases fire danger.

Five yards of wet sand and gravel were hauled from the river bottom and two miles along the road by Bruns Bros. of Contra Costa county with a 6-12 Sieve Grip tractor using two gallons distillate per round trip.

A Best's Tracklayer recently pulled a 50-ton electric transformer on broad-wheeled trucks two miles along the streets of Oakland, at one place up a 15 per cent grade.

The Kingdom of the Subscriber

In the development of the telephone system, the subscriber is the dominant factor. His ever-growing requirements inspire invention, lead to endless scientific research, and make necessary vast improvements and extensions.

Neither brains nor money are spared to build up the telephone plant, to amplify the subscriber's power to the limit.

In the Bell System you have the most complete mechanism in the world for communication. It is animated by the broadest spirit of service, and you dominate and control it in the double capacity of the caller and the called. The telephone cannot think and talk for you, but it carries your thought where you will. It is yours to use.

Without the co-operation of the subscriber, all that has been done to perfect the system is useless and proper service cannot be given. For example, even though tens of millions were spent to build the Transcontinental Line, it is silent if the man at the other end fails to answer.

The telephone is essentially democratic; it carries the voice of the child and the grown-up with equal speed and directness. And because each subscriber is a dominant factor in the Bell System, Bell Service is the most democratic that could be provided for the American people.

It is not only the implement of the individual, but it fulfills the needs of all the people.

GRAINS AND FIELD CROPS.

Colusa rice plantations are being flooded.

Lake county alfalfa growers are holding hay for $10.

Alfalfa near Elko Nev., was considerably frosted May 17.

There were 396,000 bags of limas in California warehouses May 1.

Santa Barbara and Ventura growers are rejoicing in the crop prospects.

Stockton markets have been paying $1 to $1.50 for new potatoes; 200 boxes arrived May 16.

Over 5000 acres of field corn, mostly flint varieties, are being planted in the Delta country.

An Oxnard firm last week contracted for 4,000,000 pounds of lima beans for shipment to Europe.

The frost damage to Delta potatoes will not affect next winter's supply as they are yet to be planted.

The California Lima Bean Growers' Association has 744,000 bags of limas signed up, out of the estimated crop of 1,200,000 bags.

This year 14 tons of bran-arsenic mash has been used in Imperial Valley, chiefly on ditch banks and alfalfa fields against grasshopers, spring and June hatches.

Bean shipments from California, the first six months of 1915 were 103,000,000 pounds; for the same period in 1916, 210,000,000 pounds.

Falker Bros. of Brawley have 1000 acres of barley from which they expect 25 sacks per acre. Much hay is being cut in California, because of the danger that grain will not mature.

Four hundred sacks per acre of Oregon silverskin onions are being harvested on the Tuxedo River farms and selling at $1.70 per sack. Pink beans will follow, says the Stockton Independent.

Imperial Valley cantaloupes are ripening fast. Carlots have been shipped every day lately and the season is in full swing. The first carload was shipped May 16. Two per day have followed.

The rhubarb season produced 114 cars, which sold at about $40 a ton net to growers according to Senator C. B. Bills. Much of it was shipped to the Atlantic seaboard and most of it came from Alameda county.

The U. S. Dept. Agr. estimate of the wheat crop prospects May 1 for California was 5,020,000 bushels against a final estimate for last year of 7,040,000 bushels; for U. S. 499,000,000 bushels and 655,045,000 respectively.

S. D. Sutliff of Escalon plants tomatoes just above water-level on the west banks of his irrigation ditches. They get the morning sun and are protected from the west side. Last season he had the earliest tomatoes in the community and kept weeds from the ditch bank.

During the north winds, which recently well nigh cooked the late grain in Sacramento Valley, Colusa countyites wished for cooler weather and got hail an inch in diameter. The rest of the eastern side got considerable rain. The rains till Feb. which prevented seeding were followed by dry weather and a north wind which has greatly reduced grain and grain hay in Sacramento Valley. Yolo and San Joaquin counties have good crops which are beginning to be harvested, as the dry weather everywhere has made grain early; and in most places north has shortened the straw and pinched the grain. Early sown barley further south in the San Joaquin Valley looks like a fair crop. Livermore's underground water helped save half the crop. Down the coast from San Francisco, the drouth has greatly reduced hay and grain. Hay was selling this week for $18 around Salinas. Southern California got good showers which were welcome, though much hay was down.

CITRUS AND SEMI-TROPICAL.

Navels from Corona were cleaned up last week.

The best 200-size oranges from Riverside sold May 18 at New York for $4.10.

The San Dimas Orange Growers' Association plans a $50,000 precooling plant.

Orange shipments decreased and lemons increased at Riverside markedly during last week.

The Walnut Fruit Growers' Association has shipped the last of their navels, seedlings, and St. Michaels, and is packing the 70-car Valencia crop.

Widening orange markets are indicated by the following exports by 8 month periods ending February, to foreign countries other than Canada and the United Kingdom; 27,684 boxes in 1914; 31,258 in 1915; and 43,790 in 1916.

Directors of the California Avocado Association recently chose Oct. 31 and San Diego for the next semi-annual meeting. They recommended that any one fruiting a new variety give 6 trees to the State, three of these to be planted at the Riverside Experiment Station and three at the Whittier Botanical Gardens. Dr. H. J. Webber of Riverside was elected president and C. D. Adams of Upland secretary.

Two carloads of honey shipped from Lindsay May 16 brought $3957 f. o. b. One carload had been shipped the day before at about $2000 f. o. b.

Sulphuring vines thoroughly with knapsack machines cost for labor and sulphur, 37 cents per acre on the University vineyard at Kearney Park.

DECIDUOUS FRUITS.

Sonoma cherries are a fair crop.

Alameda cherries are a very light crop.

Deer are browsing young Butte county orchards.

San Joaquin Royal Annes are on the Stockton market.

Visalia canneries are empty and preparing for a big run.

Early cherry shipping from Vacaville is practically finished.

Some Tuscan peach growers at Yuba City are holding for $30.

The California Peach Growers had $747,500 capital subscribed May 15.

Would-be buyers are offering 10½ cents at Hanford for 1916 dried apricots.

The recent rains caused considerable split cherries in the Sacramento and tributary valleys.

Stanislaus county peach growers are making an effort to pool all clings and hold for a certain price.

The Sonoma Gravenstein crop promises to be a very good one and free from scab. Late varieties are lighter.

The first shipment of Tragedy plums from the State was made May 13 from the McMurtry orchard near Vacaville.

July 1, 1917, is the date by which 75 per cent of prunes grown in California must be contracted to the new association or it will be dropped.

Fresh peach buyers around Visalia have been saying they could buy frees and clings around Selma at $15 and $250, but this is said to be untrue.

The Golden State Canning Co. of Ontario is making an awful effort to get freestone peaches at $15 and clings at $20 in the Porterville district.

The California Cured Fruit Exchange has offered to sell its large Berkeley warehouse to the California Peach Growers.

Lake county horticultural commissioner F. G. Stokes is pleading for frequent cultivation of the 950 acres of young orchard which will need all the moisture that can be conserved.

Several hundred tons of dried peaches are said to have been contracted by independent packers around Fresno at whatever price the association may set. Look for the nigger.

Bay county apricot growers met May 24 at San Jose to get an understanding as to what they ought to sell canning apricots for. With the light crop, no holdover, an outlet to the green and dried fruit markets, the growers fixed a price of $60 per ton for canning and 15 cents per pound for dried.

Green apricot shipments from Sultana and neighboring districts are forecasted at about 10 cars. They are beginning; plums will soon be coming; peaches will follow by early July; then Malagas late that month.

That fruit canners are fearing the co-operative movement around Yuba City is evidenced by their anxiety to make long-term contracts for canning peaches at $20 to $26.50 per ton. It will be remembered that the best clings dragged at $7.50 at ripening season there last summer.

OLIVES AND NUTS.

Some Esparto almond growers expect a 75-per-cent crop.

Guinda expects to ship 25 tons almonds as against 200 last year.

The Oakdale Almond Growers plan a warehouse and sulphur-shed.

Almond and fruit growers of Capay Valley were seriously injured by the early May frost.

Butte county olive growers report better offers for their crops than at this time last year.

That walnut associations should offer part cash for culls and sell them under supervision instead of letting peddlers use them to break the market for good walnuts, is the proposition urged as the Santa Ana plan.

The walnut crop is said to be practically normal. About $85,000 worth are usually grown here.

GRAPES AND SMALL FRUITS.

Tokay buyers at Lodi are offering $25 per ton for August and September delivery.

The California Associated Raisin Co. is advising Thompson raisin growers not to sulphur their raisins.

Wild blackberries from the San Joaquin river have been selling in Stockton at 20 cents per pound.

The California Fruit Exchange estimates Malagas at 85 per cent in Fresno and Tokays 75 per cent at Lodi.

The Bates Steel Mule
"One Man Tractor"
Does All Farm Work and One Man can Run It

THE BATES STEEL MULE does everything that horses do, and does it better, quicker and cheaper. Any implement that you have on your farm today can be hitched to and hauled by a BATES STEEL MULE. You can get twice the work in a day out of a BATES STEEL MULE hitched to any implement than you can get out of three span of big, strong horses hitched to the same machine.

ONLY one man is needed on any implement hitched to a BATES STEEL MULE. The operator sits on the implement and drives the machine as he would drive horses, except that it is much easier. Take harvesting for example; you only have to steer the BATES STEEL MULE with one hand while he is pulling you along as four horses would. The corners are cut as square as with horses, and you get double the acreage cut in a day.

FREE CATALOG TELLS FURTHER FACTS.

"*** There were three 35 h.p. tractors plowing where I was harrowing, but my BATES STEEL MULE was THE TRACTOR that toddled along all day. I like the machine very much: one of its features is that it does not eat a bunch of hay and feed when idle, * * *" — (Name on request.)

Bates Steel Mule Co.
of California
320 N. SAN PEDRO STREET,
Los Angeles, Cal.

"***We had no repairs on your 30 h. p. BATES STEEL MULE during 120 acres of plowing, and we used 14 gallons of distillate per day. We plowed about an acre per hour. The machine was in as good condition when we were through as it was when we received same."--(Name on request.)

Testing Showed Value of Cows.

[Written for Pacific Rural Press.]

Probably the best way to learn the benefits of a cow-testing association is to spend a day on the ranches of its members, hearing stories of increased returns from their dairies after a few months of association testing.

Such was the experience of the writer during April in the district where the Gridley Cow Testing Ass'n has been operating since the fall of 1914.

Secretary S. F. Bonner of the association related how he purchased a cow for $92 from a dairyman who had been weighing his milk but not testing it. The former owner considered the price received a big one and all that she was worth, and yet during the first year in the association, she gave 506 pounds of butter fat and was dry two months. Now her heifer calf is worth as much as Mr. Bonner paid for the cow before freshening.

Knowing the best cows is not the only important consideration with Mr. Bonner. He also knows his poor cows. This spring with a shortage of feed he has materially reduced the size of his herd rather than buy high-priced hay for poor cows. In feeding he also finds the monthly tests a decided advantage, as his records show the most efficient feeds.

One cow was giving 34.3 pounds of milk in her third month after freshening. During the fourth month three dollars' worth of rolled barley was fed which was just about offset with the increase in fat. But when the cow was in the seventh month of her lactation period, after four months' barley feeding, she was giving as much fat as she was in the third month without barley. While the barley ration was discontinued after the seventh month, the previous feeding was shown in her milk flow up to the time she was dried up and she was in much better physical condition for the next lactation period.

Before this association started, the writer visited the ranch of L. Kaiser, whose cattle were considered the best in the Biggs or Gridley district. Mr. Kaiser had tested at irregular intervals and thought that he had his herd pretty well weeded out; but this year he said that during the first three months he was in the association he sold 15 head that proved unprofitable. Last year Mr. Kaiser had the highest average herd test of any member in the association with an average for 80 cows of 317 pounds of fat.

But it is not always practical to discard a cow because she does not do well one month. This was the experience of D. G. Beale, who purchased a new herd last year and entered them in the association. Among the lot was a small cow that Mr. Beale was advised to sell after the first testing. The fact that she was small and did not consume much feed led Mr. Beale to keep her, however, and after freshening this spring she has been giving 50 pounds butterfat per month.

Like other associations of this kind, it has taken some time to prove its worth to the dairymen, but the association now has 750 cows entered and is in better financial condition than ever before. The yearly charge per cow is one dollar in the Gridley and Biggs districts and $1.25 per cow in the Chico and Marysville districts, where the expense of the tester is greater.

It is noticeable that a very much larger percentage of the dairymen in the district are using purebred sires now than two years ago, and the number of silos have increased many times during the same period. Perhaps nothing improves dairying conditions in a district more rapidly than does the cow-testing association.

SUGAR BEET TOPS FOR BEEF AND DAIRY CATTLE.

[Written for Pacific Rural Press.]

Beet tops for beef cattle are recommended by H. J. Mayo of Los Angeles county. For six years he has been selling the tops in the field to a man who brings cattle down from Antelope valley, surrounds the fields with movable fences, and makes first-class meat. There is a large percentage of readily digestible sugar in the leaves.

For dairy cows, the tendency of beet tops fed dry or green is to turn their energies to fattening and to dry up their milk according to Mr. Mayo, who used to have a dairy. The cows would turn away from bran, alfalfa, etc., to get the leaves. It is claimed that the test always went up.

COW WON'T DRY UP.

To the Editor: I have been trying to dry up a cow since April 1. She gives 10 to 15 pounds per day. I have tried milking a little out each time, then let her go 3 or 4 milkings, but no use. She is due to calve June 10. Will it hurt to milk her regularly right up to the day of calving? I always had trouble drying her up. It usually took 4 to 5 weeks, but this time seems a failure. She gives about 4 gallons when fresh.—C. O. C., Ceres.

[Don't worry if she doesn't get too thin. Don't milk her entirely dry.—Editors.]

A stallion that is not fit to work is not fit to sire work horses.

"Remco"
Air-Dried
Redwood

PIPE — For irrigation water, supply-power. Cheaper than any other pipe of equal size, capacity and endurance.

TANKS — For all uses, in all sizes from 500 gallons to 500,000 gallons, and with towers if wanted.

SILOS — For dairyman, stockmen, farmers. In sizes from 25 tons to 300 tons. The best silo made today.

All Remco products are built to your order. Only clear, air-dried redwood is used. Write us your needs and we will send you full information.

A Sale Worth While
Where you will secure good stock worth the money.
THE DISPERSAL SALE OF THE CHARLES JAY WELCH
HERD OF REGISTERED HOLSTEIN CATTLE.
105 Head-85 Females, 20 Males
AT LOS BANOS, WEDNESDAY, JUNE 28th, 1916.

This is a royal opportunity for you, Mr. Breeder, Mr. Beginner, or Mr. Dairyman, to secure your selection from a herd that has been kept intact for 14 years. An old-established herd and one of the best on the coast. Including King Segis Wayne Pontiac, a yearling son of the great King Segis Pontiac and Elsie Veeman Wayne, a 30.92 4-year-old daughter of Sir Veeman Hengerveide from a 26.-lb. dam. A good individual about 7/8 white. About 20 cows will be bred to him. A rare chance to head your herd with a brother to the $50,000 bull at your own price!

Catalogs ready about June 12, 1916. Write for one.

Jas. W. McAlister, Jr., Chino, Cal., Sales Manager.
Col. Ben. A. Rhoades, Los Angeles, Cal., Auctioneer.

KNOB HILL STOCK FARM Registered Big Type Poland Chinas : : :

SOME TYPICAL KNOB HILL BROOD SOWS.
(Large type, combined with high quality.)

Our herd is nominated in the California Poland China Futurity to be held in connection with the State Fair this fall. We have just imported and added to the herd some of the best blood of the East, including boars from W. J. Hather, Ord, Neb., and Peter Mouw, Orange City, Iowa.
We are offering pigs of both sexes from prize-winning stock. Litters coming at all seasons and stock usually on hand to suit customers.

Come and see them, or write for what you want.
ALL STOCK REGISTERED. ALL BREEDING GUARANTEED.

Alfalfa in Farrowing Pens.

[Written for Pacific Rural Press.]

Two acres of alfalfa furnish all the room necessary for 32 brood sows and their pigs on J. L. Mendenhall's ranch in Colusa county and at the same time supply all of the green alfalfa pasture that is required.

The land was especially prepared before seeding. Two checks were made 100 feet wide, separated by a driveway nine feet wide. The pens were fenced off, 40 feet wide and extending across the check, making the completed pen 40 by 100 feet. At the rear corner of each pen was scraped a mound large enough for an A shaped house.

With this arrangement the alfalfa can be irrigated, even when the pens are all occupied, as the water does not rise high enough in the check to reach the top of the mounds.

The alleyway between the checks is wide enough to allow driving through with a team and wagon. Barrels are set at regular intervals so that each one is accessible to four pens. Water is piped to each pen where an iron trough is used for watering.

The sows and pigs are kept in these lots six weeks to two months after farrowing, being fed ground barley soaked in water 48 hours, together with the alfalfa pasture. Mr. Mendenhall does not believe in feeding dry grain to young pigs as it has been his experience that they scour badly on it.

Until the pigs are six months old, they are fed a pound of barley a day and run on alfalfa pasture, later running on 1,000 acres of grain stubble about six months longer, when they are turned off to the butcher weighing about 200 pounds.

By feeding some barley 15 hogs per acre of alfalfa is the average on the Mendenhall farm the year round; and with the stubble as a finisher, the 300 brood sows show a substantial profit each year.

SALTED FIRST ALFALFA.

[Written for Pacific Rural Press.]

First cutting alfalfa is often considered poor feed by dairymen; but the experience of P. D. Bane of Orland, with a crop of first cutting in 1915, has led him to believe it better than other cuttings, if properly stacked.

His hay was poorly cured and he didn't expect it to make very good feed. However, in stacking, he salted it well. When he started to feed it to his dairy cows he found that they preferred it to either second or third cutting and that their milk flow was better also.

SELLING LAMBS FROM MERINO BASE.

[Written for Pacific Rural Press.]

One of the choice bands of lambs that buyers are always eager to secure is the annual crop raised by the Stanford University at their Vina ranch in Tehama county.

Like all sheep men, who operate under range conditions, the problem is to maintain the Merino base for their range flocks and at the same time have a crop of growthy early lambs.

This year they have 8,000 lambs, contracted for delivery in June at a very attractive figure. These lambs are sired by Shropshire bucks and out of Merino ewes. All but 1,800 to 2,000 ewes are bred in this manner each year in order to produce a better quality lamb.

To maintain their Merino base, Merino bucks are bred onto the balance of the flock, the ewe lambs being selected each year and turned with the range bands for future breeding purposes, while the ram lambs are marketed.

In 1914 and 1915 November and December lambing under shelter was practiced, lambs being sold at Easter. This has been discontinued for the time by Manager Houseman.

Unlike most other large sheep growers, the wool from this flock is not sold locally but is consigned to Boston wool dealers, having been shipped in car lots this spring as soon as sheared.

MILO AND SORGHUM SILAGE.

[Written for Pacific Rural Press.]

"Last October" (1915), said R. Breedlove of El Centro, Imperial Co., "I put in a 100-ton De Laval silo. I filled it with milo maize and sorghum and am very well pleased with the results; so much so that I will fill it just the same way this year.

"I planted 13 acres of milo and headed the first crop for dry feed. soon after a new crop grew on the old stalks and this second crop, stalks and all, I put in the silo, making about 70 tons of silage. With this I mixed in 30 tons of sorghum which I grew on an additional 3 acres. Also I blew in at the same time 3,500 gallons of water. When feeding time came I found that a little more water would probably have been a little better. One can't use too much water in siloing a milo crop in this valley.

"A silo seems the only solution in this valley for getting the whole good of a milo crop, as the stalks are too dry for feed purposes otherwise.

"During the time I was feeding silage I found that although I fed all the green feed my 70 head of dairy stock could eat, their consumption of it was only ½ what I had used in previous years. The total cost of putting up my silage was $1.50 per ton, figuring only the cutting, hauling, and filling operations."

DAIRYMEN AND DAIRYING.

Dairymen of Kings county received $150,000 for April butterfat.

Tulare creameries paid $77,000 for April butterfat at 29½ to 32½c.

The Napa State Hospital has a grade cow giving 72 pounds daily.

J. S. Moore of Manteca is gradually working into registered Holsteins.

Imperial Valley ships 400 gallons of cream each night to outside points.

All Jerseys eligible to the Register of Merit will hereafter be entered free.

A motor-driven pasteurizer has been installed by Miller Bros. of Hanford.

Wisconsin cheese factories pay for most of their milk on a butterfat basis.

John Linder of Gilroy expects to put up a ranch cheese factory next season.

The Bodega Co-operative Creamery is putting out about a ton of butter per day.

The Henderson Co. of Elliott exhibited 20 Holsteins at the Butte Co. Spring Festival.

O. P. Osborn of Success is trying chopped green oats in two silos and wheat in another.

Orland dairymen took 11 registered Jerseys from the Rancho Dos Rios sale and 14 grades.

The Central Creamery at Ferndale is putting up 700,000 pounds of butter in tin cans for the Navy.

A. M. Draper of Heber auctioned 33 dairy cows at an average of $114.50. Some went at $177.

A merry-go-round for bulls is used on the Napa State Hospital farm. Four bulls can exercise at once.

The Calla Grove Farm of Manteca shipped a 20-months Guernsey heifer to Dr. B. Bond of Hawaiian Islands.

Of American-bred Jersey bulls 9,555 were registered in the year ending March 31, 1916; 23,017 American bred Jersey cows were registered.

April butterfat purchased by the Danish Creamery of Fresno paid 31 cents to dairymen for 147,428 pounds.

The Visalia Co-operative Creamery made 109,400 pounds butter in April, for which dairymen received $28,550.

A. W. Morris & Sons of Woodland, recently sold $40,000 worth of Holsteins to Mrs. Anita Baldwin of Los Angeles. Prince Gelsche Walker is one of them.

The American Guernsey Cattle Club registered 333 bulls and 155 cows more in the year just past than in the previous year. The club has 64 more members.

The Lewis Co. and H. L. Hill have recently brought in a shipment of registered Holsteins mostly from N. J. and have placed them on the Hill ranch at Los Altos.

A. G. Litch sold a 500-acre ranch and 150 dairy cattle near Chico to L. M. Culver, who will establish a certified dairy. He expects to go into purebred Ayrshires.

The Imperial County Farm Bureau is co-operating with creameries for high-grade cream to establish and hold a good reputation for their butter in outside markets.

The American Guernsey Cattle Club meeting May 10 elected J. L. Fisher of Philadelphia, president; and W. H. Caldwell of Petersboro, N. H., secretary-treasurer.

From April 13 to 17, reports of tests of 576 Holsteins were entered in Advanced Register. The average production for seven days was 408.1 pounds milk containing 14.5 pounds fat.

Pepsin instead of rennet is being used for American cheese making at the Wisconsin College of Agriculture as a relief for the shortage on rennet. Long-keeping tests have not yet been made.

The Holstein Friesian Association of America is offering for the State Fair 15 per cent cash on the general classification and a silver cup to the first prize winner of the 5-day butterfat test if a registered Holstein.

At the Collier-Mancebo sale near Livingston May 17, Col. R. R. Briggs sold 50 cows per hour, including one per minute in the afternoon. Some 500 dairymen attended. The price averaged $82, which was very satisfactory to the owners.

The average of the 4719 Guernsey Advanced Registered records made previous to May, 1916, was 8805.91 pounds milk and 439.15 pounds fat. The past year's 949 records were better than the average by 132.18 pounds milk and 5.24 pounds fat.

The Ferndale Cow Testing Association has a Jersey which gave 81.8 pounds fat in 1221 pounds milk in April and another which gave 85.47 pounds fat in 1554 pounds milk. There were 55 cows which gave over 60 pounds fat in the month. All breeds represented except Ayrshires.

SWINE BREEDERS AND STOCK.

The Henderson Co. of Sacramento has recently received an O. I. C. sow with six pigs and four bred gilts from Oregon.

The Cal. Swine Breeders' Ass'n will hold its next semi-annual meeting in Hanford during the October fair at that place.

California swine breeding and breeders have been attracting considerable attention in "The Swine World" of Chicago.

Mrs. Della M. Foster of Brawley shipped three cars of 7 months' hogs averaging 180 pounds. They sold at $8.25 per hundred.

A Texas bank president who furnished 326 pigs to Boys' Pig Clubs secured through the acquaintance thus made, new patrons who brought in over $75,000 in deposits.

BEEF BREEDERS AND CATTLE.

An interstate roundup of rough riders is proposed for San Jose July 1 to 4

END the Morning Glory PEST with Nonpareil

"We have given Nonpareil a very good trial and find that it destroys not only morning glory but also horse radish. We consider it a thoroughly satisfactory weed exterminator."
—Luther Burbank.

If you want full profits from your crops you should use Nonpareil. It is easy to apply and economical to use—one gallon is sufficient to kill 250 plants. It does not injure the ground but acts as a tonic. It is the most successful weed killer known. Write today for interesting folder.

Livestock Queries and Replies.

DUAL PURPOSE IDEAS.

To the Editor: I would like some information about the Red Polled cattle. I have heard they were an excellent dual purpose cow. Could you tell me how they rate as a dairy animal, and do they make better beef than a grade Holstein? Some say that the butchers do not like Holsteins because of the layers of fat between the tissues of the meat. Any information will be appreciated. —F. N. P., Concepion.

[At livestock shows the Red Polled cattle are classified as beef cattle, although the chief claim for them is made on their dual purpose characters. They make good beef, although not so quickly or as economically as the strictly beef breeds, and the same is true of their dairy qualities. They give a good average flow of medium testing milk, although they have not so far developed ability in this respect to allow them to compete with the strictly dairy breeds. Our observation is that if they were bred entirely for their dairy qualities they would make good dairy cows and if they were bred for their beef qualities they would make good beef animals, but it seems highly improbable to us that a cow can be supreme in both at one time. There are those who do not subscribe to this doctrine, however. The reason that butchers discriminate against Holstein steers is that their milking qualities do not develop a type of animal carrying so large a percentage of choice cuts as the beef breeds. If you can get them fat you can sell them, but don't expect as economical gains as you would get with Shorthorns or Herefords or with a breed such as the Red Polled, which claims some distinction for beef characteristics.—Editors.]

WHICH BREED IS BEST?

To the Editor: Starting at the beginning to build up a dairy herd in the San Joaquin Valley, would you advise Holsteins as compared with Guernseys? We realize that the Holstein is more commonly used than any other breed, but are not sufficiently familiar with the dairying business to know whether they are actually superior to Guernsey as profitable cream producers.—F. A. D., San Francisco.

[We suppose this question of breed supremacy in economical production has been and will continue to be the most energetically argued subject in the entire dairy industry. On the face of it, it is apparent that no one breed is absolutely known to be the most economical producer under all conditions, else there would be but one breed grown, for it is economical production that every dairyman is striving for.

It is a time-worn expression, but nevertheless true in California as elsewhere, that "the cow you like best is the cow to breed." Like everyone else we have our own personal likes and dislikes; but it has been our observation that the man who is getting economical production is the man who has selected the breed he has a preference for, and not because some one else with a preference for the breed has recommended it to him.

As a matter of fact we believe that one breed has as good a right to claim superiority in this respect as another, because any authenticated comparative tests must of necessity include only a relatively small number of animals, and no one can say that they are better, poorer, or just average representatives of the breed. As our senior editor has previously advised, choose your breed of cattle like you would a wife, i. e., the one you like best.—Editors.]

FEEDING RICE PRODUCTS.

[Written for Pacific Rural Press.]

With the introduction of rice growing on a commercial scale in various parts of the State interest in rice by-products as a feed for livestock is becoming quite general, and particularly so in the large rice districts where rice mills are being operated.

In the Gridley district of Butte county rice bran is coming into popular favor as a hog feed and also as a concentrate for dairy cows and in some cases as a part of the concentrate ration for horses. Rice polish, while also used in rations for all of the above named animals, is used more sparingly in the rations.

The objection sometimes raised against rice bran that it becomes rancid and unfit for feed is a just one according to handlers of this product, care being necessary in its storing to overcome this objection.

One large warehouse man in the Gridley district is authority for the assertion that rice bran contains a large percentage of oil and that when stacked in the warehouse or exposed to severe heat the bran becomes rancid in a similar manner to lard. He states that where each sack is allowed to have an air space around it and when kept away from hot roofs it will keep in a nice, sweet condition.

For hogs he recommends a ration of one part rice polish to four parts rice bran mixed in a slop made with fresh water. For horses he advises using one-third each of rolled barley, rice bran and rice polish.

The Oasis Ranch of Holtville has a registered Guernsey herd headed by Imp. Starlight Lad.

WELCH HOLSTEIN SALE, JUNE 28.

Dairymen interested in Holsteins will have an opportunity to take their pick of 85 female and 20 male pure-breds near Los Banos June 28th, when the Welch herd will be sold at auction. We print a picture of the bull, Lord Snowflake of Copa de Oro. He and several of his daughters are to be sold.

STANISLAUS DUROC BREEDERS.

The first Duroc swine breeders' association to be formed in the State was organized at Modesto, May 20 and will be known as the Duroc Breeders' Association of Stanislaus County.

The objects of the association are similar to those of other community breeders' organizations, the chief ones being to establish the district as the leading Duroc district of the State, by public auction sales and to enlarge and improve present as well as future herds in the section.

It developed at the meeting that there are between 30 and 40 purebred Duroc breeders in the district, included among them being several of the oldest and largest herds in the State.

W. A. Daggs Sr. was elected president and Elmer Lamb secretary-treasurer. Another meeting will be held at Modesto, June 3 at 2 p. m., to perfect the organization and adopt by-laws and constitution.

The California Swine Breeders' Association has arranged with D. O. Lively to conduct a campaign of publicity for "More and Better Hogs in California," and better markets for them.

POLAND-CHINA BREEDERS ORGANIZE.

[Written for Pacific Rural Press.]

With a view of establishing their district as a Poland China breeding center, the Poland China breeders of San Joaquin and Stanislaus counties met at Stockton, May 20, perfecting an organization to be known as The Poland China Breeders' Association of North San Joaquin.

The new association proposes to include in its membership every breeder of purebred Poland Chinas, advertising their herds by holding purebred sales and through community effort.

Officers were elected for the following year as follows: Hale Marsh, President; W. A. Young, Vice-president; O. Lynn, Secretary-treasurer. By-laws and constitution will be drafted and presented at the next meeting, June 3, when directors will also be elected. All breeders are asked to be in attendance at the next meeting which will be held at Stockton at 10 a. m.

WHY DON'T YOU OWN SOME SHIPS?

Due to the great demand for American steamers and the unprecedented condition of the charter market, the American-Hawaiian Company will receive fabulous returns for the use of two more of their big carriers. Announcement is made that the company had hired to the Du Pont Powder Company the freighters Columbian and Ohioan, and the prices they will pay mark the high-water point in soaring charter rates. The Columbian is taken for six months at a rate of $115,000 per month. The Ohioan, let for two trips with nitrate, will bring $90,000 per month. The steamers will be utilized in the nitrate traffic from the West Coast to the Atlantic.

VISITORS DISINFECT SHOES.

[Written for Pacific Rural Press.]

An invitation to disinfect your shoes before entering Haden Smith's Duroc Farm hog pens near Woodland is designed to protect the hogs from cholera.

A box 6x12x24 inches covered with a hinged lid is kept by the gate. Visitors are expected to dip the soles and heels of their shoes in the 5 per cent solution of sheep dip which it contains. The lid keeps dirt out and prevents evaporation. The size is ample to accommodate the largest shoe.

VACATION LAND

What section of California holds forth such inducement to the vacationist as that traversed by the Northwestern Pacific R.R. Anglers will find the finest fishing; sportsmen an abundance of furred or feathered game; swimmers and bathers have a wide choice of ocean, river and bay; lovers of wild, primitive spots will find miles of great redwood and other forests; rugged mountains and elevations will appeal to trampers; cozy camping locations will entice the family; this wondrous collection of nature begins at Sausalito and extends to the world-old forests of Humboldt county.

A very interesting description of this territory is found in the booklet — Vacation—1916, free copies of which may be obtained at 874 Market Street, San Francisco, or on application to J. J. Geary, G. P. A., 808 Phelan Bldg., San Francisco.

POULTRY QUERIES ANSWERED.

[By Susan Swaysgood, Pomona, Cal.]

Combs Dry Up.—My chickens' combs gradually dry up. After a while they lose weight. So far none have died. More are taking it.—Mrs. F. F.

[The comb is merely an indicator of an internal trouble. This case suggests liver trouble and poor circulation. Feed the birds all the green feed they will eat including onion tops, dandelion greens and cabbage; if sour milk can be gotten give that and keep all meat away. The disease is not catching through the comb. Whatever caused the first one to start is the cause of the other cases.]

White Diarrhoea.—Have lost several chicks and turkeys with white diarrhoea. Have used Pratt's and Dr. Hess's cholera medicine but to no effect. Have been feeding wheat and corn. Setting hens seem to be much worse than the others.—Mrs. A. D. S.

[The term "white diarrhoea" is made to cover a multitude of things. At some stage of any bowel troubles the discharges are white. Ordinary diarrhoea is caused by inflammation of the digestive organs; sometimes corn aggravates an already weakened system and starts the trouble; sometimes climatic changes or too much meat or dosing with unknown condition powders. Put plenty of good willow charcoal where the hens can help themselves and put ten drops of tincture of nux vomica in a quart of drinking water and let them have no other drink for two or three days. If this does not stop the trouble, give each fowl a tablespoonful of olive oil, and follow this with twelve tablets of mercury bi-chloride one one-thousandth part of a grain, drug strength, to each quart of drinking water. Leave all meat alone and mix mash with skim milk scalded.]

Hens Die Suddenly.—My hens keep dying off with no apparent cause and very few symptoms. Sometimes the comb gets whitish just before hen dies. One hen that died showed no internal disease. Sometimes find a hen dead on the nest. Lost young turks just as suddenly. This began since the weather got warm.—Mrs. A. B. C.

[This sounds to me as if Mr. Mite or Mr. Tick was at work. Investigate for mites and ticks every place where hens are kept. Be there at dawn or not later than 5 a. m. and watch this night laborer going home with your hens' blood. Thousands of hens die annually of no disease whatever, but they have been robbed nightly of their life blood by these pests.

Look well in the feathers for tick eggs. I think you will need a good spray.

ALFALFA AND GRASSHOPPERS FOR TURKEYS.

[Written for Pacific Rural Press.]

Anybody who has a steady supply of grasshoppers during the summer months can raise turkeys economically, according to H. C. Hannan of Corning.

Each year Mr. Hannan has a good-sized flock, that are run on cheap grazing land that would otherwise be utilized for sheep pasture.

For the first month after hatching in spring Mr. Hannan feeds commercial chick feed and clabbered milk.

When they are old enough to range, the pasture is covered with growing grasses. At about this time the hoppers begin to come and continue well into the fall.

"As long as a turkey can get hoppers he won't touch grain," states Mr. Hannan; but it must have green succulent feed as well; and after the grass dries up this has to be supplied in other ways.

Chopped Alfalfa for Greens.—The most satisfactory as well as the most economical substitute Mr. Hannan has found for green pasture is alfalfa hay, cut into short lengths. It is soaked in warm water till thoroughly wet, then taken out and allowed to dry till just moist. This and hoppers constitute the entire ration of the growing turks till the early fall rains, when the range again furnishes green feed and the hoppers leave.

Fattening is then started, Egyptian corn, Indian corn, milo or other sorghums being used. These with wild green feed put the turks on the Thanksgiving market in prime condition.

DON'T BREED ROUPY FOWLS.

To the Editor: I have bought 118 fowls and the roup is among them. When they are cured, will it reappear, and do eggs from roupy hens produce roupy chicks? Will it affect pullets five months and younger, and retard their laying? I am scraping the ulcers in their throats, and treating with sulphur, lard, and coal oil; and use a spray disinfectant every night. They are getting better. Could I cure an egg-bound hen?—Mrs. W. S., Suisun.

[Answered by Geo. H. Croley.]

[It would not be wise to breed from any of these fowls nor any fowls that have suffered with a serious or debilitating illness. Chicks hatched from the eggs would not directly inherit the disease, but they would be predisposed to it. If the pullets are seriously affected, it will certainly limit their ability to lay; and fowls that apparently recover are liable to a relapse. Hens become egg-bound because of excessive fat, particularly about the lower abdominal cavity; therefore, this fatty condition should be reduced to relax the pressure. Hold the fowl with her vent in the steam from an open dish of boiling water. If quick relief is not obtained, carefully inject a tablespoonful of olive oil and give the fowl half a teaspoonful of olive oil every three hours. Feed on green stuff and soft, cooling food containing an abundance of bran.]

Bull tractors are being equipped with kerosene-burning attachments.

GOOSE COULD NOT WALK.

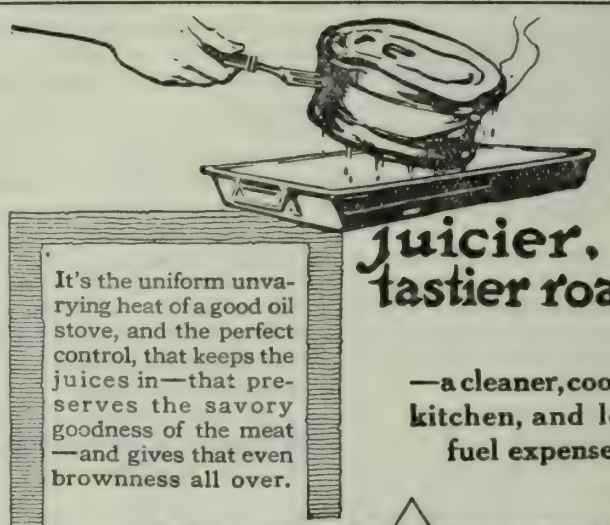
To the Editor: I have a goose that lost the use of its legs. I put her in a pen and fed her well for about two months when she became as well as ever. I have had hens affected the same way. What is the cause?—Reader, Roseville.

[Answered by Geo. H. Croley.]

[If it was a young bird that had not been injured, the trouble was due to too much fat-forming feed and lack of bone meal, bran, and other bone forming substances. If an old goose, it was probably rheumatic cramp that is caused in ducks and geese by roosting directly on sand or sandy soil. Water fowl quickly contract rheumatic cramp unless provided with a wooden floor or litter to roost upon. When mature hens are affected, it is usually in the form of rheumatism which creates more or less swelling of the joints. This is sometimes caused by improper feeding, but in nearly all cases it is due to dampness. Rub the legs with tincture of arnica and place ½ teaspoonful nux vomica in each quart of drinking water. When growing fowls are affected, it is due to excess of fat-forming food and lack of bone builder. Give bone meal, bran, and green food in abundance and reduce the starchy and fat-forming materials.]

LINE BREEDING.

To the Editor: Please explain how "line breeding" is carried on with poultry. Is "in breeding" the same? —F. O. R., Chowchilla.



[Line breeding is the breeding of successive generations to each other to fix certain characteristics. In-breeding is the breeding of close relatives.—Editors.]

A very high price paid for pure-bred poultry often yields correspondingly big return, provided, of course, that the purchaser gets what he pays for.

VARIETY IS NEEDED IN A BALANCED RATION.

To the Editor: Please state your opinion of feeding hens and other mature fowls an exclusive diet, in self-feeding hoppers, of a mixture of bran, crushed barley, and green chopped alfalfa.—J. S. A., Los Angeles.

[Answered by Geo. H. Croley.]

[In the immediate vicinity of Los Angeles these ingredients, in the following proportions, would make a balanced ration for egg production, the feeding of which to a vigorous, hungry lot of hens of a good laying strain would doubtless cause them to lay well for a very short time only because they would soon "go off their feed": 22½ pounds rolled barley, 37½ pounds bran, and 40 pounds green chopped alfalfa. Fowls are omnivorous and demand a great variety of feed, including meat and bone; without them they will not continue to thrive and produce eggs in abundance. To use green alfalfa as an exclusive green feed will cause the eggs to be of poor quality and worth ten to thirty per cent less than extras. This mixture has another fault—the boss hens will fill up on barley, get overfat, and throw the ration out of balance for the remainder of the flock.]

WATERY EGGS.

To the Editor: I have some very fine hens dying from a peculiar trouble. The eggs that are forming all turn to water; the hens linger a week or so and then die. Can anything be done to save them?—B. F. R., San Luis Obispo.

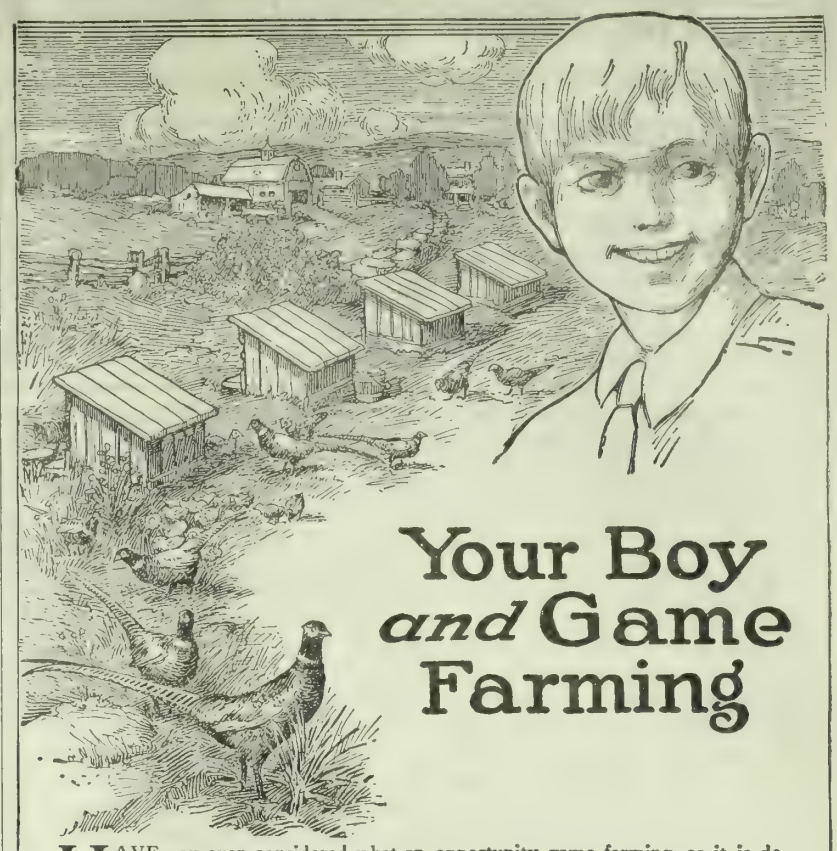
[Answered by Geo. H. Croley.]

[This trouble is rare and very little is known regarding its cause, but it is suspected that it is an unusual form of tumorous growth because at times masses of membranous tissues appear in this thin liquid that are supposed to be cystic tumors in suspension. It has been suggested that it may be caused through fright at a time when the ovary of the hen is compressed by an overfat condition. In the opinion of one European authority it is an infectious disease.]

HATCHET THE MOLE.

To the Editor: How can we get rid of a mole in the lawn?—W. F. R., Bishop.

[The best way we know of is to strike into the moving earth with a hatchet.—Eds.]



CANVAS HOSE MILDEW.

To the Editor: What kind of oil should I dip my canvas hose in to prevent mildew and rotting, but leave it pliable?—S. T. C., Berenda.

[Boiled linseed oil.—Editors.]

Careful records demonstrate that on an average, 25 fowls will pay fully as much profit as one cow, and with less labor.

B. R. Kingsberry of Heber, Imperial Co., reports an extraordinary good looking and laying quality in his poultry due to the fact that he, for over a year, has been feeding cottonseed meal. His 300 hens at present are laying about 18 dozen a day on the average. The plumage of his poultry shows a whiter and glossier effect than those not fed the meal. "I pay $1.25 per hundred for cottonseed meal and one pound of that has four times more protein than milo corn. Lots of protein makes more eggs," says he.

Your Boy *and* Game Farming

HAVE you ever considered what an opportunity game farming, as it is developing in this country, affords your boy? It offers him a splendid chance to show his worth, increase the value of your farm, and, what is most important to him, earn extra pocket money.

Thousands of ambitious, industrious boys on American farms are playing a big part in the intensive development of our agricultural resources. Game farming falls right in line with their activities.

Profit and Pleasure in Game Farming

This is a profitable and pleasant industry for you and your wife as well as your children.

The breeding of game birds is profitable from a marketing standpoint. The demand for eggs and for breeding stock is much greater than the supply, and will be for years to come. Pheasant eggs, for instance, sell today at from $20 to $25 a hundred. Live birds bring from $5 to $7 a pair.

It will, at small expense in time and trouble, supply you with an abundance of food for your own consumption. Pheasants, wild turkeys, and other birds forage much of their own food and require comparatively little attention.

Game farming will provide more shooting for you and for everyone, for it is a fact that game raised for sporting purposes cannot be confined in any restricted area. At the same time those who own large acreage, or who pool their land with others, get profit from those who pay for sport.

If you yourself haven't the time to devote to game farming give your boy a chance at it. You put up the money—and it won't be much. Let him contribute the work. You will find the combination a good one.

Write today, or let your son write, for the booklet, "Game Farming for Profit and Pleasure." You will find it well worth reading. Please use the coupon below.

CALIFORNIA POULTRY PRACTICE

WRITTEN TO TEACH BETTER POULTRY METHODS ON THE FARM.
By Mrs. Susan Swaysgood.
Price, cloth-bound, postpaid, $1.00.

Pacific Rural Press, Publishers

525 Market Street, San Francisco, Cal.

CALIFORNIA HOG BOOK

Every hog-breeder in the State should have a copy of this book handy to refer to in cases of emergency. Every day the practical side of the book will help you. The author, W. S. Guilford, is a swine breeder, and he tells just what you want to know when a difficulty presents itself. The book contains 256 pages of text, besides many full-plate illustrations. Tells how the successful breeders feed and handle their hogs.

PRICE, $2.00 POSTPAID.

MRS. BEST'S VACATION LETTER.

My dear Friends:

With school out, or nearly so, and the first of June only a few days away, vacation time seems right at hand.

While San Francisco has a bracing summer climate, and many interesting things to occupy you, yet it is not the only pleasant place to spend your time away from home. If the beach appeals to you at this end of the State there is Monterey, famous for its historical associations, and Santa Cruz with its bathing, boating and crowds of people.

In the southern end of the State there is almost one continual line of beach resorts from Santa Monica through Ocean Park, Venice, Redondo, San Pedro, to Long Beach. All of these towns have bath-houses, cottages or apartments for rent and during the season, which lasts from about June 15th to September 15th, many of them have daily concerts by good bands both afternoon and evening. The surf bathing is very good in most of the places, and it is ideal entertainment for little people playing in the clean sand or paddling at the water's edge all day long.

These resorts are well patronized, for Los Angeles is only 15 miles away, and many people come from Arizona to escape the heat there.

Only a couple of hours by steamer from San Pedro to Catalina Island, perhaps the most exclusive of any of the summer resorts. Here is where the celebrated tuna fishing is found.

On farther south is San Diego where perhaps the chief attraction at present is the Exposition. This town has the enviable reputation of having the most equable climate in the State.

We must not forget to mention Santa Barbara, which has a charm all its own, and is equally as popular for a winter as for a summer resort.

Let me urge all of you who can possibly manage it to get away from your homes for at least two weeks. You will go back with renewed vigor and energy and will find that in that respect alone the trip has paid for itself. Yours devotedly,

ROSABELLA BEST.

FRESHENING BLACK SILK.

Will you tell me how to freshen black silk by removing stains and stitch marks, and also how to brighten black lace that has become gray from age?—Mrs. L. S., Mountain View.

Various substances are recommended for cleaning black silks, including logwood, tea, coffee, vinegar and ammonia. Dust the cloth carefully, spread smooth on a flat surface and apply with a piece of flannel a cold, strong infusion of tea, or equal parts of clear cold coffee and water, or a dilute solution of ammonia in water. Sponge both sides of the fabric, taking care not to crease it, and make the silk quite wet. Press with a warm (not hot) iron between two pieces of cloth.

The same treatment will freshen black lace, but if it is too rusty dip in gasoline in which a little black tube paint has been dissolved.

MINT JELLY.

Peel and core eight good-sized apples. Cover with water and cook until nearly done. Pour off and strain 2 cups of the juice and put into a saucepan with 2 cups of sugar, when well dissolved add 10 cents worth creme de menthe syrup (may be purchased at any soda fountain), and let boil until it will jelly. This makes a nice green jelly, which is delicious with roast lamb.

ANOTHER PORK PIE RECIPE.

I was interested in the recipe for English pork pie printed in your paper dated April 15, 1916, but did not recognize it as coming from England.

Will you accept one from a really truly Englishman, or rather Englishwoman?—the kind "mother used to make," and which was baked in a brick oven, and pronounced good by the household generally.

Ingredients: 1 lb. flour, ½ saltspoonful of salt, 2 eggs, 1-3 pint water, 6 oz. butter. To every 31 lbs. meat (pork) allow 1 oz. of salt, 2¼ ozs. pepper, a small quantity of cayenne, 1 pint water and 1 dessertspoonful of powdered sage—if liked.

Mode: Spread the flour, which should be sifted and thoroughly dry, on the baking-board; make a hole in the center, into which put the butter, work it lightly into the flour, and, when quite fine, add the salt; work the whole into a smooth paste with the eggs (yolks and whites) and water, and make it very firm. Knead the paste well, and let it be rather stiff, that the sides of the pie may be easily raised, and that they do not afterwards tumble or shrink. Cut the meat into small pieces, season with salt, etc., in above proportion, and press it compactly into the pie, in alternate layers of fat and lean, and pour in a small quantity of water; lay on the lid, cut the edges smoothly round and pinch them together; decorate with leaves and flowers cut from the pastry. Bake in a slow oven.

These pies are usually eaten cold for lunch or supper, and the appearance is greatly improved by taking off the top cover and decorating with bright-colored aspic jelly either in spoonsful or molded into fancy shapes.

An inexperienced cook may find it a little difficult to raise the crust, but if a small jar or glass bottle is placed in the middle of the crust and the dough molded over it until a start is made in the raising, it will be found very simple. The crust is seldom eaten anyway, and it is easier to handle if made **plain** like the above, but if a richer crust is desired, increase the quantity of butter. The raising of the crust would then be a little more difficult, but by baking it in a cake mold and allowing it to remain in the mold until cold it would then be perfectly easy.

AN ENGLISH SUBSCRIBER.

"Johnny," said the teacher, "what is a dromedary?" Johnny did not know, but Ralph did. "I know," he said proudly. "A dromedary is a two-masted camel."

"The garden, the sunshine and the outdoor air make for health" is the motto of a "Health First" poster.

DEFERENCE TO AGE.

There is no greater test and proof of good breeding than your attitude toward elderly people. In deference to age we are far behind the Japanese and Chinese, with whom it is a cardinal virtue. Unfailing respect, unvarying courtesy, untiring consideration for those crowned with years, is a characteristic of these two great Asiatic races, one that we would do well to emulate and copy.

The self-sufficiency and self-importance of American youth is one of our gravest faults. The tendency to ignore and put on the shelf those whose life race is nearly run marks ours as a crude, half baked, crassly inexperienced civilization.

See what you can do to overcome this serious defect in our national manners by being yourself kind, attentive, and helpful to all old people, of high or low degree, who come your way in the course of a day. You have no idea of the grateful appreciation you will meet as the result of such a line of conduct, nor of the number of people who will, consciously or otherwise, follow your example.—Chicago Tribune.

DISINFECTION.

After the recovery of a patient ill with a contagious disease the room occupied should be thoroughly disinfected before being again used. All articles of little value should be burned. All other articles should be left in the room until the whole can be thoroughly disinfected. This is ordinarily done by the burning of sulphur or the use of formaldehyde. Both of these substances can be bought in candle form ready for the touch of a match. The room should be tightly closed, that the fumes cannot escape, and then afterwards thoroughly aired.

CLEANING MATTRESSES.

Stains on mattresses may be removed by covering them with dry laundry starch and moistening this with enough soap or soap jelly (made by melting scraps of hard soap in about their own bulk of boiling water) to form a thin paste, which will dry on, but not soak through into the mattress. Let dry and brush off with a stiff whiskbroom. Repeat if necessary, Afterwards sponge with ammonia and water.

Miss Fay Clake, a University of Oregon girl, is superintendent of schools in a Washington county of 9,883 square miles in which only 15 of 62 schools can be reached by railway. Once in "swinging around the circle" she traveled 400 miles in a wagon without springs.

FLORAL DEPARTMENT.

By Geo. N. Tyler, Los Gatos.

I have a query this week as follows: "I have a large bed of the blue cornflowers just about past their prime in blossoming. Should they be cut back to come up again from the root? I also have cyclamen plants from seed ready to prick out, and would be glad of your cultural notes for them."

Very few annuals amount to anything after they have flowered and made seed. It would do no good to cut the cornflowers back, as what was left would probably dry up and die. In answer to second: Get some flats or boxes three inches deep, with holes or cracks in the bottom for drainage. Put in the bottom one inch of coarse material. Make a compost of the following: Two parts leaf mold, one part loam, one part sharp sand, mix these thoroughly and run through a fine sieve; fill the boxes full with the mixture, and then firm down with a brick or board; it will leave from one-half to three-quarters of an inch of space on top of flat. If your compost is not moist it should be slightly watered before transplanting the seedlings. (Flaky leaf mold is best for the compost.) Carefully prick out the seedlings, and plant them in the flats two inches apart both ways. Care should be taken not to plant too deep; the little bulblets should be one-fourth under ground. Water carefully to prevent washing, and put away in a cool, shady place, and never let them get dry, but do not keep them too wet. When the leaves meet pot them off into three-inch pots, adding a little cow manure to the soil. For watering seedlings, etc., so as not to wash the soil, take a small can and punch the bottom full of holes. The nearer you can keep the small cyclamen to a temperature of between fifty and sixty degrees, the better they will grow.

You can still put in chrysanthemum cuttings and get good flowers. It is not yet too late to plant asters, also carnations.

Plant gladiolus now for late blooming; they like a sandy soil, thoroughly enriched with half-rotted manure; also give them a heavy mulch of straw manure after planting. Plant six inches deep so they will not blow over. They do not need any staking when planted this depth.

Give your dahlias a three-foot stake, and if they are a foot or more high give them a mulch two inches thick of fresh stable manure, and water through this manure. They require an abundance of water, and you cannot overwater them when they are in strong growth. When the buds show give them a dose of liquid manure, as described in a former article, and disbud the single flowers. You can still plant the tubers, or grow plants or pot-grown plants. In fact, most of the finest exhibition flowers are planted in late May, and the flowers will be in their prime in October, the exhibition month.

If any of the readers have a recipe for warm cabbage slaw, will they kindly send it for the benefit of others who like the good old-fashioned dish of our grandmothers'

THE COLOR FOR NUTS.

am very glad that the nuts aren't red,
the squirrels would find them all," Tom said.
Now, if nuts were blue," thought the squirrel, "oh, dear!
ney never could hide from the children, I fear."

f the nuts were bright," smiled the tree, "I know
ot a nut would be left on the ground to grow."
they all agreed in the wood and the town,
hat the very best color for nuts must be brown.

—Little Folks.

HE NEW TEN-CENT PIECE.

Esther G. Babson.

It was bright and shining, fresh om the mint, and Nora Haynes had atched it being made with hundreds st like it. Nora was on a visit to hiladelphia with her parents, and e mint was an interesting place.

"When we go out," her father id, "we will ask them to give us a w new dimes and quarters in exange for our old ones." So a right shiny dime was put away in inside pocket of Nora's little red ather purse, "for a lucky piece," as e said, "and I'm never going to end it."

But alas for Nora! That very onth, on a rainy day, she took the olley for school. On opening the d purse she found that she had forotten to ask her father for her eekly allowance; the conductor was topping in front of her, so she had to open that inside pocket and give up her precious dime into the outstretched paw. It was quite a shock to the new ten-cent piece to find itself transferred from a little red leather purse, where it could move round easily, to a dirty leathern pocket where it was crowded and jammed against five-cent pieces and even copper cents; but the new ten-cent piece was plucky and wasn't going to begin its career by being a snob, and pretty soon it was being given in change to a pretty lady, who smiled as she saw it, and said, "Oh, there's a new dime, right out of the mint!"

It stayed in her pocket-book some time in grand company—halves and quarters and crisp new bills. But one day, when the pretty lady was boarding a prepayment car, in her hurry to find five cents the little new ten-cent piece fell into the mud near the car track, unnoticed by the pretty lady.

It lay there some time, until the bright eyes of a little boy spied it.

"My!" said he, as he stooped down and wiped the mud off it, "what luck! Just in time to buy that agate I wanted!" He ran back to the news stand where he had been gazing in the window, and longed for a special glass marble, a perfect beauty, marked ten cents. It was soon in his hands, and the ten-cent piece was so happy to see the pleased look on his face that it didn't mind being thrown into the till with a lot of dirty pennies. It didn't stay there long, however, for it was given in change to a man who came along to buy a paper. The man was a good man, but not very fond of parting with his money, so the ten-cent piece thought it would stay a long time with him, and it did. But one night a kind man came to the house to ask for a little help for a family who had been burnt out. He asked only a small sum from every one, and almost every person on the street had given at least a quarter. The stingy man hesitated and wasn't going to give at all; then he slipped his hand into his pocket.

The new ten-cent piece tried its best to force its way into his fingers, for it wanted to help that poor family; but the stingy man took out a five-cent piece and said, "That's all I can find now. Good-night."

The ten-cent piece was so cross it just worked around in the stingy man's pocket until it made a little hole.

"I won't stay with a mean man for a moment longer," it said as it dropped through next day and landed on the sidewalk.

This time it was picked up, strangely enough, by a little girl, one of the burnt-out family. Her sister, Louise, had been hurt in the fire, and had lost all her playthings, which were not very many anyhow, as they were poor people. Poor little Louise had to lie in bed with a lame ankle, at a kind neighbor's, and she had cried all night for her doll's tea-set, burned up in the fire.

When Mary, the big sister, found the ten-cent piece, her first thought was, "Oh, joy! I can get a new pink hair-ribbon at the ten-cent store to replace the one I lost." So she hurried off to the ten-cent store, and the first thing she saw was a darling little tea-set, almost as pretty as the one Louise lost.

Mary thought how pleased Louise would be if she could have this one, because when people have been burnt out and have lost everything they can't spend money on playthings. Poor little Louise. crying with her broken ankle,—the only one who had been hurt! "After all," thought Mary to herself, "I can wait for my new ribbon." She looked down at her braid, tied with a shoestring.

The ten-cent piece fairly sang for joy, and only wished it could have been nearer to see Louise's look of joy when the tea-set was spread out on her bed.

Pacific Rural Press Market Report

PRICES QUOTED AS PAID TO PRODUCERS.

San Francisco, May 24, 1916.

WHEAT.

The local market remains unchanged, with very little trading aside from usual jobbing movement for current needs. Reports of light crops in many districts are causing a firm feeling in some markets.

Cal. Club, ctl.	$1.60 @1.65
Northern Bluestem	1.87½ @1.90
Northern Red	1.85 @1.95

BARLEY.

Crop reports from the west side of San Joaquin valley are encouraging but the yield in several other producing districts does not promise so well. The recent cool weather is expected to be of some benefit. Spot feed a little lower, and speculative market shows little strength.

Shipping, ctl.	$1.37½ @1.40
Choice Feed, ctl.	1.30 @1.35

OATS.

Prices fairly firm at the recent advance, but very little buying in local market, aside from routine feed requirements.

Red Feed	$1.35 @1.37½
White	1.55 @1.60

CORN.

There is not much demand for yellow corn, and the city market for Egyptian, etc., is rather irregular; there is a wide range in quality of offerings and amount handled here is small as compared with country trade.

Eastern Yellow, ctl.	$1.80 @1.85
Milo Maize	1.40 @1.45
Kaffir	1.60 @1.65
Egyptian	1.45 @1.50

BEANS.

Beans are rapidly cleaning up. Growers' stocks have been well sold for some time, making it difficult to quote prices from first hands; and while dealers have been holding considerable stock, the present demand, extending to all varieties, is expected to absorb everything available before new crop appears. The increasing scarcity has caused another advance in most lines.

(On wharf, San Francisco.)

Bayos, per ctl.	$5.00 @5.25
Blackeyes	2.90 @3.00
Cranberry Beans	4.85 @5.10
Horse Beans	3.00 @3.25
Small Whites (south)	6.60 @7.00
Large Whites	6.30 @6.50
Pinks	5.10 @5.25
Limas (south)	4.70 @4.85
Red Kidney	6.50 @6.75
Mexican Reds	4.90 @5.25
Tepary Beans	4.00

SEEDS.

Melilotus Alba, lb	23 c
Melilotus Indica	6 c
Bur Clover	11 c
Oregon Vetch	5 c
Soy Beans	6 c
Canada Peas	5¼ @ 6 c
Alfalfa, per lb.	22 @24 c
Sudan Grass	35 @40 c

HAY.

According to local dealers, the recent freaky weather, though causing damage at some isolated points, has had only negligible results, except that cool temperature and additional moisture has helped grain to fill out better, preventing the cutting of much grain for hay. Grain men are reluctant to make hay anyway, having no good facilities for handling or marketing it, and it is not believed that grain will be cut for hay to any very important extent in Tulare Lake region, where the crop is being rushed off ahead of rising water. Dealers believe the hay crop will be a little short of last year. Arrivals here are lighter, consisting mostly of old hay, with some new alfalfa and very little volunteer oat. Old hay prices are well maintained, new quotations not well established. Sales of new wheat and oat hay in the country reported at about $12, and volunteer at $9. Demand quiet, both locally and for shipment.

No. 1 Wheat	$13.00 @16.50
No. 2	12.00 @14.50
Tame Oats	12.00 @18.00
Wild Oats, new	8.00 @11.00
Barley, new	9.00 @12.00
Alfalfa, new crop	8.00 @12.00
Stock Hay	6.50 @ 8.50
Straw, per bale	.25 @ .40

FEEDSTUFFS.

(Wholesale prices, per ton, carload lots, San Francisco.)

Beet Pulp, per ton	$22.50 @23.50
Alfalfa Meal, per ton.	20.00 @21.00
Alfalfa Molasses Meal, per ton	21.00 @22.00
Bran, per ton	26.00 @27.00
Oil Cake	Nominal
Cocoanut Cake or Meal	23.00 @25.00
Cracked Corn	40.50 @41.50
Middlings	34.00 @35.00
Rolled Barley	29.00 @30.00
Tankage	45.00
Rolled Oats	29.50 @31.00

VEGETABLES.

While the local trade is not especially active, there is still considerable shipping business in miscellaneous garden truck, helping to maintain prices on a fairly high level. String beans have dropped rather sharply, as liberal supplies are coming from many points. Lettuce is considerably lower, with good offerings from local gardens. Okra is offered in fair quantity, while summer squash holds steady. Green peas are quite scarce, and have been marked up sharply. Fancy green corn has been practically out of the market for several days, and higher, though ordinary stock is easing off. Tomatoes still scarce.

Cabbage, ctl.	$1.75 @2.00
String Beans, lb.	2½ @5 c
Summer Squash, box	.75 @90 c
Peppers, bell, lb.	.15 @20 c
Rhubarb, box, Bay	.40 @75 c
Asparagus, box	1.00 @2.25
Artichokes, doz.	.40 @50 c
Lettuce, small crate	.50 @65 c
Eggplant, lb.	.10 @15 c
Peas, lb.	4 @6 c
Tomatoes, lugs	2.00 @2.25
Green Corn, doz.	.35 @50 c
Okra, lb.	.20 @25 c

POTATOES AND ONIONS.

New potatoes are coming in more freely, but good stock is still rather scarce, and prices show weakness. Dealers in the River district report heavy frost damage, about 30 per cent of the crop. New onion crop promises well, nothing but reds coming in so far, prices firmly maintained.

New Potatoes, ctl.	$2.25 @2.75
Oregon Burbanks	1.55 @1.85
Onions, red	1.75 @1.85
Australian	2.50
Garlic, per lb.	5 @ 9 c

POULTRY.

Values show no important change. Considerable young stock is appearing from the East as well as local points, keeping the market rather overloaded, with no immediate prospect of better prices.

Broilers, 15 lbs. to doz, and less, lb.	22 @23c
do, over 15 lbs. to doz.	25 @28c
Fryers	25 @30c
Hens, extra, per lb.	20c
Small	17 @18c
Smooth Young Roosters, per lb.	25 @28c
Squabs, per doz.	2.00 @3.50
Geese, per pair	2.25 @3.00
Ducks, young	Nominal
Old	15 c
Belgian Hares	10 c

BUTTER.

General range of prices a little higher than last week, as the supply has been cleaning up closely of late. There is still a little shipping business with the East, but upward tendency of prices tends to keep movement to narrow limits.

	Thu.	Fri.	Sat.	Mon.	Tu.	Wed.
Extras	25	26	25	25	25	25½
Prime Firsts	24	25	24½	24½	24½	25
Firsts	23½	23½	23½	23½	24	24½

EGGS.

Prices have been creeping up a little this week, as offerings in local market are hardly as heavy as they have been. The large shipments sent to Alaska during the last few weeks have had a stiffening tendency, which is increased by recent shipments to Australia and New Zealand, also the fact that some of the principal producing districts are shipping to Los Angeles and outside markets. A lot of 20,000 pounds cold storage eggs was recently condemned in this city.

	Thu.	Fri.	Sat.	Mon.	Tu.	Wed.
Extras	23½	23½	23	23½	24	24
Sel. Pullets	21	21	20	20	22	21

CHEESE.

Y. A.'s have been coming in freely and price has declined sharply; Monterey Cheese is firmer.

Butter	25	25	25	25	25	25
Eggs	22	23	23½	22½	23	23½

DECIDUOUS FRUITS.

Notwithstanding the light crop of cherries, shipments to local market have been coming in fairly well, and a good deal has been sold at fairly easy prices, though fancy stock moves readily at satisfactory figures, being a little higher than last week. Apricots have dropped, with stock coming from several districts; and peaches also are lower, though still in very light supply. Figs are still bringing high prices, with only moderate offerings. Melons are lower, though cantaloupes are firm at the moment, watermelons finding little demand. Currants, loganberries and raspberries are lower, though supplies are not heavy for this season. Strawberries well maintained.

Currants, chest,	$4.00 @6.00
Loganberries, chest	5.00 @7.00
Gooseberries, lb.	.05 @ .10
Blackberries, crate	1.50 @1.75
Raspberries, crate	.65 @1.00
Strawberries, chest	4.00 @6.00
fancy, chest	7.00 @8.00
Apples	.75 @1.00
Cherries, Black, 10 lb. bx.	70 @95c
White, do	50 @85c
Per lb., black	5 @ 9c
White	3 @ 5c
Apricots, crate	.75 @1.25
Peaches, crate	1.25 @1.75
Figs, box, black	.75 @1.25
White	1.25 @1.50

Special Deciduous Market Report.

By J. L. Nagle.

Sacramento, May 23, 1916.

Regarding Eastern fruit crop conditions, beg to advise that the only information available at the present time is that pertaining to the Peach crop, which according to reports is comparatively light, amounting to only 50 per cent of last season, the following being from reports received covering the larger Eastern producing sections:

Georgia: During the budding season indications were for a heavy crop of Peaches in this State, but frost during April did material damage, and it is now the general opinion that the State will not ship over 3,500 to 4,000 cars, as compared with approximately 4,400 cars last season.

Connecticut: Peach crop in this State is very uneven and scattered, cold temperatures during early part of February killing the buds in some orchards, while in others scarcely any damage was done. Crop last year was unusually heavy, fully 1000 cars being shipped, also large quantities disposed of through local markets. General opinion that crop this season is 45 to 50 per cent short of last year.

New York: During early part of the season peach crop of western New York was materially damaged by cold and it is estimated that coming crop will be fully 1,000 cars short of last season, amounting to not over 3,500 carloads.

Maryland: Last season this section shipped about 1,700 cars, but present indications are that the crop this year will amount to 850 to 950 cars.

New Jersey: Last season all sections of this State had a bumper crop of Peaches. It is generally reported that the early varieties will only be about 50 per cent of last season's shipments, while the later varieties, particularly Elbertas, will not amount to over 15 to 20 per cent. Reports are that the output this year will not be over one-third of last year.

Delaware and West Virginia: It is generally reported that the shipments will be considerably lighter than last year.

We have just received authentic information from the Northwest which may be of interest. Speaking of Washington and Oregon, my informant states: "As far as cherries are concerned, I hardly think there will be over five cars shipped out of the Northwest, as the frost wiped us out a couple of weeks ago. In the Yakima Valley, where we usually shipped forty cars, we will be lucky to get out half a car. Kennewick district will probably have about three or four cars. Regarding other crops. The last estimate states that 65 per cent of the apple crop in the Yakima Valley has been destroyed; about 50 per cent of the peaches and about 60 per cent of the pears. In Southern Idaho the entire crop has been destroyed, which takes in prunes, apples and peaches. The Kennewick district fared a little better, the loss sustained being little over 15 per cent. The Wenatchee loss will be about 25 per cent on apples. Montana was completely wiped out. The grape crop in the Yakima Valley is practically gone, and other districts that raise grapes suffered severely from the frost of last year.

The following prices have ruled for the week:

New York: Tartarian cherries averaged $1.85; Royal Ann cherries, averaged $1.95; Bing cherries, averaged $2.53; Rockport cherries, averaged $1.35; Centennial cherries, averaged $1.62; Chapman cherries, averaged $1.36; Bigarreau cherries, averaged $1.65.

Chicago: Tartarian cherries, averaged $1.50; Bigarreau cherries, averaged $1.14; Rockport cherries, averaged $1.44; Royal Anne cherries, averaged $1.42; Spanish cherries, averaged $1.20; Bing cherries, averaged $2.15; Pringle cots, averaged $1.39; Newcastle apricots, averaged $1.46; Seedling apricots, averaged $3.10.

Special Livestock Market Report.

Cattle offerings are heavy on account of the dry weather. More lightweights are coming, which is desirable to supply that demand. No Nevada stock will be coming till September. California grass-fed cows and steers have been selling in Portland at $8 and $8.50, from which commission and freight must be figured.

Hogs have weakened, being the only livestock marked down this week. Many milk hogs are coming. These are not as desirable as grain-fed stock.

Sheep are scarce in San Francisco, but receipts are increasing at Portland, where grass-fed wethers and ewes sold May 22 at $8 and $6.50 respectively. Spring lambs are scarce.

Wool is the same as last week with all markets strong, but no particular advance. Some big flocks have recently been clipped. No raw wool may be shipped from India except to the United Kingdom, until October 1. The newly formed British Association of Wool Exporters to America have been in conference with the War Office trying to get certain embargos lifted.

DRIED FRUITS.

Buyers seem to be taking a little more interest than last week, but market still lacks animation, as there is nothing of consequence left of old crop, and growers' views as to new fruit are above those of the packers at this time. While it may be impossible to realize the prices asked in some quarters, it is hard to see how anything can be lost by waiting until crop is made, as there seems to be a general shortage, and domestic demands certain to be larger than usual. A prominent broker, recently from the East, reports a condition of almost unprecedented prosperity in all parts of the country, which should be a favorable indication for products of this kind. Prices put out by packers in the East are said to be causing a little hesitation on the part of jobbers, but there is little doubt that the trade will take hold as soon as values seem to be well established. The New York Journal of Commerce says:

"Apricots are firmly held by packers, and the high cost of the raw fruit on the Coast makes it seem improbable that any reduction can be counted on. Prices are so high, however, that buyers are disinclined to take any interest as their own demands have not reached the point of urgency. Peaches are in practically the same position with higher prices in prospect, based upon the price packers are paying for the new raw fruit. The raisin situation remains deadlocked, with the association showing no disposition to recede from its position with reference to selling to speculators. Jobbers have booked their allotments of bleached Thompsons, and there is no further demand at present."

CITRUS FRUITS.

The eastern auction markets are in fine shape and are paying increased prices for oranges and in some cases for lemons. Navels are nearly all shipped as are seedlings, sweets and St. Michaels. At New York on Monday, May 22d, the citrus auction averaged from $1.75 to $3.75 per box for navels; from $2.70 to $3.85 for valencias; seedlings from $2.10 to $2.65; sweets $1.90 to $2.85; St. Michaels $2.25 to $3.25; lemons $1.60 to $3.20. Other auction points were fully as high as the above. Shipments of oranges are averaging about 150 cars daily from southern California.

New Valencias are beginning to appear in the San Francisco market, and are quite firm, with reports that price in primary markets is to be advanced shortly. Offerings of navels rather light, prices have been advanced a little, though demand here is not especially active.

A large juice factory is proposed by the Sebastopol Berry Growers. It is hoped to be ready for overripe Loganberries this season.

Publisher's Department

Mrs. M. E. Rodenkirsh of Orland, on remitting for subscription, says: "I want to add that I never spent a dollar for a better purpose in my life. After reading up on tree pests in your January and February numbers, I got busy in my almond orchard, and it is astonishing to see the results now. Last year something was radically wrong and no one seemed to be able to enlighten me and I was heart-sick about it, but was here and had to stick. About then your agent came along and I subscribed for your paper, read it from cover to cover and found plenty of information that fitted my case. Then I got busy and the result is great."

A letter from a subscriber living in San Luis Opispo Co. says he has recently written to several advertisers of bulls and hogs and in many instances has not received a reply. The writer says "While these people were probably sold out, it is no reason why queries should not be answered. I have letters from two 'live ones' who were sold out, but had the business courtesy to reply. These men will always keep sold out, because they are after business, and take care of what they get a chance at." Advertisers would do well to follow this advice.

One hundred and ninety-five new subscribers were added to our list during the past week. These new readers are scattered over the State.

Our advertising columns are more than filled again this week. Read them carefully and we are sure that you will be well repaid for the time used.

If you haven't sent for a copy of our new book "Second Thousand Answered Questions in California Agriculture" you should do so. The book is a necessity on your farm. Send for our special offer in connection with the book.

PATENTS THAT PROTECT are procured through Pacific Coast Patent Agency. Savings and Loan Building, Stockton, California. Established fifty years.

For SALE—8 h. p. Samson Engine, 3-inch Krogh Pump in good condition. B. R. Putnam, Exeter, Cal.

WANTED.

RANCH FOREMAN, married, absolutely reliable and with highest references from present and past employers, would like to take charge of well-equipped place. Familiar with the breeding of good stock, production of crops, and the management of orchards. A position is desired where results beyond the ordinary can be accomplished. Address Box 218, Pacific Rural Press.

WANTED—About sixty young men and women to enter the Western Normal to prepare for teaching, or to secure a high school education in the shortest possible time. Western Normal graduates secure and hold good positions. Time and money saved. For information address Western Normal, J. K. Humphrey, Principal, Stockton, Cal., Box 704.

YOUNG MAN, well educated, German nationality, speaks English, Danish and Swedish, wishes position on farm to learn practical farm work. Familiar treatment preferred rather than high wages. Box 217, Pacific Rural Press.

TREES AND PLANTS.

FOR SALE—Manzanillo Olive Trees, budded on Picholine seedlings. Younger and heavier bearers, longer lived and more vigorous trees than trees raised from cuttings. Geo. F. Rice, R. 1, Box 78, Reedley, Cal.

AVOCADO TREES for sale, fine field-grown budded Ganter and Harman variety. $1.00, $1.50 and $2.00. Magnolia Nursery Whittier, Cal.

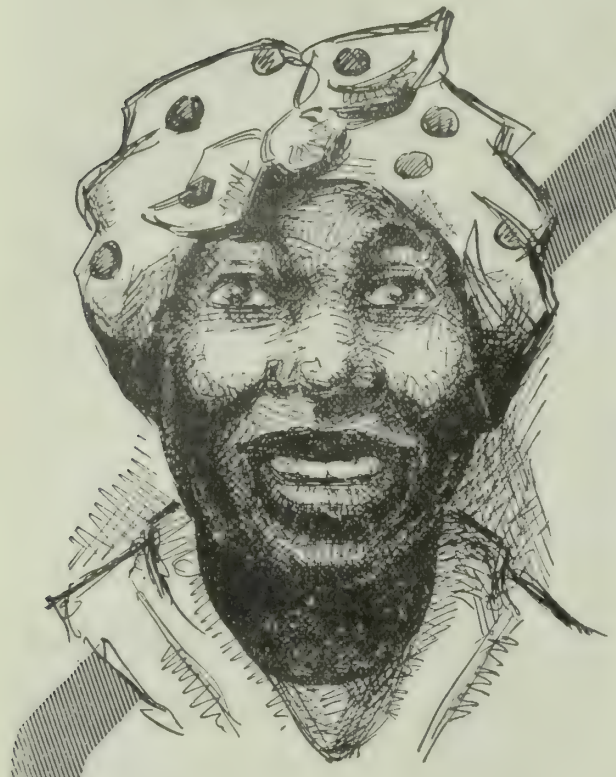
A-1 NAVEL, VALENCIA and LEMON trees, $15 per hundred, packed in moss. Less than 100 lots, 18c each. J. C. Johnson, Azusa, Cal.

SWEET POTATO PLANTS—California Yams; May delivery. $2 per thousand; 35c per hundred. J. Braswell, R. 2, Lindsay, Cal.

FOR SALE—Spineless Cactus Plants. Prices right. B. C. Engbert, Byron, Cal.

WELL BORING — Water guaranteed. Low prices. David Bahrs, Marysville.

LAND FOR SALE



COLVILLE INDIAN RESERVATION, WASHINGTON, OPEN FOR SETTLEMENT—Drrawing July 27th. About 500,000 acres. Fruit, Farm and Dairy Land. Complete Sectional Map and Description. Postpaid, $1.00. Soldiers, sailors (or their widows) of the Civil or Spanish Wars may register by Agent. Write us for blank forms, which we will furnish free. SMITH & McCREA, Room 108, Eagle Bldg., Spokane, Wash.

FREE HOMES—SAFE INVESTMENTS without residence. SCHOOL, STATE, INDIAN, GOVERNMENT Lands. YOU have 9 rights, NOW worth $1,000 each. Booklet 16 FREE. WM. JOSEPH CLARK, Sacramento.

FOR SALE, near Vacaville, eight acres creek land in table grapes, walnuts and variety of fruits. Fine house; modern conveniences; plenty water; tank house, barn; and packing shed. J. Malchi, Vacaville, Cal.

WANTED—Thousand acre sheep ranch to lease for three years. Hill land west side Yolo county. House and barn. No brush. B. Muniain, Box 57, Capay, Cal.

WANTED to hear from owner of good farm for sale. Send description and cash price. R. G. List, Minneapolis, Minn.

Tempting Dixie Baking

Sperry Virginia Corn Bread Recipe

3 cups of Sperry White Corn-Meal
1 cup Sperry Flour
1 tablespoonful of salt
2 heaping teaspoonfuls baking powder
1 tablespoon of lard
3 cups milk
3 eggs

Sift together the flour, corn-meal, sugar, salt and baking powder; rub in the lard cold, add the eggs well beaten and then the milk. Mix into a moderately stiff batter; pour it into well greased, shallow baking pans (pie tins are suitable). Bake from 30 to 40 minutes. (16)

Sperry Recipe for Maryland Beaten Biscuits

1 teaspoon salt
1 tablespoon butter
1 quart Sperry Flour
1 cup milk

Rub butter and salt into flour, add milk and a little water if necessary to make soft dough. Place on board and beat with rolling pin for ½ hour or until it becomes brittle. Roll ½ inch thick and cut in small circles. Prick with fork and bake in hot oven about 20 minutes. (14)

Sperry Recipe for Dixie Doughnuts.

3 eggs, beaten light
3 even tablespoons melted butter
4 cups Sperry Flour
1 cup sugar
1 cup sour milk
½ teaspoon soda
1 saltspoon each of cinnamon and salt

Enough more flour to make just soft enough to roll out. Mix the dough rather soft at first. Have the board well floured, and the fat heating. Roll only a large spoonful at first. Cut into rings with an open cutter. Mix the trimmings with another spoonful. Work it lightly till well floured and roll again. Roll and cut all out before frying. The fat should be hot enough for the dough to rise to the top instantly. (17)

The "Mammy" of the sunny south has long been famous for "good things to eat." Use these Sperry Recipes and you will reproduce those southern baking triumphs that delighted hundreds of thousands at the Panama-Pacific Exposition, where

SPERRY FLOUR

was awarded the Grand Prize, highest possible honor.

You are always certain of uniform baking results when you use **SPERRY FLOUR**—whether it be in making bread, cake, pie, biscuits, muffins, doughnuts or the 100 and 1 other things that flour is used for.

Every ounce of **SPERRY FLOUR** is subjected to 7 distinct scientific and practical tests to make sure of absolute uniformity in gluten quality and content.

Order Sperry Flour of Your Grocer

Read about flour making—bread making and the cause of poor bread. This is all interestingly explained in **The Sperry Book which will be sent you free—Write for it today.** If you will enclose a 2 cent stamp we will include the much prized **Sperry Cook Book.**

California State Library 7-1-

Lime Makes Fertilizers Available.

Great stores of natural fertilizers are locked up in our orchard soils, unavailable for use of trees. Soils may be acid, impervious to water and tree roots; they lack humus, air and moisture to support bacterial activity to make fertilizers available. Lime and cover crops solve the problem.

[Written for Pacific Rural Press.]

TO SECURE 100 per cent efficiency out of purchased fertilizers by maintaining the proper physical condition and chemical reaction, in the soil, is the problem in Southern California now," says R. S. Thompson, manager of the Highland Exchange Association. Mr. Thompson has been a close student of a citrus orchard near Highland since 1884, besides traveling thousands of miles by automobile through all the citrus growing regions of California. The information on which this article is based comes direct from his observation, reading, and experience growing fruit and working in a thoroughly equipped laboratory on his ranch. A soil tube is Mr. Thompson's primary tool, for he studies the soil as far down as the roots go. And be it said that examination by the writer, of many orchards, fruit stands, and packing houses, has failed to show fruit more uniformly smooth, thin-skinned, even-sized, tender or deliciously flavored, though the trees seem to indicate that he has struck the keynote of success only in time for the results to show in leaf growth during the past season.

Fertilizers Must Be Made Available.—"The best fertilizer on earth cannot exert its best effect where the soils have been injured by injudicious treatment and are deficient in organic matter and calcium carbonate," says he.

That no plant can use fertilizer elements until they have been made soluble and then dissolved in much water, is apparent. As truly, too, where water does not penetrate, natural fertility remains locked up.

If potash is necessary, but hard or expensive to get, it behooves us to unlock the immense stores of this plant food, which are naturally abundant in the granite soils of most of the California citrus regions.

Recent washouts as well as soil tube borings have proved that if citrus roots do not feed over three feet deep, it is because the soil or moisture conditions prevent their going deeper. The natural potash must first, then, be made accessible by wetting the dirt so roots can get down to it.

"A rain gage, located near the mouth of City Creek Canyon, Highland, in January, 1916, registered 17.35 inches of rainfall. Theoretically, this would wet the soil at least eight feet deep. On Feb. 2, 1916, there was absolutely dry soil at a depth of 3½ feet in a citrus orchard 80 rods from the rain gauge, where the ground had been cultivated for 26 years. The orchard across the street, that had been limed with ground limestone was tested on the same day. Instead of the soil becoming dryer at 3½ feet, it showed increased moisture. Before the latter soil was first limed in 1912, it was possible to run water on it for five days at a time without wetting it beyond 18 or 20 inches. Water running on this soil now, instead of flowing into the waste ditch, penetrates the soil where it is needed. Part of this result has been due to cover crops summer and winter."

Heavy cover crops grow where bacterial activity is favored by open non-acid soils. The cover crops loosen subsoils deeply, and admit air and water needed to enable tree roots to go deeper where more natural fertility lies. Nitrogen gathered from air by legume cover crops is the cheapest and one of the most available forms. Leachable fertility is stored in the plants until rains are over; and the cover crops prevent erosion of fertile top soil. Mr. Thompson grows summer cover crops also to prevent the drying and baking which kill bacteria and prevent growth of tree roots in top soil.
Photo by courtesy Germain Seed Co.

Having gotten water to the deeper fertility elements, and enabled the roots to go down to them, the problem remains of making those elements soluble.

Soil potash usually exists in insoluble compounds, but in general, when calcium carbonate is brought into contact with it, the calcium replaces the potash, leaving the latter soluble and available for plant food.

Even the insoluble soil phosphates of aluminum and iron are recombined by calcium carbonate, resulting in calcium phosphate. In this form the plants can more readily obtain the phosphoric acid.

EDITORIALS

THE most significant event of last week, in a large way, was the success of the fair at Chico, far up on the east side of the Sacramento valley. It was not in the fair season, which is, by common acceptation, after harvest in the autumn. It was not with State aid nor by State authorization, as local fairs often are. It was an outbreak of strong local feeling and desire for progress under the leadership of a voluntary association which has long centered effort and aspiration in that section of the State—the Sacramento Valley Development Association. The exhibits were unique, excellent, and of wide industrial significance. The spirit of the event was most bouyant and progressive. The attendance was notable, local estimates stating that not less than 20,000 people participated during the week. All these tokens of life and action indicate future achievement. If they reach their fullest power and influence, they will be concentrated in a systematic effort toward desirable ends, such as was outlined in a public appeal in this way:

The present situation in the Sacramento valley calls for a very comprehensive and vigorous effort to bring about the settlement and profitable development by an intensive agriculture of waiting lands. Millions of dollars are invested in land, irrigation and reclamation enterprises, a profitable return upon which can only be secured through the development of a population sufficient to intensively cultivate the land.

Every interest in the Sacramento valley should be concerned in the achievement of this result. That most interests are concerned and desire this work carried forward is evidenced by the large sums expended annually from public funds with almost unanimous approval and by subscriptions from private funds aggregating large amounts to the various agencies working to this end. It is entirely possible to work out adequate plans for this undertaking and to secure the co-operation of most Sacramento valley agencies in carrying them into effect.

It is surely possible, and it is imperatively necessary for the good of the State and the prosperity of the people.

INDIVIDUALISM AND CO-OPERATION.

AT FIRST thought one might hold that there is a distinguishing difference between this event at Chico and the event at Willows a fortnight earlier, upon which we indulged in comments in our issue of May 20. This first thought might recall the fact that the earlier, and at this time greater, development on the east side of the Sacramento river was due to the intense individualism which prevailed during the mining era in the adjacent foothills. It was then that individual initiative, action and self-protection seemed to most gloriously or most shamefully prevail—according to the heart and nerve of the single man. And yet it should not be forgotten that even in such a dominion of individualism, the strength was, after all, not in the man alone, but in his co-operative action with his fellow-men, who were actuated by the same aspiration for fairness and the same thirst to do noble things. It has been the testimony of many contemporary observers that never in the world, perhaps, was the evil-doer under such a weight of swift retributive justice, and never was the righteous and noble man so sure of recognition and support, as in the mining camps of '49 and the early '50's. Of course, we, living in other days and under other conditions, cannot approve their methods for ourselves, but we have never heard their motives impugned. They were self-conscious and self-respecting communities, and their standing is unimpeachably maintained by the fact that, when an early California Legislature found that neither the mining laws which the argonauts brought from their own countries, nor the Spanish mining laws, which in a way were indigenous here, were just to conditions then prevailing, this Legislature declared that each mining community should make and apply its own mining rules and decisions. Thus, at the very beginning in California, where it was apparently every man for himself as nowhere else in the world, the rights of individualism were only to be obtained or conserved by co-operation.

THE FIRST VALLEY CO-OPERATION.

NOR was this product of the earliest assemblies of miners to vanish with them. More than fifty years ago the injury of valley lands and navigable streams by flood movement of debris from hydraulic mines began. More than forty years ago the valley farmers, widely injured and in some cases actually ruined thereby, began their fight against this kind of mining. The more conflicting interests opposed them, the harder they fought, and they finally won their contention in State and National Legislatures, and even now the State and the United States will spend during the next few years ten millions of dollars toward repairing the injury, which they at first winked at or actually permitted, while land owners will contribute much more to restore our water courses to their old harmlessness and service. And this great work, of which we see only the beginning, and which, when complete, will create a new empire, through reclamation and improved navigation, traces its beginning to the resolute action of east-side farmers, who refused to be either bluffed or bought while contending for rights which only they, at that time, clearly discerned. And they were men who made their stakes on the lands by strong individual initiative and effort, but they avenged their losses and made gains for their successors by co-operation in one of the noblest adventures in defense of the man on the land which this State has ever seen. If you are an old-timer and desire to refresh your memory, or if you are a new-comer and wish to know the occasion for this uprising and endurance of the co-operative spirit, write to Congressman C. F. Curry at Washington for his report on flood control of the Sacramento river, just printed. If the reader could see those stalwart farmers contending against all odds for the rights of their lands and their rivers, as we remember seeing them in the latter '70's, he could have no doubt that strong individualism is the bulwark of effective co-operation.

AFTER THE WAR.

TALK is getting free again about the hosts of Europeans which will be pressing for entrance to California as soon as peace is declared. We cannot blame them, if that should be the case, for Europe will be a sad place for a generation at best, and survivors will not only be impelled to fly from that, but they will be very tired of imperialism generally and will be glad to dwell in the freedom of the United States, plus the salubrity of California. We doubt, however, if the European governments will allow such emigration of able-bodied people as is talked about. They have become very handy with embargos during the last two years, and we shall be rather quick to exclude the pitiable wrecks of humanity which the governments which made them would be willing to get out of their sight. But suppose there should be many able to meet our entrance conditions, and which steamship companies are reported to be preparing to carry through the canal to this coast, can we use them to our advantage or establish them on land to their advantage? Undoubtedly we can do both. There is a scarcity of the right kinds of farm labor on this coast and wages are too high for the kinds of labor we have in largest supply. Therefore, we could use a considerable number of capable and thrifty laborers to their advantage and our own, and as we are safeguarded by national immigration laws, and have good State machinery to distribute new-comers according to their suitability for different purposes, and to prevent them from becoming a burden to themselves and to us, we shall not share the apprehensions which are freely talked about until some reason for them more clearly appears.

BETTER PEOPLING OF THE EARTH.

AND while we do not see cause to fear imminent debasement of American citizenship by undue entrance of foreigners, we are quite sure that the ultimate influence of the present war will be to uplift the masses of Europeans to better fitness to become Americans, if they wish at some future time to do so. We hope those who have been so long industrially discriminated against and socially depressed may advance, through this great cataclysm, to some measure of that freedom of opportunities in their own countries which they have had heretofore to seek in this country. So far as we have read, all sociologists and economists foresee in the results of this war great changes in the European social order, which will put both the high and low in juster relations to each other though measurements of both, not by the old scale of vested rights or wrongs, but by a new scale of manhood and efficiency of citizenship. The more there comes of that the less we need fear for the safety of our own traditions and standards. The better the old world becomes in its recognition of the rights and value of a man, the freer and safer will be the relations of the new world to the old in interchange of citizenship. And this will be attended by better relation of man to land so that there shall be less of landlord and more of land-man, because the ownership of land will be more widely distributed. In a recent interview, reported by Edward Marshall, Sir Rider Haggard said this:

The war's effect will be far-reaching, beyond even our most extravagant dreams. One of its results, which already is beginning to show, will be a melting of conventions. This, I believe, will be a great thing for the world at large. England is learning fast in these days of war some things which all must learn. For instance, she is learning that it is not so much wealth that matters, but men, women, families and homes that are happy. I am driving at the almighty truth that if any nations and empires are to endure, they must root themselves in the land. No tree can flourish for long that tries to suck its strength from bricks and mortar; it must dwindle presently and perish.

And while we believe that what Mr. Haggard says is true, it is not the whole truth. Moving people from city pavements to rural highways will not alone make coming generations greater in manhood. This alone will not serve a high humane purpose, though it may better serve an imperial purpose, because it may make for a greater multitude of men physically fit. There must be corresponding advance in rights and privileges of citizenship, in more equitable distribution of the rewards for effort and investment for world-feeding, which will make possible a higher standard of rural living and greater joy and satisfaction in it. And this will come, not as a gift from above, as rural betterments have hitherto chiefly come in the old countries, but because their rural people will advance and thus secure fairer consideration—just as American rural people are now moving toward it by co-operative effort for competence in their own commercial affairs and for laws which provide equality in financial opportunity.

HOW IT WILL HELP CALIFORNIA.

FORTUNATELY California has been leading for a decade or more in organization which points the way to the attainment of things so desirable for the world's good, and so general is the disposition toward such things that hardly any of our lines of food production fail to manifest it. Few have fully arrived, but all are on the way.

Queries and Replies

ENQUIRERS MUST GIVE FULL NAME AND ADDRESS.

Commercial mastery of its own affairs is the first step—everything good will follow. So long as a farmer does not get his full share of the wealth he creates, he is a serf—no matter whether he pulls his fore-lock or pulls an oath at the man who robs him of his due, he is still a serf. It is a condition which neither cringing nor cursing can cure. Nor does it yield to denunciation nor demagoguery. Farmers can alone escape some measure of serfdom by calm, intelligent and resolute self-help by co-operation.

In order to grasp this matter a little more concretely than by our preaching, read the following version of an announcement made by James Madison, manager of the raisin growers' combination:

The California Wine Association, which controls acreage on which can be produced about 4000 tons of raisins, has signed a grower's contract with the California Associated Raisin Company, and will purchase between 500,000 and 600,000 gallons of brandy held by the Associated Raisin Company. The deal, which will involve between $300,000 and $400,000, means that the wine association has reognized the growers' corporation as a valuable marketing medium and it is now likely that the raisin association will not manufacture any brandy as it did last year. Poor wine grapes were purchased then to keep them from being dumped on to the raisin market.

This means that the association of capitalists did not have foresight enough last year to know that brandy prices would advance, and therefore would not buy grapes at a living price. The growers' association had money enough to buy them for its own protection, and, as things turned, will get its money back (and perhaps more) directly, as well as indirectly, protecting the price of growers' raisin products against competition with poor dried grapes, and this protection may have been worth as much more. Now this growers' association has not only saved itself from competition with an inferior product, but has signed up its former competitor in the raisin market as one of its own supply sources. If one could turn back and read last year's angry impeachment of the growers' association by the competitor now on the penitential stool, he could better appreciate how complete a conversion has been wrought.

And the moral of this story is that when producers get together with their wisdom and their money, and use both to serve and protect their rights, they not only help California forward, but they show how to better people the earth!

Cutting Back Bad Starters.

To the Editor: Your answer about cutting back trees which do not leaf out well, in the issue of May 20, is particularly interesting to me. I have about 600 Baldwin apple trees which did not bloom at all this year and some of the leaves are doubled up and have a grayish color, while there are small bright green leaves all over the trees. Most of my other apple trees bloomed heavily, but owing probably to the frosts or north wind more than half dropped off. I am going to follow your instructions to the other man and would like to know how soon I can begin to reduce the tops.—Grower, Mendocino county.

Cut back as soon as you are reasonably sure that the leaves are not backed by sap flow enough to expand normally. The purpose is to reduce the evaporating surfaces by shortening the branches and to direct what sap there is to the growth of a few shoots of new wood, instead of dozens of them which a tree in full vigor could send out and support. If you do not do this the tree will try to help itself by dying back and the result may be a tree mostly dead—with a few scattered shoots, or suckers from low points, and a lot of dead bark, even on the trunk perhaps. It is hard to make a good tree out of such bad stuff. If you cut back before the waste by evaporation you may get fairly good shoots from most of the branches and have all good bark below them. If your tree should regain push enough to make many such shoots, choose the best to reform the head at next winter's pruning.

We know it needs strong conviction to cut back branches which still have green color under the bark, but you must remember that it is not color which makes growth—it is push. You can have bark color, holding for quite a long time, and yet only miniature or shriveling little leaves, just as you may have moisture-color to the soil and yet not enough free water to make a plant thrifty. When a tree cannot make good leaves in the proper season and no disease reveals itself, you may be sure it needs help to make as much new wood as it can, and that is given by cutting back as soon as you are sure of the facts.

Millipeds in the Garden.

To the Editor: How can I destroy the "Beebee shots" (a kind of a worm which, when touched, form a black ball), in my garden?—E. B., Cayucos.

We never heard them called that before, but from what you say of their behavior, they are millipeds of the genus Julus. It is a question whether they are often troublesome enough to require treatment, which is rather difficult. Some students of them hold strongly that they only affect decaying vegetation, such as potatoes partly decayed, lower leaves of lettuce, etc., but Mr. Essig has found them in a solid lettuce head, so their record is not clear. They may be poisoned by powdering sliced potatoes, lettuce leaves, etc., in Paris green and placing them on the ground, under pieces of board—or they may be trapped under pieces of board or flat stones placed for that purpose and then killed, by hand or foot, as you may prefer.

"Cutting Off" and "Cutting Back."

To the Editor: Would you advise the "cutting off" the top of a ten-year bearing Burbank plum tree, in good condition, to limit fruitage? If so, is it wise to so prune at this season? The tree is a very heavy bearer, but the fruit is but medium size. Would you advise "cutting off tops"—limbs as well as branches, in general. Is it not injurious to do so, and is it not wrong to prune heavily at any time? Does not nature indicate the proper pruning time—that is when trees are dormant? My judgment is at variance with that of another as to treatment of our trees, and I anxiously await your solution of my difficulty.—R. E. Los Angeles.

There is some doubt as to your meaning. "Cutting off the top" of a tree usually means amputating leaves just above the central forking to give the tree a "new head." It is often desirable with weary peach trees to get a new outfit of branches and may be sometimes helpful to other trees which are strong in the root and weak in the top. Probably, however, you do not mean such beheading, but refer to "cutting back"—that is shortening branches which have run out too far to hold up weight of fruit which has such strong leverage on the lower parts of the supports. This is desirable with all plums and other fruits which have rather brittle wood, but is not widely practiced with some trees with more pliable and tougher wood, like the French prune and most cherries. Cutting back branches also reduces amount of bearing wood and numbers of fruits set, and has an influence toward fewer and larger fruits. If it is rationally done in choosing points of cutting and amounts of wood removed, it can be done at any season without apparent resentment on the part of the tree. It can be done now in the case of your plum tree to the gaining in size in the fruit and averting of danger of breaking by wind or gravity. Nature does not teach us much about pruning. She blows trees to pieces or breaks them to pieces whenever she likes, and if she does not choose to do that she is delighted with a tree full of pits. The fruit grower's point of view is not Nature's point of view, and he had better trust to his reason than to imitate the old lady's methods with her trees.

When it comes to really "cutting off" the top of a tree to get a new head it should usually be done near the end of the dormant season when the sap is beginning to rise, for Nature heals wounds best at that season, but, as stated, she does not in her own practices have sense enough to use her own resources.

Badly Knotted Vines.

To the Editor: The trunks of some of my Rose of Peru grapevines get black warty swellings that result in the whole trunk swelling and the branches dying. The nurseryman advises me to burn the vines. Is there any remedy?—A. L. H., Bishop.

The advise is good in the case of vines which have gone so far with black-knot. When a knot gets so far as to seriously injure the growth of the vine, there is little use treating it. Vines can often be saved if the knots are removed soon enough and the wound treated with Bordeaux paste. The starting of knots should be continually looked for.

Fears Too Much Nitrogen.

To the Editor: I have a newly planted vineyard of three acres, in desert soil containing practically no humus. I can see that I shall have to furnish humus to prevent the soil from blowing, as it is very light, although not a sand. I have been told that a leguminous cover crop would furnish too much nitrogen, causing the vines to go largely to foliage. Would one such cover crop be advisable, or would you recommend a non-leguminous crop, such as barley?—W. F. A., Thermal.

The best thing a vine just planted can do is to make plenty of leaves. When it gets to bearing age it is not well to feed it too high, but we doubt if the difference between a legume and a non-legume in making humus and nitrogen will ever bother the vine. You might get more nitrogen from barley than from a legume if the amount of growth was enough larger. We would choose the plant we could get the best cover with and let the vine answer the rest of the question.

Foothill Hog Menu.

To the Editor: I am in want of a little information and as you seem to be the fountain, I am applying at headquarters. Is ensilage good to feed hogs, and what kind is the best? We are in the foothills so do not raise alfalfa. We have a fair stand of dent corn and are trying some Soudan grass, but cannot say yet how it will turn out. We can raise all kinds of grain and have a good crop of beets. Sunflowers grow well. Can we make any use of them for hog feed?—Subscriber, Woody.

You need a good course of reading on feeding hogs. If you will take down your file of the Pacific Rural Press and study what has been written during the last year by Profs. Woll and Thompson, Mr. Goodman and many others, you will find your questions fully answered and much more. If this is not convenient, read Prof. Woll's book on "Productive Feeding of Farm Animals" and Mr. Guilford's "California Hog Book." Our "Second Thousand Answered Questions in California Agriculture" also covers your points.

A hog menu made up of the things you mention is one-sided. It has too much coarse stuff and all of them contain too little protein. Corn silage is not best for hogs, though it may be for ruminants. Your location in the foothills does not excuse you for not having alfalfa. Your land which makes good corn will also make a lot of alfalfa with the same amount of moisture. In fact you will get plenty of alfalfa pasturage before it is safe for you to plant corn and plenty more after the early fall rains when the corn has nothing but dry stalks. Alfalfa is a dry farming plant while corn is not—as a rule. It would also be much better if you would translate Soudan grass into alfalfa or sweet clover. Beets are a good hog salad and the office of a salad is to tone up the system for plenty of more strengthening food. Sunflower seeds are good for hogs if fed, as they like to take them, with other foods. For growing hogs you need alfalfa, skim milk, tankage or some other protein foods. You are better fixed to finish hogs than you are to get them.

California Weather Record.

The following rainfall and temperature record is furnished the PACIFIC RURAL PRESS by the United States Department of Agriculture Weather Bureau, at San Francisco, for the week ending at 5 p. m., May 30, 1916.

STATIONS	Rainfall Data			Temperature Data	
	Past Week	Seasonal To Date	Normal To Date	Max'm	Min'm
Eureka	0	38.98	44.92	56	46

Lime Makes Fertilizers Available.

(Continued from page 657.)

The Cheapest Nitrogen.—Practically all forms of nitrogen fertilizer pull great chunks of money out of our pockets, and most of them are not at once available. Nitrate of soda and sulphate of ammonia, the most available forms, have not proved safe to use in considerable quantities in citrus orchards except in the presence of organic matter and lime.

"The cheapest nitrogen is that from leguminous cover-crops, where the soil and moisture are right for the cover crops. As an illustration, Mr. Holland of Highland in April, 1915, sowed 10 pounds of sweet clover seed per acre. On December 10, 1915, analysis of this soil for water-soluble nitrogen showed that it carried 145 pounds per acre 30 inches deep. An adjoining orchard which did not have a summer clover crop plowed under in the fall, showed 45 pounds water-soluble nitrogen to the acre 30 inches deep. The 100 pounds additional of water-soluble nitrogen per acre where the clover crop was plowed under, would cost in the open market, $20 per acre.

That legumes do not grow well in acid soils is well known. The cover crop noted above, had received 10 tons ground limestone per acre in November before the sweet clover was sowed in April. Analysis of this soil indicated that three tons of limestone per acre had been neutralized by soil acids in a little over a year.

Acids Accumulate in Soil.—When cover crops, manure, etc., are decayed in the soil by bacteria to make humus, acids are liberated. These accumulate in time until they minimize the activities of the nitrifying bacteria and stop the nitrification of the organic nitrogen. When nitrogen fertilizers are applied to soil, most of them must be changed into soluble nitrates in which form nitrogen is available as plant food. This nitrification performed by bacteria also liberates acids which in time accumulate and inhibit bacterial activity; so that no matter how much nitrogen is applied, it cannot be used by the plants in needed quantities. These acids may also be poisonous to the trees.

Where soils are formed from granite, they have never had enough lime to neutralize all the native acidity. Where lime soils have been cropped continually, the cropping and leaching may or may not have rendered them acid.

Getting Rid of Soil Acids.—There is a cheap way of disposing of these acids. Calcium carbonate as ground limestone (or as quicklime or slaked lime which become carbonates after being applied to the soil) is composed of calcium and carbonic acid.

When calcium carbonate is applied to soils which are oversupplied with those acids which hinder activities of desirable bacteria, the carbonic acid is replaced in the combination with calcium by the stronger acids which are thereby neutralized. Bacteria can get to work again making humus and available plant food. The carbonic acid evaporates out of the soil.

In California, where constant irrigation is practiced, bacteriological months of freezing or several months of dryness, at least in the top soils. If other conditions do not hinder, such activity here proceeds the year around, and much more of acids are liberated than in the desert or in the East. These require much more calcium carbonate to neutralize them and indicate that California orchardists as a rule need more lime than Easterners. The increasing use of cover crops and manure also add greatly every season to the soil acids. Also, lime carbonate being soluble up to a certain point may be continually washed down or away by irrigation or seepage.

It is generally conceded that if the calcium carbonate content of the soil in which the roots feed, does not fall below 1 per cent, there will always be enough excess to take up all the oversupply of acids.

But the "official" method of analysis does not show the calcium carbonate of a soil. It does show the total calcium. But that calcium may have been in combination with sulphur, phosphorus, silica, etc.; whereas only calcium carbonate neutralizes acids in practical quantities. The "Marr" method of analysis shows the calcium carbonate. This is practiced by Mr. Thompson.

In April, 1914, he tested the granite soil of an orchard near Highland, but found no calcium carbonate. In May, 1914, 1000 pounds of fine limestone screenings were applied to each of ten trees at the rate of 45 tons per acre. This soil was tested for lime carbonate in November, 1915. It showed 15 tons per acre foot from six to eighteen inches deep and six tons per acre foot from 18 to 30 inches deep. As soil weighs about 2,000 tons per acre foot (92 pounds per cubic foot) this made the limed soil carry a little over ¾ per cent of calcium carbonate from six to 18 inches. Some of this may have been too coarse to be available to neutralize acids, but would become available later. Adjoining soil unlimed still showed no calcium carbonate.

Provide for Bacteria.—Beneficial bacteria require for their best growth, different conditions from those injurious ones which convert nitrates and soluble plant foods into gas which escapes into the air and is wasted.

By liming to constantly keep at least a 1 per cent calcium carbonate content of the soil, not only are the beneficial bacteria favored, but the injurious ones are hindered. Aside from correction of acidity, a large part of this effect is gained by aerating heavy soils or making sandy soils tighter.

Calcium carbonate has a cementing action which binds several soil particles, whether of clay or sand, into "crumbs" or "granules." This closes a great deal of the space between grains of sand, making it hold moisture better. Clay particles drawn together in crumbs, open the soil to circulation of air and water. This is what most of the beneficial bacteria need; and what most of the injurious bacteria cannot stand very well. It enables cover crops to grow, and bacteria to convert them into they have been plowed under. The humus in turn fills in between sandy particles still more effectively than the calcium carbonate and it separates clay particles, promoting better aeration, which results in better tree growth.

How Much Lime?—Not only acidity, but soil texture, amount of humus already present, the nature of fertilizer elements now locked up in the soil, and food requirements for calcium, are to be considered in applying lime.

There is no danger to the soil or plants, of applying too much ground limestone. Part of a great excess would probably be leached away. Clay soils require four or five times the calcium carbonate to produce the same effect as on sandy land. The dark color due to humus becomes more marked up to a certain maximum, with the application of more lime, (calcium carbonate). The more easily available the plant foods, the less lime will be required for that purpose.

While calcium as a plant food is not removed in any considerable proportion from a liberally limed orchard, it is vital to the tree. Every analysis of citrus leaves that has been made in Southern California, according to Mr. Thompson, shows that the healthy leaves invariably carry more lime than the small, mottled, or variegated ones.

Analysis of the ash of citrus trees by Rowney and Howe shows that of the ash of citrus roots 49.89 per cent is calcium oxide; of the ash of the wood above ground 55.13 per cent; of the ash of the leaves, 56.36 per cent; of the ash of the fruit, 24.52 per cent; and of the ash of the seed 18.97 per cent is calcium oxide. What part of this was calcium carbonate before the analysis, is not determined.

Moreover, something about limey soils is recognized to produce oranges thinner skinned, smoother, sweeter, more highly flavored and tender, with a noticeable aroma; and similar desirable characteristics are noticed with other fruits.

The increased crops and leguminous growth following application of calcium carbonate produces much more of soil acids than before liming. These acids neutralize more lime than ever before, so increased quantities must be applied.

The increased crops due to improved conditions brought about by liming, remove far more fertilizer ingredients from the soil, which will cost more to replace than when crops were smaller.

Quicklime acts more quickly than ground limestone in rendering fertilizer elements of humus and soil available. This may bring better crops for two or three years. But when plowed under in this form, it acts so strongly that much of the food is likely to be made soluble or turned to gas and leach or escape before the trees can use it. This is wasted.

Quicklime costs $10 per ton at Highlands. It may be converted into 3560 pounds of calcium carbonate, making such calcium carbonate cost about $5.60 per ton, besides the "burning out" of humus and fertility. Ground limestone costs $2.75 in Highland, being practically all cal-

"THE PERFECTION"

Prune Dipper and Grader

This is an automatic machine; no guess work about it; gives three grades, three trays up at once; dipping fluid is heated by a large oil-burner and a superheater, to supply hot water to the tank when needed. The prunes pass through every inch of 65 gallons of hot water, therefore no sediment. Fuel expense from 6c to 7c per ton; labor cut 50 per cent; no installing expense; most efficient and economical machine on the market.

ter and cheaper for ordinary farm conditions.

Mr. Thompson applied to his orchard 30 tons of limestone screenings per acre in 1913 and 10 tons in 1915. As this has brought the lime percentage up to a safe margin, and has almost entirely, with the help of cover crops, softened the hard plow pan of three years ago, and keeps the soil mellow, porous, and moist deep down, he expects to apply only 4 or 5 tons per acre in alternate years in the future, growing cover crops summer and winter and applying fertilizers.

Principles of Jelly Making.

[Written for Pacific Rural Press by Prof. W. V. Cruess, University of California]

Pectin, fruit acid, and sugar are the essential constituents of pure fruit jellies. Successful jelly making consists in controlling these factors in such a way that the proper proportions of each are brought together. Pectin is probably the most important of these three. Of the common California fruits, apples, loganberries, oranges, lemons, grape fruit, and loquats are very rich in pectin and make jelly very readily, while such fruits as strawberries, apricots and peaches are deficient in pectin and do not, as a rule, give satisfactory jellies. The latter fruits, however, can be mixed with apples or loganberries which will furnish enough pectin for the blend.

Extraction of Pectin.—Such fruits as oranges and apples must be boiled with a little water to dissolve the pectin from the fruit. In preparing such fruit for boiling, it should be cut in rather thin slices and given only a small amount of water—in most cases only enough to cover the fruit. Large amounts of water result in dilution of the pectin and make it necessary to concentrate the juice by prolonged boiling to make the pectin strong enough to jell, driving off the flavor and giving a "flat" tasting jelly.

The less boiling, the better the flavor. The finest flavored jellies are made without boiling. Apples, oranges, and other firm fruits should be boiled until they soften, but not until they become "mushy" in consistency, because this will make the juice very cloudy. The hot juice from the boiled fruit may be drained off through a felt jelly bag or through several layers of cheesecloth. The "free run" juice, or that which drains out without pressing, should be clear and may be kept separate from the cloudy juice obtained by pressing the boiled pulp.

Berries are very juicy and require no addition of water. They should simply be crushed, placed in double boiler to prevent scorching, and brought to 190 degrees F. or over. Bringing the crushed berries barely to or nearly to a boil is sufficient. Boiling them greatly injures the flavor and is not necessary to extract the pectin, because of their soft texture. A very large proportion of the hot juice will drain off through a bag. The remaining pulp may be pressed by twisting the bag or by placing the bag of hot pulp in a small meat press. The press is cloudier than the free run and should be kept separate.

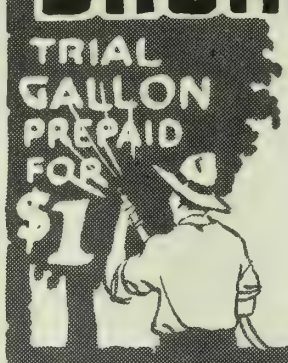
A second quality jelly can be made by adding a little water to the pressed pulp, boiling, and pressing again. Some fruits will give a third and even a fourth lot of jelly material by second and third additions of small amounts of water followed by boiling and then by pressing. Such jelly can not, of course, be sold as pure jelly.

Clearing the Jelly Stock.—The pectin solution or juice from the heated fruit is spoken of as "jelly stock." A clear jelly is much more attractive than a cloudy one; hence all jelly makers try to get the jelly as clear as possible. The clearing must be done before the sugar is added because the sugar so increases the viscosity of the juice that it is practically impossible to filter or clear it in other ways.

Jelly bags are used by practically all jelly makers. A heavy felt about three-eights of an inch thick makes a very satisfactory filter bag. This is made into a cone shaped bag with loops at the top for hanging in a convenient place. The hot juice is poured into this and allowed to filter through into a pot placed beneath. The first juice to come through is cloudy and may be returned to the bag. The filtration is very slow, but usually gives a clear juice. The rate of filtration and clearness of filtered liquid can be greatly improved by adding a handful of light, finely powdered infusorial earth to a gallon of the hot juice and mixing it in before filtration.

Most jelly stocks will settle after standing in bottles a few days. To permit this, the juice must be sterilized. It may be put in glass jars and sterilized at 212 degrees F. as directed in previous articles for sterilization of fruit in jars. The juice is then left several days to settle. The settled juice can then be poured from the sediment and made into jelly. The commercial firms use this method extensively. Orange jelly stock settles more satisfactorily than other juices and usually gives a perfectly brilliant jelly when so made.

The Pectin Test.—A teaspoonful of jelly stock mixed with a teaspoonful of alcohol in a glass will give a copious gelatinous precipitate if enough pectin is present to give a good jelly. The test is given as a matter of interest only and is not necessary to good jelly making.



(Continued next week.)

BURNS REDWOOD STUMPS.

To the Editor: Tell F. L. L., Bethany, that he can burn out redwood stumps down into the roots if he bores two holes in the stump at an angle of 45 degrees, to penetrate as near the center as a long-shanked 2-inch auger will bore. Bore the lower hole as close to the ground as the handle will allow and in a line with the ground. Bore the upper one at a 45-degree angle to meet the lower one, and drop several small pieces of red hot charcoal down the upper one which acts as flue. I have burned stumps out that were 4 and 5 ft. in diameter. This was the Indian's way of felling cedar trees before the white man stole his country, as he did not possess an axe.

SHURE-KIL SPRAY

is transforming hundreds of California orchards from a poor, scrawny, small-bearing condition to a state of perfect tree-health. It will make your trees sturdy, healthy and full-bearing. Sick trees can not bear healthy fruit—**SHURE-KIL** absolutely gets the pests that are getting your trees—one application proves what **SHURE-KIL** can do. Will not burn or otherwise injure Fruit or Tree when applied as instructed. **SHURE-KIL** is 50 per cent more efficient than fumigation, and it costs 35-60 per cent less! Send $1.00 today and we will ship a trial gallon can, prepaid to any Express Office in California.

Present Walnut Crops and Markets.

[Written for Pacific Rural Press.]

This year's walnut crop will be about 6,000,000 pounds less than in 1915 and 5,000,000 pounds more than in 1914 according to the California Walnut Growers' Association. Until the recent warm dry winds which caused almost all of the last setting of walnuts to drop, a crop of 34,000,000 pounds was in prospect on account of increased bearing acreage. Now the prospects are for a maximum crop of 23,000,000 pounds.

Markets.—"Over 95 per cent of the orders we will accept before prices are named, are now on our books, (May 8). We are fully sold up on budded walnuts." The prices on bulk nuts will not be named until the growing hazards are over.

Freight rates have been $1.40 per hundred pounds to all territory east of the Rockies; but at the suggestion of the Association, all railways originating in California have requested the Transcontinental Freight Bureau to reduce it to $1.25. Then the Interstate Commerce Commission is expected to approve.

Packages.—The two objections to the Diamond Brand packages have been removed. Instead of 14 ounce cartons, full pound cartons will will be used. The gelatin opening which was expected to attract buyers by allowing them to see the nuts, only made them look dingy. The gelatin will be replaced by an attractive photoengravure in colors.

The guaranteed maximum price to the trade is 17½ cents each for 1916. This will be reduced if the bulk price of No. 1's is named below 16 cents; as for packing, packages and special advertising, 1½ cents per pound is to be charged. The freight approximates 1½ cents so the jobbers and retailers can make six cents per package, retailing at 25 cents.

Package walnuts were sold last year for the first time, and the sales "ran greatly beyond our expectations." 100 per cent increase is expected this season. The last orders for packages will be taken June 20. National advertising will be done for packages in proportion to the amount of orders.

SAVES BREBA FIG CROP.

[Written for Pacific Rural Press.]

Eight hundred to 1200 fig blastophaga per caprifig were found early in May in the young orchard belonging to E. H. Erickson of Brawley. These pollinate the breba crop of Smyrnas, saving them where they have heretofore been lost. The climate seems to preserve and mature capriwasps earlier here. Mr. Erickson has five acres of four year Smyrnas in which he planted 12 caprifig trees per acre of a variety introduced by his neighbor Francis Heiny, of the Government gardens. One of these had thousands of heavily infested figs this spring.

Intercrops and Hogs.—Watermelons were grown between the trees the first year, cantaloupes the second, wheat the third, and alfalfa with hogs this season. The hogs do not hurt the trees; shade is good for them; they eat windfall figs; and fertilizer is kept where needed.

EUCALYPTUS FENCE POSTS.

To the Editor: Is there a way of treating blue gum fence posts to prevent rotting?—F. M., San Luis Obispo.

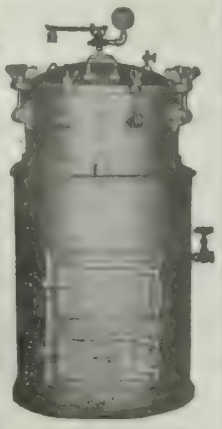
[Answered by C. A. Tupper, U. S. Forest Service.]

[Blue gum posts rot in two to four years. The Forest Service has found such posts treated with creosote, sound after eight years' service. Redwood posts last six to forty years, depending upon the conditions under which set and the quality of the wood. In order to get the best quality, railroad companies using redwood ties specify that these shall be split or hewn, and that they shall not contain sapwood.

Painting of timbers to be used in the ground has not been very satisfactory since so little of the preservative actually gets into the wood, and there is frequently no application whatever in the checks. No paint which we have tried has given better satisfaction than coal-tar creosote.

In the treatment of eucalyptus posts by the open tank method it is suggested that they be turned upside down after being removed from the creosote. The wood is very porous, and this permits the surplus creosote to run into the top of the pole instead of draining out into the ground. Treatments of four hours in hot creosote (180 to 200 deg. F.), and two hours in hot creosote followed by 17 hours in cold creosote, have given the results above quoted.]

BROOM CORN.



To the Editor: What is broom corn worth? Is there a market for it in San Francisco at all times? When is the best time to plant in this locality? What variety can be grown successfully in Madera Co.?—T. H. M., Chowchilla.

[Answered by Zan Bros. & Co., San Francisco.]

[Broom corn is worth (May 8) $150 per ton; there is a market for it in San Francisco at all times. Plant in April, May, June, or July. Use the standard variety. It can be successfully grown in Madera Co. if there is plenty of moisture and low land.]

Help us to Pay 6c for Peaches

By subscribing for more stock and signing up more acreage

You are interested in the peach business if you grow peaches. It is your business; your prosperity depends on the prices secured.

Do your part. The **CALIFORNIA PEACH GROWERS** have already made a 5c price virtually assured for this year. **SIX CENTS** may be secured if $300,000 more stock is subscribed. That will make the required million dollars. More acreage must be secured also.

Talk to your neighbors. Take more stock yourself. Help get that extra cent this year. It is time well spent if you can go after your neighbors and get them to sign up and to buy more stock.

Do it now; get the added acreage and added subscriptions for stock before the marketing season begins.

1916 SMYRNA FIGS

Mr. Grower, how many will your trees produce this season? They have brought as high as ten cents per pound in the sweat-box on account of the war interfering with importations. You have done your pruning, plowing, irrigating and cultivating, but this expense will be wasted, unless your secure a sufficient supply of **PROFICHI FIGS** of the right varieties. The Mamme crop was short this season and the **PROFICHI** crop will be short as a consequence. I have a larger Capri orchard than my Smyrna trees require and will have a surplus of **PROFICHI FIGS** for sale. After spending your time and labor to secure a crop, can you afford to lose a $200 a ton crop by neglecting to secure the necessary **PROFICHI FIGS?** Limited quantity, June delivery, for sale. Order now.

Buckwheat Summer Crop.

To the Editor: Give me some general information regarding buckwheat. How does it compare in yield with wheat and other grains near the coast of California, and is it good chicken feed? I have planted some for bee pasture and am anxious to know if I can use the grain—W. O. C., Nipomo.

[Answer adapted from "Second Thousand Answered Questions."]

[You can grow buckwheat where the soil holds moisture enough to grow a corn crop. As it will stand no frost, it must be a mid-summer crop. Broadcast like barley and harvest with a mower. Dry well before raking or it will heat in the cock. Thresh with a grain separator with proper arrangement of concaves and sieves. There is very little market for the grain. Buckwheat is gaining popularity as a summer cover crop in irrigated orchards. It will smother out a good many weeds. It may yield a ton per acre or more.

Regarding its food value for chickens we quote Geo. H. Croley:

"Buckwheat kernels, either whole or ground, are excellent feed for fowls. Seventy-one per cent is digestible; the nutritive ratio is 6.8; and it has been demonstrated that 100 pounds, after providing for maintenance of the hen, is capable of yielding 135 average whites and 179 average yolks of eggs. When fed to cows it stimulates the flow of milk, and pigs grow rapidly on it. However, when fed to fowls or other animals it must not exceed twenty per cent of the feed. Results are invariably unsatisfactory when fed in excessive quantities."

CROPPING DOWN BERMUDA.

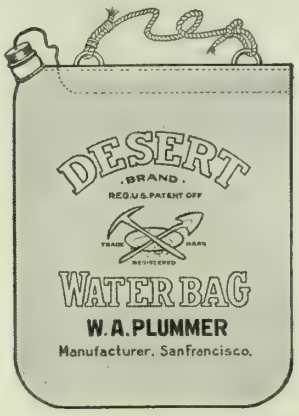
To the Editor: I have medium heavy adobe ground containing some alkali and a good deal of Bermuda grass. The field is just finishing a good crop of barley and raised a poor lot of corn last year. I wish to raise hog and chicken feed and some hay and at the same time get rid of the grass to get ready to sow alfalfa next spring. I am planning to plant feterita to be irrigated and well cultivated and about a month after this crop is sown, plant black-eyed cowpeas in or between the rows. I would expect to cut the feterita heads, then mow stalks and peas for hay to feed to cows. On part of the piece I would hog down the peas and later sow rape for winter pasture. Do you think this a good plan or would somthing else be better?—W. H. W., Riverside.

[We think it a good plan; but it will be more important to find out what the Bermuda will think of it. If you can get a good growth of the things you mention by cultivation and irrigation you will weaken the Bermuda but you will not get rid of it. If you do get sorghum and cow peas to grow well it will assure you that alfalfa will have a chance to carry on the fight with Bermuda, but if they are depressed by alkali alfalfa will not stand much chance. Bermuda will beat out anything on alkali.—Eds.]

SUGAR BEET REQUIREMENTS.

To the Editor: What soil is best adapted to sugar beets, the best time to plant them and the best method of culture?—H. C. Butts, Cupertino.

[Pofessor R. L. Adams of the University of California has recently submitted these pointed suggestions about sugar-beet growing:



Soil Requirements — Surface: Strong loam, will withstand considerable alkali. Subsoil: Compact clay, good moisture retainer. No hardpan. Depth: Surface soil 4′ or more.

Calendar of Operations— Preparing seed bed. Fall planting: Plow in August to September, irrigate, work into shape. Spring Planting: Plow 14″ in November or December, replow in February. Work into shape. Seeding: Time: Fall—November 1, December 1. Spring—January 15, May 1. Quantity Seed: 15 pounds. Method and Distance: 22″ rows. Care of Growing Crop: Irrigate two times (May and June) thin to 12″ apart when plants have 6 leaves. Cultivate at least four times—once a month, beginning in April. Hoe two times—May and July. 200 to 300 days to maturity. Varieties: Imported or domestic varieties; seed sold by factory.

Mechanical Power on the Farm.

USES GRAIN SACKS REPEATEDLY

[Written for Pacific Rural Press.]

Many grain farmers are short of sacks and yet on account of steep hillsides do not like to haul a 50 bushel hopper and elevator on the combined harvester like that shown in the illustration. They can use a few hundred sacks repeatedly as did H. D. Coombs of Washington. He harvested last year 1125 acres yielding 25 bushels per acre at the rate of 30 acres per day and a total cost of $1436.70.

He bought 500 sacks. The sack sewer did not sew them but tied and dumped them as usual. A man with a three-horse team hauled them to stationary bins for bulk grain near the center of the section. A platform 4x8 feet was hung by hooks from the edge of the bin. Onto this his load was thrown. Another man emptied the sacks into the bin. When not busy at this he did odd jobs.

Where possible, the bins would be placed on a side hill where wagons could unload on the upper side and load by gravity from the lower side.

Last season some 200 Holt combined harvesters handled grain in bulk, either this way or by the wagon-loading device illustrated.

Hopper and elevator attachment by which bulk grain is handled directly from combined harvesters. Made especially for Holt machines.

MAGNETO TYPES.

To the Editor: What is the difference between a make-and-break magneto and a jump spark type magneto.—P. F. B.

[Answered by Commercial Engine Co.]

[The Splitdorf Electrical Co., to whom we referred the query, write as follows:

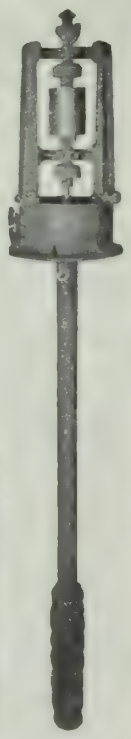
"The make and break low tension magneto is of lower voltage than the jump spark type. It has an armature wound to give six volts and it cannot generate sufficient voltage to induce strong enough high tension current. The armature of the jump spark type low tension is wound to give approximately eight volts, at 150 revolutions per minute and at higher revolutions will give as much as sixty volts. This is stepped up through the transformer containing primary and secondary windings to give the necessary high voltage for jump spark ignition.

"The make and break type cannot be changed to jump spark unless the armature is rewound and make and break mechanism mounted. The jump spark cannot be changed to make and break type unless the armature is rewound and interrupter taken off."]

EXPENSIVE ECONOMICAL ALFALFA IRRIGATION.

[Written for Pacific Rural Press.]

"Pumping water costs less now though the water level is deeper. We have better machinery and electricity." Woodward and Sons of Perris valley have the dismantled remains of four elaborate pumping plants as monuments to their experience of ten years.

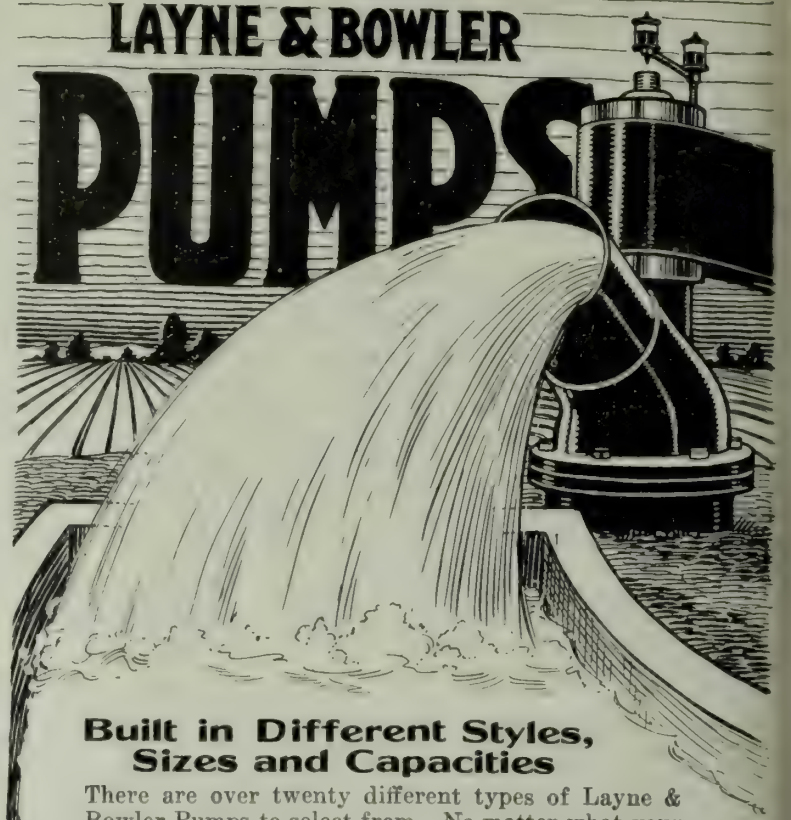


A large part of their unusual success with alfalfa on 80 acres is due to frequent irrigations. These are made possible at the right time by a modern pumping plant.

The well is 375 feet deep but water would come within 50 feet of the surface in winter if it were not pumped down below the motor. A direct connected 35 h. p. non-overloading electric motor run by a 2200 volt alternating current rest on the bottom of the pit, with its self-poised Byron-Jackson centrifugal pump. A winch and steel rope over the well are always ready to raise the motor and pump if threatened with submersion.

The pipe joints are connected by bolted flanges rather than screw joints, to make dismantling easy. Electric lights are installed at the motor so one can see from the top if all is well. A movable light is also provided. The elbows at the surface have a long radius to reduce friction.

The suction pipe is 40 feet long,



No Pit
is required with the
Krogh Deep Well Turbine Pumps

For bored or drilled wells from 10 inch inside diameter up; and for capacities of 250 to 3000 gallons per minute. Built for pumping from any depth to and including 250 feet. They are absolutely water balanced and are self-aligning. More water can be obtained from such wells than with any other type. Built in belted or direct motor driven types. A

FAMOUS LUITWIELER PUMP

Correct in every detail. No trouble. Cheaper water Perfect satisfaction. 2 Irrigation Booklets free. Luitwieler Pump Eng. Co., 713 N. Main St., Los Angeles.

for sometimes water is drawn down 20 feet below the pump. Then water falling from strata above the lowered waterlevel would carry so much air with it that it would de-prime the pump. In one of the old wells this was prevented by putting 2x4's in to break the fall of the water. Now with the long suction pipe covered at least 20 feet, not much air gets into it from the bottom.

A pressure gage is fitted to the pump which indicates the pressure in its equivalent as feet of water lift. This equals 108 feet, plus whatever the waterlevel is lowered in pumping. It includes friction of water in pipe. It also indicates how much the water is being pumped down.

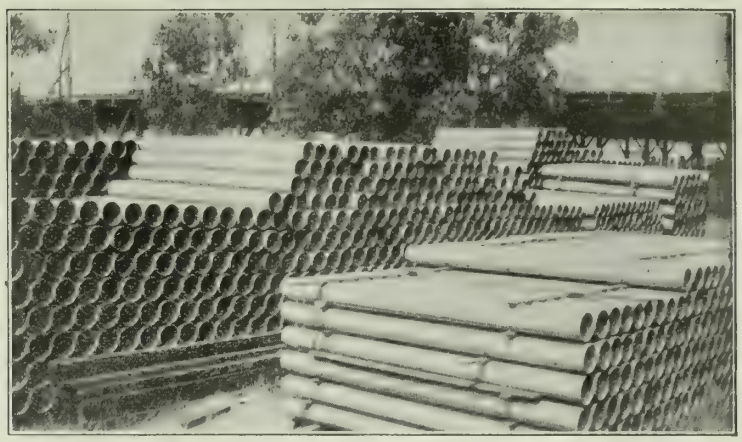
The priming pump is located outside the pump house so that no water will be spilled on the motor. A wet motor would have to be brought to the surface and dried out at great labor before turning electricity into it. Wires from switchboard to motor are enclosed in conduits to avoid moisture, and mixture with machinery should the motor have to be raised.

Electricity costs $50 per horsepower for 8 months' continuous or non-continuous running. For four winter months it runs on a meter. The total cost last year was $2070, but 70 acres were watered for a neighbor, for which $670 was received. The Woodward 80 acres were supplied for $1400. The crop is about 11 tons per acre.

OVERHEATING OFTEN DUE TO FAULTY IGNITION.

"One of the common causes of overheating is faulty ignition. A late spark overheats the motor; the charge is ignited after the piston has started downward on the power stroke; consequently the hot gases are not expelled from the cylinder before the second charge is fired. This will continue until the cylinder becomes so hot that preignition will take place. That is, the gas will ignite before the piston has reached the correct point, resulting in what is known as a "spark knock," says a writer in a standard oil bulletin.

"By advancing the spark lever on the quadrant, the mixture is ignited before the piston has reached top center, so that when the piston does reach the center and starts down, the expansion of the gases is complete, and they are exhausted at a comparatively low temperature.



"Missing of one or more cylinders has a tendency to overheat the motor, as the fresh gas is taken into the mission cylinder and ignited by the outgoing charge from the working cylinder, which causes muffler explosions and back pressure on the cylinders which are working.

"The right kind of lubricating oil is a great help in keeping the motor cool, and many of the leading automobile engineers and motor experts say that oil made from wester asphalt-base crude has less tendency to 'break down' under cylinder heat than oil made from other crudes, and is, therefore, a more efficient aid in keeping the motor cool."

The Automobile Tire Co., claims to be selling over 4000 tires per month in California. These are of nearly all the standard makes.

A little wrench is a dangerous thing, tractorly speaking.

General Agricultural Review.

CITRUS.

The Texas Orange and Fig Growers' Association expects to handle 300 cars of Satsuma oranges this year.

Studies in citrus refrigeration en route were recently made on five cars of oranges bought by the U. S. Dept. Agr. from the Upland Citrus Association.

Florida orange shipments have dwindled to almost nothing. To May 13 they had shipped 17,645 cars of oranges and 5421 of grapefruit.

Navels, Valencias, and Lemons do not need pollination according to University authorities.

The Citrus Protective League has been trying to get a refund from the railroads of the difference between the $30 charged several years and the $7.50 required in 1911 by the Interstate Commerce Commission. They have recently lost the case.

The Palmetto Ranch of Holtville, is said to have the only local nursery in Imperial county where locally grown trees would naturally be far better than imported ones. They sold 8,000 grapefruit trees and expect to sell 50 per cent more next year.

DECIDUOUS FRUITS.

Beaumont cherries are all harvested.

Beaumont apples are estimated at 75 per cent of normal by Secretary McCahan of the Fruit Growers' Association.

Plums are being shipped early from Vacaville to the East. The crop is large, as is also the pear crop.

The rain, hail, and severe winds around Vacaville May 22 did little damage, cherries having all been shipped.

Red spider is showing up badly on prunes, almonds, etc. Dry sulphur or atomic sulphur spray are the remedies.

Peach growers have been selling for green use some of the fruit contracted to the Association. This they have a right to do after due notification.

Nearly 5,000,000 cases of apples had been harvested last week in two States of Australia, and lack of ships prevents over a fifth of them being exported.

The Alameda cherry crop was very poor. Apricots spotted, probably not over 40 per cent.

Freight rates on Oregon apples to Arizona have been reduced from $1.15 and $1.17 per cwt. to $1.09 and $1.10. Why don't we supply Arizona?

Deciduous shipments by the Cal. Fruit Distributors to May 27, 1916, were 161 cars as compared with 37 last year. The season is two weeks earlier.

A new plant, the main building of which covers 30,000 square feet of floor space, for exclusive manufacture of fruit-handling machinery is being completed in San Jose by the Smith Mfg. Co.

The Tulare County Canning Peach Growers sold their 4000 tons to the Pasadena Cannery Co. at $27.50 for Tuscans, $25 for Phillips, $22.50 for Orange Clings, and $17.50 for Muirs and Lovells.

The Porterville Cannery will run, having signed up 1500 tons of peaches at home. They are now competing with Visalia canneries for what is left of the crop around Visalia since the 4000 tons were sold to Pasadena.

The Northwestern Fruit Exchange has promised, at the suggestion of Acting State Horticultural Commissioner G. P. Weldon, not to allow wormy and scabby apples to be shipped to Cal. as heretofore, knocking the market for our own standardized product.

San Joaquin Valley peaches have been selling: Elbertas, $20; Lovells, $20-$22 to can; clings, $22.50 to $27.50; plums $32 to $40; dried apricots 10 to 11 cents and green apricots $40; dried peaches, 5½ cents; nectarines 7½ cents; Muscat raisins, 5 cents and natural Thompson raisins 7¼ cents to outside packers.

GRAPES AND SMALL FRUITS.

Grapes, potatoes and melons south and east of Fresno were frosted last week, not seriously.

California strawberries in Oregon have been found in undersized boxes which will hereafter be confiscated.

Raisins are being sold in the Southern States, extensively for the first time in the spring and summer season.

San Joaquin Valley grapes are selling at record prices: Malagas, $30; Emperors, $50 to $60 packed in drums; Cornichons, $27.50; Thompsons, $30.

A carload of California strawberries were sold in Milwaukee recently. It was four days on the road. Top tiers slightly molded. One thousand cases of Dollar berries.

The Brazilian representative of the Cal. Associated Raisin Co. says America is capturing the market formerly supplied by Germany, and that our raisins are in much better demand and of better quality than those from Spain.

GRAIN AND FIELD CROPS.

Cotton around Holtville is estimated at 5000 acres.

Manteca sugar beets look like 13 tons per acre on 4,000 acres.

Shipments of new Delta potatoes out of the State have begun.

Beets and limas in Ventura and Santa Barbara counties are coming along in fine shape.

Titanic wheat is being exploited. The U. S. Dept. Agr. warns growers not to invest too heavily.

An Oxnard lima bean grower of 8,000 sacks recently refused $5.05 for them.

Cantaloupe shipments from Imperial Valley increased from 297 carloads in 1905 to 4480 in 1914.

A cantaloupe inspector in Imperial county has been appointed for each shipping shed, with power to destroy all condemned melons.

Foreign importers of American grain are complaining to American

SULPHUR

Fleur de Soufre, Anchor Brand, Velvet Flowers of Sulphur and Eagle Brand. Packed in barrels and double sacks. Are the fluffiest Sulphurs that money can buy; the best for vineyards; the best for bleaching purposes. LEAVING NO ASH. SEND FOR ILLUSTRATED BOOKLET, also PRICE LIST and SAMPLES.

SAN FRANCISCO SULPHUR CO.
624 California St., San Francisco, Cal

RHUBARB - CACTUS - HOGS

Wagner's Giant Rhubarb Plants less than half price.
If planted this May or June should yield 15 tons the first year.
Spineless Cactus, the best known dairy and hog feed. $10 per 1000 slabs.
Mulefoot hogs, choice pedigree breeding stock, both sexes, 140 head ready for delivery.
Bankable notes or mortgages accepted as payment.

J. B. WAGNER,
Pasadena, Calif.

We are the largest manufacturers of pumping machinery on the Pacific Coast.

consuls that the grain is not up to grade standards.

Wheat in Stanislaus county is negligible; oat acreage 50 per cent reduced, and 75 per cent crop on that; early barley on west side fine, late grain needed rain, and got a little.

On the Armour tract, in the Sutter Basin, near Knights Landing, fifteen thousand acres are being planted to beans. The Lady Washington, pink, and Kidney varieties will be sown.

NUTS AND OLIVES.

Santa Barbara is receiving inquiries about Cal. walnut growing from residents of warring countries.

Oakdale almond growers voted recently to set aside ¼ cent per pound to build a warehouse and bleaching shed. They have 60 members.

That nursery tree peach roots dipped in 5 per cent bluestone solution died while untreated, similar ones set on adjoining land lived, is reported by D. S. Nelson of Arbuckle. The loss of labor, trees, and time is estimated by himself at $10,000. He might have saved that $10,000 by reading Prof. C. O. Smith's article in Pacific Rural Press, April 8. A 3¾-per-cent solution killed the trees in this case.

MISCELLANEOUS.

The Alameda pea crop is all harvested.

A logful of honey recently ran into a buzz saw.

Knights Landing bean growers are getting ready to plant.

There are 26 Government reclammation projects now under way.

About 3000 acres of grain around Huron were recently burned.

The Orland Farm Bureau is launching a campaign of grasshopper extermination.

Rice growers of the State, met June 2 with Market Director Weinstock.

Cotton insects are to be studied in Imperial Valley by the U. S. Dept. Agr.

Stanislaus county stock is eating hay faster than it is being produced there.

Processes for removal of alcohol from beer and wine have been announced.

Wind and water broke Tulare Lake levees and flooded 8 more sections last week.

Blacks Landing (San Joaquin county) jackrabbits were recently driven into the canals.

The Grange system of direct marketing at Sacramento is announced a success.

On the Brack tract, northeast of Stockton, one thousand acres is being seeded to Indian corn.

The first carload of Imperial Valley cantaloupes that reached Chicago sold at $4800 or about $16 per crate.

The State Market Director is circularizing 3000 bee growers to find out what they want in regard to marketing honey.

Chowchilla farmers are planning to grow sugar beets for the Visalia factory, which is drawing on all surrounding counties.

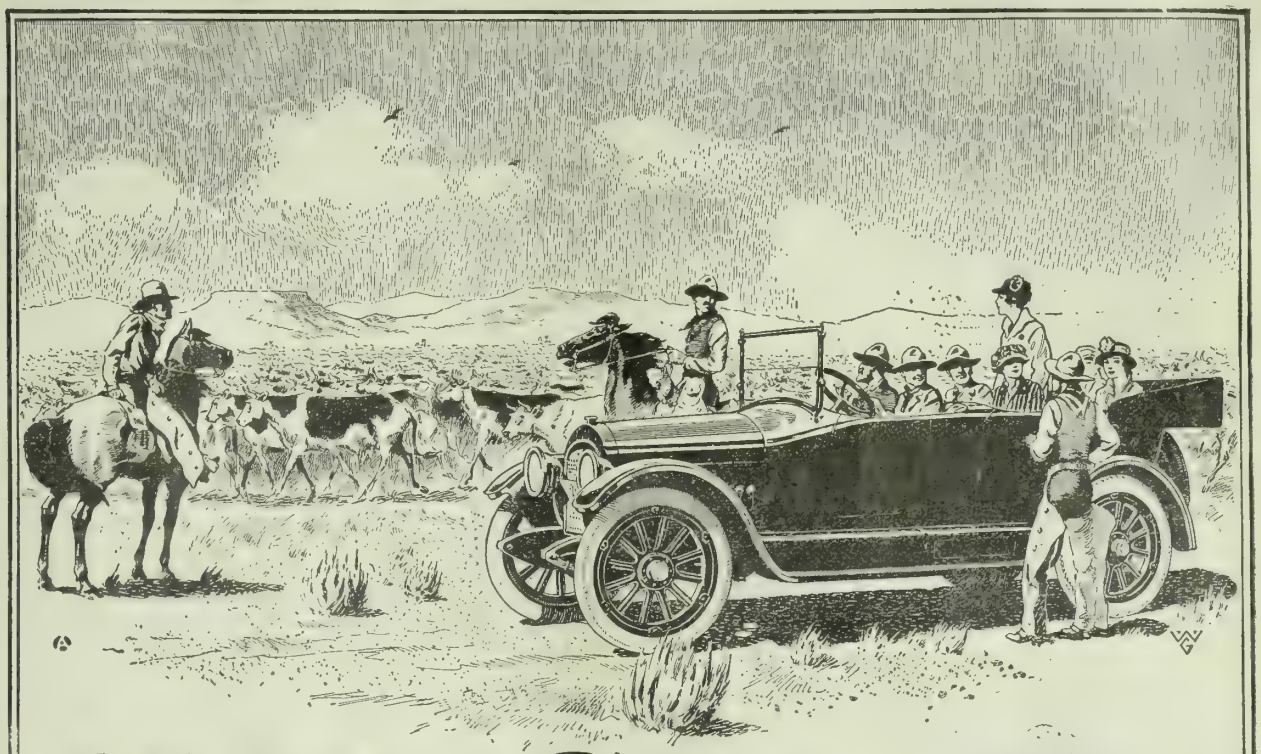
The Utah-Idaho Sugar Co. advised Truckee-Carson sugar beet growers to turn under a crop of alfalfa before planting.

The U. S. Senate recently passed a bill providing for Federal co-operation with the States in the construction of rural post roads.

The Imperial Valley cantaloupe crop of 8000 acres from Brawley to Calexico is ripening fast and promising the biggest crop ever.

The Cal. Development Board will meet at Yreka June 23 and 24 to discuss the needs and problems of Northern California.

To kill rose aphis the U. S. Dept. Agr. recommends a teaspoonful of blackleaf 40 in 1½ gallons water with ½ ounce laundry soap, to be sprayed on the bugs. It gets all it touches.



The bean acreage in island sections will be unusually heavy this season. Among the large planters is Peter Cook, who will seed about 600 acres near Rio Vista.

More than half the 180,000 acres under the Elephant Butte dam recently completed in New Mexico to control the Rio Grande river, are in a virgin state and open to homesteaders. Apply to Dept. Interior, Washington, D. C.

The West Side Irrigation District comprising 11,000 acres around Tracy will vote in August on the issuance of $285,000, 6 per cent bonds to fix up to pump water from Old River to a high point whence it would be distributed by gravity.

"Farmers do not seem to need money," says V. C. Bryant, farm loan manager for the Savings Union Bank and Trust Co., who last week addressed the Ft. Bragg High School and the Ukiah Farmers and Merchants Club.

Kansas commission merchants must be licensed, to do business after July 1. Indemnity bonds must be provided to insure honest dealing, The State Secretary of Agriculture is given a right to investigate all complaints. A record of each sale, of each shipment, the name of the party to whom sold and the sale price, must be kept and payment made within 48 hours; $10 to $500 fine is the penalty for failure to do this.

KING EIGHT CYLINDER

for the WIDEST RANGE *of* SERVICE

Only an EIGHT *can compete with an* EIGHT—
and there are but two Pioneer cars of this class

WHY the eight cylinder motor gives the quickest acceleration, practically eliminates gear-shifting, takes all but the steepest hills on "high", banishes vibration, develops great power and speed at small fuel expense, and adds years to the car's life, is explained in the words—CONSTANT POWER.

The Eight has *four* power impulses per revolution; the Six, *three;* and the Four, *two.* An Eight's power strokes *overlap at the point of their highest efficiency.* No gaps between strokes to be bridged by the momentum of a heavy, power-wasting fly-wheel; no high and low power periods to cause vibration and wear, but a constant, swift flowing stream of energy, composed of strokes received at right angles, instead of vertically, and giving a smoothness of power that relieves mechanism and tires of the "killing" effects of violent power strokes. In accessibility the King's motor surpasses all other engine types.

The King is the *original* popular-priced Eight and has been in operation the world over for more than a year. A demonstration in the new Model E is a most necessary part of your "before buying" experience.

60 Horse Power, 7-passenger Touring Model, $1350

Junior Monarch Hay Press Company. San Leandro, Cal.

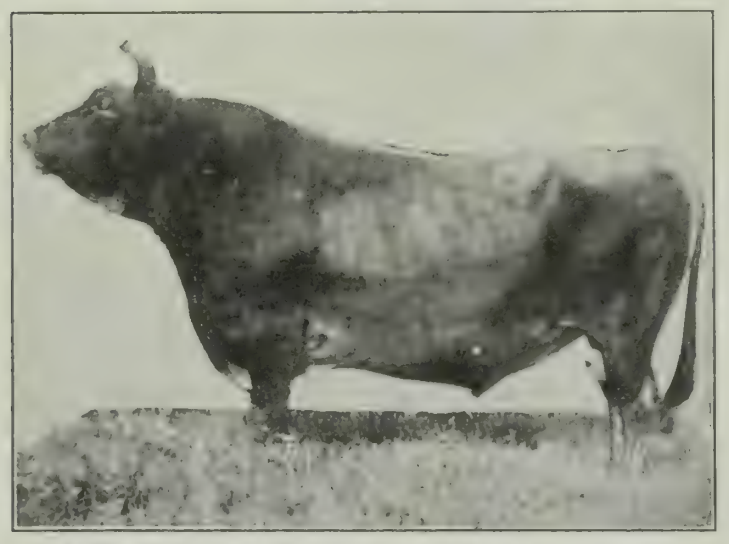
A Man, a Cow and Two Bulls.

What an ideal in Jersey breeding has done for a man, his family and the State, and the importance of his work to future Jersey breeders.

[Written for Pacific Rural Press.]

Jersey breeders are wakening up. Such is the alarm that is being sounded all over the United States. It is mentioned in the farm press; it is common gossip among the breeders themselves; and it is being publicly displayed at the livestock shows.

It seems apparent that the aroused interest is more directly traceable to type than any other one thing. While the Jeresey known as the Island type, is still admired by many, the man who rubs elbows every day with the producer of butterfat on the farm believes the heavier, more Americanized Jersey is the one to hook up with.



In this change California holds a unique position, largely due to the fact that Jersey breeding here has been in the hands of men who, as dairymen first, last, and all the time, required and bred Jerseys for utility. With them breeding has been no gentleman's pastime or hobby. Perhaps this can be best described by a remark dropped at the Panama-Pacific Exposition last fall by a prominent Eastern advocate of another dairy breed. .

As a group of California Jerseys was being led into the judging ring this man said: "Those are the first real dairy cows I ever saw in a Jersey show ring. That is the type the man on the milk stool will whoop it up for. California breeders are to be congratulated on being so well down to earth on this matter of dairy type."

This type, which promises to come into national favor, has been developed by men who were dairymen as well as breeders; and there is no better illustration of this than the story of N. H. Locke. He has been one of the foremost advocates of the purebred Jersey in recent years in this State, and is essentially a dairyman and always has been.

A Jersey Crank.—He admits that he is a crank of the first water on Jerseys. But he isn't. He's simply a crank on dairy type. Way down in his heart he has no more use for a Jersey that doesn't fit his ideal of dairy type than he has for any other breed.

Mr. Locke, his ideal cow, Empress Lass, and King's Valet, the bull that perpetuates the dairy type in the Locke Jerseys.

We knew this when we started for his ranch at Lockeford, San Joaquin county but we wanted to learn where this ideal originated. And here is his story.

In the early 60's he began to form conclusions as to what a cow should look like if she was to give the largest amount of butterfat at a minimum cost of production. His father, on whose ranch he worked, preferred Durhams, for milk as well as for beef. In fact "father was as touchy about Durhams as I am about Jerseys," he now recounts.

And then young Locke got interested in Jerseys. He had an idea that Jersey bulls crossed on those Durham cows would result in a better producing cow and, "when I'd say, once in awhile, 'let's get a thoroughbred Jersey bull and breed up,' father would go up in the air."

But after the management of his father's estate was placed in his hands in 1887, he tried out his pet theory as soon as possible, with the result that the first two-year heifers from the Jersey cross were better producers than their dams.

Having satisfied himself as to value of the cross he continued to use registered Jersey bulls till 1899 when the estate was settled. During all of that time he was trying to breed a type which fitted his ideal, not for beauty, but for production.

At that time the other heirs said "You've got to buy the Jerseys" so he did. His share of the land consisted of 35 acres of upland and an equal amount of bottom land.

In 1904 he bought his first registered females. One, Dereen C. Marigold, was first and grand champion cow at the California State Fair that year and the other, Lady of San Joaquin, was second in the same class.

A Bull Dairy.—He had a surplus of bulls so went to the State Fair as exhibitor. His winnings consisted of one blue ribbon and a lot of experience. In 1906 he got three ribbons and in 1909 he made still further progress in prize winning. But all this time he had only showed young stock and one of his competitors took advantage of the situation to tell prospective purchasers that "Locke runs a bull dairy."

When this finally reached Locke there was one mad man on the State Fair grounds and right there he promised to bring out a show herd the next year that would make their mouth water.

Unconsciously his competitor had done him and the breed a service, for he would no doubt still be searching for his ideal of a Jersey cow if it hadn't been for that resolve to beat the other fellow in 1910.

So he began a silent search for Jerseys, finally making a trip to Washington, where they were holding the Alaska Yukon Exposition. The man who judged the Jersey show there, tied the grand championship ribbon on a big, light colored, young cow with wonderful conformation and having the accepted dairy type. Her name is Empress Lass.

Finds Ideal.—That cow suited Mr. Locke to a T. In fact he had been looking and hoping for just such a cow for about 50 years and when he saw her he cut the strings to his pocketbook and bought her. While in Washington he saw something else to his liking; he found two Jersey bulls, one King's Valet and the other Borello's Golden Laddie. Again he had found his ideals and put faith and money into it.

Altogether on his northern trip he secured 18 head. After the California State Fair of 1910 nobody could call his, "a bull dairy," because he carried off 24 of the most valued prizes; and since then has always showed a full herd of Jerseys.

At Last a Foundation. — Don't imagine though that he was satisfied with blue ribbons alone. While he now owned a moderate sized herd of purebreds and a good sized herd of highly bred grades there were after all only three animals in his possession that just exactly suited his ideal of a dairy animal. So after almost 50 years he had a foundation to his liking; one grand champion cow and two grand champion bulls.

For the last six years he's been building around that type. "It's a big type" he explained. "Can't get them too big for me if they have the dairy type. King's Valet weighs 1600 pounds. His son, Valet's King, out of Empress Lass, weighs 1700 pounds and will make a 2,000 pound

Salt a Necessity for Dairy Cows

Deprived of It for Long, They Suddenly Suffer Complete Breakdown.

EXPERIMENTS REVEAL INTERESTING FACTS.

Salting of Hay in Stacking or Baling Now Considered Excellent Plan.

Experiments conducted at the Wisconsin State Experiment Station prove conclusively that salt should be supplied to dairy cows unless the ration furnishes a sufficiency thereof. It is calculated that the minimum quantity in the food to keep a cow of 1000 lbs. live weight in flourishing health is that which is equivalent to ¾ oz. of salt per day, and that a cow in milk needs as much more as will restore the proportion removed in the milk, namely, a little over ½ oz. of salt for every 20 lbs. of milk.

The conclusions from these experiments are briefly as follows:

"In every case the cows exhibited an abnormal appetite for salt after having been deprived of it for 2 or 3 weeks, but in no case did the health of the animal, as shown by the general appearance, the live weight, or the yield of milk, appear to be affected until a much longer time had elapsed. This period of immunity varied with individual cows from less than a month to more than a year. There was finally reached a condition of low vitality in which a sudden and complete breakdown occurred. This stage was marked by loss of appetite, a generally haggard appearance, lusterless eyes, a rough coat, and a very rapid decline in both live weight and yield of milk. If salt was supplied at this period recovery was rapid. In one case potassium chlorid was given instead of common salt (sodium chlorid). Considerable of the potassium salt was eaten, though cows ordinarily refuse to touch it, and recovery followed as quickly as when common salt was supplied—evidence that not the lack of the sodium but the lack of chlorin was responsible for the troubles. The breakdown due to the lack of salt usually occurred after calving, when the milk flow was heavy, and generally the cows giving the largest amount of milk were the first to show distress."

Farmers who salt their hay when stacking or baling have found the plan an excellent and profitable one. The salt more than pays for itself in the increased weight of the hay, and besides improving the feed, it removes the danger of musting by checking the growth of molds when the moisture content of the hay is high.

Twenty pounds of salt to each ton of hay should be used, which should be sprinkled on by hand as each three feet of the hay is stacked.

Tagus Ranch

R. R. HOUSTON,
Byron, California

bull when he gets older. Sure the Jersey is going to be typey, but not the Island type."

That's as near as he can put into words what is his idea of type. But he can show it to you now, not only in Empress Lass, but among the registered cows in his herd of over 150 head as well, for he has been making progress in type building since 1910.

This is directly attributable to the prepotency of his herd sires. As we walked through his wonderfully rich, sub-irrigated pastures some comment was made on the udder one cow carried. "Yes, that's a King's Valet udder and there's another, and another over there." As we went through that great herd we soon learned why this man has formed such a deep appreciation for his bulls. They sire the kind of dairy cows, every dairyman is striving for, the nearest thing to Empress Lass that Mr. Locke has ever seen. But she is still his idol.

Results Speak.—So far as the origin and accomplishment of his ideal, that is Mr. Locke's story. How the value of his work has spread to all parts of the State is best shown by his general and successful show career. There he has exhibited his ideal. There he has unconsciously directed in a large measure the future course of the Jersey breed in this State.

Besides the satisfaction that comes with accomplishment, his venture in purebreds has brought him financial returns. To the 70 acres of land with which he started in 1899, he has added, till he now owns almost 400 acres of bottom land and about the same of upland.

"As fast as I sold cows, I put the money into land. That's been my game" he says, "but I've sold only three registered cows. Always I've sold grades, filling their places in my milking herd with the younger animals as they came fresh."

The foundation work is about all done. The grades have been practically replaced with purebreds and no more land is needed. Next will come the trimmings, so to speak, the new modern dairy buildings and the official test work.

But Mr. Locke hasn't founded a great Jersey enterprise alone; he has also founded and raised a family, fundamentally right on dairying and breeding matters. It was therefore appropriate that the N. H. Locke Co. should be incorporated and the stock held by members of the family as is now the case.

And by carrying on the great work started by their father, the family may rest assured that when the history of the transformation of the Jersey cow is written, their father, his pet cow, and his two favorite herd sires will receive no inconspicuous mention.

SHEEP ON GRAIN FARM.

[Written for Pacific Rural Press.]

From a flock of 157 ewes and their lambs, N. L. Tomlinson of Stanislaus county marketed $1000 worth of wool and mutton two years ago, having grown them largely on what would otherwise have been waste.

Mr. Tomlinson has a large acreage of grain land, through which laterals of the Turlock Irrigation District run. It is primarily to clean up the ditch banks that the sheep are kept.

During spring months the sheep are pastured on a small piece of alfalfa; and this is also headquarters for them at night during the balance of the year. Besides cleaning up the ditches they are pastured on grain stubble in summer and fall, taking care of themselves without a herder during the entire year.

With this arrangement of feed, the lambs mature rapidly, lambing usually being done in January though delayed till March this year. The local butchers always furnish an outlet for the lambs because Mr. Tomlinson has always kept good rams, mostly of the mutton breeds.

To begin with he had Merino ewes. These were bred to Dorset buck, the ewes from this cross being bred back to a Merino buck. The next buck was a Shropshire and last year an Oxford Down buck shared honors with a Shropshire. Each buck is used on the flock two years. This cross-breeding has developed a fine band of ewes, it being Mr. Tomlinson's custom to select only the best ewe lambs for his breeding flock. While only a side line of his farming, sheep on this ranch are more than paying their way.

MEAT FROM LUMPY-JAW CATTLE.

To the Editor: Is it safe to eat meat from a cow that had lumpy jaw? Are butchers allowed to sell it?—W. G. C. Tranquillity.

[It is safe to eat the meat from a lumpy-jawed cow if you cook it thoroughly. The disease which causes the lumpy-jaw may or may not be extended throughout the system of the animal. A veterinarian can easily find it if it is.

Butchers in country towns are not subject to any inspection other than what the town governing body may impose. Large cities have inspection departments, and the Government has inspectors at packing plants which make inter-State shipments. These inspectors will pass a lumpy-jawed cow if the disease is not shown in the carcass; but they will always condemn the head.—Ed.]

FOR SALE SINGLE OR CARLOAD LOTS

KING LANCASTER,
Son of King Edward, Grand Champion Bull California State Fair 1909, 1910, 1911. The only Bull 3 times Grand Champion at State Fair.

My range-raised bulls this year are the finest lot I have ever had.

THEY HAVE GRAND CHAMPIONS BEHIND THEM.

With the Livestock Men.

DIARYMEN AND DAIRYING.

Mayor Rolph of San Francisco has started a registered Jersey herd.

Three dairymen of Tulare county paid fines last week for running insanitary dairies.

W. W. Stice of Tulare sold his 22 Holsteins and dairy equipment last Saturday.

The N. H. Locke Co. of Lockeford recently sold three registered Jersey heifers through D. O. Lively.

John Baron of El Centro recently sold 100 young cows averaging $77.50 per head.

Modern dairy barns and silos have recently been erected on the Greer ranch near Turlock.

The University Farm is putting out a 3½ pound family cheese to be shipped by parcels post for $1.

Five acres of barley filled a 67½-ton silo, tramped down by four men, for S. Spyres of Modesto—13½ tons per acre.

The Chico grand champion Holstein cow is Homestead Girl Wigertje owned by the Henderson Co. of Elliott.

A. W. Morris and S. Lawson have in operation a new $6,000 pasteurizing plant large enough for the neighbors too.

The Alpine Evaporated Cream Co. wants to reopen their Hollister factory if they can sign up 20,000 pounds of milk daily.

State Veterinarian Chas. Keane is receiving numerous advance requests for tuberculin testing. This cannot begin till October 1.

Over 900 cows have been signed up for the Orland Cow Testing Association. Foreign cheese is getting scarce in California.

The Red Bluff Creamery has installed a steam pasteurizing plant and will pasteurize all cream. They are putting out about 750 pounds butter per day.

Two Guernseys were recently shipped to the Hawaiians; a young bull from A. B. Humphrey and a heifer from Calla Grove Farm, Manteca.

Corn and oats two parts to one, fed to calves right after their milk at the time of changing from whole milk to skimmed, is recommended by the Mo. Col. of Agr.

H. T. Harrold of Orland bought two purebred Jersey cows from S. F. Williams of Chico for $1000 May 26. The sale came as a result of the exhibition.

The secretary of the Stanislaus County Cow Testing Association, recently sold three grade cows for $700. The buyer paid this high price on account of their records in the testing association.

Bacterins, serums and the like for contagious abortion are showing good promise, but need much more experimental work before their true value is determined, says the U. S. Dept. Agr.

Joseph Colosio of Modesto recently sold to the Geer Bros. of Turlock 90 head of Holsteins for $4950. Mr. Colosio will go this summer to Wis., Mich., and Ia. to buy a purebred Guernsey herd.

The E. Clemens Horst Co., of San Francisco recently established a Holstein dairy on their ranch near Los Molinos. They now have about 60 head milking, besides 200 young heifers that will have their first calves next spring.

The Stockton State Hospital is using four registered Holstein bulls on their grade herd of dairy cows. They are Col. Colantha Pietertje, Cloverleaf Prince of West Lawn, King Mercedes Hengerveld and Blithdale Hengerveld.

J. A. Goodall of Turlock reports that the cow Euzelia of Venadera finished her first year's official test with 402 pounds of butter. Another cow to recently complete an annual record was Bonanza Fox which gave with her first calf 402 pounds of butter.

C. A. Starkweather, president of the Stanislaus County Cow Testing Association, says that dairymen in that district are supporting the association better than ever; and that as a result of the testing the members are materially increasing the income per cow.

A well known auctioneer in the San Joaquin valley is authority for the statement that dairy cow values are lower there than they have been for two years. He says the condition is due entirely to the price of hay, many farmers not having learned that to get cows that pay one must breed them up by using a good bull.

Thirteen contestants entered cheese which scored over 90 in the California Butter and Cheese Scoring contest. J. A. Scaroni of Santa Cruz scored 95; Clarence Ebbe, McArthur 94½; Victor Britor, Chico, and John Reber, Bieber, 94; C. Kolbeck of the University Farm, Davis, H. C. Watson of Bieber, and A. J. Davis of Gilroy, 93½. The next scoring will be held in July.

Twenty-eight creameries sent butter which scored 90 or over in the May California Educational Butter and Cheese Scoring Contest. The highest award was 95 points to L. Larsen of the Sunset Creamery, Loleta. Three scored 94; Los Angeles Creamery Co., Hanford; Visalia Co-operative Creamery; and the Valley Flower Co-operative Creamery, Ferndale. Among the 28 are five co-operative creameries.

Mr. Dairyman or Breeder

Do you want to improve the butter-fat output of your herd? If so, I have just the bull you want.

Peterje Cornucopia Creamelle.

His dam on her first test made a record of nearly

25 Pounds Testing 4.7%

He is just ready for service and just the sire for your herd. **Write, or come and see him.**

F. STENZEL,
Breeder of Holsteins.
SAN LORENZO, CALIF.

MISCELLANEOUS.

CROLEY'S CALF FEED with skim-milk will raise fine dairy heifers cheaply. Geo. H. Croley Co., Inc., 631-637 Brannan St., San Francisco.

D. O. LIVELY, 216 Hobart Building, San Francisco, buys and sells live stock—any kind—any quantity.

DUROCS AND GUERNSEY BULL CALVES—Gilts bred to 900-lb. boar. Ed E. Johnson, Turlock, Cal.

SWINE BREEDERS AND STOCK.

Over 500 California boys are raising purebred pigs in competition.

About $4,000,000 of California money goes to Idaho and Utah for live hogs every year according to D. O. Lively.

Peters, Lamson and Walker recently bought a Duroc gilt from Iowa, sired by Cherry Chief and out of a Proud Col. dam.

R. K. Walker expects to visit the leading eastern Duroc herds in July to get "some animals of the best type and breeding I can find."

Glenn county is getting another run of hog cholera. There are others. A survey of the situation will be made and a campaign of cholera extermination started.

Wylie Giffen, of Fresno, has recently purchased five registered Duroc sows and a boar from John Daggs of Modesto. They will be put on Mr. Giffen's ranch in Merced county as a foundation herd.

Both the Duroc and Poland China Futurities at the 1916 State fair at Sacramento will be new features. Many Duroc and Poland China breeders have saved some choice pigs from their spring litters for these classes.

A shipment of Berkshires from the Oak Grove Dairy Farm of Woodland and from A. B. Humphrey of Escalon has been put on the unplanted orchard land near Monroeville owned by the Kuhn people and now managed by W. S. Guilford.

BEEF, SHEEP AND HORSES.

The Whitehall Estates of Tracy recently bought a registered Hereford bull.

D. O. Lively is starting a 400 acre purebred Hereford cattle farm near Palo Alto.

The Porterville Alfalfa Co. recently bought 160 purebred Shorthorn yearlings from the Bay district.

An organized hunt is proposed for a bear which has been killing Starr Valley cattle.

The University Farm recently bought a Percheron stallion and seven fillies from the Paicines Ranch of Hollister.

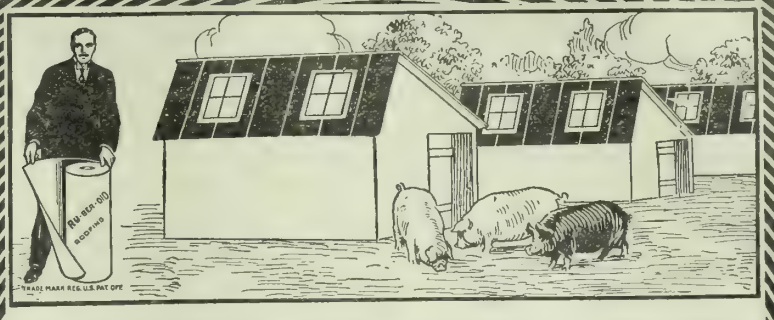
Contagious abortion on the cattle ranges in some instances takes half the calves according to the U. S. Dept. Agr.

Two South American cattle breeders have been selected as judges for the International Fat Stock Show at Chicago.

The Elliott Brant Ranch of Owensmouth bought five Shorthorn bulls for $1500 from H. L. and E. H. Murphy of Perkins, May 20.

O. N. Shaw and Powell & Shaw of Holtville shipped several hundred lambs to the East recently, having sold them at $7 each, weighing 75 to 80 pounds.

D. O. Lively recently shipped 14 two-year purebred Hereford bulls to the Haleakala ranch in the Hawaiian Islands. He has also sold purebred swine, sheep, goats, and dairy cows to South America.



MISCELLANEOUS.

The Farmers Union of Stanislaus county proposes to erect a market pavilion in Modesto in which to hold regular private livestock sales on specified days of the week.

A Western Pacific stock train recently carried 28 carloads 783 miles from Sacramento to Salt Lake City in 30 hours, including stops at Marysville and Portola, where five of the cars were picked up at each place.

A new purebred stock firm is being organized under the name of Elder and Starkweather, which will breed sheep, beef cattle, and hogs on a ranch of two thousand acres on the Haggin grant, north of Sacramento. To start, about 200 purebred sheep (Lincolns, Shropshires, and Hampshires from England and Corriedales from Australia) have been purchased and are on their way. Also about 200 Lincoln-Rambouillet cross have been secured from eastern Washington. A car of purebred Hereford heifers and bulls is coming from the east; also some Berkshire and Duroc Jersey swine are to be shipped in.

The Toyon Farm Herd at Los Altos includes Finderne Netherland Fayne 2nd. The lowest producer among her first four dams made 28 pounds butter as a 2-year-old. Her dam and sire's grandam still each have better than 37 pounds, writes De Lancy Lewis.

Better Hogs Mean Bigger Profits

A hog-house should be dry and comfortable. Leaky, draughty roofs breed discomfort and disease. Insure hog-health and hog-profits with a roof that is weatherproof and practically wear-proof. There are almost no repairs with rot-proof, fire-resisting

Pronounced "RU" as in RUBY
RU-BER-OID ROOFING
COSTS MORE - WEARS LONGER

Brick manufacturers use RU-BER-OID on kilns—in which the heat reaches 300° Fahrenheit. Heat from within and constant sparks from without do not injure RU-BER-OID.

Captain Scott used RU-BER-OID on his winter quarters near the South Pole. It kept his party dry and comfortable for two years at 56° below zero.

RU-BER-OID has been widely imitated. The U. S. Court of Appeals enjoined imitators from using the word "Rubberoid or any similar name as the trade name or brand" of their roofing. The genuine has the "Ru-ber-oid Man" (shown above) on every roll.

Colored RU-BER-OID (Ka-lor-oid) comes in beautiful, permanent Tile Red and Copper Green.

First Annual Auction Sale

25 Head Saddle Horses

JUNE 20, 1916, 7:45 P. M.
San Francisco Riding and Driving School.
7th Ave., near Golden Gate Park.

In this Sale will be Horses ready to use shown under saddle; Mares already bred to the P. P. I. E. Jr. Champion Le Grand McDonald; and Foals by their side; also some 2-year-olds and yearlings by Artist Jr., the winner of the Sweepstake at California State Fair last year he was shown. He was sired by Artist Montrose, winner of Sweepstake at Chicago World's Fair; Artist Jr. is sire of Don Pedro, the horse selected after an inspection of the State by the Japanese American Association and presented to the Mikado upon his coronation. Artist Jr. will be included in the Sale. Will also sell the imported French draft stallion Alexander.

Catalog furnished on request.

BRIDGEFORD COMPANY

519 California Street, San Francisco

CALIFORNIA HOG BOOK

Every hog-breeder in the State should have a copy of this book handy to refer to in cases of emergency. Every day the practical side of the book will help you. The author, W. S. Guilford, is a swine breeder, and he tells just what you want to know when a difficulty presents itself. The book contains 256 pages of text, besides many full-plate illustrations. Tells how the successful breeders feed and handle their hogs.

PRICE, $2.00 POSTPAID.

PACIFIC RURAL PRESS, Publishers

PAICINES RANCH COMPANY

SHORTHORN BULLS

Sixty head of registered yearling and two-year-old bulls for sale.

STRONGEST BLOOD LINES.

David J. Stollery

320 Sharon Building, San Francisco, California.

Veterinary Queries and Replies.

[Answered by Dr. H. B. Wintringham, Petaluma, Cal.]

[Subscribers wishing an immediate reply should send money order for $1.00. No charge for questions answered through this department. Name and address of subscriber must accompany each query.]

BLOODY URINE AND SPASMS.

To the Editor: Of 30 calves, under two months old, which became sick, 13 died. In one lot, their urine was blood color and sometimes black as ink. They urinated often and much. It would sometimes be clear in the morning but bloody by noon. They craved water but had no fever. Their bowels were in perfect condition. They were greedy for milk until a few hours before death, which came in spasms about 24 hours after first symptoms. Those that recovered, shed hair in spots, principally on neck and shoulders. They seemed tender to touch on back over kidneys. In the second lot, none died and the urine was all right but a similar trouble affected the bowels. We have used the same feed successfully for 30 years. Everything is sanitary—plenty of wood ashes and creosote are used around the airy barns and corrals.—T. E. B. Gonzales.

[Personal autopsies would be the only way for me to make a positive diagnosis in this case. However the symptoms point to the creosote poisoning. Calves are prone to lick foreign substances, and they have probably taken up enough of the disinfectant to account for their death.]

HORN STUBS DO NOT HEAL.

To the Editor: On a bull dehorned a month ago, one side heals very slowly. The other is open and smells bad. Have been cleaning it with peroxide and carbolized water, then drying and using healing powder.—W. A. L., Turlock.

[Use pine tar freely on the horn stubs daily.]

HORSE LIES DOWN IN HARNESS.

To the Editor: A young mare often lies down while in team and seems in pain. Is usually all right while working but trouble comes when she stands. She eats well.—W. A. L., Turlock.

[Feed the mare one pint common molasses twice a day.]

HOGS EAT DIRT.

To the Editor: A herd of hogs in a half dry barley field has enough to eat but they eat a lot of dirt and sand, then die.—P. L., Bakersfield.

[This is depraved appetite due to lack of mineral substances. Give them all the charcoal they will eat as well as slaked lime.]

DOES NOT COME IN HEAT.

To the Editor: A young Jersey cow had her second calf Feb. 15 and cleaned all right, but does not come in heat.—A. C. N., Edenvale.

[Let this cow run with a bull and see if she does not come around of her own accord.]

CUT TEAT INFECTED.

To the Editor: On a heifer whose teat was cut off three weeks ago, the wound healed but the canal of the teat is sore, the milk flow stopped so have to use a tube. Sometimes I can squeeze a little bloody pus from it.—R. P., Stockton.

[This teat will always be worthless. To control the infection give potassium iodide in 2 dram doses, twice a day, dissolved in water.]

MARE INJURED IN FOALING.

To the Editor: The womb came from a mare after foaling Mar. 22. We put it back and kept her in a sling nine days washing with lysol to prevent inflammation. A week ago she began lying down most of the time. When she would get up she would be trembly, stiff, weak in the back, seemed trying to urinate five or ten minutes, then would step out very cautiously, breaking down in the back at times, lifting her hind feet as if string halted, is stiff in front, and short winded after getting up.—R. N. F., Copperopolis.

[The mare will probably succumb to the infection she has. Give one dram fluid extract nux vomica every six hours and 2 ounces fluid extract echinecia twice a day.]

BOIL ON MARE'S NECK.

To the Editor: A collar gall on top of a mare's neck developed into a boil. Have been syringing with castile soap and then with a Kreso solution, then applying a tablespoonful of powdered alum. Today I removed a spongy lump.—W. J. W., Kern.

[There is danger of a fistula forming. Paint the cavity daily with tincture of iodine.]

HORSE HAS WORMS.

To the Editor: My horse has worms and a ravenous appetite, and is losing flesh. Food does not seem to be assimilated. Hair is dull.—Sub., Los Gatos.

[Give the horse the following dose daily for six days: iron sulphate 2 drams, tartar emetic 2 drams, arsenic 5 grains. Then give one quart raw linseed oil.]

COW'S FEET SORE.

To the Editor: Last winter I apparently cured a sore between a cow's toes but this spring the same foot and another became affected and have an offensive smell. The corral is not muddy even in winter.—H. C. McK., Ukiah.

[This is foot rot. Stand the animal in a 2 per cent solution liquor cresolis compositus for an hour twice a day.]

RED URINE IN CALVES.

To the Editor: Of twenty calves eating skim milk and barley hay and 30 acres green pasture with plenty of water, have lost four in the past few days and the rest seem listless. The bladders of the dead ones were full of red water and the kidneys were not normal. Calves on hill pasture are doing fine.—A. C., Paicines.

[This is either blackleg or contagious pleuro-pneumonia which a careful autopsy carried further than you went should reveal. For the former trouble, vaccine is efficient; for the latter sanitation is the treatment. See page 576, May 1 issue.]

SURFACE IRRIGATION EXPOSITION DRAIN PIPE.

We have puchased all the Drain Pipe in the Palaces and Courts at the Exposition. This is made of light galvanized iron in 10-foot lengths, and will slip together—can be used for surface irrigation.

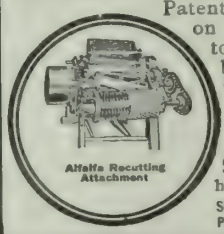
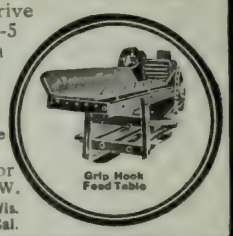
Here's A Silo Filler That Makes Alfalfa Chop



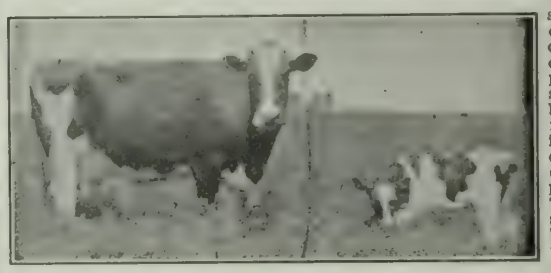


Thousands of farmers fatten cattle, sheep, hogs and poultry with wonderful alfalfa meal made by patented recutting attachment on the Smalley. Handles leaves, stems and all without waste or injuring color of hay. Enables you to sell No. 1 hay and mill off-grades for feeding. Makes combination feed from clover, rice straw, bean straw, pea vines, oats, rye and dried cornstalks. Capacities 1200 to 2700 lbs. meal per hour. Junior Mill makes 500 to 800 pounds of meal per hour with 5 to 8 H. P. engine. Grip Hook Table feeds cutter automatically, saving wages and board of at least two men on big outfits. Paddle roller grips a bundle of corn in record time.

Powerful Smalley Silo Filler

Chain Drive—Grip Hook Force Feeding

Blower built independent of cutter. Fan speed can be increased or decreased without changing speed of knife shaft. Patented low speed one pulley chain drive on blower cuts down power cost 1-5 to 1-4 and saves needless wear on belt. Extension Table on hopper prevents accumulation of litter.



Steel in castings makes machine one-fourth heavier and far more durable than any other.

Save piles of money by sending for handsome, illustrated FREE Book NOW.

GRANDSONS OF TILLY ALCARTRA

At Prices within Reach of Every Breeder and Dairyman.

A Grandson of Tilly Alcartra.

We have several splendid grandsons of this now famous cow, which we can deliver to you at prices which will suit the pocketbooks of every dairyman wishing to improve the quality of his herd, whether it be a grade or pure-bred herd. These bulls are sired by our herd bull, Prince Alcartra Korndyke and out of A. R. O. cows, and are the only living grandsons of a cow having a record of over 30,000 pounds of milk in a year. Such an opportunity for increasing production has never been offered **DAIRYMEN AND BREEDERS** in California, price and quality considered. Buy one of these bulls and solve your low production problem. Write

ALFALFA MEAL FOR HORSES.

To the Editor: "What value has alfalfa meal for horse feed as compared with chopped or whole alfalfa hay?"—M. E. B., Acampo, Cal.

[Answered by Prof. F. W. Woll, University Farm, Davis, Cal.]

[I cannot see that alfalfa meal has any advantage over chopped or whole alfalfa as a horse feed; on the contrary, long hay is as a general rule preferable to either chopped or ground alfalfa for both horses, cattle, and sheep. The objection of the latter feed is, that they are dusty and more expensive than long hay. They can only be recommended as a part of the grain ration for horses when mixed with molasses or in the form of special molasses feeds, manufactured by reputable dealers, when sold at a fair price, say below that of wheat bran or rolled barley. Ordinarily, however, the best and cheapest plan is to feed long hay to horses, and let them do their own grinding. They generally have plenty of time and the necessary apparatus.]

FEEDING YOUNG CALVES.

To the Editor: What, how, and how much should I feed heifer dairy calves now a week old?—L. E., Stockton.

[Answered by F. Stenzel, Lorenzo.]

[Calves at that age should be fed whole milk until 3 or 4 weeks old, about 8 pounds (one gallon) per feed twice a day. Then gradually substitute skim milk and add a little cooked oil meal. Water, alfalfa hay, and grain should be kept before them at all times. The grain should consist of equal parts bran and rolled barley. When weather permits, they should be out in the sun.]

SWINE ON FRUIT FARM.

[Written for Pacific Rural Press.]

Purebred swine raising on a fruit ranch pays C. A. Cooley of Durham, Butte county. Mr. Cooley has been breeding purebred Poland-Chinas for six years and maintains a good-sized herd on his 67-acre ranch, which includes 30 acres of almonds, 23 acres prunes, and 10 acres olives.

By interplanting summer crops such as Egyptian corn, enough grain is grown for the hogs. This mixed in equal proportions with alfalfa meal and fed dry, is the main ration.

In years when fruit crops are short on the Cooley ranch, the income from the swine is doubly appreciated. In years of abundant crops the hogs dispose of waste fruit at a profit.

BERKSHIRES AT STATE FAIR.

The first Western American Berkshire Congress Show and Sale will be held this fall in conjunction with the California State Fair at Sacramento, Calif., Sept. 2 to 9. The California State Fair Board has agreed to make the premiums for Berkshires $600. To this is added $300 by the American Berkshire Assn. From present indications it looks likely that this will be the greatest Berkshire exhibition ever held in the West, surpassing even the great Panama-Pacific Berkshire show. Every Berkshire breeder in the West should begin now to select and fit one or more animals.

The Western American Berkshire Congress Sale will be held during the week of the show after the awards have been made; and many of the show animals will be entered in the sale, thus giving the buying public a chance to get prize-winners at their own prices. Selected animals from the greatest Berkshire herds in the West will be sold in this sale, each animal inspected and passed by a judging committee from the W. A. Berkshire Congress before being allowed to enter the sales ring. For further information write F. R. Steel, Sec.-Treas. W. A. Berk. Congress, Grants Pass, Ore.

CHEAP MILK COOLING.

[Written for Pacific Rural Press.]

An economical and practicable way of cooling milk to a lower temperature than is possible with well water is the one practiced on the dairy at the Stockton State Hospital.

Adjoining the milking barn at this dairy is the milk room in which a large coil cooler is located. Close by is a galvanized iron box, large enough to hold three cakes of ice. In the bottom of this tank is a set of pipe coils one end of which leads to the hydrant nearby and the other end to the milk cooler.

By keeping ice in the box at milking times, all of the water that goes through the cooler is brought to a low temperature by passing through the ice cooled coils in the box, thus greatly reducing the temperature of both the water and milk. The entire outfit is inexpensive and while not so cooling as brine, answers the same purposes under most conditions

Everybody knows that paraffine oil is best for lubrication. C. & S. Axle Grease is made of palest paraffine and vegetable oils.

98% Of the World's Creameries Separate their cream with a DE LAVAL

TEN YEARS AGO THERE WERE A DOZEN DIFFERENT MAKES of creamery or factory separators in use. Today over 98 per cent of the world's creameries use De Laval Separators exclusively.

IT MEANS A DIFFERENCE OF SEVERAL THOUSAND DOLLARS a year whether a De Laval or some other make of separator is used in a creamery.

EXACTLY THE SAME DIFFERENCES EXIST, ON A SMALLER scale, in the use of farm separators. Owing to the fact, however, that most farm users do not keep as accurate records as the creameryman, or test their skim-milk with the Babcock tester, they do not appreciate just what the difference between a good and a poor separator means to them in dollars and cents.

NOW IF YOU WERE IN NEED OF LEGAL ADVICE, YOU WOULD go to a lawyer. If you were sick you would consult a doctor. If you had the toothache you would call on a dentist. Why? Because these men are all specialists in their line, and you rely upon their judgment and skill.

WHEN IT COMES TO BUYING A SEPARATOR WHY NOT profit by the experience of the creameryman which qualifies him to advise you correctly? He *knows* which separator will give you the best service and be the most economical for you to buy. That's why 98 per cent of the world's creameries and milk dealers use the De Laval exclusively.

THERE CAN BE NO BETTER RECOMmendation for the De Laval than the fact that the men who make the separation of milk a business use the De Laval to the practical exclusion of all other makes of cream separators.

Your local De Laval agent will be glad to let you try a De Laval for yourself on your own place. If you don't know the nearest De Laval agency simply write the nearest main office, as below.

HOG CHOLERA PREVENTED

WE GUARANTEE your hogs immune against cholera if vaccinated with I. S. V. Co. HOG CHOLERA SERUM. We teach you free.

Read this letter:

Dr. J. B. Green, Mgr.,
Inter-State Vaccine Co.,
Los Angeles, Cal.

Dear Sir:

This will acknowledge receipt of 2,200 cc. of your Hog Cholera Serum for which I wish to thank you for such prompt delivery.

We have been using your serum and virus the past year on more than 500 hogs and can truthfully say that we never have had such good success in vaccinating for hog cholera as we have had with your medicine. We have tried other serum and virus but have had poor success. With yours we have not lost more than 1 or 2% and in all these cases it has been partly our fault.

I wish I might impress the hog raiser that vaccination for this dread disease among hogs is the only sure and successful way to insure success. It costs so little and gives absolute immunity against cholera that it is the best insurance to be had and anyone raising hogs should not do without it.

I am more than pleased that you have a branch here in Los Angeles where we can get our serum fresh any day without sending east or even to Berkeley after it. Yours very truly,
San Gabriel Live Stock Co., Pasadena,

LICE, MITES AND FLEAS.

[Written for Pacific Rural Press by Susan Swaysgood, Pomona.]

One ounce of prevention is better than a pound of cure in the prevention of lice and mites.

While chickens do breed lice with very little encouragement, they can be kept entirely clean and free from all the pests that assail them. During the molting season is a good time to commence. This should be done by dipping every hen in some good dip, such as Kreso Dip, No. 1, or creolin and water. These things do not soil the feathers, but if used right will kill every louse.

After that if the hens are dusted with a good insect powder once in two weeks regularly there will never be a trace of lice on them. Now this is not such an awful big job unless a man keeps a flock that runs into thousands, in which case he must find some easier method of keeping his hens free from these pests.

Where dropping boards are used this can be accomplished without touching the hens at all. Just paint the dropping boards with a mixture of pine tar, naphthaline flakes, and crude oil or black distillate, using all the naphthaline flakes the oil will absorb. After the hens go to roost if the odor can be confined by hanging something up in front it will be found more effective. Any good liquid lice killer will do the work if it is applied a few times until all the nits are caught.

Coal or wood ashes placed where the fowls dust themselves are also a good help, especially if some finely powdered tobacco stems are mixed with the dust, or powdered sulphur can be mixed in.

To Prevent Mites.—Never fail to spray the houses at least once a month in cold weather and twice a month in warm weather with crude oil or black distillate and crude carbolic acid in the ratio of one quart of the carbolic to one gallon of the oil. Now there are two ways of spraying, one is carelessly throwing the liquid on the boards, perches, and other places in the hit and miss style. After this, the mites still march along lanes that were missed and find the poor hens to feast on. A thorough spraying to be affectual, should take in the dropping boards, perches (under sides included), walls all around the sleeping quarters, and nests. If these places are sprayed right there will be no mites, but all knot holes and rough surfaces in perches and boards should be looked into carefully.

Fleas.—The same treatment will keep fleas down, salt water will kill fleas too, but it is very little cheaper than crude oil in most places and it dries up quicker than does the oil.

Lice on Young Chicks, Turks, etc.—The place to look for lice on young chicks, young turkey poults, etc., is on the head and around the throat. Take the poult or chick in your hand and go out into a strong sunlight, rub down the head the wrong way and the lice can then be seen as they are always black.

A small chick can stand but a very little of any kind of grease or oil so if you use a liquid remedy be sure to use it very carefully. A drop or two of oil of cedar put on the head will drive them away, but they will come back unless it is repeated. A good insect powder is really the safest remedy for chicks, well dusted over the head and throat, repeat at intervals and you will keep them away. If hens are dusted once a week, the chicks will be safe. If you notice chicks or poults with droopy wings look for lice if they act mopy, look for lice and be sure they are not hiding when you think there are none. Head lice are sure death to chicks. No matter how strong the chicks are to begin with, if lice are left on them they will pass in their cheeks.

MILK FOR POULTRY.

Milk is the most beneficial to hens when mixed in mashes, as then it can be served clean and counted as a meat-product. Creamery skim milk is worth five cents a gallon to any poultryman. Whole milk is not worth so much because of its higher fat content. When milk is skimmed by hand methods care should be taken to take off all the cream. Buttermilk is not so good for poultry as good fresh creamery skim milk, the University advice to the contrary. Whey is too good to throw away, but is less value than buttermilk; and when used should be neutralized by adding lime water to it in proportion of one quart to five.

Curd is perhaps the best form of milk that can be served to all young stock, including turkey poults, but it should be mixed with other foods as it is very high in protein and nearly all albuminoids. It is very easy to digest and chicks will eat a lot of it. Being so rich, of course it should be fed in proper quantities.

Nearly all forms of milk are better for a little sourness, but that does not mean that you can feed decomposed milk to young stock or old without causing a disturbance in the bowels.

SPOTS ON HENS' LIVERS.

To the Editor: My chickens have an epidemic, resulting in their death after a week or two of sickness. I find white spots on the liver. I feed my chickens twice a day on pure wheat, and pasture them all day in the open.—L. B. L., Suisun.

[Answered by Geo. H. Croley.]

[There are several diseases which show these symptoms, including aspergillosis and tuberculosis. However, as nothing is fed but wheat, which is practically all starch, the trouble is most likely due to lack of a balanced ration. These fowls should have some mash, including some meat and a variety of grains; also see that they have grit, shell, and charcoal, which are necessary to preserve their health.]

BROILERS OR ROASTERS?

To the Editor: I have 300 chicks of Easter hatch, Rhode Island Reds and White Leghorns. Will it be best to sell them as broilers or soft roasters, and what weight should the latter be? Is there any chance to sell pullets for laying?—Mrs. R. D. K., Richfield.

[The chances are that it will pay best to sell the Leghorns as broilers at 1 to 1¼ pounds and keep the Reds for soft roasters at 3 pounds. Our classified ads reach over 24,000 people, practically all farmers, or people who expect to farm soon. They are likely to buy your pullets quick. —Ed.]

SHRUNKEN BARLEY GREENS.

Many of our farmers have small shrunken barley; if they have not, they know who has; and as its grain value is about nothing, this can be used to furnish a constant and cheap supply of green feed with very little labor.

Soak the seed twelve hours in water, then pour the grain in boxes with draining space and cover the whole with sacks. It will need sprinkling and stirring every day until it commences to mat together, when it can be just sprinkled and opened up to the sun. At two or three inches high, feed the whole thing, a square foot per 25 hens. The barley need not be spread over three or four inches thick before sprouting. It can be let to grow until a foot high, and it makes more in green feed.

But it has been satisfactorily proven that if good feeding barley is soaked, and sprouted in a box without waiting for sprouts to turn green, it acts both as a grain and greens. In fact it is the better for egg production, but the sprouts should be a quarter to a half

Motor oil made from asphalt-base crude gives best lubrication with least carbon. Such is the testimony of motorists and experts alike. As Lieut. Bryan, U.S. N., puts it: "Oils made from the asphalt-base crudes have shown themselves to be much better adapted to motor cylinders, as far as their carbon-forming proclivities are concerned, than are paraffine-base Pennsylvania oils." Zerolene is scientifically refined from selected California crude—asphalt-base—not only made from the right crude but made right. Dealers everywhere and at service stations and agencies of the Standard Oil Company.

inch long. To get in just this particular stage takes about three or four days from time of putting in the box and it must be stirred and sprinkled. Stirring is to keep the barley from getting musty by overheating.

This is a great saving of labor over trying to get other field crops to grow in hot weather where there is little water, but it is not so economical in money as most of us must buy barley.

Poultry Breeders' Directory.

Rates in this directory, 3c per word each issue; or if carried weekly for one year, 2½c per word.

MODEL POULTRY FARM—White Leghorn Specialists. We are now booking orders for Hatching Eggs. Baby Chicks and 10 weeks old pullets for delivery after January 1st, 1916. Prices on application. INDIGESTION KILLS HENS.

To the Editor: Where can I get a book on chicken diseases? My chickens have diarrhoea. They have good wheat and pure water; their droppings are whitish. Some have died.—A. Z., Hylton, Nev.

[Answered by Geo. H. Croley.]

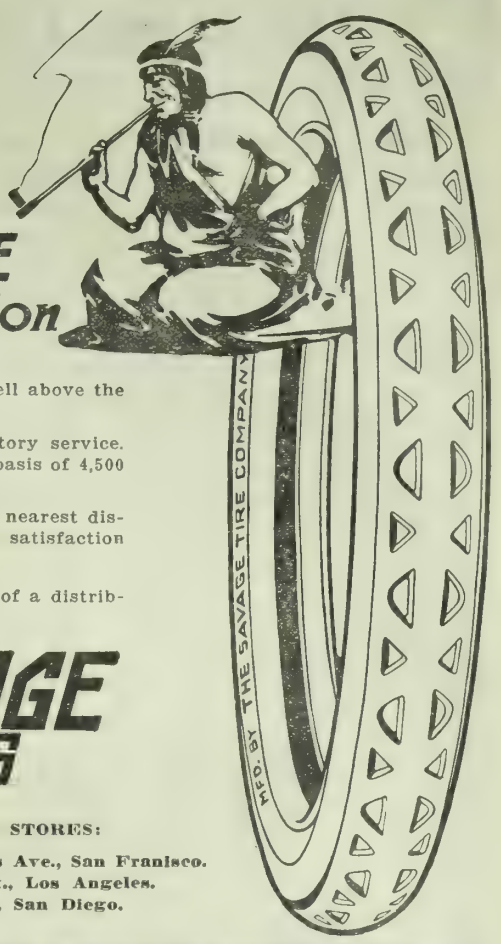
[We have a book, "California Poultry Practice," which contains a chapter on diseases of fowls, and remedies. In addition, it teaches how to care for fowls so as to prevent disease. If wheat alone is fed, this is probably the cause, as wheat is very starchy; fowls must have a balanced ration, such as mash, including some meat and a variety of grain; they must have a constant supply of grit, shell, and charcoal, which are necessary to preserve their health. Make proper change of food, and then for first week add 1 teaspoonful of sulphate of magnesia to every quart of drinking water.]

BUTTE COUNTY EXPOSITION.

The Butte County Spring Exposition at Chico May 22-28 which began last year as part of a street carnival, turned the tables on the carnival this year. Agriculturally, it was a livestock show represenative of the entire Sacramento Valley. Beef, hogs, dairy cattle, and horses made strong high quality classes. At the California Swine Breeders' Sale May 24, Durocs seemed as a rule of the best quality, and sold at highest prices, a sow having sold for $155. Good ring management was shown, in that information as to pedigree and show record was always quickly available. A few of the offerings showed that inferior specimens of the breeds had been used for foundation instead of being butchered before they could harm the purebred industry by breeding.

The C. L. Leonard Jersey sale brought $1780, or an average of $118. The Bank of Orland took several for its livestock clients. The highest price was $177.50 for a cow.

There were 300 awards to competing livestock. Cattle entries included Jerseys, Holsteins, and Shorthorns. Shorthorn honors were divided between the Brighton herd of the Murphy boys of Perkins and W. H. Hammond of Chico. The grand champion bull is the 2000 pound Colonel Courier recently brought from the East by the Perkins'. The grand champion female belongs to Hammond.



All sheep prizes went to J. G. Wannop of Chico for Shropshires.

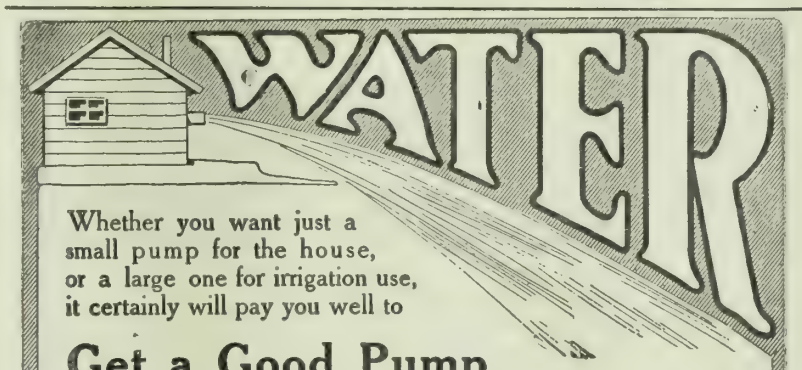
Percherons and Shires were represented. Percheron prizes went to local breeders; Shire prizes to the Black Hawk Stock Farm of Burlingame.

Most of the Holstein awards went to the Henderson herd of Sacramento. Competition was keenest in the Jersey breed where J. B. and J. E. Thorp of Stockton, S. F. Williams of Chico, and C. L. Leonard of Glenn came out with colors flying. The grand champion bull is Alva Lady's La Foss Boy owned by Williams.

Berkshires, Poland Chinas, Durocs, and O. I. C.'s were entered for 96 prizes. Three of these prizes were for the best hog of any breed, age, or sex raised by a Butte county boy or girl. C. B. Cunningham of Mills won all O. I. C. awards. Berkshire prizes were well distributed between A. L. Stephenson of Los Molinos, the Murphy's and Jas. Mills Orchard Co. The biggest competition was in Durocs. The high winners belong to J. B. and J. E. Thorp, Stockton, Rucker and Coppin of Fair Oaks, J. K. Fraser of Denair Stanislaus county, and L. D. Collins of Denair. S. F. Williams, C. W. Williams, C. L. Van Schoiak, and R. B. Huffman, all of Chico, drew the Poland China premiums.

The San Francisco Post Office prints lists of farmers who have produce for sale, but they do not distribute them so that people know the possibilities. We recently asked a number on the list, covering the State, and all mailable agricultural products, whether they had received any orders through this medium. They replied unanimously that it was no good.

Surety of mileage well above the average.



Prompt and satisfactory service. Adjustments on the basis of 4,500 miles.

MICA AXLE GREASE

The Home Circle Page of the Pacific Rural Press

MRS. BEST'S LETTER.

My dear Friends,

I had the privilege this week of attending a very pretty church wedding and as all of us are interested in weddings from one view point or another, I am going to write to you about it.

The church was beautifully decorated with palm branches and pink rambler roses, the roses being so arranged that they seemed to be growing on the palm branches. At the altar were Easter lilies and hydrangeas with more palm branches. The effect was not stiff, but more like a garden and with the exception of the Easter lilies, quite possible for any country church.

As the organist played the Wedding March, the bridal party entered, led by six young men as ushers, followed by six bridesmaids, two by two, then came the little flower girl, scattering rose petals and then the maid-of-honor who walked alone. The bride followed, escorted by her father to the altar where a groom and best man waited. During the beautiful marriage service, the organist played softly and at the conclusion of the service, which was not more than ten minutes long, again rendered the Wedding March.

The bride and groom led the bridal party down the aisle, followed by the maid-of-honor escorted by the best man and they in turn were followed by the bridesmaids, each escorted by an usher. The members of the families followed.

No wedding would be complete, without a description of the clothes worn—the bride of course was in white with long, white tulle veil and orange blossoms. The bridesmaids were dressed in the popular rainbow colors, each one different and wore little hats to match their gowns. They all carried old-fashioned bouquets made up of many varieties of flowers. As this was an evening wedding, the men all wore the conventional black. After the wedding, which many people attended, there was a reception and light supper at the bride's home to which the more intimate friends were asked.

Only the bridal party were seated here for refreshments, all other guests being served a buffet supper. The plan of not trying to seat everyone makes it easier to handle a large crowd.

Small boxes of wedding cake, tied with white tulle, were provided, so all the girl friends of the bride could have the privilege of dreaming upon it.

According to custom, the bride tossed her bouquet as she passed up the stairway to prepare for her wedding journey and the young lady who caught it is supposed to be the next bride. The guests pelted the bridal couple as they left with paper confetti and rose petals as well as rice.

Yours devotedly

Rosabella Best.

First Aid to Charity.—After charity has covered a multitude of sins the sinner ought to let them stay covered.—Memphis Commercial Appeal.

TO KEEP ON PUMPS.

Fasten a small piece of elastic two inches long across the heel inside, attaching the ends only. When the pump is drawn on, the elastic stretches tight over the ball of the heel and prevents its slipping. Or sew a piece of chamois or velvet ribbon to the lining inside the heel.

RAISIN AND RHUBARB PIE.

(Contributed.)

Have you ever eaten raisin and rhubarb pie? If not, you have missed one of the most delicious of pies, and here is the recipe for it:

2 cups seeded raisins chopped.

2 cups rhubarb, cut in half-inch pieces.

1¾ cups sugar.

Stir together and add one beaten egg. Place bits of butter on before adding the top crust. This is sufficient for two pies.

JELLY RECIPES.

[Written for Pacific Rural Press by Prof. W. V. Cruess, University of California.]

(See articles elsewhere.)

Loganberry.—Crush and place in double boiler without addition of water. Heat until fruit reaches about 190 deg. F. or over. Drain off free juice through jelly bag. Press out remaining juice and keep separate from free run. This cloudy juice may be filtered through the jelly bag. To each cup of juice add 1½ cups of sugar. Dissolve. Heat to boiling and boil until the liquid will "sheet" freely from the spoon or until 9 deg. F. above the boiling point of water is reached. Pour into glasses.

Orange-Lemon.— Six oranges and 3 lemons. Slice and barely cover with water. Boil over one hour without stirring, replacing from time to time the water that boils off. Drain off free run. Press out pulp; heat the press juice to boiling and let settle 24 hours. Pour off the settled juice and combine with free run juice. Add 1½ cups of sugar to 1 cup of juice. Boil till juice will sheet from a spoon or until 9 deg. F. above boiling point of water is reached. Let cool to about 180 deg. F. in the pot. Add a few drops of orange extract to flavor the jelly. Strain and pour into glasses.

Currant.—Crush, and add equal quantity of water, and proceed as with loganberries.

Other fruits can be made up by slight modifications of the above recipes.

Preservation of Jelly Stock.—Very often, due to the rush of the fruit season, or because sugar or glasses, etc., are not at hand, it is not possible to make as much jelly as desired. A way out of this situation is to sterilize the juice or jelly stock from the boiled fruit by placing it in fruit jars or cans and processing at 212 deg. F. as directed in previous articles on canning. Then, when it is desired to make jelly, simply open a jar of the stock, pour off the clear juice, add sugar, boil and make into jelly as you would the fresh jelly stock. Commercial jelly makers carry large supplies of stock in this way

ANNOUNCING ENGAGEMENTS

At one of the large universities the custom prevails of having the engaged girls of the senior class announce their engagements at the senior banquet, which is one of the events of senior week.

This year a unique plan was evolved. As the dinner progressed two big bunches of flowers were passed around the table. One of these bouquets was of orange blossoms, the other of bachelor buttons. As these passed, each girl selected a flower and by her choice announced her future state.

TO REMOVE GREASE FROM WALL PAPER

To remove grease and oil stains from wall paper, fold a piece of blotting paper, and in the fold spread French chalk. Fasten the edges together to keep the chalk from falling out. Place this over the grease spot and apply a hot iron, being careful to not scorch the wall paper. If the spot is not bad, apply a paste of French chalk and water. When dry, brush off and repeat if necessary.

PERSONAL HABITS.

When noted psychologists agree that personal habits are formed under the age of 20, it behooves all mothers to be exceedingly observing and critical (in a kindly way) of the young people of the household. Careless table manners, slovenly dress and incorrect speech indulged in during youth will be found very difficult of correction later in life.

BURNS.

For slight burns a solution of common baking soda and water will give relief, but for more severe burns sweet oil, lard, vaseline, or white of egg will relieve the pain. The object is to exclude the air so that burns should be covered as quickly as possible with soft cloths after applying the remedy.

DO YOU KNOW THAT

The defective citizen of today is ofttimes the unhealthy child of yesterday?

Every man is the architect of his own health?

It's the baby that lives that counts?

Tuberculosis is contagious?

The full dinner-pail, the open window, the clean well, make for health?

PREVENTING SPIDER WEBS.

To the Editor: Is there any way to keep cobwebs from the house? I brush them off and spray them two or three times a week, but they still come back. There are some trees about 12 feet from the house.—A. P., Turlock.

[Who can help this reader?—Editors.]

FLORAL DEPARTMENT.

By Geo. N. Tyler.

House Plants.—No plant should be kept at the same degree of moisture at the root all the time, (except aquatics), the cyperus alternifolius or common umbrella plant, for example. A plant that does not dry out in a reasonable length of time has no feeding roots. Nine people out of ten, if their plants start to go back, give water and then, if they show no improvement, more water, and finally drown them or rather rot all the roots, so there is nothing to sustain the top. If your plants drop the leaves or begin to get light colored, it is a sign of too much water. Now I'll tell you why some plants do well for some, and go to the bad for others. The feeding roots of a plant are against the side and bottom of the pots, if you stand them in saucers of water you rot the feeding roots. Then again, if you have them in the dry atmosphere of a living room, the pot which is porous dries out, and the feeding roots suffer.

All plants, with few exceptions, like water on the foliage and it is a good plan to take them out twice a week in the hot summer months and spray the foliage. Here is a way you can grow most varieties of house plants, ferns, palms, etc. Take a pot two sizes larger than the one your plant is growing in, put some coarse material in the bottom to make the two pots level, fill in the space around the sides with moss and keep it damp. This prevents the feeding roots from drying out, and also gives out a moist atmosphere around the plants, which greatly benefits them. This is the only way you can make any success with the maiden hair fern.

For scale on palms and some varieties of ferns, take pure grain alcohol and go over your plants with a camel's hair brush, touching each one, afterwards washing off with clear water, and it will quickly rid your plants of scale, and will not injure the most delicate plant.

Your plants at this time of year should not have the direct rays of the sun, they will do best in an east window.

Here is a list of plants that do well in the house: Aspadistra for halls and dark places. Palms, Kentra fosterraria and belmoriana, most varieties of ferns—especially the neprolepsis or sword fern family, which includes Whitmanii, Boston, Smithi, Pearsonii, Tuberosa, etc.

The anthericum or soap plant (some call it the air plant) both green and veriegated does extremely well and the old umbrella plant, is fine if grown in water.

If your plants have been growing long in one pot, they are greatly benefited of you scratch in one teaspoonful of fine bone meal to a five inch pot. This does not apply to ferns.

Delay Explained.—"What are you doing there, Ellen?" "Excuse me, miss, but my apron caught in the door." "But you left the room ten minutes ago!" "Yes, miss, but I only just found it out."—The Passing Show.

THE HOUSE OF PAIN.

Unto the Prison House of Pain none
willing repair—
The bravest who an entrance gain
Reluctant linger there—
For pleasure, passing by that door,
stays not to cheer the sight,
And sympathy but muffles sound and
banishes the light.

Yet in the Prison House of Pain
things full of beauty blow—
Like Christmas roses, which attain
Perfection 'mid the snow—
Love, entering, in his mild warmth
the darkest shadows melt,
And often, where the bush is deep,
the waft of wings is felt.

Ah, me! the Prison House of Pain!—
What lessons there are
bought!—
Lessons of a sublimer strain
Than any elsewhere taught—
Amid its loneliness and gloom, grave
meanings grow more clear,
For to no earthly dwelling-place
seems God so strangely near!
—Florence Earle Coates, in
"Lyrics of Life."

A FABLE.

"Put the young horse in the plough," said the farmer, and very much pleased he was to be in a team with Dobbin and the gray mare. It was a long field, and gayly he walked across it, his nose upon Dobbin's haunches, having hard work to keep at so slow a pace.

"Where are we going now?" he said when he got to the top. "This is very pleasant."

"Back again," said Dobbin.

"What for?" asked the young horse, rather surprised.

But Dobbin had gone to sleep, for he could plough as well asleep as awake.

"What are you going back for?" he asked, turning around to the old gray mare.

"Keep on," said the gray mare, "or we shall never get to the bottom, and you'll have the whip at your heels."

"Very odd indeed," said the young horse, who thought he had had enough of it, and was not sorry he was coming to the bottom of the field. Great was his astonishment when Dobbin, just opening his eyes, again turned and proceeded at the same pace up the field again.

"How long is this going on?" asked the young horse.

Dobbin just glanced across the field as his eyes closed, and fell asleep again as he began to calculate how long it would take to plough it.

"How long will this go on?" he asked, turning to the gray mare.

"Keep up, I tell you," she said, "or you'll have me on your heels."

When the top came and another turn, and the bottom and another turn, the poor young horse was in despair; he grew quite dizzy, and was glad, like Dobbin, to shut his eyes, that he might get rid of the sight of the same ground so continually.

"Well," he said, when the gears were taken off, "if this is your ploughing, I hope to have no more of it."

But his hopes were vain; for many days he ploughed, till he got, not reconciled to it, but tired of complaining of the weary, monotonous work.

In the hard winter, when comfortably housed in the warm stable, he cried out to Dobbin, as he was eating some delicious oats: "I say, Dobbin, this is better than ploughing. Do you remember that field? I hope I shall never have anything to do with that business again. What in the world could be the use of walking up a field just for the sake of walking down again? It's enough to make one laugh to think of it."

"How do you like your oats?" said Dobbin.

"Delicious," said the young horse.

"Then please remember that if there were no ploughing there would be no oats."

This little fable is as good for boys and girls as for horses. Can you find the moral?—Our Dumb Animals.

PICKLED WALNUTS.
English Method.

Please give receipt for black walnut pickles.—V. P., Dixon.

Make a brine sufficient to cover the walnuts, using 6 ounces of salt to a quart of water. Take off the scum, which will rise as the salt dissolves, and throw in the walnuts. Stir them night and morning. If they are wanted for immediate use leave them in 12 days. Otherwise drain them from the brine in 9 days. Spread them on dishes and let them remain exposed to the air until they become black. This will be in 12 hours or less. Make a pickle with a good half-gallon of vinegar, 1 teaspoon salt, 2 ounces black pepper, 3 bruised ginger roots, a drachm of mace, and from one-fourth to one-half ounce of cloves and 4 ounces mustard seed to each 100 walnuts. The cloves, if desired, may be stuck into 3 or 4 small onions. Boil these ingredients together 5 minutes, have the walnuts ready in a stone jar and pour the vinegar over them as soon as it is taken from the fire. When the pickle is quite cold, cover the jar securely and store it in a dry place. Keep the walnuts well covered with vinegar and always boil any vinegar which may be added to them.

The walnuts for this pickle must be picked while a needle can still pierce through them. As soon as the inner shell has formed they have ceased to be in a proper state for pickling.

Dreams Come True.—"Did you ever dream of being a pirate when you were a boy?" "Oh, yes. Isn't it queer? Now, I'm in the prosaic business of managing an automobile repair shop." "Umph! You didn't miss it so far."

Proper Feeding War Started by Women

NEW YORK, February 27.—Prominent women representing all parts of the country have been appointed members of a special committee to organize the campaign undertaken by the National Housewives' League to build up the health of the nation through proper feeding as its contribution to the preparedness movement, it was announced here tonight. Every woman's organization in the country will be urged to take up the propaganda.

Nutrition Experts recommend chocolate as one of the most nutritious and delicious of foods. Health—and economy—follow the daily breakfast cup of strength-supplying

FIGURES GIVEN ARE INDEPENDENT AND RELIABLE

Pacific Rural Press Market Report

PRICES QUOTED AS PAID TO PRODUCERS

San Francisco, May 31, 1916.

WHEAT.

The holiday this week caused a general suspension of operations in the local grain market for several days, and there has not been enough business to permit any change of quotations. The general situation shows little change.

Cal. Club, ctl.	$1.60 @1.65
Northern Bluestem	1.87½ @1.90
Northern Red	1.85 @1.95

BARLEY.

Both spot and future business has been extremely dull for the last week, with holders and buyers somewhat apart in their views. Prices show no further change.

Shipping, ctl.	$1.37½ @1.40
Choice Feed, ctl.	1.30 @1.35

OATS.

Jobbing sales for current feeding requirements are keeping up fairly well, but there is little important business in the local market, spot offerings being very moderate.

Red Feed	$1.35 @1.37½
White	1.55 @1.60

CORN.

There is a fair amount of Eastern coming in on orders for milling firms, but otherwise the movement is of a small jobbing nature. Egyptian, etc., find a good demand at many country points, but the amount passing through this market is limited, and variations of quality make it difficult to give a quotation that will apply generally.

Eastern Yellow, ctl.	$1.80 @1.85
Milo Maize	1.40 @1.45
Kaffir	1.60 @1.65
Egyptian	1.45 @1.50

BEANS.

The buying movement that started about the first of the month still continues, and dealers, who have been holding considerable stock, are in hopes of making an early clean up of most varieties. Prices are still advancing, though not as much as last week. Both small and large whites have taken another jump, and limas also are stiffening up, though there is still a good deal of stock in the south. The close clean up of small whites is giving tepary beans a chance, but they have found little favor with the consuming trade, and according to local reports few people know how to prepare them so as to make them desirable food.

(On wharf, San Francisco.)

Bayos, per ctl.	$5.00 @5.25
Blackeyes	2.90 @3.00
Cranberry Beans	4.85 @5.10
Horse Beans	3.00 @3.25
Small Whites (south)	7.00 @7.10
Large Whites	6.40 @6.60
Pinks	5.10 @5.25
Limas (south)	4.90 @5.00
Red Kidney	6.50 @6.75
Mexican Reds	4.90 @5.25
Tepary Beans	4.00 @4.50

SEEDS.

Melilotus Alba, lb.	23 c
Melilotus Indica	6 c
Bur Clover	11 c
Oregon Vetch	5 c
Soy Beans	6 c
Canada Peas	5¼ @6 c
Alfalfa, per lb.	22 @24 c
Sudan Grass	35 @40 c

HAY.

Arrivals still consist mostly of old hay, including no choice red oat, and but little desirable wheat hay. Offerings of new hay, however, are gradually increasing, and the quality is reported exceptionally good, much of the volunteer being almost as good as red oat. The harvest is well under way, and while the crop is showing up better since the weather turned cooler, and a good deal of grain in the Sacramento Valley is being cut for hay, it is no means certain that the crop will be up to normal.

No. 1 Wheat	$13.00 @16.50
No. 2	12.00 @14.50
Tame Oats	12.00 @18.00
Wild Oats, new	8.00 @11.00
Barley, new	9.00 @12.00
Alfalfa, new crop	8.00 @12.00
Stock Hay	6.50 @ 8.50
Straw, per bale	.25 @ .40

FEEDSTUFFS.

While local trading is rather dull, the consuming demand is very fair for this time of year. Bran and middlings are both higher, as the present output is limited.

(Wholesale prices, per ton, carload lots, San Francisco.)

Beet Pulp, per ton	$22.50 @23.50
Alfalfa Meal, per ton.	20.00 @21.00
Alfalfa Molasses Meal, per ton	21.00 @22.00
Bran, per ton	26.00 @28.00
Oil Cake,	Nominal
Cocoanut Cake or Meal	23.00 @25.00
Cracked Corn	40.50 @41.50
Middlings	35.00 @36.00
Rolled Barley	29.00 @30.00
Tankage	45.00
Rolled Oats	29.50 @31.00

VEGETABLES.

String beans are decidedly firm, with light offerings from the Bay district, and prices are up to 6c. Peas are easier, but still fairly high, with limited supplies, Artichokes are going off crop, and few are offered. Tomatoes have dropped sharply, as native stock will soon be in good supply, though arrivals so far have been light. Green corn is in liberal supply and much easier, though some fancy stock sells up to 50c.

Cabbage, ctl.	$1.75 @2.00
String Beans, lb	5 @ 6 c
Summer Squash, box	75 @90 c
Peppers, bell, lb.	15 @20 c
Rhubarb, box, Bay	40 @75 c
Asparagus, box,	1.00 @2.25
Lettuce, small crate	50 @65 c
Eggplant, lb.	10 @15 c
Peas, lb.	4 @ 5 c
Tomatoes, lugs,	1.50 @2.00
Green Corn, doz.	15 @25 c
Okra, lb.	20 @25 c

POTATOES AND ONIONS.

Old potatoes are scarce and firm, but new Delta stock has dropped sharply, with rapidly increasing arrivals and most offerings of good quality. Dealers say the reports of frost damage are greatly exaggerated, but it is evident that the output will be considerably curtailed, and with a shipping movement to other states beginning, no great decline is expected. Onions are stronger.

New Potatoes, ctl.	$1.75 @2.25
Oregon Burbanks	1.65 @1.85
Onions, red	1.75 @2.00
Australian	2.50
Garlic, per lb.	5 @ 9 c

POULTRY.

The local demand is about normal for this time of year, while arrivals from nearby points are much of the time in excess of requirements, and clean up slowly at rather easy prices. The general list is about as before.

Broilers, 15 lbs. to doz. and less, lb.	22 @23c
do, over 15 lbs. to doz.	25 @28c
Fryers	25 @30c
Hens, extra, per lb.	20c
Small	17 @18c
Smooth Young Roosters, per lb	25 @28c
Squabs, per doz	2.00 @3.50
Geese, per pair	2.25 @3.00
Ducks, young	Nominal
Old	15 c
Belgian Hares	9 @10 c

BUTTER.

Butter has eased off a little in the last few days, but no great decline is expected, and a good deal of stock has been shipped north. The Eastern movement seems to have stopped for the time, but it is felt that the continued demand in the East will tend to stiffen prices; while the early shipments have given little opportunity for storing, and this will mean a larger demand later on.

	Thu.	Fri.	Sat.	Mon.	Tu.	Wed.
Extras	25½	25½	25½	25	—	25
Prime Firsts	25	25	25	24½	—	24½
Firsts	25	25	25	24	—	24½

EGGS.

Extras have dropped back a little, but on the whole the market is firm, with production light in many sections, and the Los Angeles market is offering high prices.

	Thu.	Fri.	Sat.	Mon.	Tu.	Wed.
Extras	24	24½	24	24½	—	23½
Sel. Pullets	21½	22	22	22	—	21½

CHEESE.

Flats are a little firmer than last week, all offerings being readily disposed of. Monterey cheese shows some easiness, though values are fairly well maintained.

Y. A.'s fancy	14½c
Fancy Calif. Flats, per lb.	14 c
Monterey Cheese	16 @17 c

LOS ANGELES DAIRY PRICES.

	Wed.	Thu.	Fri.	Sat.	Mon.	Tu.
Butter	26	26	27	27	27	27
Eggs	24	24	26	25	25	26

DECIDUOUS FRUITS.

The general demand for fresh fruits has picked up noticeably during the last week, and the daily arrivals in most lines clean up well at satisfactory prices. Cherries hold firm, with an active Eastern shipping movement; most of the arrivals being of attractive quality. Apricots are in much better supply, but with better quality the demand has increased, and prices are higher. Peaches are somewhat lower on larger offerings, while figs sell at stiff prices. Clyman plums are appearing this week. A few green apples are offered, while there is still considerable old stock in storage. Currants and gooseberries remain firm, and strawberries are higher, while larger supplies have brought a decline on all other berries. Cantaloupes are scarce and sell off quickly at a good figure, while watermelons move rather slowly.

Currants, chest	$4.00 @6.00
Loganberries, chest	4.00 @5.00
Gooseberries, lb.	.05 @ .10
Blackberries, crate	.90 @1.00
Raspberries, chest	8.00 @10.00
Strawberries, chest	4.50 @7.00
fancy, chest	7.00 @9.00
Apples, old	.75 @1.00
green, box	.65 @ .75
Cherries, black, 10 lb. bx	.70 @ .95
White, do	.50 @ .85
per lb. black,	.07 @ .11
White	.03 @ .05
Apricots, crate	1.00 @1.90
Peaches, crate	1.00 @1.50
Figs, black, box,	1.75 @2.00
White	1.25 @1.50
Plums, crate	1.00 @1.50
Cantaloupes, standard crate	3.50 @4.00
Watermelon, lb.	.04 @ .05

DRIED FRUITS.

Local packers continue to report nothing doing in the dried fruit market, as they are unwilling to meet the views of growers in some of the most important lines, and indeed characterize the prices asked for apricots and prunes as out of the question. Peaches are nominal, as packers are unwilling to quote until the Association names its prices. There are very few pears left on the market, with nothing doing yet in futures. Spot prunes are pretty well cleaned up, and new prunes are not yet moving, as few growers are willing to sell. The fig crop is rapidly being contracted, with prices firmly maintained; and apples show a little more strength than for some time past.

Packers, though admitting the prospect for success of the Peach Association, hold that the attitude of growers on apricots and prunes is entirely unjustified by conditions, and that the prices asked will shut off the demand; and they naturally refuse to make speculative purchases under the present conditions.

Apples, old crop	6¼ @6½c
Apricots, per lb., 1916	10 @11 c
Figs, white, 1916	6½ @ 6¾c
Black, 1916	5 @ 5½c
Calimyrna, 1916	9 @10 c
Prunes, 4-size basis, 1915	5 c
1916	5 @5¼c
Peaches,	Nominal
Pears	5 @6½c

(Associated Raisin Co. Prices)

Fancy Seeded, 16 oz.	7 c
Choice Seeded, 16 oz.	6¾c
London Layers, 3-crown, 20-lb. box, 1916	$1.30
Imperial Clusters, 6-crown, 20-lb. box, 1916	2.75
Bulk, layers, 50-lb. box, 1916	2.75

CITRUS FRUITS.

The orange markets in the East are from 10 to 25 cents per box higher than a week ago. Shipments of navels and valencias are going East in good volume. At New York on Monday, May 29, navel oranges averaged on auction from $2.70 to $3.90 per box; valencias from $2.45 to $4.25; sweets from $2.75 to $3.15; lemons $4 to $4.55 per box. Other auction points paid about the same as the above. Navels are nearly all shipped from the southern part of the State and valencias are going forward rapidly.

The price on the smaller sizes of fancy navels at San Francisco has again been marked up a little, as offerings are diminishing, though there is no great demand here. Valencias are coming in more freely, with prices as last quoted.

Oranges, Navels	$1.75 @3.15
Valencias	2.75 @3.00
Grapefruit	1.50 @2.50
Lemons, box	1.75 @3.50
Lemonettes, box	1.25 @1.75

HONEY.

Values stand about as before. New honey is quite firm, and so far all that has come in has found a ready market, as the old stock is pretty well off the market. The outlook is

Special Deciduous Market Report.

By J. L. Nagle.

Sacramento, May 29, 1916.

The early ripening of the Deciduous crop is decidedly noticeable this season and varieties that are now moving and that have already arrived in the East, at this time last year were not ready for shipment. The Standardization Law in certain districts is holding back some shipments that, without legal restrictions, would already have been on the market in a condition unfit for consumption.

All fruits are carrying better this season, due in a measure to the quality and to the dryness of the weather. There are very few rejections in the East and the demand is active on all varieties. The following prices have ruled for the week:

New York: Tartarian cherries averaged, $1.60; Royal Anne, $1.50; Bing, $2.30; Rockport, $1.05; Bigarreau, $1.40; Republican, $1.52; Oregon, $1.57; Seedling Apricots, $2.57; Pringle, $1.50; Newcastle, $1.65.

Boston: Royal Anne cherries, averaged $1.65; Tartarian, $1.90; Republican, $1.70; Bigarreau, $1.60; Oregon, $1.75; Bing, $2.52.

Special Livestock Market Report.

Sheep.—The most pressing shortage of mutton ever seen; none in town and very little hope for the early future. At Portland, a fair run; top price wethers $8.25; lambs down to $9 per cwt.

Hogs are coming freely to San Francisco and Portland, mostly from dairy farms. 5000 into Portland May 29, selling $8.65-$8.85. Most eastern markets lower than last week.

Cattle plentiful supply, poorer quality than last year, less inside fat. Scarce at Portland, mostly California grass stuff with Mexican steers beginning to come. California stock top prices, $8.50 but mostly $8 to $8.25. Supply considerably heavier than last year.

Wool local market still very strong. No real change in values. London sales opened 5 to 10 per cent higher all around. Australian sales suspended for few days.

uncertain, reports of a light crop being favorable for rather firm prices throughout the season.

HORSES.

Only a small sale of miscellaneous middleweight stock is being held here this week, and dealers say the market is duller than for some years, even heavy horses finding less demand than usual. Values, however, are well in line with the old quotations. The country market is strong, as Eastern buyers for military purposes are scouring the country, picking up all light and medium weight horses at higher prices than local buyers can pay. The United States Army has been buying considerable stock, but the principal contracts have gone to Seattle, Reno and Kansas City. Orders for a few carloads, however, have been placed with local dealers.

(Approximate values in San Francisco, based on auction sales.)

Publisher's Department

In renewing her susbcription to the Rural Press, Mrs. M. L. Ward of Occidental, says: "I think it a very valuable farm journal. Every article is interesting. At present we are more than interested in your rural credit articles. We think rural credits is the State's greatest need."

In our next issue we will devote considerable space to the sheep industry of California. This branch of agriculture has been neglected by farmers, especially on the small ranches, but the high prices of mutton and wool are commanding attention. Prof. Wickson is now preparing a special article and we have several written, especially for our next issue.

We are getting many favorable criticisms of our new book, "Second Thousand Questions in California Agriculture Answered." Many questions are answered in this volume that just fit your needs. Send for our special subscription offer in connection with the book.

California Fruits and How to Grow Them

EDWARD J. WICKSON.

Seventh Edition, Extended and Revised.

Contains over 500 pages of text with many illustrations. Goes thoroughly into every phase of that immense industry, California Fruit Growing.

In the preliminary chapters, the important subjects of Climate and Soils are handled in a masterly manner, with the necessary modifications called for by the immense latitude, the topography of the country and the different regions with their relation to coast, valley and mountain.

The book then goes into the subject of Fruit-Growing from the nursery, on through budding and grafting, preparation for planting; planting, pruning the trees and thinning fruit; cultivation, fertilization and irrigaton right along to picking, canning and preserving, with chapters on injurous insects, tree diseases and the protection of the trees therefrom. Every fruit and nut which can be grown commercially in California or countries possessing a similar climate, has received the attention which the forty years' experience of the author makes of incomparable value to the fruit grower.

Price, $3.00, Postpaid.

WANTED to hear from owner of good ranch for sale. State cash price and description. D. F. Bush, Minneapolis, Minn.

WANTED to hear from owner of good farm for sale. Send description and cash price. R. G. List, Minneapolis, Minn.

TREES AND PLANTS.

FOR SALE—Manzanillo Olive Trees, budded on Picholine seedlings. Younger and heavier bearers, longer lived and more vigorous trees than trees raised from cuttings. Geo. F. Rice, R. 1, Box 78, Reedley, Cal.

AVOCADO TREES for sale, fine field-grown budded Ganter and Harman variety. $1.00, $1.50 and $2.00. Magnolia Nursery Whittier, Cal.

FOR SALE—Spineless Cactus Plants. Prices right. B. C. Engbert, Byron, Cal.

VACATION LAND

What section of California holds forth such inducement to the vacationist as that traversed by the Northwestern Pacific R.R. Anglers will find the finest fishing; sportsmen an abundance of furred or feathered game; swimmers and bathers have a wide choice of ocean, river and bay; lovers of wild, primitive spots will find miles of great redwood and other forests; rugged mountains and elevations will appeal to trampers; cozy camping locations will entice the family; this wondrous collection of nature begins at Sausalito and extends to the world-old forests of Humboldt county.

A very interesting description of this territory is found in the booklet — Vacation—1916, free copies of which may be obtained at 874 Market Street, San Francisco, or on application to J. J. Geary, G. P. A., 808 Phelan Bldg., San Francisco.

Quality First

5000 Farmers Have Bought This 3400 r. p. m. Chalmers Since January 1st

History will call the 3400 r. p. m. Chalmers the machine with the long-lived engine.

For the same causes that produce ease of driving and economy of operation, insure length of life for her engine.

Long life in a machine of any kind depends largely on absence of strain under average working conditions.

A man—a machine—anything that has to strain itself to the utmost to accomplish results is doomed to short life.

There's no trace of strain in the quiet action of this machine.

No matter how low you sink the accelerator button, as you let her go faster and faster, she'll always convey the impression that she's saving herself. And that's exactly what she's doing, too.

That's because of the great margin of reserve between all normal driving exertion and her crank-shaft speed limit of 3400 revolutions per minute.

You couldn't saddle any back-breaking task upon her if you tried. Chalmers engineers have insured her against that.

She does 5 miles an hour with only 250 revolutions per minute. At 10 miles she does 500. At 20, 1000. At 30, 1500.

You see, she delivers the sort of car speeds at which you run 90 per cent of the time with 16 to 40 per cent strength. She holds 60 to 84 per cent in instant readiness for the heroic hill work and spectacular pick-up which have thrilled the Western Hemisphere all the way from New Brunswick to Buenos Aires.

This high-speed engine gives long life as well as great fuel economy. She develops her high touring car speed at 2900 r. p. m. Her crank-shaft is saving itself even there, for you can still let her out and out.

The faster she spins, the smoother she runs. That's the open secret of her smooth power and riding comfort.

She's remarkably economical, too; gives 18 miles of travel to the gallon of fuel.

When you drop in at your nearest Chalmers dealer's, be sure to inquire about the Chalmers service inspection coupons. They are negotiable with all Chalmers dealers everywhere. This system is a most important consideration in buying your machine.

What Sheep Did for California.

Ninth of a series of sketches in which the Editor presents suggestions drawn from long experience, of what Californians should think and do for the advancement of California Agriculture.

DOMESTICATED sheep were brought to California by the Franciscan padres, and by the soldiers who attended them on their mission-founding enterprise, in 1769. This introduction expanded into a large, rude form of sheep husbandry very quickly. An early writer says: "Between San Diego and San Francisco in 1825 there were at the missions 1,003,970 sheep, and at the ranches away from the missions as many more." We are aware that these figures are impeached by later historians as exaggerations, but that concerns us not; we are dealing with the conception of the facts which exerted an influence in the early years of American occupation, and that was that the coast district of California had been a very great sheep country.

Why So Many Sheep at the Missions?—Another conception of the early days is interesting, and that is that the American pioneers found a most lofty purpose in the mission sheep-husbandry, and were so exalted by it that they forgot the services of the sheep in providing food for hungry soldiery and Indians and in supplying vast numbers of pelts and much tallow for sale to coast trading ships from Atlantic seaports. They looked upon the padres' sheep as a direct Christianizing agency, for one writer says this:

"The Mission fathers reared their sheep solely for the purpose of obtaining a textile from which to fabricate garments for the savages as an auxiliary means of proselyting. Therefore they undertook sheep husbandry on such a scale, that in no long time, the rude inhabitants who flocked to the missions were clothed in garb more fitting their advent among those of Christian civilization."

Suggestions of California sheep on an upland range and in such rough shelter as serves well in a mild climate as protection during the short storm spells.

Here, too, the picturesque conception of the pioneers has been pierced by later historians, who have rummaged through the narratives of travelers adventuring among the California sheep farmers of a hundred years ago. Not only do they forget to record the existence of any such tailoring establishments as would be required to fabricate for the Indians the elaborate and ornate costuming of the Spanish dons, but they distinctly repudiate the capability of such weaving outfits as they saw to produce Christian apparel. Though these narrators do say that they saw, "at the larger missions, as many as two hundred or more women and girls at a time, spinning and weaving," they pronounce the resulting fabric suitable for coarse blankets, but unsuitable for clothing, because it lacked the process of fulling. They say that the soldiers and their families would have been naked at times but for the clothes brought by the traders. Thus it becomes pretty clear that the only weaving was for blankets, or, possibly, father and mother Hubbards, which could be easily fashioned from such a fabric, the coarseness of which would not offend an Indian—for epidermal irritation has always been recorded as an aboriginal pastime. But the classification of such costumes as Christian clothing could never prevail except in the competent imagination of the California pioneers. However, it may be granted that the mission sheep did produce Christian clothing, but very indirectly, and then not for the Indians. The sheep gave the covering of their backs and kidneys for trade with ship captains, who brought fabrics and finery of all kinds for the personal adornment of the soldiers and rancheros, and the families of both. The recent converts from paganism probably secured neither pants, shirts or skirts until such garment had been well tested by their over-lords, spiritual and temporal.

A Very Small Bequest. — What, then did the Americans inherit from the Mexico-Spanish regime? Very little indeed. Though the pioneers believed that there had been two million sheep grazing the coast lands in 1825, so many had perished for their pelts and tallow during the secularization of the mission properties, and so many were probably required to appease the appetites of the first run of gold-seekers in 1849, that the first census taken of the new American state in 1850 records the existence of only 17,514 sheep—or less than one per cent of the number said to exist twenty-five years before.

And what was the character of these few sheep? J. E. Perkins, secretary of the first California Sheep and Wool Growers' Association, which was organized in 1860 (as will be farther noted later), left this record of the mission sheep, which were then called "natives":

In size, form, vigor and disposition they were all that is undesirable—shearing two to two and a half pounds of coarse, uneven, kempy wool, suited only for the coarsest fabrics and scarcely worth the cost of sacking and transporting to market. Yet it is from this basis that our flocks of the present day have mainly sprung, and we owe to this basis the demonstration of the suitability of our climate and grasses to the growing of superior sheep, to which we are now approaching.

We are evidently to credit our picturesque predecessors of the Spanish regime with a demonstration to be made good use of and a foundation to rise away from as rapidly as possible.

The First American Decade.—It is probably not generally known to this generation how energetically, enterprisingly and swiftly the American pioneers lifted sheep husbandry in California to greatness in State development and to national importance. "California for sheep!" was the cry which followed first the world-stirring outcry: "California for

(Continued on page 698.)

EDITORIALS

THE WEEK.

WE ARE experiencing this year the advantage of a cool springtime following an omission of late rains. It has occurred before and always to the advantage of most crops. If it is true, as often said, that it is the late rains which make the crops, it is also true that when such late rains fail, a cool spring can save the crops. Not only is there more grain and hay being harvested than would be expected from the rainfall record, but there is plumper grain than in some years when fair spring rains alternate with hot drying winds. The plants seem to say by their behavior and performance: if we get the ground filled below we would prefer to draw it up for slow growth during small evaporation than to have ordinary spring showers alternated with heat, which at the same time forces growth and robs it by rapid evaporation. And the same conditions seem to serve well the summer-ripening fruits. In the interior valley we never saw cleaner, stronger foliage of tree and vine than during a run to the Fresno district last week. And this was true even where a good load of fruit was being carried. As shown by reports on another page of this issue, there is wide variation on the probable fruit yields at different points, but fortunately, on the whole, there will be some compensation for less tonnage in higher grades and good prices.

The occurrence of Memorial Day last week brought out some interesting facts about California's resources in veterans of '61 to '65. It seems that the "thin blue line, which grows thinner every year," does not apply to California, where the Grand Army has grown no less in twenty years, while there has been a loss of 50 per cent in the Eastern departments. The California department is recruited by immigration to some extent, but it is also held that "the old soldiers come to California to die, and when they get here they find a new interest in life that makes them change their minds and keep right on living." At a recent Grand Army parade in Washington the people in the reviewing stand declared that the veterans from California stood straighter and marched with firmer step than all the rest. California is surely a grand place to await the sunset.

PORCINE PREPAREDNESS.

WE HAVE pulled so much wool over this issue that a few bristles are needed to keep it from going soft. Therefore, we turn to the hog and express our satisfaction that the grunts which our associate editors have kept up for months past, about doing better things with hogs, are now rapidly connecting up into a shrill squeal. Things seem to be moving now toward a systematic effort to realize our opportunities in the line of swine growing and local manufacture of pork products. This effort seems to cover, first, the needs of growers who have the knowledge and enterprise to turn off good hogs—few or many, according to the conditions under which they work; second, to get clear of local buyers, who practice all sorts of greedy exactions and iniquities, which prevent growers from getting value which belongs to them; third, to give those packers who play fair a chance to get all the good hogs which they can use to keep their manufacturing establishments and capital profitably busy; fourth, to secure both for growers and local packers of the right kind, the advantage of local consumption and such export as may be developed from California shipping points. These are some of the planks of our pig-platform, and they will be found more closely related to California prosperity than some of the planks which the political carpenters will be smoothing off this summer for the presidential platforms. At any rate, we are going to preach a little from those four planks right now, for they seem to us to constitute fundamental issues in securing the preparedness which will enable us to meet the problems which must be first solved. They may not be all that must be done in the future. Our readers should remember that practical progress does not usually consist in doing everything at once, but rather in doing one thing after another, as one gets wisdom and strength for it, and in this way to attain at length the last thing which makes the job complete.

TO GET THE GROWER HIS DUE.

WE TAKE it for granted, of course, that the hog-grower knows how to grow a hog which will entitle him to some dues. We pass over silently all those fundamentals of wisdom, insight and emotion which make a man a hog-expert and hog-lover, and of which you can get the biggest two dollars' worth in the world by buying Guilford's "California Hog Book." If a man does not know and feel the things which are written in that book, no decent hog owes him anything, and we are not fool enough to try to help him collect where nothing is due. But suppose he does know and feel these things, and has a bunch of hogs which show that he does, what shall he do with them? That is where we begin. We know well enough how a man feels sitting on the fence with the sun burning his back and his belly caving in, after some smart Alexander of a buyer has made him a call, cussing all hogs in general and his bunch in particular, and ended by offering him a price which will not cover the breeding and board of them. And we know also how he feels later, after he has figured the freights and commissions on a small lot of hogs sent to the city, and finds he may not have enough left to pay for the boar which made them. No wonder he cries out: "There ain't nawthin in hawgs!" and kicks the house cat out of the rocking chair to get even with the animal kingdom!

Brethren: such things ought not so to be, and they need not, if you will produce hogs which manufacturers can use to advantage, and you arrange to sell them in a business-like way. There are probably different ways to do this, according to local conditions, but here is one way in which it is now being done. In Minnesota they had on January last about 150 neighborhood stock-selling associations. The members appoint as manager some man living at a convenient point on the railway. On a certain day (usually one day in each week) the members send their small consignments of stock to the shipping point, where the manager takes charge of them, assembles them in car-load lots and despatches them to the primary market. Before being loaded on the cars each member's stock is ear-marked, weighed and recorded in the manager's books; and when the returns from each car-load are received from the commission agent in the primary market the proceeds are distributed to the members on the basis of these records. And this is the way it works out, according to a recent statement by Prof. Weld of the office of markets and rural organization of the U. S. Department of Agriculture:

In 1913, the last year in which particulars were collected, the total value of live stock marketed through the associations then in operation (115 in number) was about $6,000,000. The number of head of stock sent to market was as follows: cattle 3,300, calves 30,000, sheep 15,000, pigs 250,000. The chief market for Minnesota live stock is South St. Paul, and prices throughout the State are based on the prices current in that market. It has been found that local cattle-buyers pay farmers from 50 cents to one dollar per hundred pounds less than South St. Paul prices, while by shipping through their own associations the farmers receive on an average about 33 cents less than market prices. The saving, therefore, is considerable; and as associations are easily formed and easily managed they are rapidly increasing in number and dealing with a constantly increasing proportion of the Minnesota live stock business.

This means that the growers secure, by associated shipping, service for 33 cents, which the local buyer charged them 50 cents to $1 for. It is possible that even greater economy could be realized by more direct trade. We are not expounding the situation, but merely giving a concrete suggestion.

THE HOGS WHICH ARE WANTED.

WE HAVE had the advantage of seeing some business correspondence on the subject of the hogs which packers, who are now engaged in the effort to make popular products out of California hogs, find to serve best their business purposes. As the letters were written personally from a hog-user to a hog-grower to guide the latter in his business of making marketable hogs, it may perhaps be taken as having superior inwardness to writing undertaken for propaganda purposes. It looks to us like the real thing in local hog commerce, and we outline the points made:

Hogs fed on milk from tubercular cows must be discounted in price because the packer has to stand the losses from condemnation by inspectors. This has run in some lots as high as six per cent. Losses on stubble hogs are less, and when our receipts are largely dairy hogs we can soon tell the difference.

The hogs we like best weigh in the vicinity of 200 lbs. At times there is good demand for light hogs for block trade, although lighter weights, say 100 to 150 lbs., usually sell at some discount as compared with the heavier hogs.

California hogs are not forced as they should be, and, age for age, the California hog does not weigh as much as the hog handled in sections where the business is on a better basis. As a result we are obliged to handle at all seasons of the year a large number of hogs not properly fitted for the market, and to get a share of good weights we are obliged to include a number of these light, poorly nourished and unfinished hogs, which are dear at any price. Cured meats from these undesirable hogs cannot be put out under our regular brands, but must be sold to peddlers and other cheap buyers, who sell them to a trade which is not particular what it sells.

Dressed weight on the run of local hogs does not compare with that of Eastern hogs. There the buyer is reasonably sure of his net weights; here there is no way of telling whether the hogs will dress out 73 per cent or 77 per cent, and this variation is equivalent to 50 cents a hundred on the dressed weight.

With our limited population the demand for trimmings, spareribs, hearts, tails, etc., is comparatively small, and large quantities of them have to be shipped for sale at the East at low net returns, or put in our rendering tanks. The difference in the return for these small cuts will run from 25 cents to 30 cents per hog in favor of the Eastern packer.

Although we think well of the California cured meats there is still much prejudice in favor of Eastern. We hope to reduce this is soon as we are able to put out a really first-class selection of California cured meats, and we propose to tell both dealers and consumers that they are getting California cured stock. We must look for expansion in the packing business in California through an increase in the number of marketable hogs, and still more through an improvement in their quality, and only through the individual efforts of the hog-raiser can this condition be realized.

If you ship to packers in carload lots, you are not dependent on local shippers, and there is no reason why you should not get the highest market prices.

This looks to us like a heart-to-heart talk from a man who has outfit and capital to use a vast number of California hogs, and is disposed to stake his enterprise on the chance of popularizing first-class California pork products. It may not cover everything involved, but so far as it goes it seems frank and rational, and it is up to the hog-raisers to look into it and, so far as it is true, to give it weight in their producing plans and policies. And the best way to find out how far it is true and pertinent is to gather together in neighborhood groups, affiliate with the State Swine Breeders' Association, and root over the whole field. We believe California can be greater than any other State in swine breeding for pure-breds, in the production of commercial hogs and in the supremacy of pork products. The first thing is to know how and the next thing is to do it. But no man nor hog can do it alone.

INQUIRERS MUST GIVE FULL NAME AND ADDRESS.

POPULARIZING OUR PORK PRODUCTS.

OF COURSE the prime requisite is to make them at least as good as any other. Then, so far as the local demand goes, build on patriotism aroused by publicity. Every one of our State products, which are now winning world-fame, had first to overcome local damnation, and they all succeeded in doing this in the same way—first, by improvement efforts, which made them better than others, and then by publicity efforts, which forced people to know it. The hog interest has a great advantage over all other interests in achieving the necessary improvement. It would not take much more than a year to wholly change over all the bad hogs in the State, for two crosses of the right kind would deliver the goods. It ought not to take longer than that to change over the feeds and feeding policies, which may need to be changed to get the right kind of hogs and the proper care to make the better feed effective. If there were any way to be sure that this very quick, and often easy, thing would be done, the publicity campaign would not bring results too soon if it should be begun at once. But of course reforms do not come that way. They come, one thing after another, and the first thing is to organize and exhort for better hogs and to clear the way for profitable sale of such hogs, for these things take more time. It takes more time to make over a man than a hog; therefore, you have to begin on a man. And when you get a man converted and working with his fellowmen toward ends which command his enthusiasm, you have also started well the publicity campaign. For the way to get Californians to appreciation of California hogs is to awaken their interest and engender among them conversation and disputation on the subject. Fill the countryside with pig clubs, the larger towns with pig conventions and the fairs with exhibits and demonstrations, and you will soon dispose of the prejudice that California hams and bacon cannot be good. If you start to frying good California bacon in a State fair pavilion, you will draw to your side everything which has the semblance of a man—even some of the portraits in the art gallery may be near enough to nature for that. And all this means that the Californians who put money in hogs for the purpose of drawing more money out of hogs must do exactly what every other group of California producers is doing, with greater or less success, at this very moment, and that is: get together and squeal!

Potatoes in Los Angeles County.

To the Editor: What is the proper time to plant potatoes in this locality for sale as seed potatoes; also as to the width between rows and the depth they should be covered? I have received conflicting advice from neighbors and write you for information that is reliable. I am planning to plant on gound now being graded after taking out 30-year old seedling walnut trees. When the potato crop is harvested I expect to sow to alfalfa, and would like to know when the seed should be sown and whether the Peruvian alfalfa does better in this locality than the ordinary kind.—I. W. M., Los Angeles.

We would prefer not to plant as late as this unless the land is moist and low and near enough to the coast to get some moist cool air. Except where the air is cool and moist and the soil amply supplied with moisture, midsummer potato planting is risky. The safest planting is earlier in the season so the crop can make winter growth, or later in the season, say in August or September, for autumn growth—in places where sharp frosts are not to be expected. You see it is reasonable that your neighbors should give you conflicting advice for each of them is speaking from a different line of experience had under different local conditions, probably. If you think your conditions justify the risk, make your planting furrows about 30 inches apart, drop the seed about 10 inches apart in the furrow and cover four to six inches, according to soil character and moisture—deeper in lighter, drier soil. Keep the surface flat as possible and loose by cultivation. Irrigate in furrows midway between the rows and do not let the surface flood. Keep the tops growing evenly; do not let them stop and start again by irrigation.

Alfalfa can be sown at any time of the year in your region, except in very high or low places where frosts may be sharp. Probably from October to February is the best period, avoiding of course spells when heavy cold rains may be on. You can watch the clouds and the soil with more profit than the calendar. We are not yet sure that any alfalfa is better, on the whole, than the common variety which came to California from Chile over 60 years ago and which now constitutes nearly all our acreage.

Determining Sex of Offspring.

To the Editor: Is there any known way to make cows have heifer calves? We read in Genesis that Jacob took colored rods and put them in the water where the cows drank or stood looking at the reflection in the water about the time they were being served and the calves were streaked, speckled and spotted. Of course we do not know for sure, but believe those old timers were better posted on cattle than the present cattle farmers.—G. R., Orland.

Jacob was surely some jockey and played his poor old father-in-law in a way that was morally shocking and you are probably right that jockeying has not improved since his day. But if Jacob would do his relative in that way how can we have any faith that the explanation which he gave to the corral loafers of his day was true? We believe that his story was a blind and that he put over on Laban's dams sires of brindled ancestry and got more stars and stripes that way than he could by building lath-fences all the way from Succoth to Padanaram. However, as you say, we really know very little of what was actually done in those days and we do not know much more about the crooked things which are, even now, being worked on us.

But experience is that marking through prenatal influences is probably easier to accomplish than determining sex of offspring and Jacob did not claim to manage that. Some of the theories are given on page 85 of our "Second Thousand Answered Questions in California Agriculture," but none of them has been demonstrated to be workable.

Getting to a Real Market.

To the Editor: I would like to know why there is such a difference in the prices of products in the short distance of 160 miles. You quote the price of barley in San Francisco at $1.30 to $1.40 per ctl. New barley was sold here yesterday for $1.10. A person could purchase a big auto-truck capable of drawing 5 tons down the State highway and make $200 a trip. Automobiles run from here to San Francisco in six and seven hours. I do not know how long a truck would take.—Subscriber, Orland.

We cannot figure it as you do. Suppose the truckman should make the whole difference between $1.10 and $1.40 for barley, and suppose the barley selling at $1.10 was gilt-edge brewing and therefore worth the highest price, the total possible gain would be 30c per ctl. or $6 per ton and the whole increment on five tons would be $30 and not $200. But that, or even any considerable part of it, is too much for the grower to give away. Therefore it is up to the growers to get together and find out just how much they are losing to local buyers because they do not assemble their products and get them to real markets at carload rates, or because they do not deliver their own stuff at primary markets. This is a great fundamental question with all producers. It can only be answered by organization, inquiry and action.

Why So Much Spraying?

To the Editor: In correspondence about buying an apple orchard in another county, we are informed that the trees have their first crop this year and "they have been sprayed four times already." Is it not hazardous to buy an orchard which requires so much spraying? Is there not something awful the matter with it? The knowledge we have acquired of apricots and prunes in the Santa Clara valley does not seem to carry us very far in an apple orchard.—W. L., Santa Clara.

The persistent spraying in this case simply indicates that the owner of the orchard is on his way to a sound apple crop. He is spraying to kill the apple worms as soon as they hatch from the eggs, so that they shall not get out of his reach by boring into the fruit. Such spraying is the price of success in growing apples and pears, and there is nothing awful about it. You are right in your observation that successful growth of one fruit may not mean preparedness for the growth of another fruit. The requirements of each fruit must be diligently studied.

Topping Onions.

To the Editor: I would like to ask if there is any method of topping onions other than by hand? When is the best time to top them?—G. P., Selma.

We know only the usual hand and knife method. It is usual to puli two or more rows laying the onions near to the standing rows and placing the next pulling over them, leaving the pulled onions in long continuous piles across the field. If the tops are well dried and shrunken, topping can proceed immediately; if not a short time in the piles will fix them for topping. California has great advantage in dry summer and autumn air which promotes curing and hastens condition for sacking in the field without house drying. There is no best time for topping; it depends on the condition of the bulb and of the weather prevailing.

Failing Prune Tips.

To the Editor: I send specimen of a discolored tip of a prune branch. I have about ten trees affected in vicinity of others having healthy green color. Will you please diagnose trouble and advise remedy.—C., Chico.

We find no sign of local disease in the tip except a little shot-hole on some of the leaves—not enough to cause the trouble. The affected trees may be standing in bad places and may have suffered some partial root injury. We should cut back the failing tips if the trees are young; on old trees we should wait for the later growth to take the place of the failures—unless the trouble should be following down the branch, and then cut in ahead of it.

Flax Growing.

To the Editor: I am thinking of putting in some flax. When is the time to sow on a dry farm? I saw fine flax grown in Canada and I do not see why it would not do well here.—G. R., Orland.

Flax is about as easily grown in California as barley and is handled with the same machinery—the separator being properly screened for it. It is a winter grower in California and has to be sown in fall or early winter to grow on the rainfall. As flax is not a feed grain, you ought to know something in advance who you are going to sell it to. Therefore intending flax growers should have some understanding with the oil mills, which are the only consumers of large quantities.

Carobs.

To the Editor: Has the tree Algaroba ever been grown in this State? If so, with what success? If not, what do you think of its possibilities?—R. T., Gilroy.

You probably refer to the carob, or St. John's Bread (Ceratonia siliqua). It has been introduced from time to time since pioneer days and old bearing trees can be found in many valley and foothill situations. It does exceedingly well and is handsome for ornamental planting and would be profitable for stock feeding according to standards prevailing from prehistoric times in Asia Minor. It can be purchased from California nurseries carrying ornamental trees in variety.

California Weather Record.

The following rainfall and temperature record is furnished the PACIFIC RURAL PRESS by the United States Department of Agriculture Weather Bureau, at San Francisco, for the week ending at 5 p. m., June 6, 1916.

STATIONS	Rainfall Data: Past Week	Rainfall Data: Seasonal To Date	Rainfall Data: Normal To Date	Temperature Data: Max'm	Temperature Data: Min'm
Eureka	0	38.99	45.28	58	42
Red Bluff	.04	20.21	24.69	94	48
Sacramento	0	18.28	20.00	94	44
San Francisco	0	27.12	22.16	76	48
San Jose	0	16.31	16.75	90	40
Fresno	0	11.72	9.65	96	46
Independence	0	10.34	9.51	90	—
San Luis Obispo	0	26.89	20.48	82	42

San Diego	0	12.55	10.01	66	52

How a Stock Breeder's Son Made Good.

What a pioneer sheep and cattle breeder did for the State and how, by intelligent management, a son has successfully carried on the work.

[Written for Pacific Rural Press.]

"When the late J. H. Glide founded, he founded well." Such was the expression of a California pioneer in recounting the important part the Glide Merino played in the early development of the sheep industry.

Later, as we interviewed his son, T. S. Glide, at his home ranch near Davis, from which he directs in detail the handling of his large flocks of sheep and herds of cattle, we appreciated the words of the old flockmaster. But while the pioneer had known the early Glide for his constructive sheep and cattle breeding, we were beginning to know him for his ability to raise a son—one who could take up the work where the father left off.

Likes Something Alive.—That he did found well in family as well as in livestock is shown by the younger Glide's, "No, I haven't any orchard, except a small one for family use. I'd never be satisfied on a grain or a fruit ranch. I like something alive. Animals keep you interested in your work."

Thornton Glide breeds Rambouillet and Shropshire sheep and Shorthorn cattle; because, like his father, he believes in them. He runs them on range land, because it is the most economical way. He is constantly striving to improve them by selection and breeding in order that he may have the best, as did his father.

The Father's Work.—Many of our readers know the Glide story; how the father came to the State in the early days and raised sheep in preference to mining gold; how he exerted a decided influence in the present French Merino type of sheep by breeding and selection; how this type was eagerly sought by range sheep raisers in all parts of the world; how he acquired immense areas of perhaps the best stock ranges in the State, gradually founding herds of Shorthorn cattle and flocks of Shropshire sheep; and how he came to be recognized as the premier breeder of livestock in his State, on the Coast, and in many ways in the entire country.

The Son Carries It On.—Thornton Glide started for himself in 1906, his mother retaining the cattle while Thornton and his brother took the sheep. In 1911 he also took the management of the cattle herds, picking 30 registered cows from the show herd before the Glide dispersion sale of 1911.

Between the lowlands adjacent to the Sacramento river and the mountain range back of Winters lay a strip of country 30 miles long. To fill this gap T. S. Glide made one of the few improvements in his father's system. He purchased 600 acres of upland, where his present home stands.

One Improvement.—Here he developed water, planted alfalfa, erected modern barns, a silo, and a comfortable dwelling. It is on this place that you find the show flocks and herds; and hundreds of young bulls and rams during sale season. Being midway between the two ranges it is also headquarters for the entire holdings of T. S. Glide.

It is here that the champions and other prize winners shown at the principal livestock shows under the Glide colors have been developed in recent years, except a few Shropshire sheep which were imported from England.

And it is this winning by Glide-grown and developed animals that is most prized by T. S. Glide; for it not only demonstrates the quality of the foundation flocks and herds, but it indicates that the son has been successful in perpetuating the quality of Glide sheep and cattle. Every grand champion Shorthorn at the hundreds of young bulls and rams which annually leave the Glide ranch for range service.

A Continuous Supply of Feed is an important consideration, in which also the senior Glide founded well.

Principally this is furnished by the lowlands, or tules. Much of this is overflow land; and as the water recedes in the summer months it leaves in its wake a green carpet of grasses on which both sheep and cattle pasture.

Late in fall and after winter rains have started, the flocks and herds are taken to the mountains, 30 miles distant, where another supply of nutritious green feed is growing; and where they are kept throughout the winter. Here they get added ruggedness which is a requisite of the range grower of beef and which

Scenes on the T. S. Glide ranch—Upper: Turning ranch over to University Students. Center: A Glide-bred Shorthorn just off the range. Lower: Merino and Shropshire ewes, residence in the background.

State Fair for the last 10 years has been a Glide Shorthorn and all but two of them have been Glide bred and raised.

Uses Prize Winners for Breeding.—With both sheep and cattle, the show ring has been but a stepping stone in the breeding operations. Long before his death the senior Glide decided that to maintain registered cattle in such large numbers as he required was too costly to be practicable. Accordingly the registration papers for most of his herd were destroyed.

That left the range stocked with purebred cattle; but did not necessitate the heavy expense of caretakers and herdsmen. To still further improve the quality of these cattle and sheep, smaller but representative show herds and flocks of registered animals have been kept.

The chief function of these has been to provide sires for the range flocks and herds. With but one exception all of the champions in the show ring have been used as sires on the range stock. This is why uniformly high quality prevails in the few breeders are so well able to supply.

The health of the Glide cattle is also an interesting point. Every tuberculin-tested animal has proved to be a non-reactor. All of these tests have been made by State or Government veterinarians.

While the ranch is one of the largest breeding establishments of its kind in the State, the selling of breeding stock is by no means the only revenue derived. Each year lambs, fleeces, and beeves are marketed in large numbers; for only the best animals are sold for breeding.

As we approached the barns to look at the show herds and flocks, we noticed an unusually large crowd in one of the corrals. "Those," Mr. Glide remarked, "are boys from the University Farm. They make several trips a year over here and I turn the ranch over to them. They need some place like this to study types and practices; and I'm glad to be of service. They are sincere in their desire to learn; otherwise they wouldn't pedal way out here on bicycles."

THE BASQUE SYSTEM OF SHEEP HERDING.

[Written for Pacific Rural Press.]

The Bedding Out, Blanket or Basque system of sheep herding as practiced almost entirely by Nevada sheep raisers is the most economical method of herding on open range lands according to the Forest Service of the U. S. Dept. of Agr.

Their experiments under the Basque system show a saving of 10 to 50 per cent in feed and a greater gain in lambs, of .05 pounds a day.

This system was originated by the Basco sheep herders who operate extensively in Nevada both for themselves and the American flock masters.

There are two ways in which the Nevada Basco herds his flock. One is to establish a camp as near the center of his feeding grounds as practicable. From here he works out in all directions, doing his cooking at the central camp, but after the first night sleeping away from camp with his sheep. This keeps the flock on new feed all of the time and does not necessitate driving them to and from camp night and morning. The latter method always occasions loss in feed and weight. Sometimes he works out from a central camp in this manner two weeks. Other times not so long.

The other method of Basque herding is for the Basco to bed out wherever night overtakes him. Each morning he breaks camp loads his outfit on a burro and starts his flock in the general direction of the next water course for the next night's camp.

Gradually, by both these methods, the flocks are moved from the winter quarters in the lower sections to the high mountain ranges, following the green feed as it becomes available till fall when they again move down to the lower altitudes.

While conditions are more adverse and the ranges more heavily stocked in Nevada than in California, sheep owners here are being urged to practice the Basque system that their ranges may have a heavier carrying capacity and that their lambs may be more economically produced.

WASHING WOOL.

To the Editor: Will you please tell me how to get the grease out of sheep wool?—E. B., Cayucos.

[Wool washing on the sheep's back is practiced in humid countries using stream water when it is running warm and the weather also warm. The sheep are actually washed in the stream or in long vats the width of a sheep, in which several can be put at a time, tandem fashion. Only pure water is used in such practices. The old Spanish method was to wash fleeces after shearing, with ordinary soap and water, and if one wanted a little wool for home spinning he could still do that. But, commercially, no wool grower washes wool. That belongs to the scouring establishments whose expeditious and cheap processes no grower could profitably imitate. If our correspondent wishes a home-use method of washing wool perhaps some reader will give advice on that subject.—Eds.]

Breeding Dual-Type Range Flocks.

[Written for Pacific Rural Press.]

The 1916 way of spelling sheep is D-o-l-l-a-r-s. This is perhaps the spectacular way of putting it, but it is the way nine-tenths of the people one talks to are thinking.

This condition holds true whether you talk to the man already "in," or the man who has fond hopes of getting "in"; the man with a large acreage of cheap land, or the one with a small acreage of high-priced land. In fact, it is difficult to classify them into "ins" and "want to get ins," for the very good reason that those who have sheep are trying to get "in" stronger.

Lambs Do It.—The lamb is the dominating influence in the present cry for more sheep, for his value has jumped from an almost inconsequental one-third of the sheepman's income to about two-thirds; and wool, even at present startling high prices, has to be content as a poor second.

These comparisons are based largely on the business of the large flock master, for while we are rapidly drifting toward sheep on the small farm, the present sheep profits are being reaped by the large operator.

But the fact that he is "in" doesn't in all ways simplify his troubles. On the contrary, the new order of things upsets the breeding system which dates back to the beginning of the American in the sheep-raising business in California in the early 60's.

Must Be Herders.—As far back as history goes in this State, the range-grown sheep has been of Merino breeding. Attempts have been numerous, and one might say continuous, to cross out the Merino blood by the introduction of other breeds, but always it has been necessary to revert back to that breed as a base, for the very good reason that none of the downs or coarser-wooled mutton breeds have developed herding qualifications to meet the range conditions.

As one gray-haired flock master recounts, "Instead of staying with the band, a Black-face seems to try to slip away and hide out." And to the shepherd on open range, nothing is more disconcerting than a flock of sheep that will not band well.

While their good herding propensities were responsible in a large measure for their popularity, the Merino was naturally a wool sheep; and by careful breeding and selection, together with favorable market differential between wool and mutton, both the Spanish and French Merino has been improved in size of carcass, ruggedness, quality of wool, and size of fleece.

To accomplish all of this improvement, years of work were required, intermingled with discouragements, changing demands from the manufacturer, legislative and range troubles, which space here forbids recounting; but which are still vivid in the minds of all sheep growers.

All of those struggles were mainly for wool. The American people had not yet become converts to mutton as a table delicacy, and the two or three year old wether who had yielded two good, full-year fleeces of wool before being sent to the shambles and the unfit ewes, supplied the market demands for mutton, even though they were of wool, rather than mutton breeding.

Consumer Particular.—The American consumer doesn't want heavy mutton. And that is the way sheep authorities account for the present popularity of the lamb in the market and the corresponding high price it has been bringing.

No More Wethers.—This develops the fact that the day of the wether is over. It has also incidentally developed a great, new source of profit to the range flockmaster whose open range affords transportation possibilities in reaching the lamb market. But it makes another complex breeding situation, equally as trying and perhaps more so than the breeding in and ironing out of wrinkles for wool in the past.

Ellenwood and Ramsay's flock of Romney, Lincoln, Merino, cross-bred ewes to be top-crossed with Corriedale rams, in the hope of getting a larger ewe, shearing a good quantity of wool, that will produce a quicker maturing lamb.

Not knowing whether the lamb factor was a permanent one or not, and facing a none too certain tariff revision on wool, the tendency has been to deplete the ewe supply by breeding to mutton bucks almost exclusively, the progeny of this cross going to market at an early age, rather than into the range band of ewes for future breeding purposes.

True, many far-sighted growers have kept up their ewe bands, both in Merino quality and numerically, by keeping two distinct bands; one, the larger, being bred to down or mutton bucks for the production of lambs; and the other, the smaller, being bred to Merino bucks, from which ewe lambs are taken to replenish the range flock of ewes.

Notwithstanding that this system allows of playing both ends against the middle it is not altogether satisfactory, because the first cross lambs are neither as large or as early maturing as the strictly mutton breed lambs. Neither does this first cross prove desirable for wool, so more attention has to be paid to the fleece as well as the lamb.

The Present Need.—Epitomized, the following extract from the National Wool Grower outlines the apparent need of the range flock master at this time. It says, "There is an imperative demand for a ewe with a large frame, good flocking tendency, capable of producing a lamb that is hardy and that will fatten cheaply, and herself producing a paying fleece—one that will protect her during the winter with density, to exclude our cold winds and the dirt they carry, and also of sufficient length of staple to make it always in demand at top prices."

Perhaps the Merino will arise to this occasion as they have to other occasions in the past. In fairness to them, it must be said that the great majority of flock masters in this country are pinning their faith to this possibility.

The claims for the Corriedale are that they have a large frame, are of good flocking tendency, produce large early maturing lambs and a long staple wood.

On the other hand, there are those who believe the New Zealand shepherd has developed a breed during the past 50 years that already fits the specifications. This is the Corriedale, sometimes termed a cross-bred; but in reality a breed by itself now, after continuous inbreeding and selection for many years.

Originally, they were produced by crossing either the coarse-wooled Lincoln or the Leicester onto the fine-wooled Merino. After the first cross, inbreeding was practiced with the progeny, and now it is claimed for them that they shear a long staple medium wool, are of large size with good herding qualities, able to raise a lamb that matures quickly, and makes good mutton.

A California Experiment.—The firm of Ellenwood and Ramsay of Tehama county was the first one to do any experimental work with this new breed, they having imported rams from New Zealand to be top-crossed on Romney, Lincoln, and Merino cross-bred ewes.

Like many present-day summer ranges, the one owned by this firm lies adjacent to transportation facilities, making it possible and highly desirable to market their lambs in mid-summer, direct from the range.

They believe that the Corriedale will be an improvement for their condition over the Merino, because the latter, at present, does not produce the early and quick-maturing lamb, and because they believe the demand of the manufacturer will be for a coarser and longer stapled wool in the future.

They recognize that the Corriedale in itself is not so good a mutton sheep as the regular mutton breeds, and they do not propose marketing the straight Corriedale lambs. On the contrary, they will maintain two bands, as they have previously done with Merinos.

Summed up, Mr. Ramsay has the following expectations of these sheep in California: that they will produce a good quality of wool, now preferred by the manufacturer, that they will produce a more profitable lamb, and that they will prove equally as desirable a herding sheep as the Merino.

After all is said and done, the present market situation has developed a new phase of breeding which seems to say to the prospective raiser, "Pay your money and take your choice." Unless the Corriedale proves a practicable solution of the problem, sheep raisers who operate on large areas of cheap land will probably continue with the Merino, sacrificing some on the lamb, but maintaining the wool-bearing and herding qualifications. The latter two will always be factors.

SHEEP POSSIBILITIES.

[Written for Pacific Rural Press.]

Is the sheep industry at its apex? Is it a good time to go in or a good time to stay out?

To answer these questions intelligently, the markets should be considered. Both locally and nationally Americans are becoming mutton eaters. Present living conditions call for small cuts and roasts. Mutton answers this purpose. The European war has proved a prodigious waster of wool; and industrial activity at home has promoted the more general use of wool in America. As to the world-wide supply, Roscoe Wood, writing in the Breeder's Gazette, says this: "Sheep raising and wool growing are declining in nearly every part of the world. Drouths have materially reduced Australia's wool production. South America's sheep population is decreasing. In our own country the range is being continually curtailed. While foreign wools affect domestic prices, the foreign competition of mutton has little influence on the price of lamb; for the quality of the frozen lamb from the Antipodes or the Argentine practically prevents it from competing with fresh American meat."

What Does It Cost to Produce Crops?

Suggestion of a basis for estimating cost of production submitted for approval or criticism by those who have considered the subject by study or through experience. Discussion is invited.

[Written for Pacific Rural Press by Prof. R. L. Adams.]

It seems to me that a study of cost of production constitutes the first step in a consideration of what a farmer should receive. The second step is to investigate whether he does receive that to which he is entitled, and if not, whether he can so regulate conditions as to secure it.

Elements of Cost.—Viewing farming solely as a business—eliminating for the time being the home aspect—and requiring from the product those items which any business man expects of his business, the items which enter into the cost of production are:

1. Cost of labor, material, taxes, and insurance required to grow and market the crop.

2. Interest on all investment, including land at present market value under forced sale, equipment, and operating capital.

3. A sum to offset depreciation of working capital wherever it occurs, as the wearing out of implements and buildings, and the aging of work stock and live stock.

4. A sum to constitute a sinking fund or emergency fund, to cover damage from fire, flood, drouth or accident.

5. A sum for management or executive ability.

A review of these items indicates that a farmer who secures a price sufficient to cover these five things—provided everything has been included which should be considered—receives payment for his time and labor, replacement of his investment where diminishing values may occur, and interest for the use of his capital.

Factors of Cost.—Viewed in this way, it is evident that with those crops limited in production by soil, climate, water, or acreage, thus resulting in a market demand greater than the supply, the price received by the grower may be greater than his cost—a bonus, which is one of the attractions of specialized farming. Such a man can usually take care of himself. But the man who is receiving less than his cost of production needs consideration. His betterment can be brought about many times not alone by better markets but in many cases by one or more of a number of ways which are well known to the general farming public. For instance, in individual cases, relief may be brought about by one or more of the following: (1) Improvement in labor conditions; (2) better financing; (3) increase in acreage; (4) change in cropping system; (5) increase of soil fertility; (6) better transportation facilities; (7) standardization of farm products; (8) reduction of land values; (9) inspection of products; (10) reduction of overhead expense; (11) reduction of operating expense; (12) introduction of live stock; (13) more intelligent management; (14) elimination of leaks.

Let us investigate, with figures assumed for the purpose, although even at that they are approximately correct, the cost of producing a box of apples, a sack of barley, and a box of oranges.

Apples.—Taking up the items as mentioned above for the usual crop of 150 packed boxes, we find that the cost of caring for a mature orchard—pruning, spraying, harvest, packing and hauling to market, runs about $94. This figure includes interest and depreciation on work stock and implements, but not on buildings, fences, irrigating plant (if one is present) or similar improvements.

The usual producing orchard is worth under present market conditions, about $800 per acre with all improvements. Seven per cent interest upon this valuation adds $56 to the acreage cost.

Depreciation for a one-man orchard, assuming that an experienced man should handle one hundred acres, will amount, let us say, to about $3 per acre when irrigation is not required.

Five hundred dollars is stated to be the extent of a sinking fund to be set aside on one hundred acres of apple land, hence a $5 per acreage charge is to be included.

If $1,800 is required to pay a good man for running one hundred acres, a further charge of $18 per acre is necessary to cover management.

The sum total thus secured amounts to $166 per acre as expense for the usual producing land. On the basis of 150-box yield, the cost per box is $1.11.

Barley.—In general the usual ranch devoted solely to barley production apparently averages about one section of growing grain annually. If the land is cropped two years in three, a total of 960 acres is required. The work stock, implements, wagons, and the like, necessitate an investment of $3,000. Cash for operating expense amounts to about $4,000, for a crop yielding an average of 12 sacks (1300 lbs) per acre.

Taking up the items in the same way as for apples, the figures stand, per acre:

(1) Cost of labor, material, taxes, etc., $6.93; (2) interest at 7 per cent, $ .77; (3) depreciation, $ .56; (4) sinking fund, $ .31; (5) management, $1.50. Total cost of cropped acreage, $10.07; add for working fallow land, $ .31; total cost, $10.38.

Dividing the cost—$10.38—by the yield—12 sacks—the cost per sack amounts to 87½c.

Oranges. — In similarly figuring the production cost of oranges, a good yield is assumed to be 400 packed boxes; the usual yield, 230. Out of 100 commercial producing orchards, not over 12 to 15 will produce "good" yields; and 40 to 50 "usual" yields. A very few of the remainder produce more than 400. The average value of the good crops, in the picking boxes, is figured at $700 per acre; $400 in the usual orchard.

The operating cost, upkeep, and harvest is averaged at $360 and $275 respectively; management, interest on operating capital, and depreciation $75. This leaves $265 as interest on investment in land, buildings and permanent improvements on good orchards. This pays 6 per cent on a valuation over $4400 per acre. For the usual orchard, $90 is left for interest on investment. This would make the value of the orchard not over $1500 per acre.

The time is ripe for a careful investigation into costs, based upon a unit farm for each of the principal lines of agriculture. What figure shall cover investment, interest, depreciation, management and entire cost of production should be known.

A carload of Lindsay Valencias sold lately in Boston at $4.35.

A knowledge of the cost of producing crops should be the first step in determining the price a farmer is entitled to receive for his product. During these days of agitation for better prices, much talk about the 27 cents, 35 cents, 46 cents, or whatever the figure may be that constitutes the farmer's share of the consumer's dollar, and a pretty widespread feeling that something should be done, how much thought is paid to what constitutes the real rights in the matter?

Fruit Crops and Markets.

[Written for Pacific Rural Press.]

Frost, wind, and disease have reduced many crops since the last report. Rains cracked the cherries but they are mostly gone. Rains early in the season rotted apricots or prevented pollenization.

This report is based on tables prepared by chief deputy State Horticultural Commissioner Geo. P. Weldon from monthly reports of county horticultural commissioners. We include below figures from only those counties where 5 per cent or more of the State crop is grown. Subject to change by future conditions.

Almonds 20 per cent of normal in Butte account frost; 60 per cent Contra Costa account rain, wind, and insects; 65 per cent Sacramento; 40 per cent San Joaquin; 80 per cent Stanislaus; 75 per cent Sutter; and 65 per cent Yolo.

Apples 65 per cent in Monterey on account of frost, rains, and diseases; 80 per cent in Santa Cruz, frost; 75 per cent Sonoma.

Apricots 60 per cent Alameda; 25 Fresno; 50 Kings; 20 Riverside; 40 San Benito; 50 Santa Clara; and 40 in Ventura and Yolo. Rain in the early stages is given as the cause. Orange county reporting total failure. In Napa look better than last month.

Berries are 90 per cent in Alameda; 100 Fresno; 100 Los Angeles; 100 Orange; 100 Sacramento; 100 San Diego; 75 Santa Cruz; and 65 Sonoma. First time in 15 years Grass Valley Loganberries frosted.

Cherries 10 per cent Alameda; 85 Sacramento; 25 San Joaquin; 10 Santa Clara; and 25 Sonoma.

Figs 100 per cent in Fresno and Merced, 50 Stanislaus.

Grapes.—Most of the frost damage was to wine grapes. Full crops of table and raisin varieties are reported from all the principal districts except San Joaquin 70 per cent, Yolo 80 per cent, and Placer 33 per cent where American River grapes were in some places frozen back to the arms. Imperial Valley grapes will be moving next week. Merced best set in many years. Vines well cared for and sulphuring universal. No frost.

Peaches 50 per cent Fresno largely on account of disease and lack of attention last year; 90 Kings; 50 San Bernardino; 75 San Joaquin account previous heavy bearing, especially Lovells and Elbertas, many hanging in bunches at ends of limbs; 75 Santa Clara. Root knot and crown gall as well as little leaf and blight are the worst diseases on peaches in the State aside from wood decay.

Pears 65 per cent in Contra Costa where there has been a steady drop, no scab on Bartletts but much on one orchard of 10,000 boxes Easter Buerres; 25 per cent Lake account frost, heavy crop last year, and scab; 68 Sacramento account blight, scab, etc; 50 Santa Clara; 75 Solano; 80 Sonoma, account scab; and 80 Yolo. Grass Valley pears considerably frosted; Placerville and Placer looking better; some of the Sacramento orchards worst blighted two years ago are practically clean now and vigorous. Colusa pears short account rain. Mendocino 1-3 crop account frost and scab.

Plums 80 per cent in Placer where early varieties have been shipped as also from Solano (75 per cent crop). Early plums moving from Sacramento (65 per cent). A 30-acre orchard in Madera bearing this year. Los Angeles 1-3 crop.

Prunes 50 per cent in Santa Clara; 40 Napa; 35 Sonoma.

Walnuts 70 per cent in Los Angeles; 100 Orange; 65 Ventura; 50 Santa Barbara.

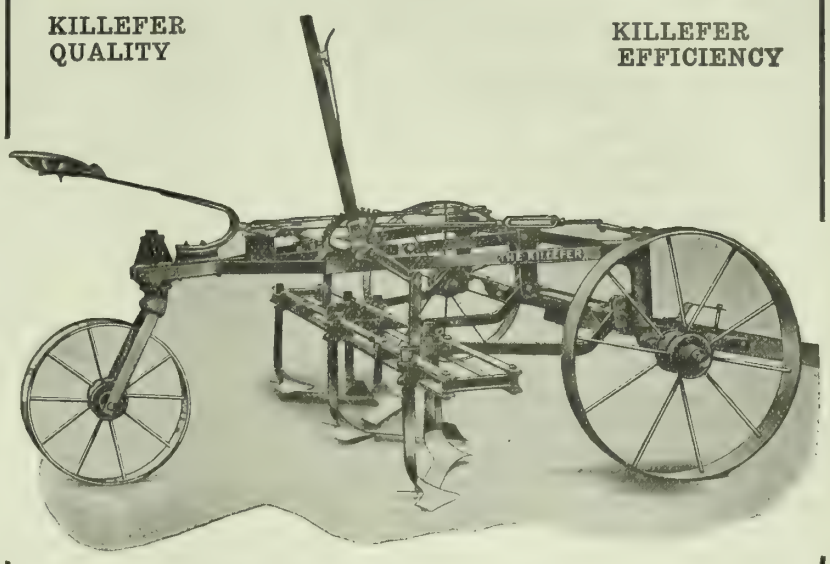
Market Prospects.—There is a general air of prosperity in the fresh fruit markets; the season is two weeks ahead of last year, and the quality of fruit is fine. The new standardization law is being rigidly enforced to the benefit of all legitimate interests.

Cal. Fruit Distributors report shipments to June 3 were 144¾ cars cherries, 100½ apricots, 20½ peaches, 67¾ plums and ½ pears as against 82½, 2½, 1½, 4½, and 00 respectively last year. Totals are 334 cars for 1916 as against 91 to the same date last year.

Early apples have been going East, cherries are nearly all gone, early plums, apricots, and peaches have been shipped. Bartletts from Sacramento river are going forward; and one grower expects to ship a carload about June 25.

In canning fruits, last year's output is nearly all sold and operators are competing keenly for the little of the 1916 crop not yet contracted. Some canneries will pack less than they want. The situation has given a feeling of almost overbullishness among some of the growers who feel that they can dry their apricots and freestone peaches profitably if canners do not come up to their prices.

Growers' organizations are a powerful factor in all dried fruits except apples and pears. Raisin growers have more holdover than last year but they also sold more than to this time last year. Peach growers are promised a fair price and will probably control both the crop and the price. Whether they can sell the entire crop at their prices remains the problem. Dried peaches in the East compete with dried apples, of which there is likely to be a surplus on account of difficulties in exporting fresh fruit. As dried peaches are sold, in U. S., mostly south of Mason and Dixon's line, and prunes north of it, these fruits are not such strong competitors. 1916 prunes are rather weak, probably because eastern buyers are hoping for a break in prices. There is not much doing in either prunes or apricots but growers seem to hold the whip hand provided they do not sell secretly.



There is an element of danger in high prices. This is recognized by the Raisin Co. which attempts to keep consumer's prices down to where the crop will be moved this year. That they failed on Thompsons this year to accomplish this, may get people somewhat out of the notion of using them and it may require extra work, expense, and advertising to regain the consumption.

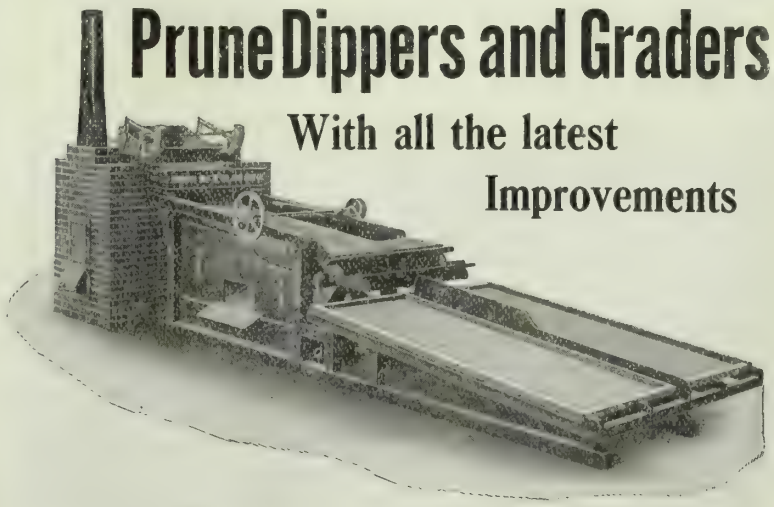
Sugar beets 16 inches long and 10 inches around at two months are being shown by H. E. Blaco of Chowchilla.

Model Bean Cultivator

KILLEFER QUALITY

KILLEFER EFFICIENCY

This Cultivator, like most of our implements, has been developed at the request of Dealers and Ranchers for a strong, simply controlled cultivator, capable of doing their work deeper and better than possible with the light Eastern-made tools. The frame is one piece of high carbon steel without joints to work loose or sag and holds the wheels always true and in line with the rest of the machine. The double frame bar gives ample clearance between the standards and eliminates the tendency to clog in trashy ground. This frame bar has a double lifting device, which holds it rigidly on both sides. A man's weight on the extreme end will not spring it out of line. The seat is set far enough back to give an unobstructed view of the rows and the foot control is very easy on the driver.



An important item for the Bean Growers' consideration is that all parts and repairs are easily and quickly obtained without the delay of sending East for them.

Careful Apricot Summer Irrigation.

[Written for Pacific Rural Press.]

Summer irrigation of apricots in Imperial Valley is dangerous but necessary, according to H. S. Reed of El Centro, who has 4,000 seven-year Blenheim, Royal, and Newcastle trees, one of the best producing orchards in the Valley.

One danger lies in allowing the trees to suffer for water. "The sap goes down or evaporates, the bark contracts, trees become partially dormant. Then when water is applied, the sap rushes up, the dried bark can't expand fast enough, the sap bursts out, the sun cooks it and the bark under it, eventually kills the trees, and people generally complain of an obscure 'disease' as the cause of death."

Water Scalds Bark.—Another danger pointed out by Angel Sacellaris who has long worked for Mr. Reed, is that water applied in July is allowed to reach the tree. Then it scalds the bark. July watering is necessary, says he, to get good plump fruit buds on Imperial Valley apricots, but it should be run through furrows at least four feet from the tree. Water may be allowed to soak within two feet of the tree. It does no good to get nearer. September flooding may be safe if not too warm.

Water After Fruit Off.—Mr. Reed emphasizes the need of irrigation when the fruit is about an inch in diameter and the pits starting to harden. Then is the greatest draft on the tree. No more irrigation is permissible until the fruit is off. Then he says the water must be kept from the trunks or they scald, the leaves drop perhaps within 48 hours, the roots die and blacken. This has happened to thousands of young trees in the Valley.

Unequal Soaking.—Mr. Reed has noticed as water flows through furrows in what seems absolutely uniform soil, it soaks much farther at certain places than elsewhere.' Trees on such places are endangered.

A post hole digger is used not only to know whether the water is going deep enough, but to know where it is going close to the trees.

Alkali and Irrigation. — Everywhere in a country which has been desert, one may suspect alkali. Usually after a few years of irrigation, the alkali comes to the surface. E. Steiner's place on the bluff overlooking New River near Brawley is no worse than the rest, but he has observed alkali collecting along the ridges between furrows after repeated irrigations. He has 600 Blenheim and Newcastle trees three years old, planted on an old alfalfa field. They were uniformly 4 and 5 inches in diameter at exactly three years old, but of one row accidentally set where an alfalfa check had been, over half of them died. The replants lived because Mr. Steiner's system of irrigation had "dissipated" that alkali. He irrigates usually by furrows. But once or twice a year he floods the orchard to "equalize" the alkali through the soil so that it is too weak to be harmful. Sometimes this flood is drained into the river to actually reduce the alkali. This flooding is not done in hot weather. No alkali is seen for four or five months after such treatment.

Mr. Steiner's fruit buds were not so plump last spring as Mr. Reed's or Mr. Erickson's, due as he said, to neglect of irrigating enough in Sept. or Oct. while fruit wood under good conditions would have been still developing.

PEAR TWIGS DYING.

To the Editor: We have young winter pear trees that seem to be blighted. They grew well for first two years, then limbs began to die back. They have been well taken care of, sprayed with winter spray and summer spray of arsenate of lead for slugs.

We are planning to dig them up, but would like to save them if there is a remedy for this trouble.

This valley is considered an ideal place for pears, both summer and winter varieties, and we have raised them successfully, with this exception.—A. M. S., San Juan Bautista.

[If the dying twigs on your trees hold their leaves long after they are dead and the leaves turn black, you probably have pear blight.

All blighted twigs or limbs must be cut off several inches below the last sign of discoloration of the inner bark, and the shears, as well as the cut surfaces, disinfected with a 1 to 1000 solution of corrosive sublimate, carried preferably in a glass or earthenware jar, as the sublimate is quickly weakened by attacking metal containers and even wooden containers. The use of a swab also weakens the disinfectant properties of the solution in time, and the best way to disinfect the tools is to dip them in it.—Ed.]

Surveys have been made for bee pastures in the Santa Barbara national forests, and permits will be issued for each suitable location at $10 per year for 50 hives or less. Permits for 2500 hives have already been issued.

THE BOSS TREE PROTECTOR

Made of Yucca Palm. Is cheap, durable and quickly put on the tree. It prevents rabbits from destroying your trees. A sure protection against frosts, sunburn, grasshoppers, or dry winds. Can be easily removed, will last for years. Send for samples.

Principles of Jelly Making.

[Written for Pacific Rural Press by Prof. W. V. Cruess, University of California.]

(Continued from last week.)

Acid.—A jelly stock should contain near 1 per cent acid to give the best jelly. This is enough to give a "tart" taste. The amount can be roughly judged by taste when it is known that lemons carry about 7 per cent acid. By diluting one spoonful of lemon juice with 6 spoonfuls of water, a mixture containing about 1 per cent acid results. A little practice in tasting various stocks and noting their jelling qualities will make it possible to judge whether enough acid is present or not. If the acid is too low, lemon juice may be added, or other acid juice blended in.

Sugar.—The final jelly should contain about 65 per cent sugar. Some of this sugar is in the fruit, but most of it is added. A jelly may often be made with less than this amount of sugar, but it will not keep. Sixty-five per cent sugar is necessary to prevent fermentation and spoiling of the jelly in other ways. Nearly this amount of sugar is required to cause the pectin to jell.

If one cup of sugar is added to one of the jelly stock the mixture must be boiled a long time to drive off the water and in this way concentrate the liquid until the required per cent of sugar is reached. This long boiling results in loss of flavor. It is better to have a jelly stock rich in pectin and then add 1¼ to 1½ cups of sugar to 1 of juice. In this way, the boiling period is shortened and the flavor will therefore be better. In fact it is perfectly possible to make jelly from currants or berries without boiling at all by pressing the fruit after heating to 180 degrees F., adding 1¾ cups sugar to 1 of juice, heating to 180 degrees F. and pouring into glasses. A rich flavor is retained by this method.

The Jelling Point.—The mixture of sugar and jelly stock is ordinarily boiled until it will "jell." This point may be determined in several ways. The most common way is to dip a large spoon into the boiling liquid and let the juice drip from it. If it "sheets" across the spoon and hangs in broad sheets from the lower edge, it is done.

A more reliable method is to use a thermometer. The thermometer's boiling point in water is first found by heating a little water to boiling and inserting the thermometer in the boiling water, leaving two or three minutes and reading top of column. At sea level, an accurate Fahrenheit thermometer will indicate 212 degrees F. and a Centigrade thermometer 100 degrees C. This point is determined once only and is necessary because many thermometers are not accurate and because at points above sea level, water boils below 212 degrees F. The thermometer can then be used on the boiling jelly stock. The bulb must be inserted to the bottom of the pot. When the jelly boils at 9 degrees F. or 5 degrees C. above the boiling point for water, it is done. At sea level the jelling point is 221 degrees F. and 105 degrees C.

This method is used by large jelly manufacturers and gives a sure method of control.

If a temperature much more than 9 degrees F. above the boiling point of water is reached, the sugar becomes so concentrated that crystals form in the jelly.

Filling Glasses.—The hot jelly may be strained through cheesecloth into glasses; straining avoids the necessity of skimming off of coagulated albumen, etc., formed during boiling. For home use, melted paraffine poured on the jelly in the glasses while the jelly is still hot is the most satisfactory way of protecting against mold.

CANNING RIPE OLIVES.

To the Editor: I would like to can ripe olives at home so they will keep.—C. I. L., Upland.

[Answered by Prof. W. F. Oglesby, University of California.]

[Can them in the same way as other fruit, only use brine instead of syrup. Heat to boiling, one pound salt per 4 gallons water. Then put the olives in, cook 10 minutes, and seal them. Better still is to put the olives and hot brine in the cans before cooking. Of course the bitterness must be removed previously.]

We May Be Able to Pay 6c for Peaches---

---*BUT* we will need more acreage and the balance of stock subscriptions

Will you do your part to secure this added cent over what is now virtually assured?

Five cents will probably be the price as things now stand. But if the **CALIFORNIA PEACH GROWERS, Inc.,** can get enough acreage signed up and can sell $300,000 more stock and thus make up the million dollars capital, it is possible that the greater price may be secured.

Help get it! Go after your friends and neighbors. Get them to sign. Get them to subscribe for stock. It will be the best application of your time possible.

1916 SMYRNA FIGS

Mr. Grower, how many will your trees produce this season? They have brought as high as ten cents per pound in the sweat-box on account of the war interfering with importations. You have done your pruning, plowing, irrigating and cultivating, but this expense will be wasted, unless your secure a sufficient supply of **PROFICHI FIGS** of the right varieties. The Mamme crop was short this season and the **PROFICHI** crop will be short as a consequence. I have a larger Capri orchard than my Smyrna trees require and will have a surplus of **PROFICHI FIGS** for sale. After spending your time and labor to secure a crop, can you afford to lose a $200 a ton crop by neglecting to secure the necessary **PROFICHI FIGS?** Limited quantity, June delivery, for sale. Order now.

Irrigation Ditch Bottoms Level With Land

[Written for Pacific Rural Press.]

The trick in building irrigating ditches is to have the bottom of the ditch on the same level as the land that is to be watered, according to E. Harter, ranch superintendent for A. B. Humphrey at his large Berkshire and Guernsey breeding establishment near Escalon, San Joaquin county.

Mr. Harter has superintended the leveling and checking of 250 acres of alfalfa land. After leveling for the checks, he runs a regular railroad grade where the ditch is to be located, the top being level with the adjacent land.

After this is finished he adds a 10 inch fill on top, the entire length of the proposed ditch. This fill is then made into banks two feet high with a scraper, making the top of the original grade the bottom of the completed ditch. With this arrangement the ditch does not have to be filled with several inches of water before irrigation of the land is started; and neither is there much left in the ditch after the water is turned off. The ditch drains completely right after the water stops running.

Another feature of Mr. Harter's ditches is the six foot width at the bottom. When water breaks through gopher holes, etc., he opens all the gates, lowering the water in the ditch and making it easy to repair the hole.

Another advantage of the wide bottomed ditch it is accessibility for a mowing machine in cutting weeds on the ditch banks. Usually a scythe is used to do this work but Mr. Harter can drive a mowing machine down the bottom of his ditch and in two trips cut all of the weeds on both banks.

EASY MONEY.

To the Editor: The following explanation of how a rural credit concern operates in this state was given to the writer recently:

The company was organized and incorporated under the state laws. Shares were issued and sold to the amount of $88,000.00 to pay 8 per cent interest.

The farmer who wishes to borrow $1000 from this corporation gives his note for $1,200.00 secured by a 1st mortgage on his property and receives $1000.00.

He pays from this time on, until he is able to pay off the loan, 6 per cent interest on $1200 or $72 per year, which is 7 2-10 per cent on the $1000.00 actually borrowed.

If he is able to pay back the $1000.00 at the end of 12 months, he pays $1200.00 plus (6 per cent) $72.00 or $1272.00. In other words he pays $272.00 for the use of $1000.00 for one year, which is 27.2 per cent, whereas $1000 at 6 per cent would have cost him only $60.00.

The loans are made to cover a period up to 10 years. Supposing the farmer should pay up his loan at the end of any year from the 1st year to the 10th or expiration of the loan when he is subject to the usual foreclosure, we have the following schedule of interest which he has been obliged to pay annually.

$1000 borrowed on the basis of a $1200 note bearing interest a 6 per cent—1st year 27.2 per cent; 2nd, 17.2 per cent; 3rd, 13.8 per cent; 4th, 12.2 per cent; 5th, 11.2 per cent; 6th, 10.5 per cent; 7th, 10 per cent; 8th, 9.7 per cent; 9th, 9.3 per cent; 10th, 9.2 per cent.

This is a simple exposition of how crafty high finance is worked out for the farmer's benefit.

You will observe that the farmer who is unfortunate enough to be able to pay back his loan at the expiration of the 1st year is rewarded by being charged over 27 per cent while a running debt for 10 years lets him out to the tune of only 9.2 per cent.

Officers' salaries, overhead expenses and interest to stockholders have to be paid. These items are met in the sweat of the summer's sun, in the face of drouth, flood, frost, blight, mud, and pest.

God helps those that helps themselves if they only know how to dip in. That is the main thing!

Wm. Curtis Clark.

HOT-BEDS TO START CANTALOUPES FOR FIELD CULTURE.

[Written for Pacific Rural Press.]

Hot-bed plants for a perfect stand of early cantaloupes are very profitably raised by D. C. Smith of Ripon, who has been experimenting three or four years.

Last season he planted over six acres from the hot bed. Two weeks later he found just 40 hills to replant. In April our representative noticed that the vines were making a splendid thrifty growth and a number were in bloom. At the same time, those starting from seed on the same place were just coming through the ground. Comparative costs and profits are being kept.

Mr. Smith plants in small pasteboard frames in the hotbed. In transplanting, he sets frame and all quite deep for sake of moisture and removes the frame before filling in the dirt. The plants do not wilt down.

LAYERING FEIJOA TREES.

To the Editor: I wish to propagate from an Andre feijoa tree by layering. Should the shoots be partially severed in order to make them callous over and send out rootlets; or is all that is necessary to simply heap earth around these shoots at the base of the tree? At what time of the year should such shoots be layered. How long will it take them to root? The tree is a layered one, so shoots from the base will be of the right variety.—C. R. C., Proberta.

[Answered by F. O. Popenoe, Altadena.]

[The best method of layering the Feijoa trees is to bend the lower limbs down and fasten them into scooped-out places in the ground. A forked stick with one end longer than the other may be driven into the ground to hold the branch down firmly. Cover with three or four inches of earth. The best time for this work is in the fall, but it can be successfully done at almost any time of the year. The shoots should not be partially severed until they have made some roots. Then, by making a cut in the branch between these new roots and the main tree, the top growth of the new plant is increased. Two or three months will be required for the layered branch to start out the new root growth, and during this time the ground, while it must not be kept wet or soggy, must never be allowed to dry out, and should at all times be moist.

The layering of the upper branches may also be successfully worked, but the process is more difficult. A frame must be built up to hold boxes of earth or moss into which these upper branches may be fastened and then in the same way these boxes of earth or moss must be kept moist.]

ACRES OF WILD FLOWERS INCLUDE 225 SPECIES.

[Written for Pacific Rural Press.]

When we described the five acres of native California wild flowers in Los Angeles Exposition Park early last spring they were not so lovely nor so suggestive as now. The county supervisors contracted with Theodore Payne, who has devoted most of his life to California wild flowers, to prepare the ground, plant it on artistic wild landscape gardening lines and care for it two years. The result is a condensed education as well as a creation of beauty 'mid city surroundings.

Water Pipe

Why Tepary Market is Poor.

To the Editor: In your issue of May 20, I note an article entitled "Tepary Market Poor." At present the tepary market is poor for two principal reasons: (1) There is a prejudice against the tepary bean as a substitute for the small white largely because its value in comparison with the small white is not thoroughly understood. The tepary bean contains a higher nutritive value than the small white, and in addition, has the peculiar quality of giving 40 per cent more bulk when used for canning purposes than the small white.

Cooked Differently.—Many persons who have tried to cook the tepary bean as other beans are cooked have been disappointed. To educate the consumer concerning the value of this bean we have collected and are publishing a number of recipes which will produce a most delectable dish when carefully followed. [Recipes in Home Department.]

Need Carload Lots. — The other reason why the tepary bean has not found a better market has been that it has been produced in such small quantities that it has been almost impossible to secure a carload lot in any locality. If enough farmers were to plant five acres apiece, in the aggregate there would be sufficient to ship several carloads in many localities, and yet no farmer would run the risk of losing very much in case of failure for any reason.

That these beans are so very drouth resistant and will produce a good crop where the small whites are a failure, is bound to make them increasingly popular throughout the entire Southwest; and more of them will undoubtedly be grown every year in Texas, New Mexico, Arizona, Colorado, and California. Therefore, the thing for the bean growers to do is to get busy immediately and endeavor to establish a standard staple market for this bean.

Plant Only White Teparies.—One word of caution in connection with this bean, and that is that only the standard white tepary should be grown. In planting seed, beans which have a tendency to be yellowish in color should be discarded, and so far as possible pure seed should be secured. In Arizona we distributed last year some seed of the pedigreed strain known as the Arizona Tepary No. 17. A considerable supply of seed was grown from this distribution and will be planted locally this year. In addition, we are distributing more seed of this strain. We would suggest that the California bean growers demand the Arizona Tepary No. 17 so that they may be insured of securing a purebred, high-yielding tepary. **S. F. Morse.**

University of Arizona.

DRY-FARMED INDIAN CORN FOR SILAGE.

[Written for Pacific Rural Press.]

June feed was needed so badly one fall for his herd of seventeen Jersey cattle that G. W. Dimmick of Sonoma county began using silage as soon as it was cut. The green corn he had been feeding was not so well eaten as the fresh silage, although both methods involved waste until the remainder was well fermented, when none was wasted.

The silo was a new one, but previous experience bade Mr. Dimmick cut up his corn before it should dry up in the field. Half of his twenty acres were planted to Eastern seed and produced but little feed. The rest filled the 14x24-foot 71-ton silo.

After August 31 each animal had eight pounds of silage twice a day and 2½ pounds of dry alfalfa meal moistened, besides what dry grass they would pick up in pasture.

The corn, a white dent, was planted for silage by hand three feet ten inches apart each way. There is seldom any rain after the planting in the last of April, so the corn must be placed deep in moist ground. Mr. Dimmick thinks one plowing is enough if done in the spring and followed by four harrowings and one clod-mashing. His soil is a loamy adobe. He cultivates four to six times and cuts when the kernels are in the stiff dough just before denting. Since grass comes in Sonoma county in November, not all of the silage is fed this fall. To keep it from spoiling ten inches to two feet before he begins feeding next summer the top of the silage is wettened and barley or other grain or cheat are sown to make a sod which preserves it.

SUDAN FOR SEED.

[Written for Pacific Rural Press.]

A man who subscribed to Pacific Rural Press last October in Inyo county has failed to look over the headings of the articles since Jan. 1, 1916. He asks several questions about Sudan grass which have been answered during that period. We would refer him to pages 64, 177, 225, 251, 291, 353, 417, and 459 of the 1916 issues. And he forgot to sign his name.

Plant sudan grass in drills if seed is scarce or broadcast if time is scarce, which it is now.

Frost kills the young plants like corn, but if they have made the "button" they will usually sprout again. Sudan may be cut for hay about 60 days after sowing under fair conditions, when it is 2½ to 3 feet tall, coarser for horses if desired, than for cows or hogs. Then if only hay is needed, cut about every 30 days. If seed is desired, let the second crop do it, for there will be more seed than would come on the first crop. Under fair conditions of soil and moisture you may get 1½ tons of seed per acre whether drilled or broadcasted, as it stools freely. If planted in June there will be some danger that seed on the second crop will not mature before the fall rains. Sudan yields more than alfalfa dry farmed, and less than alfalfa irrigated. It contains less protein and is sweeter than alfalfa.

MAY IMPORT PECANS.

To the Editors: Are we allowed to import pecan nuts, buds, and trees from Florida?—J. D. N., Modesto.

[Answered by E. Clare Dutton, State Commission of Horticulture.]

[They may be imported if the regular horticultural inspection on arrival in your county shows them free from disease.]

Beaumont early apple shipments will begin soon.

The

Bates Steel Mule

"One Man Tractor"

THE BATES STEEL MULE is the only machine in the world that replaces horses. It has been in the hands of farmers all over the world for the last several years, and stands today without a rival.

No other tractor in the world goes into the owners' hands guaranteed as is the BATES STEEL MULE, and the only reason it is so protected is because the quality and durability of the material in its make-up is so good that its manufacturers can afford to give this extraordinary protection:

Guaranteed for four years from its head to its tail and a perpetual guarantee on its crawler.

Pays for Itself in Less Than One Year

Mechanical Power on the Farm.

AUTO CRANKSHAFT CONNECTED TO MACHINERY.

[Written for Pacific Rural Press.]

Many people are putting belts onto the rear wheels of their automobiles to run saws, silage cutters, hay choppers, fanning mills, separators, concrete mixers, hay presses, pumps, etc. This works all right but puts severe strain on the transmission sometimes.

To take the power directly from the crankshaft a device is now made back east. It is all ready to bolt onto Fords with bolts already there, and can be adjusted to other ma-

Cutting silage without hurting automobile.

chines. It may be taken off in a few minutes, and as easily put on again.

The device consists of an extension rod connected to the crank shaft to hold a belt wheel just beyond the front line of the front tires. A smaller pulley on this rod runs a fan to cool the radiator. A crank handle is fitted in front of the belt wheel to start the engine. It does good work up to 10 h.p. without straining the machine.

STATE WANTS TRACTOR OPERATORS.

Applications for employment as Farm Tractor Operator in the service of the State will be received at the office of the State Civil Service Commission, Forum Building, Sacramento, on or before June 24, 1916. The salary is $45 a month, with room and board in addition.

This examination is open to all American citizens residing in California who are between the ages of 21 and 60 on the date announced above and who meet the requirements.

A candidate must have had at least one year's recent experience as a gasoline tractor operator, should be able to make his own repairs, and have had experience in working land.

No written test will be required. Candidates will be rated upon their experience and upon an oral examination to be conducted by a special Board of Examiners designated for the purpose by the Civil Service Commission. After all the applications have been reviewed, candidates will be notified when and where to appear for the oral examination.

SEPARATE PUMP FOR BARNS.

It is not always convenient to raise the irrigation water high enough to use around the barnyard. This is the case with W. S. Rosecrans of Los Angeles county. He has Layne & Bowler pumps for irrigation at a well distant from the house. For home and dairy use and to water the stock he has a little 2 h.p. General Electric motor located under a large water tank and connected by belt to a pump several feet distant. The pump is on a concrete foundation,. but to avoid the strain which would tend to rack its belt wheel, the axis of that wheel is extended to a boxing on a separate concrete pedestal. The belt wheel runs a small cogwheel on each side of the pump. The small cogs run large ones. These are connected to the arms which work the pump rod.

Air Pump Uneconomical. — There is also a motor-driven air compressor irrigation pump near by, which Mr. Rosecrans says is only 25 to 30 per cent efficient as compared with 50 to 60 per cent efficiency of the centrifugals. However, it is valuable where the water lift is only 20 to 30 feet, or where there is so much sand in the wells that it would wear out ordinary pumps. As the water-lift here is 75 feet, the air pump is not used.

WINDMILL TANK OUTFITS.

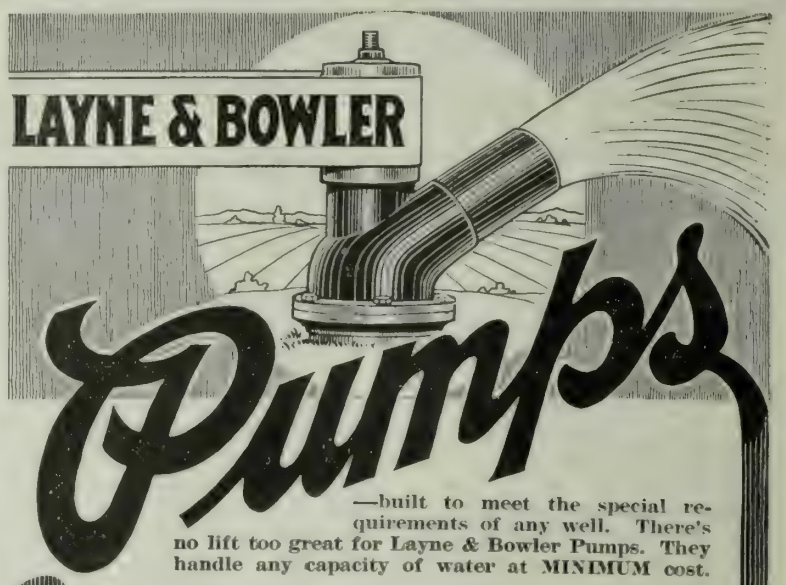
[Written for Pacific Rural Press by Wm. Curtis Clark, Oakland.]

A combination tank and windmill frame, which supports a mill mast at one side of the platform, is excellent.

See that all braces and girts are flushed with the outside of the main supporting posts so that the frame may be enclosed with siding to give extra storage or cooling room at little extra cost.

Do not make the mistake of using very small main pipe from the tank, because the friction will choke down the pressure delivered to your house and hose nozzle and entirely destroy the expense of putting your tank up in the air.

If possible use 1½-inch pipe or at least 1¼-inch for 100 feet, reducing to 1-inch and then to ¾-inch at the house for the domestic system.



If you have trough capacity for one full watering it is all right to use ¾-inch run to a ball float valve in trough, but if flushing pressure is desired in the stables it is better to use 1-inch pipe to hose bibbs.

Never tap the tank through the bottom. Let the discharge come through the side 4 inches to 6 inches above the tank bottom so as to leave a settling space for sand or sediment that may be easily cleaned out at intervals without getting into the faucet valves.

Use a "full way" gate valve on the main supply pipe beneath the tank so that the water may be cut off for washer renewals and repairs.

Redwood stave tanks are giving

—built to meet the special requirements of any well. There's no lift too great for Layne & Bowler Pumps. They handle any capacity of water at MINIMUM cost.

Consult Us Before Having Your Well Drilled

Unfortunately, many wells are sunk prior to giving much thought as to the kind and type of pump to be used. The idea that the essential thing to be considered is to secure a well that will produce a sufficient quantity of water and then select a pump, is wrong. The sinking of a well is the first cost, but the pumping cost is continual, therefore, the question of selecting the right pump should be duly considered beforehand.

We would especially recommend that you consult us before having your well drilled, as we can materially assist you. It is a common error to drill wells that are too small in diameter to permit the installation of the style of pump that will give the best efficiency for the amount of water it is desired to handle. It is surprising how few owners of pumping plants realize the enormous saving that an efficient pumping plant will make or who are really aware of just what the efficiency of their plant is.

We have authentic data on file regarding water conditions all over the country, and will be glad to place it at your disposal at any time. Our engineering department is at your service to assist you in solving any irrigation problems that you may have. This original Layne & Bowler service is free and places you under no obligation whatever.

Write for Catalog No. 25.

Layne & Bowler Corporation

900 Santa Fe Avenue, Los Angeles.

"The World's Largest Water Developers."

For Water Deep Under The Ground

Jackson Deep Well Turbine Pumps give continuous and efficient service. They do not get out of order as they have no valves or plunger rods. Very little care or attention needed as they are oiled from the surface. Are much lower in cost than other types of deep well pumps when the expense of dug pits, cribbing and timbering is reckoned. They raise water from the very bottom of the well, thus eliminating heavy vacuums and delivering all the water the well yields. They develop slow wells and increase their flow.

Like all Jackson Made Pumps These Deep Well Turbine Pumps Are the Very Best Pumps Made for the Purpose—They are Dividend Earners, Not Expense Makers

Whatever your water problems may be our Expert Pumping Engineers will help you out free of charge—write

good service and in some locations there is a saving in cost with freight.

In laying out the frame plan be sure to provide the right offset to center the mill over the well and offset the tank on the platform a sufficient distance from the mill mast to allow clearance for the power cut off lever to work up and down alongside the tank.

DRAINAGE DITCHES DUG BY EXPLOSIVES.

[By J. R. Mattern of the Giant Powder Co.]

Under proper conditions, digging drainage ditches with explosives, saves much time and hard work. Economical ditch blasting can be done only when the ground is wet. Yet if it is too wet, experience has shown that a successful ditch can not be made. For instance, in muck swamps where the material was semi-fluid, the explosives threw out enough material to leave a ditch, but the banks immediately moved in and closed up the cavity.

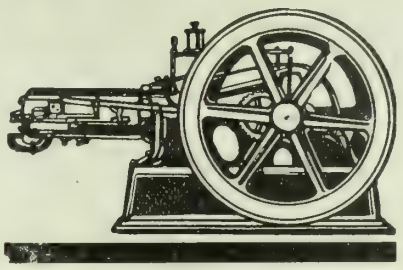
Sandy soil offers another problem. When there is just enough water to bind the sand and what little loam and clay may be mixed with it, and not enough to make the sand soft, ditches can be blasted out very effectively and satisfactorily. Place the charges shallow enough so they do not send their force to useless depths in the softer subsoil. Do not try to blast ditches in dry sand, though if you cannot wait for the wet season and you are willing to meet an increased expense, you can blast ditches through dry clay or heavy loam.

The most economical and satisfactory soils in which to blast ditches are the lighter clays, or heavy loams. Here whenever the ground is water-soaked, or even fairly moist, the results of blasting are surprisingly good. One reason probably is that the substrata of earth nearly always are solid and gas-resisting.

AUTO REPAIR KIT.

[Written for Pacific Rural Press by Wm. Curtis Clark, Oakland.]

The repair kit furnished with the car is supposed to be complete, but we know it is not, by hard experience.



Here are a few additions that every driver ought to have with him.

A box of assorted cotter pins, box of assorted A. L. A. M. nuts, box of assorted spring washers, roll of friction tape, spool of No. 18 or No. 20 gage flexible steel wire, 25 feet of ⅜-inch hemp rope, 25 foot coil ⅜-inch wire cable, three lengths of baling wire, and ½-doz. extra spring tire valve cores.

A new crescent wrench is now made double ended combining two sizes in one. This is a very handy and economical tool.

When you inflate a tube or tire never forget to put a drop of spittle on the end of the valve before screwing on the cap. If a bubble forms you will know that the valve is not air tight.

Economy

ECONOMY that is real economy. Economy in fuel, in the greater amount of power generated for a given fuel expense, in reliability, endurance, and in every quality that spells engine satisfaction, is built into the

Commercial Engine

The Commercial is always ready when you want it. The parts are few—the operation simple—breakdowns almost unknown. It is designed and built for fuel and service conditions of the West. Most rigidly inspected, and sold under the strongest guarantee that we know. Tested and proven by years of service. Write for Catalog explaining construction, and containing testimonials, and irrigation data FREE.

GOLDEN GATE WEED CUTTER AND MULCHER

Farmers, order early if you want the Golden Gate Weed Cutter and Mulcher, as the demand this year will be great, as it not only cuts weeds, but kills them, and leaves finely pulverized top soil. Cuts any depth. Prevents evaporation by working under the soil without disturbing soil on top. Write for circular. C. G. SIGURD,
Capitol Avenue and McKee Road, San Jose, Cal.

General Agricultural Review.

GRAIN AND FIELD CROPS.

An entire section of 640 acres in rice has recently been planted near Corcoran.

E. S. Emmett of Las Posas sold 70 tons of lima beans late in May at 5 cents cash.

New crop potatoes have been shipped out of the State from the Delta this week.

"Wireworms Destructive to Cereal and Forage Crops" is a U. S. Dept. Agr. bulletin recently issued.

New grain has been coming into the Simon Newman warehouses on the west side of the San Joaquin.

The Glenn County Rice Growers' Ass'n was formed in Willows last week with L. H. Tweed as temporary president.

Eighty crates of asparagus per acre netting $4 per crate were averaged on 45 acres of the Fetterman ranch, Brawley.

Dry weather brought grain harvest earlier this year than usual in Fresno west side where it started last week. Grain is being hauled.

Seven crates of cantaloupes from Imperial Valley returned $130.91 to the shipping company late in May. The New York sale price was $155.

Grain in Solano county east of Dixon suffered from early excessive rain and later excessive dryness; and will make only a light yield of hay.

It is said that U. S. grows 24 per cent of the world's wheat, 76 per cent of the corn, and 70 per cent of the cotton; and has 1-3 of the wealth of the world.

Cantaloupes shipped from Brawley previous to June 1 numbered 340 carloads this season. Of these, 277 went east. Daily shipments average about 40 carloads.

Nevada hay, a mixture of alfalfa, timothy and clover, is being bought at $17.50 baled, by eastern race horse owners. Four carloads were shipped from Reno last week.

Button clover will succeed wherever bur clover does well, according to U. S. Dept. Agr. It produces more seeds but without the stiff whiskers; so they do not stick in sheep wool.

Cotton acreage in U. S. is over 15 per cent greater than last year according to the Chamber of Commerce of U. S. It is felt that there will be a strong market when peace is declared.

About 7,000,000 bushels of Marquis wheat were grown in U. S. last year. It ripens a few days earlier than the other Fife varieties. It stands drouth or rust and fall rains better, says U. S. Dept. Agr.

Market Director Weinstock is lending his influence for a co-operative effort to eradicate potato diseases from the Delta. Subscriptions for the purpose are being asked at 10 cents per acre.

A rice experiment on 20 acres 20 miles south of Sacramento is being made to determine adaptability of thousands of acres near the River overflow line. Wateribune has been selected, to resist the wind and cool nights.

The best barley crop in the Athlone district is estimated at 8000 sacks on 400 acres belonging to the Hayes Cattle Co. The ground was plowed 12 inches deep two years ago and a crop of corn grown. Other crops in the neighborhood are said to be generally poor.

The cotton crop of U. S. on May 25 was 77.5 per cent of normal as compared with 80 per cent a year before and 74.3 per cent two years ago according to U. S. Dept. Agr. California's crop is 97 per cent as against 80 and 100 for the two years preceding, at this date.

A bill has been introduced in Congress authorizing the Secretary of Agriculture to determine, establish, and compel use of grades for grain shipped in interstate or foreign commerce if sold by grade at all. This follows complaints by foreign markets of unscrupulous grading.

To prevent threshing machine explosions, the U. S. Dept. Agr. recommends one or more of three precautions: ground the machine so as to remove static electricity; install a suction fan to remove smut and dust; or install an automatic fire extinguisher.

CITRUS AND DECIDUOUS.

The California Peach Growers elected seven directors this week.

Japanese plums will begin moving from Dinuba about June 15.

There is hope of six cents per pound to growers of dried peaches.

Hanford Elbertas will begin shipping east about next week.

Apricots, plums, and peaches have been going out from Merced for a week.

Peach growers are urged not to contract dried peaches at 5½ cents, as 6 cents is hoped for.

Ten and 11 cents are offered at Dinuba for dried apricots. Green apricots are going at about $40.

A million empty cans and two carloads of sugar have arrived at the Hanford plant of the C. F. C. A.

Five and ten-year contracts have been signed at Yuba City for free peaches $15, and clings $22.50 to $27.50.

A special San Joaquin valley label is put on the souvenir packages of their fruit being sold at the San Diego Exposition.

Freestone peaches at Dinuba are sought at $20 to $22.50 and clings around $30. Growers are refusing 5½ cents for dried peaches.

A jar of German prunes put up in Chico in 1888 by Mrs. Rolland Diller took a special prize at the Butte County Spring Exposition.

Hunt Bros.' cannery at Hayward expects a big run on apricots, peaches, pears, plums, and tomatoes, though they had to ship in cherries.

An 11½-acre Valencia orchard near Anaheim has changed hands for $22,000 cash. Another near Whittier, of 10 acres, sold for $33,000 recently.

Green fruit from San Joaquin valley is to reach Chicago on the morning of the seventh day and New York on the tenth day. About 4000 cars were assembled and shipped from Fresno via S. P. last year.

The Tulare County Growers' Ass'n will can at least 100 tons of apricots this season. The Golden State Canning Co. of Ontario have assumed control and have shipped four carloads of machinery for the plant.

The Cal. Peach Growers' Ass'n has signed agreements with several fresh fruit shipping companies by which the former is protected as to dried fruit; and all members are authorized to sell to those companies without further permission.

NUTS, GRAPES, BERRIES.

Berry pickers are scarce at Graton, Sonoma county, where the harvest is in full blast.

The Durham Almond Ass'n elected Thos. Mitchell president and George Jones secretary.

A San Francisco fruit dealer has contracted 800 tons of Thompson Seedless fresh grapes at about $35.

The Cal. Wine Ass'n have signed contracts to deliver their 4,000 tons of raisin grapes to the Associated Raisin Co.

PAY FOR CHOICEST PEAR AND PRUNE LAND

When Orchard Comes Into Bearing.

20 to 40 acres of proven pear and prune land in Bear River Gardens. River sediment soil, sub-irrigated. On the Electric Railroad near Sacramento. 10 per cent to 15 per cent down and no further payment on principal for 7 years, providing you develop. Then six yearly payments.

California Fruits and How to Grow Them

EDWARD J. WICKSON.

Seventh Edition, Extended and Revised.

Contains over 500 pages of text with many illustrations. Goes thoroughly into every phase of that immense industry, California Fruit Growing.

In the preliminary chapters, the important subjects of Climate and Soils are handled in a masterly manner, with the necessary modifications called for by the immense latitude, the topography of the country and the different regions with their relation to coast, valley and mountain.

The book then goes into the subject of Fruit-Growing from the nursery, on through budding and grafting, preparation for planting; planting, pruning the trees and thinning fruit; cultivation, fertilization and irrigation right along to picking, canning and preserving, with chapters on injurious insects, tree diseases and the protection of the trees therefrom. Every fruit and nut which can be grown commercially in California or countries possessing a similar climate, has received the attention which the forty years' experience of the author makes of incomparable value to the fruit grower.

Pacific Mill and Timber Co.

1000 First National Bank Bldg, San Francisco.

The Sebastopol Berry Growers Inc. shipped its first carload of berries for this season, May 25, to Nebraska.

All the western brokers and salesmen of the Cal. Associated Raisin Co. will meet in Fresno June 16 to outline 1916-17 campaign plans.

To can berries and vegetables at Porterville is the project being suggested by Manager R. A. Powell of the Tulare County Growers' Ass'n.

A green-grape growers' ass'n has been formed at Reedley to pack and market their crop. They will have a packing house on the Santa Fe which has already laid a spur to the site.

MISCELLANEOUS.

The Santa Rosa Fair Association will have exhibits under the trees this year instead of in pavilions.

The sale of squash flowers at 30 cents per pound is said to be a thriving young industry around Atwater.

Vegetable canners on the Sacramento have had adequate help this season through the State employment bureau.

Nearly 770,000 persons, mostly farmers, are aiding the U. S. Dept. Agr. by furnishing information, demonstrating new methods, experimenting, and reporting local conditions.

UNIVERSITY SHORT COURSES.

The University Farm Short Courses will be held at Davis Oct. 2 to Nov. 10, 1916. The catalog is ready for distribution. The course in "Agriculture" includes Animal Husbandry, Farm Management, Agricultural Engineering, Field and Forage Crops, Irrigation, Veterinary Science, Horticulture, and Dairying. There are special short courses in Horticulture, Dairy Manufactures, Poultry, and Tractor Engineering. There are no entrance examinations; any man or woman over 18 years old can enter. Total expenses need not exceed $60 plus carfare, which will be 1 1-3 for the round trip.

CACTUS DISAPPOINTMENT.

To the Editor: You recently asked who has spineless cactus and is glad of it.

In the fall of 1911 neighbors clubbed together in this vicinity and bought a carload spineless cactus for planting. Each planter averaged 75 slabs. It was planted in the best of land—some in gardens. Most of the planters gave it good cultivation for five years. It grows slowly and gives a poor yield. Windstorms blow it over. Squirrels and gophers like it. The stems rot off at the bottom if the soil gets too wet. Scarcity of moisture stops growth. [Wild claims must be accepted with salt or disappointment surely follows. —Eds.] W. D. Brinan.

Second Thousand Questions in

CALIFORNIA AGRICULTURE

Our latest book, just from the press, contains 256 pages of text, cloth bound, and sells for $1.50 per copy.

This book is made up of questions and answers. Divided into nine parts, covering fruit growing; vegetable growing; grains and forage crops; soils, fertilizers and irrigation; live stock and dairy; feeding animals; diseases of animals; poultry keeping; pests and diseases of plants.

The live stock and dairy, the diseases of animals, and pests and diseases of plants are very fully covered. We believe that there has never before been printed such a complete list of sprays and poisons and tables for use as are here given.

You need this book in your library. It will come in handy every day in answering some bothersome question which may need quick action. The carefully compiled index tells you where to locate the information you want at a glance.

We want to send you a copy. Send for our special offer made to every one of our subscribers.

What Sheep Did for California.

(Continued from page 681.)

gold." It arose before the greatness of either wheat or fruit was even dimly foreseen. The following is a public exhortation on wool growing given by Col. J. B. Crockett at the California State Fair held at San Jose on October 8, 1856:

In California, owing to our mild and equable climate, sheep are liable to fewer diseases and multiply more rapidly than in any other portion of the world; whilst our mountains and valleys furnish them with the most inexhaustible pasturage the year around. The cost of rearing them is, therefore, exceedingly small, and, instead of importing them from abroad for daily consumption, our mountains and valleys should be dotted with sheep and every clipper ship that leaves our ports should bear away tons of wool to set in motion the looms and spindles of Great Britain or New England. The time will come and, in my opinion, is not very remote, when sheep culture on this coast will become a great and most lucrative branch of productive industry. Indeed, I am aware of no greater benefit which an enterprising farmer can bestow upon California than by importing a flock of choice sheep of the best varieties to test our capacity to compete with Australia and other countries, in the wool markets of the world.

And in the matter of this suggestion of bringing in better breeds of sheep, it is now clear that California surpassed proverbial standards of spontaneity, because, instead of "'twas no sooner said than done," it was really done before it was said, though Col. Crockett did not seem to know it. At the very fair at which he was speaking premiums were awarded for exhibits of Leicestershires and Southdown sheep, and at the fair of 1857 awards were made to two exhibitors for imported French merinos. But there is reason to believe that such sheep as Col. Crockett prayed for were in California two years before the date of his oration. J. E. Perkins, whose official position has already been noted, wrote this as history in an essay for which he was awarded a premium by the State Agricultural Society in 1864:

In 1854 enterprising sheep raisers, believing from the fact that poor sheep did so well on California climate and feed, higher classes of sheep could be profitably grown for their fleece alone, set about importing purebred merinos from Vermont and New York. Curtis & McConnell of Sacramento brought the first Spanish merinos from Vermont. Other importations of Spanish and French merinos followed; also Cotswolds, Leicestershires and Southdowns. Large quantities of Australian sheep were also brought in and sold at extreme prices.

Introductions of purebred sheep which began apparently in 1854 continued in great variety and numbers, so that at the State Fairs before 1860, there were exhibitors to the number of 34, showing 200 purebreds at a single exhibition. And the breeds for which premiums were awarded were Spanish, French, Saxon, and Silesian merinos; Southdowns; Cotswolds; Leicestershires; Shropshires; Cheviots; Chinese. At the fair of 1861 W. M. Landrum exhibited Cashmere goats—"the first introduced into the state." Speaking of the array of pure-breds on exhibition the committee of judges for 1860 enthusiastically reports:

No department of agriculture has more just claims upon attention of our people than wool growing. That many of our most enterprising farmers are actively awake to this idea is sufficiently attested by the numerous flocks of the finest classes of sheep already imported and reared here regardless of cost. We have seldom met so fine an exhibition in any part of the world, whether development of form or texture of fleece is considered.

And the spirit and achievement thus manifested by the wool growers of the first American decade continued active and effective for the two following decades, though our limitations forbid pursuit of the details of it.

Early Protective Measures.—It is interesting to note that the first state-wide organization of flock owners was the "California Sheep and Wool Growers' Association" organized on September 24, 1860: "to foster and promote the enterprise of sheep breeding and wool growing in all its branches; and to provide a remedy against a repetition of such efforts to establish a monopoly in the wool market of this state as characterize the operations of the wool buyers this year." The charter members of the first association numbered eighteen and they owned in the aggregate 64,825 sheep from which a spring clip of 157,000 lbs. of wool was shorn. It does not appear just how the organization went to work at its local marketing problem 56 years ago, but surely with that much wool, at that time, these eighteen growers must have uttered a great cry. We do know that the cooperative action of California wool growers, thus initiated, was influential in securing the wool tariff of 1867 which a representative of the woolen interest claimed "was imposed upon the wool manufacturers by the wool growers." However that may have been, the manufacturers have managed to get the cream of all the legislation since that time and will continue to get it unless the growers can amass more influence and acumen than they have hitherto—but that is a question for the future.

It is also interesting to note that in 1866 California passed her first anti-dog law in the interest of the sheep owners, who demonstrated, to the satisfaction of the legislature, that they had sustained an aggregate loss by dogs of $828,095 between 1860 and 1865.

A Return to the Foundation.—Having thus scaffolded the sheep industry into its second decade it is interesting to take another glance at the foundation. We have seen that probably very little of the old mission material survived pelt-killing, neglect and argonaut feeding. A far greater amount of similarly poor foundation was, however, within reach. Between 1852 and 1857 there were 551,000 sheep driven into California from New Mexico. In 1858 the Apaches of the southwest, aggravated by the amount of good meat which was being run in front of their keen appetites without contribution, took such toll that they stopped the driving. Of the New Mexican sheep thus introduced the butchers were probably chief buyers, but there was plenty left for sheep rangers, for between the years just named this record was made: "Immense increase of sheep raised and the drives from New Mexico brought the supply of mutton beyond the demand."

Naturally the first thought of local sheep raising was to supply the local butchers and get the prices which all foods commanded during the great gold rush. This undoubtedly actuated the importation of the best mutton breeds of English sheep which have been noted as coming in so early that the first state fair awards went to them and not to distinctively wool sheep, which, however, quickly followed. As is the case with all new undertakings the earliest pioneers in sheep raising did not know where they were or whither they should go and their very first venture was a very poor one. Mr. Perkins writes in his historical sketch, already cited:

Scarcely anything but native or New Mexican sheep could be found and these, worthless as they were, were further debased by crossing with some Chinese rams imported in 1852. The only recommendation either of these classes of sheep possessed was their tremendous fecundity—the ewes often bearing triplets and sometimes five and even seven at a birth.

And another account says that these Chinese sheep would drop two such litters in a year! It is laughable to think how eagerly some of the pioneers must have invested in this mutton bonanza —reproduction a thousand per cent a year and lamb chops at a dollar or two a plate! But they soon found that they might as well have taken to breeding jack rabbits.

Mutton or Wool?—Evidently the first great question was, shall we grow mutton or wool, but it was very quickly answered. And now we choose another historian. J. D. Patterson (of whom we would joy to insert personal reminiscence, if space permitted), looking backward in 1867 to his work of a decade before, wrote this:

Though I imported from the best flocks in England, Southdowns, Leicesters and Cotswolds, I believed that growing sheep chiefly for mutton could be overdone, but wool growing for the whole world could not be overdone and I concluded that good wool-growing sheep, which are also good mutton sheep (though for that purpose alone not equal to the English breeds mentioned above) are best adapted to the wants of growers on this coast, and I have paid most particular attention to the breeding of the merinos, both French and Spanish.

And this conclusion of Mr. Patterson was practically the conclusion of all wool growers, and for several decades the distinctively mutton breeds did not regain their popularity of the '50s and Californians ate merino mutton. Year after year in the '80s there only appeared at the State and district fairs a single Southdown ram (and the same ram at that), which was hippodromed around the circuit of fairs to get the premiums as long as he could stand up by leaning against the side of the

pen. In fact it has only been within the last two decades that the mutton breeds began to gain the recognition to which they are now entitled in this state and their relation to a new phase of California sheep husbandry has become clear.

The Battle of the Merinos. — As has been sbown, Californians had introduced practically all the known kinds of merinos during the first decade of American occupation. It would be interesting to note some of the details of the way they contended for supremacy, but it would be as long as an account of the battle of Verdun. We can only note the result, which was the survival of two Merinos, the Spanish or American and the French, and the latter contributed very little to our greatest wool achievement for there were very few flocks kept pure at the time of our greatest wool production, though they did survive and are now far more influential and popular than forty years ago. Mr. Patterson wrote in 1867:

The first pure merino sheep introduced into this state were purchased at my farm in Chautauqua Co., N. Y., by Searle & Wynn of San Francisco. Previous to that time fine wool sheep were brought from Australia, but they were of the Saxon variety, not so large, hardy nor yielding so heavy fleeces though their wool is of finer quality.

Mr. Patterson was probably right as to the first French merinos coming from his former establishment in Western New York. Searle & Wynn of Solano county were awarded a premium for their imported French merino buck "Napoleon" in 1857. But so far as we can now see, the credit for the earliest introduction of the American merino belongs to the McConnells and Curtis, as noted by Mr. Perkins above. In fact the survivor, Thomas McConnell of Sacramento, told this writer a year ago that such was the fact.

But in the writer's memory J. D. Patterson stands out clearly as the greatest merino man of the early days. He first sold the sheep to go to California, but he soon concluded that if California was such a good place for sheep it was also a very good place for him and he came with such an amount of capital and energy that he could write, in his claim for the gold medal at the State Fair of 1867, that he owned over 1500 strictly pure bred merinos: French and Spanish—a larger number than were owned by any other individual breeder in America and more pure merinos than were owned by all other persons on the Pacific Coast put together. And he got the gold medal!

The Survival of the French Merino in California. — But though the American merino vanquished the French in contribution to California's greatest wool product, the latter survived for a very good purpose. When about twenty years ago a new demand arose for the heavier bodies and the other characters of the French type, the country was ransacked for them and the famous sheep man of the last generation, W. G. Markham, of New York, came to California seeking French merinos for an Australian purchaser. He found descendants of Patterson's importations, subsequently grown by Blacow and Roberts, then in the skillful hands of the elder Glide at Sacramento, and made free purchases of these sheep for shipment to other parts of the country and abroad. Thus California figured influentially in the revival of interest in the French merinos which has been active during the last two decades. This writer distinctly remembers the satisfaction expressed by Mr. Markham at finding such sheep in this state.

California's Achievement in Wool. —We have been referring frequently to California's notable attainments in wool growing without giving either time or measure of it. It has all gone by, but it is a good thing for this generation to know and remember.

Of the wool product in different years, there is some discord in available figures, but the following probably present the rise and decline as well as can be determined:

Year	Pounds
1854	175,000
1860	3.055,325
1870	20,072,660
1876	56,550,970
1880	46,074,154
1890	34,917,320
1900	21,360,000
1910	13,500,000
1914	11,480,000

The value of the wool crop in the period of greatest production was about ten millions of dollars a year.

In a report made to Congress in 1880, J. L. Hayes, in his time held to be the best informed man in the country, presents figures showing that in 1876 California had 7,061,000 sheep—more than twice as many as each of the nearest states. Texas and Ohio, and more than twice as many as all the territories which have since become great wool states. In fact California had one-fifth of all the sheep in the U. S.

Mr. Hayes also stated: "California alone produces as much wool as the U. S. census reported in 1850 for the United States entire."

Such an achievement for a state only a quarter of a century old is surely notable and memorable!

At another time the writer hopes to give an outline of what, in his judgment, sheep can still do for California's advancement.

Purebred Sheep on Alfalfa Ranch.

[Written for Pacific Rural Press.]

Because he has confidence in the future of mutton sheep N. O. Brown of Turlock has turned his 20-acre alfalfa ranch into a purebred sheep-raising establishment with 75 purebred Shropshire ewes and their lambs. He will eventually breed 200 ewes.

Unlike most sheep raisers Mr. Brown does not pasture his alfalfa. He keeps his sheep in three one-acre lots where they are fed alfalfa hay in feed racks. There are two reasons for this: (1) there is no danger of bloat; (2) he believes that pasturing alfalfa with sheep lessens the yield as it does with cattle.

By keeping them in small lots adjacent to the combination barn and lambing quarters and by having a good hog-tight fence around the entire three acres he is not bothered with dogs.

The soil on this ranch is very sandy and the lots never get muddy, however continuous the rains may be. Largely on this account the sheep have good feet and hard hoofs, an important consideration where they may later go onto dry hard range lands.

Lambing started about March 15 this year, the ewes being in lamb when brought from Idaho in February. As most of the ewes were young, the percentage of lambs was cut down to 100 per cent, but more are expected in the future.

Lambing quarters are provided in one side of the barn, which was originally intended for dairy and horse purposes, the hay loft being in the center of the building. In making lambing pens, two four-foot panels, three feet high, are hinged together at top and bottom. These are set up against the side walls of the barn in an L shape, each set making the front and one side of a pen. The other two divisions in each pen are made by the wall of the barn and the side panel of the adjoining pen.

The ewes and their lambs are kept supplied with hay and water in these pens for a couple of days, or until the ewe has owned her lamb and it is strong, after which they are turned into the lot with the rest of the flock.

One lot is set aside for the lambs as they grow older, a creep through the fence being provided. Alfalfa and water are provided in small racks and low watering troughs.

In feeding hay, Mr. Brown does not keep the racks filled all the time, preferring rather to feed smaller quantities twice a day, about what they will clean up nicely. Otherwise they would get too fat. By this method he carries a mature sheep on one-half ton of alfalfa.

That his system could be profitably applied to the raising of lambs for market, if there were enough sheep in his neighborhood to market by the carload, is shown by this year's lambs, which were as large at two and a half months as the ordinary range lamb when marketed. Next year lambs will come in January.

The Paicines Ranch, with probably the largest herd of purebred Shorthorns and Percherons in the West, is developing breeding stock—first as calves on alfalfa, and later in the San Benito mountain ranges. Part of their herd is composed of the former Howard Cattle Co. Shorthorns.

Johnny, aged four, went into a nearby grocery and asked for a box of canary-seed. "Is it for your mother?" asker the grocer. "No, of course not," replied the little fellow. "It is for the bird."—Exchange.

Building a Dairy on Twenty Acres.

[Written for Pacific Rural Press.]

"Some of my friends say they can't afford a $200 bull. I tell them I can't afford anything else as long as I expect to make my living from my dairy." Such is the logic of A. J. Morey of Orland, who operates a dairy on 20 acres so profitably that his herd is one of the prides of the district.

When Mr. Morey started dairying on his present ranch he picked up a herd of the best grades he could find. Their average fat production was 225 pounds a year and they were making a living for him. But he was not satisfied with that, so he sold the herd and paid the N. H. Locke Co. an average of $50 more per head for a bunch of high grade Jerseys that were entered in the San Joaquin County Cow-Testing Ass'n.

The producing capacity of each cow he purchased was shown by the records of the Association. The average was over 300 pounds of fat. With the cows he took home a fine young Jersey bull, determined not only to have a high producing herd for the present; but to build a higher producing herd for the future.

Mr. Morey believes every cow that dropped a heifer calf last year has already repaid the difference; for he expects the heifers to be worth more at freshening time than their dams.

Grain Feed.—But he does not believe the best cow living can do full justice unless she is well fed; and it is his opinion that besides all the alfalfa hay a cow will eat, she should have a pound of barley for each four or five pounds of milk she gives. This keeps up the milk flow, saves hay, and makes stronger calves.

Nor does he expect that every heifer, even from his registered bull and out of his present high average producing cows, will be good enough to keep. He will keep 20 cows, all that his ranch will support, and each year select five of his best heifers to replace older and poorer producing animals.

Of course his ultimate aim is to have a purebred herd of Jerseys, but he has been situated on a new place where development is of necessity gradual.

Whenever he sells a grade bull calf for veal, the money is put into a purebred fund. When that fund becomes large enough to purchase a registered cow he will buy one, and then start another savings fund for the next one.

With the calf fund, which, as he says, "I never miss," and the gradual increase from the registered cows, he expects to replace all of his grades in the next few years without any additional effort or sacrifice.

Like all progressive farmers Mr. Morey is always looking for methods better than his own; and true to form he asked us, just before we left, "What can I do to improve my system?" and we had to confess that we didn't know unless it were the erection of a silo. That we found included in his future plans.

SWINE BREEDERS' MEETINGS.

[Written for Pacific Rural Press by D. L. Schrader.]

Poland China.—The second meeting of the Poland China Swine Breeders' Ass'n of North San Joaquin was held in Stockton June 3. A. M. Henry and Henry Miller were elected directors besides the president, vice-president, and secretary.

The Pacific Rural Press was again tendered a vote of thanks for assisting to organize. An association seal was authorized, to be used on stationery of only those members whose breeding and selling operations are approved by the Ass'n.

A meeting will be held on the first Saturday of each month at 10 a. m. at Stockton Chamber of Commerce.

Duroc.—Seventeen breeders attended the second meeting of the Duroc Breeders' Ass'n of Stanislaus county at Modesto June 3. J. M. De Vilbiss was elected vice-president and director. The president and secretary also being directors, Guy Miller and L. D. Collins were elected as the other two. Initiation fee of $1 and dues of $1 per year were fixed. Anyone raising purebred Durocs in Cal. is eligible for membership. The Ass'n will meet the first Saturday of each month at 2 p. m. at Modesto Chamber of Commerce.

CONCENTRATES FOR DAIRY CALVES.

[Written for Pacific Rural Press.]

Raising the heifer calf is an important problem with all dairymen who sell sweet milk, and many of the large city dairymen do not attempt to raise their own heifers at all.

On the dairy of the Stockton State Hospital this has been successfully overcome by Mr. Foley, herdsman, by the substitution of concentrates for milk to a large extent.

This is two parts ground oats, two pounds wheat middlings, one part barley, and one-half part linseed meal.

At first he puts a handful of this mixture into the calf's milk, gradually increasing from day to day, till it makes a thick paste. This with alfalfa hay keeps the young stock in good growing condition and makes a large saving in milk, especially as the calf becomes larger.

Community Swine Breeders' Association.

To the Editor: Answering your inquiries: We organized the Kings County Poland China Breeders' Association with nine members. It was primarily formed for the purpose of holding a consignment sale and getting all the good that might result from such a sale. By holding the sale it was easy to induce the breeders to come into the organization.

A few of us realized that by holding such a sale we accomplish several things. First, the advertising of such a large number of hogs of the very best breeding in the State would naturally be of benefit to our county breeders. Second, the distribution of such a number of well-bred animals would interest a larger number of people and would increase the number of breeders and improve more herds. Third, the financial results of a successful sale would induce our own members to a still higher standard of breeding. Last, but not least, the co-operation of our people now in the business of breeding pure-blooded stock.

We have not yet perfected a real organization in the way of adopting laws for the governing of such bodies. We adopted rules for the first sale and the requirements for membership; and have not as yet gone further than that.

In arriving at the cost per animal in the sale we estimated our expense and made a pro rata cost. Owing to more extensive advertising than at first decided, the cost exceeded our estimate. It being our first sale, we made some mistakes that can easily be overcome in our next sale and the final cost materially reduced.

Our results have been: Extensive advertising for our herds and the success of this county in producing this class of stock, a better distribution of good stock, a better co-operation between our breeders in the selling of stock and indirectly the fixing of a higher value on the better grades of hogs in this county.

To some extent we worked with local organizations; but most of our work has been done under our own name. We took advantage of the local reputation for the entertainment of visitors and proceeded along similar lines, so that all our guests from abroad went away with a good impression of our community whether they bought or not. We will expect results from such work in the future.

We received aid from our local banks and merchants by having their support and the good word in the right place. We find that when they talk to their customers in favor of a better class of stock, it helps us very much in our sales. The fact that some of our business and professional men are interested in ranching helps to secure their influence.

The thought occurs to us that if the banks or financial men of any community would get behind our organizations and assist in bringing of new blood from the East, it would greatly assist us in building up strains here that would soon prove to the world that California was the best place in the world to raise the best of stock.

Hanford. W. Bernstein.

DO WATERY FEEDS DECREASE FAT TESTS?

To the Editor:— "Has it yet been determined by any Experiment Farm, whether a herd of cows fed on dry alfalfa hay, with milk tests of 3.9, would decrease their test according to their increase of milk, if fed watery feeds such as cactus or beets with the dry alfalfa? Any information you or anyone who has had any experience, will be gratefully received."—S. and R.

[Answered by Prof. F. W. Woll, University Farm, Davis, Cal.]

[Watery feeds have practically no influence on the percentages of fat or water in milk, unless they are fed in excessive quantities with but little other feed. Then there may be an increase in the milk flow accompanied by a lowering of the quality of the milk. Many experiments have been conducted in studying this point, and the evidence is rather conflicting. Only last month, a report of an experiment on the Effect of Water in the Ration on the Composition of Milk, was published by the United States Department of Agriculture, (Journal of Agricultural Research, Vol. VI, page 167), in which the following conclusions are drawn:

"Certain individual cows at times produced milk having an abnormal fat content. This effect was apparently independent of the ration as it occurred not only with the high water-content ration but with the dry as well. A study of the data obtained in the four series shows that the watery character of the ration has no effect upon the fat content of the milk. There was even less variation in the other milk constituents than in the fat. This indicates that rations of varying water content have no effect upon the composition of milk."

GRAIN IN SELF-FEEDER.

To the Editor: How much grain will a 90-pound hog eat in 90 days if fed in self-feeder with tankage and chopped alfalfa hay. Is it possible to put on two pounds per day that way?—D. F. C., Lemoore.

[Answered by Prof. J. I. Thompson, University Farm, Davis.]

[The amount of grain that a 90-pound pig will eat in 90 days after reaching that weight will vary considerably according to the age and condition of the pig. If he is 10 months to a year old, yet has considerable frame, he will eat much more than if he has been grown along regularly up to that time, and will probably gain faster. The pigs in our experimental work which weigh 90 pounds when 3½ to 4 months of age will usually consume in the next 90 days about 500 pounds of barley from a self-feeder and 40 to 50 pounds of tankage. This is when they are on pasture—and they will gain 1.4 to 1.5 pounds per day. They will usually eat slightly more barley than that and gain not quite so fast when alfalfa hay or alfalfa meal is fed instead of pasture. Pigs that were thin, but had considerable age and weighed 90 pounds might gain two pounds per day.]

BLACK LEG LOSSES SURELY PREVENTED by Cutter's Blackleg Pills. Low-priced, fresh, reliable; preferred by Western stockmen because they prefect where other vaccines fail. Write for booklet and testimonials.
10-dose pkge. Blackleg Pills $1.00
50-dose pkge. Blackleg Pills 4.00
Use any injector, but Cutter's best.
The superiority of Cutter products is due to over 15 years of specializing in vaccines and serums only. Insist on Cutter's. If unobtainable, order direct.

DAIRYING AND DAIRYMEN.

Prince Gelsche Walker brought the Morrises $12,500.

Riverside county health and dairy officers are enforcing sanitary dairies.

Tillie Alcartra had a fine heifer calf 29 days after finishing her record two-year test.

A. Kelting of Utah has bought 38 Dutch Belted cattle from U. G. Strader of Modesto.

Alexander and Kellogg of Suisun recently bought a registered dairy Shorthorn from Iowa.

Pasteurized butter and milk will be made from now on at the Jersey Farm Dairy of Colusa.

The 2-year Inka Tritomia Walker had given 9,448.7 pounds milk in 144 days preceding June 4.

A Farmington dairyman butchered bloated cows and got into trouble trying to sell the meat.

Murray and Jones of Modesto have 70 registered Jerseys from Belknap of San Jose and Snover of Ceres.

Walter H. Dupee of Santee bought the bull Florham Victor, dropped Nov. 1915, in New Jersey, for $700.

At the National Dairy Show, Oct. 16 will be Guernsey day; Oct. 17 Holstein day; Oct. 18, Ayrshire day; and Oct. 19 Jersey day.

J. S. Gibson's 28-pound Uneeda Korndyke Abbie recently had a bull calf. She is a daughter of the $25,000 Johanna McKinley Segis.

The University of Nevada has bought for the Prison Farm five purebred Holsteins, 37 grades, and six heifer calves for $6,130.

The Ayrshire senior 3-year champion Lessnessoci Buntie, made 548.44 pounds fat in 15,798 pounds milk. She is owned in Ohio.

Of the 570 Holstein heifers and cows reported Apr. 18-24 for Advanced Registry, the average 7-day production was 405.6 pounds milk containing 14.732 pounds fat.

The J. S. Gibson Co.'s purebred Holstein Winnie is still giving over 90 pounds a day. Up to June 1, she had made 15,763.8 pounds milk in 159 days—practically 100 pounds a day.

Oriand folks were reminded by the Orland Register that Humboldt county dairymen, because of the superiority of their cows, could buy Orland hay at $9, get it home for $17, and make money.

Dr. W. W. Hand of Glenn county recently bought from Guy Miller, Modesto, two Register of Merit cows, Lolita of Venadera and Belle of Venadera. Each has produced over 600 pounds butter.

Cheese making is to be resumed with modern machinery, in the old Santa Clara cheese factory which was organized in the 70s. Operations were discontinued 20 years ago, because so much milk was demanded in the city and so much dairy land set to fruit.

F. J. Gillian's herd of over 20 cows in the Yolo-Solano-Colusa Cow Testing Ass'n averaged 1.06 pounds fat through May. Cows which made over 50 pounds were: Hewitt & Hewitt, Dixon, Holstein, 66.85; F. Beebe, Woodland, Holstein, 64.82; H. Hiddleson, Woodland, Holstein, 59.04; J. Nelson, Williams, Jersey, 58.22; A. George, Williams, Jersey, 57.18; Hughes Bros., Woodland, Holstein, 57.16; F. Beebe, Woodland, Holstein, 56.44; H. & O. Wilkendorf, Woodland, Holstein, 56.09; F. Beebe, Woodland, Holstein, 53.82; Watson Bros., Dixon, Holstein, 53.77.

SWINE BREEDERS AND STOCK.

Ambrose and James Porter led the Dixon High School pig-raising contest with 90 and 89 points respectively.

A "fashionable" herd of Berkshires is to be established in the Jacinto district of Glenn county by Dr. W. W. Hand.

Duroc futurities will be held at State fairs of Cal., Ida., Ill., Ia., Kan., La., Minn., Mo., Mont., Okla., Neb., S. D., and Tex.

A lantern slide lecture on hog cholera and bovine tuberculosis will form part of the program at each Glenn county farm center meeting in June.

The Tulare County Swine Raisers' Ass'n suggested a livestock show in connection with the county citrus and agricultural fair. It will likely be held in Nov.

The Butte City Ranch of Glenn county sold 10 sows and a boar to Mark Requa of Orland. The boar is White's Longfellow's Model. All are cholera vaccinated.

A North Carolina school teacher of 60 pupils in one room a year ago put a purebred pig in a pen built by the children, who planted forage and grain crops to feed it. This has led to the establishment by tax payers and school board, of a small demonstration farm.

BEEF BREEDERS AND FEEDERS.

F. M. Stuart of San Francisco has bought 24 Shorthorns from Neb.

Miller and Lux have imported 100 purebred Angus bulls and 30 heifers.

A Fresno county man who stole 8 calves was sentenced to 3 years in prison.

C. H. and S. B. Fuller of Drake recently brought in from Kansas 126 purebred Herefords.

Three cars of steers were recently shipped in excellent condition from the Vascher Ranch of Athlone.

Alfalfa-barley finished steers of the Porterville Alfalfa Co. command a fancy premium in San Francisco.

J. E. Montgomery recently shipped a carload of purebred Durham bulls to Horton & Co. of Klamath Falls.

A. L. Gatzman, Leo Rosasco, and Fahey Bros. of Oakdale recently sold 30 cars of cattle to C. N. Ellinwood who shipped them to Seattle.

Shipment of cattle from Sacramento county to the mountains around Truckee is to be facilitated by railroad stockyard improvements at White Rock.

SHEEP AND SHEEPMEN.

The last of the Vina ranch's 4,000 lambs were shipped to San Francisco June 3 at $5.25 per head.

Australian wool sales were suspended pending definite assurances from London regarding an embargo on wool.

The Northern Electric claims to have shipped 14 cars of sheep from Durham to San Francisco via Western Pacific from Sacramento, in 4 hours 20 minutes, a distance of about 175 miles.

The Calla Grove Farm of Manteca have bought 10 purebred Hampshire ewes from Utah and five from Kaupke Bros. of Woodland. They will be bred to Peter Pan, the Chicago International champion.

There is very little encouragement for the wool grower to wash his sheep before shearing as he loses weight and the cost of washing, without corresponding increase in price, according to the results of careful 3-year experiments by the Ohio Experiment Station.

GENERAL ITEMS.

"The Capsule Method of Breeding Mares" is the title of a recent bulletin by the Utah Experiment Station.

The Silver Birch Farms of Pend d'Oreille county, Wash., is starting a big purebred Berkshire-Jersey-Hereford ranch.

The State health officers announce a scarcity of coyotes throughout Lassen county, following a campaign for extermination of rabies.

At the California Rodeo at Salinas July 12-16 cowboys and girls from all U. S. cattle districts will compete for $50,000 in prizes. There is to be a livestock show in connection.

LIVESTOCK DIRECTORY.

Rates in this directory, 3c per word each issue; or if carried weekly for one year, 2½c per word.

SWINE.

BILLIKEN HERD OF IMPROVED CHESTER WHITES—The kind that makes the money. Pure-bred—registered—cholera immune. An extra fine lot of weaned pigs—both sexes—representing the best and most popular blood lines this breed produces. Five different sires used. Can mate up not akin. Quality combined with size. Rapid growing—early maturing. A few nice fall gilts that will be bred and ready to ship in September. Write for prices and circular. C. B. Cunningham, Mills, Sacramento County, Calif.

REGISTERED DUROC-JERSEYS—Fall boars and gilts. Weanlings sired by an excellent son of the 1020-pound Royal Muncie. We have pigs sired by this boar weighing 240 pounds at 7 months, and out of line bred Golden Model, Crimson Wonder, Orion, Chief, and Colonel sows. For information write Haden Smith, R. 1, Box 84D, Woodland, Cal.

YOUNG POLAND CHINAS, LARGE TYPE—Boar IBA Wonder won first and Reserve Championship P. P. I. E., weighing 730 pounds under 2 years and in breeding condition. 60-day special—fine young sows bred to IBA Wonder at very low prices; also weanling pigs, either sex. Satisfaction, or money refunded. W. A. Young, Lodi, Cal.

REGISTERED DUROC-JERSEY — Weanlings, shoats, gilts and boars. Unrelated. Many of our hogs are related to the several prize-winners at Panama Exposition. This herd is undoubtedly the finest in the State. Have had as many as 19 pigs to a litter. Grange Stock & Poultry Farm, Yountville, Napa Co., Cal.

BIG TYPE POLAND CHINAS—The profitable money-making hog. The hog for the farmer. The real mortgage lifter. Large herd to select from. Bred sows, bred gilts, open gilts, weanlings of both sex. Boars ready for light service. Extra special prices. Geo. A. Smith, Corcoran, Cal.

HAMPSHIRE SWINE—Both males and females from Grand Champion 700-lb. boar and Grand and Junior Champion sow. Also Guernsey bull calves from Grand Champion bull. BELLA VISTA HERD, J. W. Henderson, 1st National Bank Bldg., Berkeley, Cal.

TO SELL ONE OF OLDEST HERDS.

[Written for Pacific Rural Press.]

The dispersion sale of the Chas. J. Welch Holstein herd at Los Banos, June 28, should prove an attraction out of the ordinary to Holstein fanciers.

Founded at a time when Holsteins were not so well known as they are today the herd may be called one of the oldest in the State. Those who knew Mr. Welch best knew him as a constructive breeder of dairy type. And in securing type he also demanded and secured

Heifers of the Chas. J. Welch herd to be sold at auction at Los Banos June 28, 1916.

sires from high testing dams. This combination of type and production placed his herd in the front ranks in the State; and youngsters from his herd have gone into many a younger breeder's foundation where they have made good.

With this reputation back of them the animals to be offered at public sale should be eagerly sought, both as additions and as foundation cattle.

HOG SHRINKAGE REDUCED WITH WATER BAGS.

[Written for Pacific Rural Press.]

Shrinkage in shipping livestock to market is an expense that every shipper has to consider. Especially is this true with fat hogs in hot weather.

To minimize shrinkage in hog shipments, T. H. Ramsay of Red Bluff equips each car with a canvas bag, eight or nine feet long and about four feet wide. This is sewed together at top and ends, the bottom being made with the fold.

The top edge has hooks sewed into it which are hooked onto the side of the car to hold the bag off from the floor. An opening is left in the top, like an ordinary water bag and a faucet sewed into the lower edge.

When the hogs are loaded, this bag is filled with water; and as occasion permits, the attendant sprinkles the car en route, so that the temperature of the car is much lower than would otherwise be the case, and the shrink in shipment is greatly lessened. If the supply in the bag becomes exhausted it is replenished at the nearest station. After arrival at the destination the bag is folded into a small bundle and sent home.

SLIMY MILK.

To the Editor: What causes milk to get stringy and slimy when it begins to sour; or to be ropy even when sweet, if it comes in contact with soap in washing utensils? Is it safe, and does it affect butter? The cow has green alfalfa in day time and hay at night. She refuses salt. Has plenty of water.—L. A. W., Orosi.

[Answered by F. W. Andreason, State Dairy Bureau.]

[It is caused by certain bacteria which thrive better at low temperatures than lactic acid bacteria. The latter tend to control them under normal conditions. Each bacterium is surrounded by a capsule of sticky gummy snbstance. When a thread of slime is drawn out it is really a chain of bacteria.

Ropy milk is not injurious to health. Edam cheese is made from it. Norwegians add the bacteria to milk for beverage purposes. These bacteria may enter the milk on barn dust, or by splashes of the water in which milk is kept overnight, or by use of incompletely sterilized strainers or containers. Scalding containers thoroughly, disinfecting floors with 5 per cent sulphuric acid, adding potassium bichromate to the tank water, one ounce per cubic foot—are ways to stop the trouble. If milk is slimy when drawn from the cow, it is generally caused by inflammation of udder and should not be used.]

RICE PRODUCTS FOR HOG FATTENING.

[Written for Pacific Rural Press.]

One sack of rice bran and a sack of rice polish daily to 56 young pigs weighing about 150 pounds each, has been found a satisfactory ration this spring by D. G. Beale of the Gridley district in connection with alfalfa pasture and a small amount of buttermilk.

Mr. Beale considers this ration equally good as barley for growing pigs and believes it is cheaper; as the bran is purchased for $15 a ton and the polish at $22.50 from the local rice mills.

As a feed for brood sows, however, he has not found it so satisfactory. The sows which he fed rice by-products did not seem to do well.

Productive Feeding OF Farm Animals

F. W. WOLL, PH.D.
Professor of Animal Nutrition.
University of California.

FIRST EDITION—1915

360 pages; handsomely illustrated. Cloth bound.

Prof. Woll has had long experience in the work covered by his book. Before coming to California a few years ago to take up his work at the University Farm, Davis, he was for years Professor of Agricultural Chemistry, University of Wisconsin. This book in a practical way covers productive feeding from a scientific standpoint. Every breeder of stock needs this work to make a success of his feeding operations.

Price, $1.50 Postpaid.

CALIFORNIA HOG BOOK

Every hog-breeder in the State should have a copy of this book handy to refer to in cases of emergency. Every day the practical side of the book will help you. The author, W. S. Guilford, is a swine breeder, and he tells just what you want to know when a difficulty presents itself. The book contains 256 pages of text, besides many full-plate illustrations. Tells how the successful breeders feed and handle their hogs.

PRICE, $2.00 POSTPAID.
PACIFIC RURAL PRESS, Publishers

A Forty-Acre Sheep Ranch.

[Written for Pacific Rural Press.]

Albert Nordyke of Tehama county is one alfalfa grower who believes sheep raising on alfalfa land is feasible and profitable. He is an old sheep man himself, having operated on a large scale in Idaho, whence he came onto his present 40-acre ranch in 1914.

His 40 acres is all irrigable except one or two small knolls which are rather rocky and gravelly. This is an asset with sheep as one of them is utilized for the barn that is used in the wet winter months, and for a lambing shed. The other one provides a grazing place for the sheep when the alfalfa land is damp from rains or irrigation.

A Cheap Foundation Herd.—Mr. Nordyke got into sheep in perhaps the most economical manner possible. In the fall of 1914 he purchased a small band of old ewes from a range sheep man just as they were being driven from the mountain range to the winter range in the valley. They were ewes with bad mouths, backs, and bags, which were unfit for another year on the range because of their physical condition.

On alfalfa pasture, however, where green, succulent feed is abundant the year round, and where more attention can be given at lambing time, most of them make useful mothers.

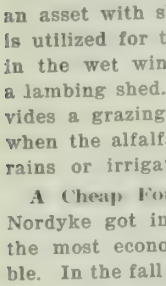
These ewes were bred to a Shropshire buck, and the poorer ones fattened after weaning time in 1915. The ram lambs also were sold during the summer of 1915 at a good figure, the ewe lambs being kept for future breeding purposes. The cross-bred ewes not only lamb a larger percentage than the Merino, but their lambs are earlier maturing.

In the fall of 1915, another small flock of range Merino ewes was purchased and bred to Shropshire bucks. In this way the flock will be built up to 10 ewes per acre, the capacity of alfalfa land according to Mr. Nordyke. Besides supplying a foundation of crossbred ewe lambs at no cost except for feed and care, the ewes show a profit in the difference between buying and selling price, the fat ewe in the summer bringing a better price and carrying more weight than when purchased from the range man in the fall; and lastly, they shear a fall and spring clip of wool varying in price according to the quality, and size of the sheep.

But the profits so far with crossbred lambs have been nowhere near as large as they will be when all of the ewes carry more of the Shropshire blood. This is due to the smaller percentage of lambs which the Merino ewes produce and the slower maturing qualities of the lambs.

As an evidence of this, Mr. Nordyke pointed out Shropshire lambs from half-breed Shropshire yearling ewes, lambed in December and weighing 65 pounds in April. These are what Mr. Nordyke is striving for with the entire flock and the kind he will raise, now that he has a foundation band of Shropshire-Merino ewes. Such lambs are the kind that top the market and the coarser stapled wool which such ewes bear is the kind that commands the best price.

Ranch Arrangement.—Mr. Nordyke has his ranch divided into four ten-acre fields. Each of these has an irrigation canal running through it that provides fresh drinking water for the sheep. Large oak trees are located in each field to provide summer shade, a very important consideration with sheep as well as other livestock.



As a protection against dogs, which are the sheep man's "bugaboo" in every country, Mr. Nordyke will erect a hog-tight fence, four feet high, around the boundary of his ranch. A strand of barbed wire will be buried in the ground under the hog-tight wire, and another strand along the top of the posts.

As previously mentioned, the lambing quarters consist of a building situated on a high gravelly knoll. This building is 64 feet long and 50 feet wide, with a hay loft in the center, built off the ground about seven feet in order that the entire floor may be used for the sheep in bad weather.

Low mangers have been built along each side of this building and through the center for hay feeding in bad weather and at lambing time. Posts set at regular intervals throughout the building allow the use of panels to divide small bunches of ewes when necessary. This building cost $600 and has a capacity of 300 ewes and their lambs.

Bloatless Alfalfa.—Most of the alfalfa is pastured off, only a small amount being necessary for winter feeding. It is interesting to note that while many sheep raisers maintain that alfalfa pasture is dangerous on account of bloat, Mr. Nordyke states that by keeping sheep on alfalfa continuously there is very little danger. Not over 15 or 20 head a year die from bloat in his flock.

Except during lambing season there is very little work connected with sheep raising in this manner; and Mr. Nordyke is certain from his past experience that he will clear fully $2,000 annually from his 40 acres.

GRANDSONS OF TILLY ALCARTRA
At Prices within Reach of Every Breeder and Dairyman.

A Grandson of Tilly Alcartra.

We have several splendid grandsons of this now famous cow, which we can deliver to you at prices which will suit the pocketbooks of every dairyman wishing to improve the quality of his herd, whether it be a grade or pure-bred herd. These bulls are sired by our herd bull, Prince Alcartra Korndyke and out of A. R. O. cows, and are the only living grandsons of a cow having a record of over 30,000 pounds of milk in a year. Such an opportunity for increasing production has never been offered DAIRYMEN AND BREEDERS in California, price and quality considered. Buy one of these bulls and solve your low production problem. Shropshire Demand Strong.

[Written for Pacific Rural Press.]

One of the best illustrations of the possibilities of purebred sheep raising in the State is the experience of Bishop Bros. at San Ramon, Contra Costa county.

Starting a few years ago with the idea that some day sheep would be more extensively grown on the average California farm, and that by founding a flock of high-class Shropshires they would be fully established when this demand should begin, they have forged rapidly ahead as the leading breeder of the West.

Some San Ramon Shropshires that show California's purebred possibilities.

Their winnings at the P. P. I. E. last fall came as a surprise to many out-of-State exhibitors but were fully anticipated by those familiar with the foundation flocks that have been imported by the Bishops from England.

As an indication of the demand which has resulted from their consistent showing and advertising, they have been unable to fill all of their customers' orders from their own flock and have been compelled to purchase 210 yearling rams, mostly registered, from the Smith, Hunt, and Patten flocks of Oregon.

That this flock will do much toward giving California a national reputation as a sheep breeding State, develops from the announcement that a show herd will be taken to the Chicago International this year, as well as through the Northwestern show circuit.

BREEDING DUAL TYPE MERINOS.

[Written for Pacific Rural Press.]

One of the best evidences that Merino breeders are alive to the possibilities of the lamb as a range product is seen on the Bullard Bros. ranch near Woodland.

By selection and careful breeding these pioneer breeders produce Merinos weighing 300 pounds and shearing as much as 35 pounds of wool. They believe that this improved Merino type will always be the most profitable and most favored sheep for the average sheep grower.

Not only have they sold Merinos for foundation purposes in all parts of the West, but they have also shipped rams to Australia and South American points.

RE-SEEDING ADOBE PASTURES.

[Written for Pacific Rural Press.]

C. A. Beecher of San Joaquin county makes more money from a piece of his poorest land by pasturing it, than he does from an equal acreage of wheat.

This poorest land is always pastured off by his young dairy heifers; and for a number of years it has been his practice to haul the manure from his barns to it with a spreader.

In this manure there is a good deal of burr clover seed as cows do not digest these seeds. By applying the manure in the fall of the year the pasture is re-seeded each year, besides having a heavy coating of manure to aid in the plants' growth in the spring. The land is heavy adobe and could not otherwise be profitably managed.

FISK

NON-SKID TIRES

—a full dollar's worth of rubber, fabric, careful and conscientious workmanship and mileage for every dollar you pay. Every Fisk Tire that leaves our factory has passed inspection after inspection—it is an absolutely perfect product, and represents more real dollar-for-dollar tire value than you can buy anywhere. And it is backed up by the Fisk reputation for first quality that has been our only standard for the past 17 years.

Fisk Non-Skids have been the tire value sensation of the country ever since they were introduced three years ago. With their strong and reliable non-skid tread, ideal for country road conditions, **they cost less than the plain treads of several other standard makes. You can't buy a better tire.**

35,000 Dealers and More Than 100 Fisk Branches Are Ready to Serve You

Through your dealer you are sure of the promptest attention of the Fisk Branch in your vicinity—and if you are handy to that branch you can make use of Fisk FREE Service to motorists. Dismounting, inspection, air testing, inflation, reassembling, changing tubes and casings, inspecting your wheels for alignment—all free whether you use Fisk Tires or not. No charge except for actual repairs and supplies.

Send for price list—or call on nearest branch.

Poultry for Profit---Producing and Marketing.

HOT WEATHER LAYERS

[Written for Pacific Rural Press by Susan Swaysgood, Pomona.]

A great many people lose out during the hot weather because they have set rules and follow them whether the thermometer registers high or low. This is no more right for hens than for men.

The first place to make a change is in the sleeping quarters, more ventilation and fresh air. This can be done most economically by placing four inch blocks under the house, one at each corner, and removing the floors if convenient. It is also a great aid in preventing the breeding of mites and mice, and sometimes of rats. Cool air from under a house, when all around is open, is one of the best tonics the hens can have—it keeps the appetite braced; and to lay eggs, hens must eat.

The eating is where the next change must be made; not so much in the change of food, though this needs attention, but in the method and time of serving.

With a night spent on perches where plenty of fresh air can reach them, the hens are necessarily hungry early in the morning. To make a profit out of fresh air the hens must be able to get food just as soon as they get off the perch. If they must hunt around for little odds and ends early in the morning the best part of the day is being lost, for the hens are using up energy that should and could be used to make eggs if the material was on hand. Later in the day when it gets real hot, the hens can seek a shelter from the sun. While seeming inactive, the inward activities are going on creating eggs and maintaining health.

Have a spot of moist ground in the shade for the hens to bathe and roll around in; they enjoy it and it helps to keep them free from lice and disease. I have seen days when my hens never left a little shady spot from nine or ten o'clock in the morning until five or six at night except to get a drink, when they were well provided with feed early in the morning. This is as it should be; the days are long, and while fowls need to be active, their activity should not be forced on them in the heat of the day. If it is, they will just be active enough to provide food enough for the upkeep of their own body, and eggs can go to grass.

No matter what breed of hens the flock is, they will not require so much heating food as they do even in moderately warm weather because the external heat keeps them warm enough. Plenty of green feed not only helps the flock to maintain health and keep up the production of eggs, but it is a big help in cutting the grain bills which are usually higher priced during the summer months. Corn meal should not be fed unless it is cheaper than other mill feed, in which case only about half what is fed in winter may be allowed. Corn is both heating and fattening, white middlings is about on a par with corn meal or nearly so, while shorts, brown mids, and bran are more cooling while still containing the elements for egg-making. Good wheat bran is very high in protein and nutrition and if mixed with one-third ground barley or oats and one-half brown mids, chopped alfalfa, and a moderate amount of beef scrap and bone meal, I think both Leghorn men and others would get a full supply of eggs without burning up the constitutions of the hens by a too heating diet as is done if the winter mash is fed all through the hot weather. Green alfalfa, or kale, would add a relish to the feed and also be helpful in keeping the blood cool no matter what else is fed. It requires practical experiments to decide on the right proportions of some foods; but you can never be wrong in feeding good tender green feed ad libitum, to all fowls under your care. If they don't thank you in words, they will in acts for they will stay healthy and lay eggs, when if fed on an all-grain diet they will only be half-way healthy.

Give the evening feed as late as consistent with the length of day, so that the hens will go to bed with something in their craw. For those who positively have no green feed and cannot get any, feed sprouted barley with sprouts one inch long.

BROODY HENS.

[Written for Pacific Rural Press by Susan Swaysgood, Pomona.]

One of our subscribers asks why so many of her hens get broody, even in the fall.

Broodiness, or the desire to set, is Nature's method of propagating the species. If wild fowls did not want to set, all game would die out by race suicide. So that, plainly speaking, is the why of it. The best way to lessen the trouble is to breed it out of the flock. This is slow work, but it can be done—in a measure, not wholly. The Mediterraneans have not the desire to set so strongly as the heavier breeds and yet thousands of Leghorns have to be broke up every year from spasmodic efforts to perpetuate the breed.

If eggs are selected from hens that do not make good setters the trait can be bred out so that each generation will improve.

The treatment given to broody hens differs radically, no two people agreeing as to the best. A good many starve and imprison hens. Both are wrong, in my opinion. At some stage of the game I have tried all the methods advocated by others and then some, even to tying a red rag on the hen's tail, which trick is often done in the eastern states. But it is cruel and does not do one bit of good, only to make the person that ties it on feel cheap and mean.

The best method I have found is to wire off a part of the house where the hens have been roosting and laying so that they are always in sight of the other hens; have nothing in this space but a water trough and feed box—no nests or straw. Give them 10 drops tincture of aconite in a quart of water once a day for three days and feed them all they will eat of the same food you give the layers.

By starving hens you weaken their nerve force and delay their usefulness, as it is not possible for them to commence to lay until they have stored up enough energy and material for the work.

Feed her the elements for egg making, give her lots of fresh air and water, and the worst cases can generally be broken up in three to four days. If a good lively cockerel is kept in the pen with several broody hens, they will be so busy trying to evade him that they will forget they ever wanted to set until the desire has left them. Don't, however, put one hen in alone; that is cruel. But give both sides a fair show by putting several hens in and the cockerel will keep them busy.

As to why the hens want to set in the fall, I do not know, but conclude that as the hens are more or less depleted of their strength, and molting time is approaching, the need for a rest seems to be quite general and they take it that way. If many of these fall setters were given a nest of eggs I doubt whether they would hatch them.

POULTRY QUERIES.

[Answered by Susan Swaysgood.]

Leg Trouble.—I have some trouble with my chickens' legs. When they walk they waddle like a duck and their legs seem to draw up; in others the legs stick straight back. Have been feeding cracked rice.—F. H. P.

[Cracked rice is probably the cause. Too much starch in the diet will cause leg weakness; and if these chickens had only cracked rice, it is time to feed something else. I have seen chickens lose all control of their legs when fed too many potatoes, and rice is similar in starch elements to potatoes.]

White Spots on Liver.—I am losing a good many young turkeys after they are one week old or more. They don't seem to have any diarrhoea, but they have white spots on the liver and an unusually large gall. I feed three times a day chick feed, boiled egg with onion tops, and milk weed. I lost a good many last year after they got the size of quail, though I fed the same except the milk weed.—A. B.

[I have no knowledge of milk weed. Make a bread of one quart of chick feed, one quart corn meal, one quart of white mids, one quart of steel cut or rolled oats and mix to a stiff batter with skim milk and infertile eggs, adding a little salt and a tablespoonful of cayenne pepper. The bread requires thoroughly good baking and keeping dry. It can be fed after soaking in skim milk or grinding in a food chopper. Be sure your poults do not have head lice. When they die at the size of quail, it looks suspicious.]

BAKERS' EGGS.

To the Editor: For a long time I have been shipping my eggs to a firm in your city, always receiving the market price as quoted in Pacific Rural Press. The other day I received a statement from them with check for 3 cases of eggs. Out of the 3 cases they had marked 5 dozen as "Baker" at 11c. What does that mean?—M. N. O., Acampo.

[Answered by Geo. H. Croley.]

[Bakers' eggs are those that are somewhat inferior for family use. They may have blood clots in them, or they have been washed with water or sour milk, either of which processes brings on very quick deterioration. They may be in very good condition if used quickly, but might not keep even two or three days.

It has been customary in testing out eggs to class as bakers' eggs those that have been tested out of incubators or those that hens have set on a few days.

A recent United States law now makes it a prison offense to sell eggs for food that have been tested out of incubators, even if they are clear eggs and apparently in good condition.]

COLD TURNING TO ROUP.

To the Editor: Three of our fowls have a hard swelling by the eye; watery eyes; and running at the nose. Can I add any disinfectant to the drinking water to prevent the rest of the flock from taking the disease?—E. H., Laton.

[Answered by Geo. H. Croley.]

[These fowls have a severe cold that is assuming the form of roup. Separate the sick from the healthy ones. Give a physic in the drinking water, such as Epsom salts—tablespoonful to one gallon of water—taking all other water away from them. If this is not possible, give salts in small quantity of moist mash, seeing that it is evenly distributed. Wash the heads, eyes, and mouths with a strong solution of soda bicarbonate, or one of the following solutions: Half an ounce of

CHICKEN POX AND COCCIDIOSIS.

To the Editor: Does your veterinary department answer chicken disease questions?—R. E. H., San Bruno.

[Answered by Dr. H. B. Wintringham.]

[I am attempting to handle poultry diseases which are sadly neglected in my profession. The field is large and the work of necessity original. To date I can point to but two diseases which can be treated with certainty: vaccination for pox which I manufacture; and a remedy of my own for coccidiosis (bloody diarrhoea). There is much tuberculosis present but not to such dangerous extent as in our other domestic animals.]

GAME WARDENS AVAILABLE.

To the Editor: I noted with interest a rather facetious letter signed by H. Overacker which appeared in your paper March 25. The letter appears to be an attempt to depreciate the value of birds as insect and rodent destroyers. The defenders of the birds as valuable allies of the farmer seldom attempt to prove that the destruction of angleworms is a direct benefit to the rancher, nor do they attempt to defend those birds which, on account of their abundance and food habits, destroy large quantities of fruit or grain.

Many of the best insect destroyers among birds destroy many beneficial insects. Nevertheless, the very fact that birds constantly prey upon all sorts of insects increases their efficiency as checks on insect life. Birds eat food to sustain life, not to benefit the human race.

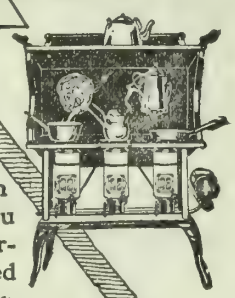
Were half, or even a small part of all of the individuals of each species of insect suddenly destroyed, many of the species that are now troublesome would be rendered comparatively innocuous, and the farmer would doubtless be able to withstand the remainder successfully. It is therefore in this general attack upon insects that birds find their real value.

Mr. Overacker's suggestion that the hunter is turned loose on the farmer without so much as giving him the protection of a game warden is entirely misleading. The California Fish and Game Commission maintains an efficient warden service. Considering the size of the State and the funds available, the warden service is far above the average. With the exception of a few instances, a long-distance call will bring a game warden to any locality within a few hours, and it is this sort of call from the farmer that the game warden is ever ready to heed. Furthermore, a man who is troubled by the hunter can enforce the law of trespass. **H. C. Bryant.**

Berkeley.

Whenever trouble occurs from feeding milk, look well to the drinking vessels, for there is likely where you will find it. All drinking vessels that are used as milk containers should be well washed every day and scalded at least once a week.

The Western Meat Co. recently renewed its lease to 40,000 acres of the Chowchilla ranch for cattle range.



lighter, flakier biscuits

Steady, evenly distributed heat, under perfect control makes a good oil stove wonderful for baking.

NEW PERFECTION OIL COOK-STOVE

For Best Results Use Pearl Oil

A good oil stove is just like cooking with city gas. If you haven't a New Perfection you've missed comfort for years. Bakes, broils, roasts, toasts. More efficient than your wood or coal stove, and costs less to operate. Cuts out the coal-hod and wood-box drudgery. *Keeps your kitchen cool.* The long blue chimneys prevent smoke or odor. CALIFORNIA POULTRY PRACTICE

WRITTEN TO TEACH BETTER POULTRY METHODS ON THE FARM.
By Mrs. Susan Swaysgood.
Price, cloth-bound, postpaid, $1.00.

Pacific Pural Press, Publishers

525 Market Street, San Francisco, Cal.

The Home Circle Page of the Pacific Rural Press

MRS. BEST'S LETTER.

My dear Friends:

The sales are in full blast at most of the stores and one dollar will now do what it took two to do, two months ago.

All ready-made suits and dresses are very much reduced and even the tailors make a decisive cut in their prices for this month. The tailor-made suit may seem like a luxury to most of my readers, because you always pay more for them than for the ready-made garment. But you must take into consideration that usually there is no comparison in materials and a tailor suit made by a good tailor is never extreme in style and you can practically wear it until the garment is worn out and feel comfortably dressed.

Those of you who are coming to the city for a change or to get away from the heat, will find many tailor shops that will make a great effort to please you if you should desire to patronize them.

Millinery is quoted in some stores at about one-third its original price. Generally speaking, the styles are conservative, both in shape and color. A great many large sailors are being seen, both on the streets and in the windows, and the trimmings are simple. The favorite colors for these seem to be either black or white, although there are some bright-colored ones.

Never has there been such a run of sport hats as we have seen this spring, and now that everyone is provided for, there are new ones appearing to tempt us to invest again. These new ones are of soft felt, usually sailor shape and in very soft colorings, with a simple band of white ribbon around the crown.

They are very attractive looking and not so noticeable as the earlier ones of stripes.

The gay-colored sweater is still much seen in the stores and I am informed that the very best style for the early fall is to be the wool jersey cloth instead of the knitted fibre silk. This jersey cloth can be purchased by the yard and the garment made at home at much less expense. One I saw recently on a young girl was made of a deep rose with large collar and cuffs trimmed in white. With this, she wore a white hat (made by herself) of picot edge ribbon, gathered and running round and round the hat.

There are more lingerie blouses being shown than we have had in years. The prices are almost as high as the silk, but they are very fresh and dainty looking, many of them with large collars that hang well down the back and full reveres on the fronts edged with lace.

Corduroy is still popular for separate skirts—I saw some very good looking ones for $5.00, but a good wool skirt of either checks or of white will in my judgment give more service and look better. Gabardine is one of the popular materials for the white skirts and there is a new stitch that looks like braid that is used as a trimming on them.

Yours devotedly,

Rosabella Best.

A FRICASSEE OF LAMB.

Lean lamb should be cut into small pieces, say two pounds. Cover with boiling water in a saucepan, with salt and pepper. This should cook very slowly one hour; and then add one quart of green peas. When the peas are cooked add a tablesp. of butter and a tablesp. of flour rubbed together. Let boil a moment or two longer, and the fricassee is ready.

MAKING HARD WATER SOFT.

To the Editor: Farm women use many checks and ginghams, but when we use borax or soda to soften hard water, it runs the colors and makes the cloth dingy. What can we use, how can we test water easily for hardness, and if borax or soda are to be used, how much per gallon?—Mrs. J. F., Mendocino county.

[Answered by John S. Burd, University Chemist.]

[We know of no simple test for home determination of the hardness of water by which you could judge how much borax or other softener to use. Boil your water, allow it to settle, and use the clear surface water. Another system consists in adding lime water and soda ash, in amounts depending on the hardness of the water. If after trying these, you still have trouble, we would have no objection to making chemical analysis. We do not care, however, to suggest methods of treating of water unless they are followed, as the cost of the analysis would not be justified.]

HOW TO COOK TEPARY BEANS.

[By C. R. Fillerup, Farm Adviser, Ariz.]

Stewed Tepary Beans—One quart teparies; one-fourth T. soda; one-fourth T. butter; pepper and salt.

Look beans over carefully; put into a kettle with enough water to cover. Add one-quarter teaspoon soda and boil five minutes. Drain soda water off and cover with cold water; boil until tender. Add one tablespoon butter. Pepper and salt to taste, and boil over rather slow fire for six hours. Serve hot with catsup.

Recipe 2—One quart teparies; ¼ T. soda; 1 T. butter; 1 cup tomatoes; 1 onion; pepper and salt.

Look beans over carefully; put into kettle with enough water to cover. Add soda and boil five minutes; drain soda water off and cover with cold water; boil until tender. Add butter, tomatoes and sliced onions. Pepper and salt to taste, and boil six hours over rather slow fire. Serve hot.

Note: Preserve these recipes and watch for more. Let us create a demand for this real dry farms product.

NIGHTGOWNS FOR BABIES.

Cotton crepe nightgowns made with peasant sleeves are good for the summer for baby, but they should be finished at the bottom with an inch hem in which a tape can be run. When this is drawn up, the baby cannot kick his feet out.

TO THICKEN CREAM.

If the cream is too thin to whip, add the unbeaten white of an egg and beat vigorously and the result will be very satisfactory.

RABBITS FOR FOOD.

Many children have rabbits for pets, but Belgian hares are more than a plaything for children—they furnish a very economical and appetizing meal when properly prepared. They should not be allowed to grow too old, if you wish them delicate in flavor—from four to six months is a suitable age to use for food. Some of the strains like Flemish Giant make very large animals, but the meat is not as fine-grained as in the smaller breeds, and so is less desirable for the table.

After the rabbit is ready for cooking, cut in pieces, flour well and fry in hot butter or drippings. Long, slow cooking is necessary to have tender, appetizing meat. When well done, the meat is perfectly white and is equal to the breast of chicken.

BREAD AND BUTTER PUDDING.

Cut slices of bread a medium thickness, spread well with butter and lay in a pudding dish. Over this put a layer of currants, sugar and nutmeg; then add more bread and butter and another layer of currants, etc., and repeat until the dish is full. Pour over this one quart of milk, sugar to taste, to which has been added two well beaten eggs. Bake twenty minutes.

SLAW RECIPE.

One small head of cabbage, chopped fine, stand in cold water twenty minutes. Take one-half cup vinegar, one-half cup sugar, 1 egg, salt and pepper to taste, beat all together and cook until thick. Drain the cabbage, add two hard-boiled eggs chopped and pour the dressing over all. Serve hot.—Contributed by L. C. W., Hanford.

STAIN REMOVERS.

Acid stains, ammonia.

Alkali, vinegar or lemon juice.

Blood stains, salt and warm water.

Coffee and tea, javelle water.

Fruit stains, javelle water.

Grease, rub with French chalk and hang away for a day.

Ink, lemon juice and salt or sour milk.

Indelible ink, potassium cyanide (deadly poison).

Iodine (fresh), cold water; then rub in baking soda.

Iodine (old), oxalic acid or ammonia.

Mildew, cover with lemon juice and salt and lay in the sun. Rinse at night in cold water and repeat if necessary.

Paint, benzine, then alcohol.

Rust, javelle water.

Scorch, wash again, then hang in the sun.

FLORAL DEPARTMENT.

By Geo. N. Tyler.

Chrysanthemums that were planted out last month are now well established and should be staked while they are small, as you do not break off many of the roots. The best stakes are made from split-shakes, each shake making twelve stakes. The single and pompons should leave the top pinched out so they will branch.

Smilax that has gone to seed and are turning yellow, should be cut to the ground and no more water applied. If you want to increase your plants, lay one of the strings that you cut off, in a small trench in a moist, shady place and cover over one inch with soil. They will make small plants to be set out this fall.

Rose Cuttings—Keep on putting in cuttings of roses and runners.

Begonias.—If you have tuberous rooted Begonias, you can increase your stock by making cuttings just below a joint and rooting them in sharp sand. When rooted pot them up, or plant them out, which ever you desire, and they will make fine tubers for next year, but do not let them flower, or the tubers will not be so strong. The parent plants should now be in six and seven inch pots, if you are growing them in pots, using one part rotted cow manure, two parts leaf-mould, one part sand and one part loam. After they have filled the pots with roots, give weak liquid manure, the kind I described in a former article is just the thing. If you use any other kind of liquid manure and you get it too strong it will cause the flowers to drop.

Hydrangeas are now in strong growth and are making flower buds. The flowers are greatly improved by watering with liquid manure, but do not feed after the flowers show color, or it will bleach them. If you want some blue ones, put some sulphate of iron around the plants and water through this. If you put it on one side of the plant, one side will make blue flowers and the other side their natural color. Iron filings in the soil will do the same thing, but are not as good or as sure as the former.

Moist Atmosphere.—Those that have small conservatories or greenhouses, should keep all absorbent surfaces sprayed, to give out a moist atmosphere. All kinds of greenhouse plants can be started from cuttings now, especially the Begonias and Coleus.

Repotting.—A good rule to follow in potting up plants is to remember to pot the flowering plant in a one size larger pot than you think it requires. If any of your ferns get light colored in the foliage, it is a sign that the drainage is bad; knock them out of the pot and shake off what dirt you con from the roots and repot into a smaller pot, giving ample drainage; afterwards potting over as they require it.

Every woman at one time or another finds that some wet pieces in her clothes basket have caused mildew among the clothes. To remove rub the spots with soap and cover them with chalk. Dampen and put on the grass in the sun to dry.

THE BOY FROM TOWN.

Last night a boy came here from town
To stay a week or so,
Because his maw is all run down
And needs a rest, you know.
His name is Cecil, and he's eight,
And he can't skin the cat—
His maw she calls him "Pet;" I'd hate
To have a name like that.

He wears a collar and a tie
And can't hang by his toes;
I guess that I would nearly die
If I had on his clo's;
He can't ride bareback and today,
When we slid on the straw,
He ast if roosters helped to lay
The eggs I pick fer maw.

When our old gander hissed he run
As though he thought he'd bite,
And he ain't even shot a gun
Or had a home-made kite;
He never milked a cow, and he
Can't even dive or swim—
I'd hate to think that he was me;
I'm glad that I ain't him.

He thinks it's lots of fun to pump
And see the water spurt,
He won't climb in the barn and jump,
For fear of gettin' hurt.
His clo's are offle nice and fine,
His hair's all over curls;
His hands ain't half as big as mine;
He ought to play with girls.

A little while ago when we
Were foolin' in the shed
He suddenly got mad at me,
Because I bumped his head.
There's lots of things that he can't do;
He thinks that sheep'l bite,
And he's afraid of ganders, too;
But he can fight all right.

—S. E. Kiser.

A MASQUERADER.

This is a real true dog-story.

He is a pug and a great pet of his mistress, who is very proud of his fine pedigree. One day she discovered that Teddie could not see as well as usual. A famous oculist was consulted, who told her to bring her pet dog to him.

They started, but a great obstacle presented itself. Conductor after conductor insisted that the dog should not ride in the car. So it was only after getting on and off about a dozen times that the doctor's office was reached.

Teddie was as quiet as could be while having his eyes examined, and his mistress was told she must bring him every day for a month, and all would be done for him that was possible.

So Teddie's mistress went to a neighbor who had a small baby and borrowed an outfit that was not too dainty. Teddie kept very quiet while being dressed in a long white dress, then a cloak and muslin cap, and over the face a long white veil.

Thus they started. Immediately upon entering a car, if it was filled up would jump a man to give the lady carrying a little baby a good seat. Teddie never wagged his little curled-up tail once, neither did he even bark.

One day the doctor's office was filled with people waiting their turn, when a lady turned politely to Teddie's mistress and said: "My turn comes next, but I will wait for you on account of your baby. It is so very tiresome to wait with a baby."

The doctor opened his door at that moment, and called them both into his private office. He said, "I will show you the very best patient I have," and took Teddie carefully in his arms.

He threw back the white veil and disclosed the dog's little pug nose and pert little face looking out from under the frills of the cap.

Teddie can see pretty well out of one eye now. His mistress expected a huge bill for the expert's service; but instead she received a receipted bill from the good doctor, with a note saying that, as Teddie was the first patient he had ever treated of royal dog blood, he esteemed it a great honor to have been the means of helping him.—Boston Globe.

Jerry Simpson was about to be tried for murder. He managed to get a word with Pat McGlynn, one of the jurors.

"I'll give you $100 if you'll get them to bring in a verdict of manslaughter, Pat."

"I'll do my best, but I think I'll have a hard time for the evidence is dead agin you."

The trial came off and when the jury retired it was evident that they were having a stormy time to reach a verdict. Finally it came, and the verdict was manslaughter.

"I'm grateful to you, Pat," said Jerry. "How did you manage it?"

"Faith I had a hard time of it, for the whole eleven were after acquittin' you."

Give the children a little spot in the garden for their own with the understanding that they must do the weeding, planting, and watering themselves. The boys will likely choose vegetable seed and the girls flowers, but whatever it may be, their time will be profitably employed, and they will get an insight into nature's treasures that they can learn in no other or better way. The study of plant life is delightful and a little work all their own appeals to them.

For a lady's motoring gown a farm woman recommends medium gray satin as it sheds the dust and does not spot easily.

"Pa's Got His New B. V. D.s On"

He had old-fashioned notions, until the Boys went out, bought B. V. D. and made him put it on. Look at him! Now, Pa joins right in the young folks' fun, because he's cool.

Loose fitting, light woven B. V. D. Underwear starts with the best possible fabrics (specially woven and tested), continues with the best possible workmanship (carefully inspected and re-inspected) and ends with complete comfort (fullness of cut, balance of drape, correctness of fit, durability in wash and wear).

Pacific Rural Press Market Report

PRICES QUOTED AS PAID TO PRODUCERS

San Francisco, June 7, 1916.

WHEAT.

The local wheat market shows no change. The California crop outlook is, on the whole, a little better owing to cooler weather and light rains in some places. The shipping outlook is very uncertain owing to scarcity of ships, though some European buyers are reported on the Coast.

Cal. Club, ctl.	$1.60 @1.65
Northern Bluestem	1.87½ @1.90
Northern Red	1.85 @1.95

BARLEY.

While quotations are unchanged, the feeling is a little weaker owing to the appearance of samples of new barley. One car of very light new grain arrived this week and sold for $22.50 per ton. In some sections the new crop is reported to have been damaged by high winds last week.

Shipping, ctl.	$1.37½ @1.40
Choice Feed, ctl.	1.30 @1.35

OATS.

Aside from an advance of five cents in red feed there is no change in oats. Offerings of spot stock are small and the demand moderate.

Red Feed	$1.40 @1.42½
White	1.55 @1.60

CORN.

Kaffir corn is no longer quoted here; and just at present there is no great amount of business in any line. Eastern corn continues to come in in fair volume for the mills.

Eastern Yellow, ctl.	$1.80 @1.85
Milo Maize	1.40 @1.45
Egyptian	1.45 @1.50

BEANS.

The flurry in the bean market seems to be about over. The recent advances in quotations appear to have checked buying. There has been very little doing during the past few days, and no price changes are to be noted. The recently advanced prices are still held, however; and, as stocks are small, a firm market is expected. Advices from the Lima bean growing sections report spot stocks as selling at $4.75, $5 and $5.05, with 1916 futures being sold at $5 or better. In the Sacramento and San Joaquin districts the acreage of large whites, pinks and cranberries will be increased, while the blackeye acreage will be much smaller than last year.

(On wharf, San Francisco.)

Bayos, per ctl.	$5.00 @5.25
Blackeyes	2.90 @3.00
Cranberry Beans	4.85 @5.10
Horse Beans	3.00 @3.25
Small Whites (south)	7.00 @7.10
Large Whites	6.40 @6.60
Pinks	5.10 @5.25
Limas (south)	4.90 @5.00
Red Kidney	6.50 @6.75
Mexican Reds	4.90 @5.25
Tepary Beans	4.00 @4.50

SEEDS.

Melilotus Alba, lb.	23 c
Melilotus Indica	6 c
Bur Clover	11 c
Oregon Vetch	5 c
Soy Beans	6 c
Canada Peas	5¼ @6 c
Alfalfa, per lb.	22 @24 c
Sudan Grass	35 @40 c

HAY.

The market here remains steady as to prices, the total volume of receipts running fairly even, with an increase in the shipments of new hay and a falling off on supplies of old. Reports here indicate that the supplies from some sections will be considerably larger than was predicted a few weeks ago; but advices from interior points, notably from southern California, are not so promising. In portions of the San Joaquin Valley the third crop of alfalfa is being cut, both tonnage and quality being pronounced good. The export movement of hay has been checked by the longshoremen's strike.

No. 1 Wheat	$13.00 @16.50
No. 2	12.00 @14.50
Tame Oats	12.00 @15.00
Wild Oats, new	8.00 @11.00
Barley, new	9.00 @12.00
Alfalfa, new crop	8.00 @12.00
Stock Hay	7.50 @ 9.00
Straw, per bale	.25 @ .40

FEEDSTUFFS.

Bran is up again this week, and middlings may follow with another raise, as the demand continues fully up to the supply. Business is rather quiet in other lines.

(Wholesale prices, per ton, carload lots, San Francisco.)

Beet Pulp, per ton	$22.50 @23.50
Alfalfa Meal, per ton	20.00 @21.00
Alfalfa Molasses Meal, per ton	21.00 @22.00
Bran, per ton	28.00 @29.00
Oil Cake,	Nominal
Cocoanut Cake or Meal	23.00 @25.00
Cracked Corn	40.50 @41.50
Middlings	35.00 @36.00
Rolled Barley	29.00 @30.00
Tankage	45.00
Rolled Oats	29.50 @31.00

VEGETABLES.

Supplies of vegetables have come in quite freely this week in spite of the strike of the river boatmen, gasoline launches and the railroads having proved equal to the emergency. Some lines are getting out of season and are firm for good stock; but the general run is showing weakness on account of increasing supplies. Specially fancy asparagus brought a new high figure at $4 per box. Tomatoes are lower and very weak.

Cabbage, ctl.	$1.75 @2.00
String Beans, lb	3 @ 6 c
Summer Squash, box	60 @75 c
Peppers, bell, lb.	15 @20 c
Rhubarb, box, Bay	40 @75 c
Asparagus, box	1.25 @4.00
Lettuce, small crate	50 @65 c
Eggplant, lb.	10 @15 c
Peas, lb.	4 @ 5 c
Tomatoes, lugs	1.00 @1.25
Green Corn, doz.	15 @25 c
Okra, lb.	20 @25 c

POTATOES AND ONIONS.

Oregon Burbanks are up this week, though advices from the north indicate that the top has been reached there. Advices from the south report prospects for a large onion crop. New crop garlic is now quoted here at from 5 to 6 cents per pound.

New Potatoes, ctl.	$1.75 @2.25
Oregon Burbanks	1.90 @2.10
Onions, red	1.75 @2.00
Australian	2.50
Garlic, new crop, per lb.	5 @ 6c

POULTRY.

Generally speaking, the poultry market is in good shape with all lines moving off well. Hens are now in better demand than broilers; and the latter are selling a little lower.

Broilers, 15 lbs. to doz. and less, lb.	21 @22c
do, over 15 lbs. to doz.	23 @28c
Fryers	25 @30c
Hens, extra, per lb.	20c
Small	17 @18c
Smooth Young Roosters, per lb	25 @28c
Squabs, per doz	2.00 @3.50
Geese, per pair	2.25 @3.00
Ducks, young	Nominal
Old	15 c
Belgian Hares	9 @10 c

BUTTER.

Butter is up again this week, having a little more than recovered the ground lost last week. Receipts have been coming in slowly for several days; and the demand has continued good, especially for extras, which are now quoted a full cent above other grades.

	Thu.	Fri.	Sat.	Mon.	Tu.	Wed.
Extras	25	25½	25½	25½	25½	26
Prime Firsts	24½	25	25	25	25	25
Firsts	24½	25	25	25	25	25

EGGS.

Eggs are up a cent and a half in both grades, with all lines very firm. Receipts are rather light for this season. Some dealers are predicting a further advance.

	Thu.	Fri.	Sat.	Mon.	Tu.	Wed.
Extras	24½	25½	25	25	25	25
Sel. Pullets	22	23	22½	22½	22½	23

CHEESE.

The cheese market is in excellent shape with stock moving off well. The report that China is to be in the market for California cheese caused some interest, but has had no effect on prices. An advance in both Young Americas and California flats is reported.

Y. A.'s fancy	15 c
Fancy Calif. Flats, per lb.	14½ c
Monterey Cheese	16 @17 c

DECIDUOUS FRUITS.

The high price of sugar is said to be having some effect on the demand for fruit, the sour varieties such as currants and gooseberries feeling the effect. Both are lower and not in great demand. Other small fruits are holding their own pretty well, though the longshoremen's strike has interfered with the movement of California strawberries to the northern markets. New apples are coming in more freely and are selling at a better figure. Old apples are also higher for the best stock. Figs are very scarce; and are not quoted at all by some houses. Plums are lower owing to increased supplies, but are moving off well. Cherries are not so plentiful and are tending higher. Both apricots and peaches are lower; but the heavy shipments of fruit to the East are keeping the local market firm. Watermelons are down one-half from former prices. Fruit buyers for canners and packers are out looking for apricots, peaches and grapes.

Currants, chest	$4.00 @5.00
Loganberries, chest	4.00 @5.00
Gooseberries, lb.	3 @6 c
Blackberries, crate	.75 @1.00
Raspberries, chest	8.00 @10.00
Strawberries, chest	4.50 @7.00
Apples, old	.75 @1.25
green, box	.75 @1.00
Cherries, black, 10 lb. bx	.75 @1.00
White, do	.50 @ .85
per lb. black,	.07 @ .11
White	.05 @ .07
Apricots, crate	.75 @1.00
Peaches, crate	.75 @1.00
Figs, black, box,	1.75 @2.00
White	1.25 @1.50
Plums, crate	.75 @1.00
Cantaloupes, standard crate	2.25 @2.75
Watermelon, lb	2 @2½ c

DRIED FRUITS.

The dried fruit market is very firm, though some of the packers are bearish in discussing the future. Locally, prunes are now being quoted at 5 to 6 cents on the four size basis; and it is claimed that business is being done at that figure. Advices from the north report that Oregon prunes are being bought at 6 and one-half cents on a 30-35 basis. Apricots are very firm and are now quoted at from 12 to 12½ cents. Apples have been moved down a half cent from the top figure of a week ago. Reports from New York are to the effect that buying of apricots has temporarily stopped since the last advance.

Apples, old crop	5½ @6 c
Apricots, per lb., 1916.	12 @12½ c
Figs, white, 1916	6½ @ 6¾ c

Special Deciduous Market Report.

By J. L. Nagle.

Sacramento, Cal., June 5, 1916.

Eastern markets on all varieties of deciduous fruits remain active and already inquiries are being made for assorted cars for the Fourth of July trade. On account of the season being exceptionally early, eastern buyers will receive better assortments for their holiday trade than they have been able to secure in several years.

It is a noticeable fact that this year, on account of the advance in the season, fruit has colored very quickly, but has not sized up as in former years. The quality, however, is exceptional on all varieties.

Alexander, Hale and Triumph peaches are now moving, likewise Tragedy, Burbank, Formosa, Abundance, Red June, Beauty and Climax plums. Cherries are practically cleaned up. The shipment of apricots will be at its height this week and we look for the first Bartletts to move in about ten days. The season in some districts is three weeks ahead and in a great many districts two weeks.

The manner in which Bartlett pears are coming on would indicate that the Placer county Bartletts and the Sacramento river Bartletts will be moving about the same time.

Grapes that were not damaged and those that were only partially damaged are showing up very well. The vines that were scorched on the new growth are putting out new leaves but no buds.

There are quite a few cars of grapes that will be ready for shipment from Mexico about the first of July. These will contain Black Prince, Malagas, Tokays and Rose Peru, likewise Cornichon and Muscats. The shipment of these grapes to eastern markets will be somewhat of an experiment as the carrying quality has not been determined and the packing may not be acceptable.

The following prices have ruled for the week:

New York — Tartarian cherries averaged $1.70; Royal Anne, $1.45; Bing, $1.97; Rockport, $1.18; Bigarreau, $1.60; Republican, $1.60; Oregon, $1.50; Seedling Cots, $2.15; Pringle, $1.25; Newcastle, $1.60; Royal, $2.50; Clyman plums, $1.60; Mayflower peaches, $1.95.

Chicago — Tartarian cherries, $1.71; Royal Anne, $1.72; Bing, $2.04; Republican, $1.49; Oregon, $1.87; Royal apricots, $1.92; Newcastle, $1.37; Clyman plums, $1.27; Beauty, $1.67; Mayflower peaches, $1.50.

Total cars of deciduous fruits shipped from California up to June 5th were 216, as against 124 to same date last year.

Special Livestock Market Report.

Cattle are slightly marked down and will probably be lower next week as there is an oversupply. Most of the receipts are light weights. Nearly 1,000 head came into Portland June 5, practically all from California, but the market remained steady.

Hogs are marked down. Arrivals are plentiful—mostly dairy hogs with an extra supply of tuberculosis. Sizes of 174 to 225 pounds are preferred. These dairy hogs will likely come until Aug. 1, then stubble stock may be coming. At Portland, prices sagged on heavy receipts.

Sheep are in small supply, mostly lambs, a few more than last week in San Francisco, but lighter in Portland where there were many last week.

Wool has been active locally in sellers' favor but not enough to change quotations. London markets higher. Australian sales suspended until embargo questions settled, but soon will open and there is a firm feeling. Eastern U. S. no higher, mills reported well stocked and not likely to buy for some time.

Black, 1916	5	@	5½c
Calimyrna, 1916	9	@	10 c

Bulk, layers, 50-lb. box, 1916	2.75		

CITRUS FRUITS.

The eastern markets continue in good shape and are paying good prices for oranges and higher on lemons. Practically all of the navels will be shipped from California by the end of this week. The valencia crop is now going to market and is being eagerly bought at prices ranging from $2.25 to $4.40 per box.

Nearly everything in citrus fruits at San Francisco is up and firm at the advance. Lemons are very high, not only on the Coast but in the eastern markets as well. They are quoted here a full dollar higher. Valencia oranges are higher for the best grade.

Oranges, Navels	$1.75	@	3.15
Valencias	2.75	@	3.25
Grapefruit	1.50	@	2.50
Lemons, box	2.50	@	4.50
Lemonettes, box	1.50	@	2.00

HONEY.

The honey market is firm, though there has been no quotable advance. Some of the cheapest stock is now out of the market. The outlook seems to be for a small crop and some of the trade are predicting higher prices. It is still too early to say much about the new crop. Old stock is now getting scarce.

Water White, comb	14	@	16 c
Amber	10	@	12 c
Water White, extracted	8	@	9 c
Light Amber, new	4½	@	6 c
Dark			4½c

HORSES.

The horse market has practically moved out into the country, where the bulk of the buying is now being done at figures which San Francisco buyers are unwilling to meet. Lots of eastern buyers are in the country; and they are taking everything suitable for military purposes at higher prices than can be realized here. Just now little or nothing is wanted, even good heavy stock meeting with little demand.

Publisher's Department

Here is what one owner of our "California Fruits" book thinks of it: "I received your 'California Fruits' and am very much pleased with it: The very thing I wanted—would not take anything for it."—W. H. Dale.

A letter from C. A. Stowe of Stockton tells us that he is pleased with the Rural Press in bringing him results. He writes: "I am very glad to repeat what I told as regards the value of the Rural Press as an advertising medium, and will continue to speak a good word for what I consider the best and cleanest paper on the Coast."

We are rather surprised at the amount of advertising carried in this issue—but agreeably so. From the publisher's standpoint the issue this week is a well balanced, valuable number. The special articles on sheep will interest a large number of stockmen and farmers. Swine breeders will read the editorial page with interest and profit. Fruit men will find special articles and crop reports of great interest at this time. Poultry raisers will also find timely advice. The last, but most important reading matter, are the market pages. Read them carefully and keep posted on prices paid for produce.

Canning of Fruits and Vegetables—A new book by Justo P. Zavalla. This book contains much practical information that has not hitherto been available. It is the result of careful study by the author, who was sent to California by the government of the Argentine Republic, to learn the subject. The book describes actual methods of canning, also deals with the control of various micro-organisms that are found in canned fruits and vegetables. It is handsomely bound and illustrated, containing 244 pages, and sells for $2.50 net. Published by John Wiley & Sons, 432 Fourth Ave., New York.

D. H. Fallon of Pleasanton recently sold 300 two-year grade Shropshire ewes at $9 each.

The net gain in membership of the **CALIFORNIA ALMOND GROWERS' EXCHANGE** for the month of May was 53 growers, making a net gain over 1915 of 222 growers.

The total membership of the Association is 1041 growers.

Every ton added gives greater strength in maintaining prices and developing the market.

All growers are cordially invited. For full information address

California Almond Growers' Exchange

311 California Street, San Francisco.

TOMATO DISEASE.

To the Editor: Will you please inform me what to do with my tomato plants? They have the blight; it is a white, fuzzy substance in appearance.—G. H. R., Lindsay.

[We do not know any tomato disease which manifests itself by white, fuzzy substance except as that may be due to mold or mildew coming after the growth has been killed by blight, of which the symptoms are curling or blackening of the stems and leaves. A full account of the blight is given in University Circular 147 of the College of Agriculture at Berkeley, which will be sent free on application.—Eds.]

The Antelope Valley traveler on a still day is reminded on all sides of the undeveloped possibilities, by the chugging of gas engine pumping plants for the scattered alfalfa patches up to 20 acres in extent, which break the monotony of sage brush and yuccas.

Classified Advertisements

Rates in this directory, 3c per word each issue; or if carried weekly for one year, 2½c per word.

MISCELLANEOUS.

REBUILT GAS ENGINES from 3 to 50 h. p. Thoroughly overhauled and guaranteed. We only handle high grade engines. Write us your requirements. Motors, Gas Engines bought, sold and exchanged. Mechanical Installation Company, 181-89 Second St., San Francisco.

EVERY SIZE WROUGHT IRON WATER PIPE and screw casing water pipe, guaranteed as good as new. Prices right. Send for catalogue. We beat no one; everybody gets a SQUARE DEAL. Weissbaum Pipe Works, 160 Eleventh Street, San Francisco.

SECOND-HAND WATER PIPE and Screw Casing. New threads and couplings dipped in hot asphaltum. All guaranteed. Send us your inquiry. SHECTER PIPE WORKS, 306-8 Howard St., San Francisco.

FOR SALE—Used Ranch Tools, Windmills, Pumps, Engines, New Galvanized Tanks; 1000, $22.50; 2000, $32.50; guaranteed. Save half. Demmitt Company, 120, North Main, Los Angeles.

FIELD GAS ENGINES—One 20 h.p., one 15 h.p. with magnetos. Cheap. Motor installation cause of selling. The Phalanx Company, 516 Chamber of Commerce, Los Angeles, California.

WE HAVE ONE SECOND HAND Southwick Horse Power Hay Press, in good condition. If interested, write for price. Dixon & Griswold, 146 North Los Angeles St., Los Angeles, Cal.

FOR SALE—Threshing Machine, 16x32-inch cylinder. Self-binder. 5 ft. cut. Cheap; in good condition. Trade for cows or heifers. Address T. G. Hester, Morgan Hill, Cal.

SPECIAL FOR CAMERA OWNERS—Roll films developed FREE. Secret process produce fine pictures. Prints 1c up. Send for samples. Sunset Studios, San Diego, Cal.

LIVING EXPENSES REDUCED THROUGH CO-OPERATIVE BUYING—Write for catalogue and particulars. Pacific Co-operative League, D236 Commercial St., S. F.

BUY ROASTED COFFEE WHOLESALE—Best, 10 pounds, $3.00 delivered. Order with remittance. WM. J. SCHROTH CO., 112-B Market St., San Francisco.

PATENTS THAT PROTECT are procured through Pacific Coast Patent Agency. Savings and Loan Building, Stockton, California. Established fifty years.

GAS ENGINES—I can furnish rebuilt Fairbanks, Morse, Otto, Peerless, Samson, Union and other good makes in all sizes. All investigators buy and all buyers are delighted. Pay when satisfied. J. J. Pottinger, 189 2nd St., San Francisco.

TO REDUCE THE HIGH COST of living, send for our Wholesale to Consumer Catalog. SMITHS' CASH STORE, 1006 Clay St., San Francisco.

FOR SALE—Complete canning plant. Used one season. Capacity, two tons per day. Address C. H. Drake, Calistoga, Cal.

TREES AND PLANTS.

FOR SALE—Manzanillo Olive Trees, budded on Picholine seedlings. Younger and heavier bearers, longer lived and more vigorous trees than trees raised from cuttings. Geo. F. Rice, R. 1, Box 78, Reedley, Cal.

AVOCADO TREES for sale, fine field-grown budded Ganter and Harman variety. $1.00, $1.50 and $2.00. Magnolia Nursery Whittier, Cal.

AVOCADO SEEDLINGS FOR SALE—Also all varieties of Budded Avocados. Newberry-Sherlock, R. F. D. 2, Pasadena, Calif.

FOR SALE—Spineless Cactus Plants. Prices right. B. C. Engbert, Byron, Cal.

WANTED.

WANTED—About sixty young men and women to enter the Western Normal to prepare for teaching, or to secure a high school education in the shortest possible time. Western Normal graduates secure and hold good positions. Time and money saved. For information address Western Normal, J. K. Humphrey, Principal, Stockton, Cal., Box 704.

LAND FOR SALE

COLVILLE INDIAN RESERVATION, WASHINGTON, OPEN FOR SETTLEMENT—Drawing July 27th. About 500,000 acres. Fruit, Farm and Dairy Land. Complete Sectional Map and Description. Postpaid, $1.00. Soldiers, sailors (or their widows) of the Civil or Spanish Wars may register by Agent. Write us for blank forms, which we will furnish free. SMITH & McCREA, Room 108, Eagle Bldg., Spokane, Wash.

STATE LAND NOW coming on market for first time. LISTS any 3 counties, services until 1917, $5. COUNTY Sectional MAPS showing GOVERNMENT Land, $2.50 ANY County. STATE Map showing 600,000 acres SCHOOL Land, $2.50. June Booklet, FREE. JOSEPH CLARK, Sacramento.

WANTED to hear from owner of good farm for sale. Send description and cash price. R. G. List, Minneapolis, Minn.

VACATION LAND

What section of California holds forth such inducement to the vacationist as that traversed by the Northwestern Pacific R.R. Anglers will find the finest fishing; sportsmen an abundance of furred or feathered game; swimmers and bathers have a wide choice of ocean, river and bay; lovers of wild, primitive spots will find miles of great redwood and other forests; rugged mountains and elevations will appeal to trampers; cozy camping locations will entice the family; this wondrous collection of nature begins at Sausalito and extends to the world-old forests of Humboldt county.

A very interesting description of this territory is found in the booklet — Vacation—1916, free copies of which may be obtained at 874 Market Street, San Francisco, or on application to J. J. Geary, G. P. A., 808 Phelan Bldg., San Francisco.

Northwestern Pacific R. R.

SOAP--30 lbs.--35c

The ingredients cost 35c at any drug store. The product is a splendid lyeless toilet or laundry soap, beneficial to the skin and non-injurious to the most delicate textiles. Easy to make. Can be scented to suit. Send 50c in silver, stamps, or money order for formula.

MID-YEAR MODEL
73 NEW IDEAS

Mitchell SIX

$1325 F. O. B. RACINE
WITH 26 EXTRA FEATURES

2000 for New York

The Smartest Car Ever Shown There, They Say

The first Mid-Year Mitchells arrived in New York about April 15.

This model brought out 73 new attractions. It combined all the best ideas from 257 new-season designs exhibited at the January Shows.

It had 26 extra features which other cars omit. No car on the market, we think, has more than four of them.

This New Mitchell, complete and exquisite, won a sensational welcome. The critical New Yorkers crowded the showroom to see it. And our New York dealers placed with us an order for 2000—worth $2,700,000.

How Can the Mitchell Give So Much?

The first question asked when men see this car is, "How can Mitchell do it?"

How can we give such size, power and luxury for $1325? How can we afford to combine in one car all the new details and touches? How can we add these 26 costly extras without any added price?

Our answer is, John W. Bate.

Due to Efficiency

John W. Bate, the great efficiency engineer, has completed here a model automobile plant. It covers 45 acres, and every building is of his designing.

He has equipped these buildings with 2092 up-to-date machines. The total investment is nearly $5,000,000.

We build in this plant 98 per cent of the car. We build it for half what it would have cost under old-time methods. All of our extras—things you don't find in other cars—are paid for from these savings.

John W. Bate's Ideas

Mr. Bate also applied his efficiency methods to the Mitchell car itself. He stands for simplicity, lightness and strength. And our last two models show the final result.

Castings are almost eliminated. They are heavy and brittle. Instead, the New Mitchell has 440 drop forgings and steel stampings. They are tough and stanch and light.

The car has a wealth of Chrome-Vanadium steel. It has a new-type steering gear fitted with ball bearings. It has the "Easy gear-shift."

$1325 F. o. b. Racine
For 5-Passenger Touring Car or 3-Passenger Roadster
7-Passenger Touring Body $35 Extra

High-speed economical Six—48 horsepower—127-inch wheelbase. Complete equipment including 26 extra features.

These make it the easiest car to drive.

It is the only car with Bate cantilever springs, which make country roads like pavement. There was never a car so comfortable.

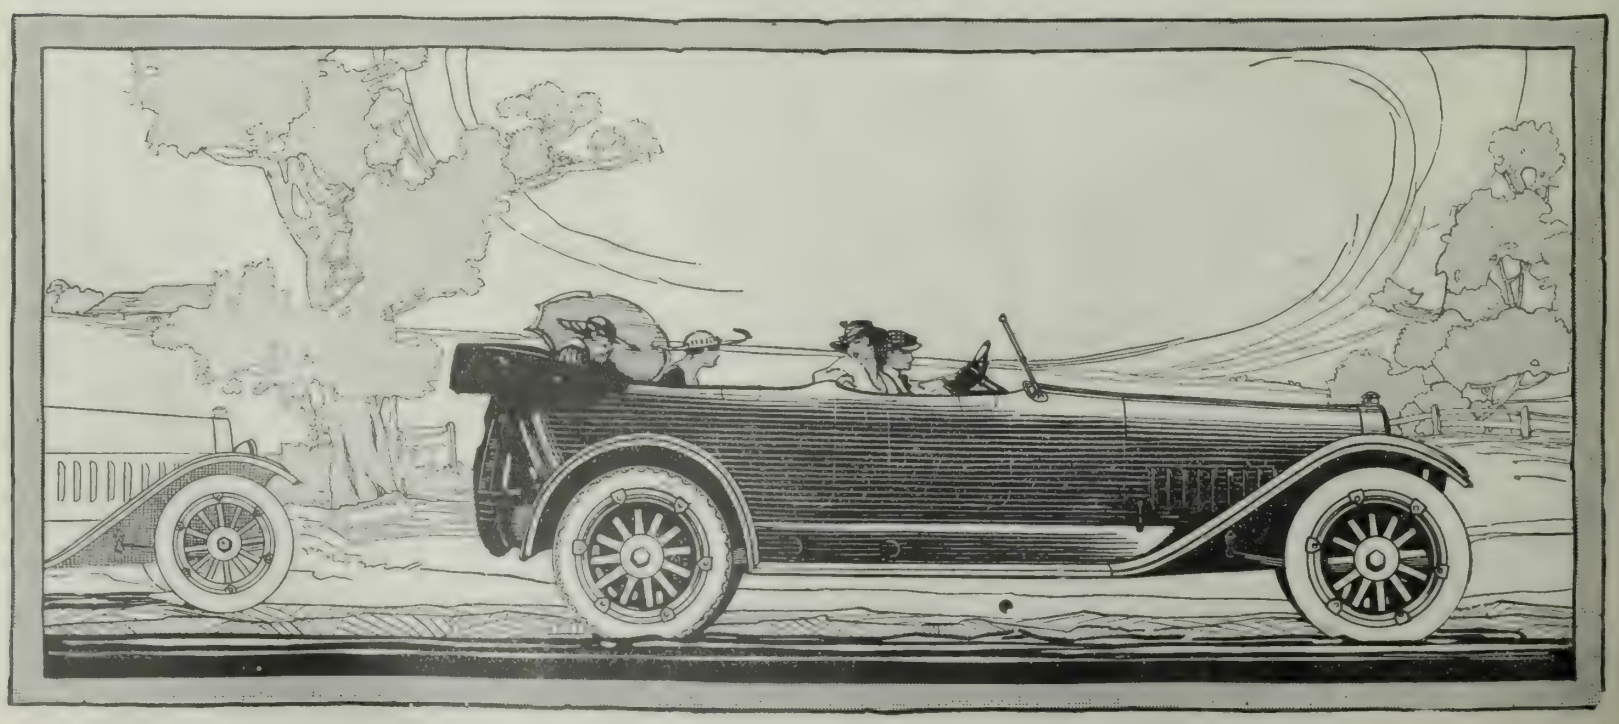
It has a power tire pump, reversible headlights, dashboard engine primer — all the known conveniences.

It has a 22-coat body finish—ten-inch seat springs — soft-finished leather upholstery.

Mr. Bate once said, "Never shall my name be connected with this car until it gives a matchless value." Now that time has come.

30-Year Service

The engineers' ambition used to be to build a five-year car. Now Mr. Bate has aimed at a lifetime car.



We know of six Mitchell cars which have averaged 164,372 miles each, or over 30 years of ordinary service. One Mitchell has 218,734 miles to its credit.

In the past two years many great engineers have selected the Mitchell for their personal car. Your dealer has a list of 37—men of national fame—who have done this.

So you will find here the handsomest, most complete car on exhibit. You will find a mechanical masterpiece. Behind this car is an 82-year-old concern, which has spent 13 years to develop a car like this.

If you don't know the nearest Mitchell dealer, ask us his name.

Better Apricot Drying With Less Labor.

A light crop lowers cost of drying by permitting stack drying, which means more weight of better fruit, and higher prices. It will also stimulate the demand for dried apricots in the future. Labor-saving devices lower cost of production and make greater profit.

[Written for Pacific Rural Press.]

THIS year, with a light crop of apricots, there will be plenty of trays, so that fruit may be principally cured in the stack. T. A. Jenkinson of Kings county cured his entirely in the stack one year. He did not spread the trays out at all, and got the fanciest kind of uniformly dried fruit, meatier and thicker than usual. The light crop meant higher prices, lower cost of production, and better fruit to create a desire in Eastern and foreign consumers for the heavier crop that followed next year. Apricots dry away 3½ to 1 in stack, according to F. E. Goodrich of Santa Clara county, where in the sun they would dry 5 or 6 to 1. However, this would vary widely with the weather, and stack drying might not be safe in damp weather.

Care must be taken not to leave them too moist. Mr. Goodrich says they should feel like chamois skin but not slip back and forth between the fingers. Another Santa Clara grower tests by squeezing double handfuls. They are all right for the bins, says he, if they fall apart in the hands when opened.

Sun-drying apricots. When trays are scarce or are used to dry part of the crop entirely in the stack, the cut fruit may be placed on paper sheets laid on trays. These are slipped off carefully when spread on the ground, and the few trays used repeatedly.

Shaking Fruit from Trees.—Ordinarily it is necessary to minimize the cost of production. This is done partly by Mr. Jenkinson who shakes his fruit from the trees. President E. O. Eggen of the Hemet Cured Fruit Exchange, however, with marketing difficulties in mind, says that "the greatest problem here is to get growers to handle fruit carefully to get good quality. They lose enough fruit by shaking the trees to more than offset the advantage." Mr. Eggen pays 8 cents per box for hand picking, while others pay 6 cents for shaking and picking from the ground. They get a lot of fruit too ripe and a lot too green. Hemet apricots are mostly Royals. Mr. Eggen aims to pick twice a week through a month. This gives him prime fruit at very little extra expense.

The Prune and Apricot Growers' Information Bureau of Santa Clara Valley where Blenheim is the principal variety, urges growers to pick and handle apricots for drying, as carefully as for canning. They also are thinking of its effect on the market. "Shaking the fruit to the ground," say they, "is false economy." The high prices to be received this year make it especially unnecessary.

This would seem evident with over-ripened fruit. It would be so with any fruit if it showed the bruises when dried; and if the dried fruit were sold at a premium for the best grades.

The new prune and apricot selling organization will base its selling price on grades. This will also fix the price ultimately received by the grower according to the quality of fruit he dries. This grading and standardization instills confidence not only in consumers, but also in the wholesale and retail trade, which can therefore take more interest in pushing its sale. This will increase consumption. Even now, with no premium for grading, "first quality dried apricots sell easiest at best prices."

But Mr. Jenkinson says that whatever bruises are received do not show on the dried fruit. This is partly due to his practice of not allowing fruit to get so ripe as most driers do. They get too many slabs and dark fruit; whereas if picked a little less ripe they will at worst lose a little more weight and go into standards. Over-ripe fruit hauled in a box mushes up the fruit all around it into unattractive stuff that sticks to trays. Picking a day or two earlier avoids this.

In shaking the fruit from the trees, Mr. Jenkinson uses a long pole with a hook to fit over the limbs. This may skin the limbs slightly but not considerably. Two canvases 15x30 feet are spread under the tree. The branches are not heavily shaken as they will be gone over two or three times. He has the Peach and Tilton varieties for succession of ripening. A heavy crop ripens more evenly. The canvas is lifted from one edge so the sound fruit rolls off into boxes. Over-ripe fruit lags behind with the trash and is picked out by hand anyway to avoid emptying trash into the boxes.

Clean the Trays Before Picking.—"Before the fruit is ripe, the trays and boxes should be washed in warm water if possible, to which has been added a little washing soda. The practice of dry-rubbing trays with steel brushes is a poor substitute for the wet bath because the steel brush merely loosens the dirt and mold which later soils the fruit wherever it touches the tray."

Sulphuring.—The greener fruit requires more sulphur; but on the other hand, both sulphur and time are saved by putting a bucket of water in each "stall" of the sulphur house every day. Mr. Jenkinson leaves the cut fruit in the sulphur house at least an hour after the sulphur is

EDITORIALS

THE WEEK.

PEACE seems to be coming fast in Europe. We wish in this country we could be as near to peace of mind. We do not refer to political excitements, for they are desirable and make some of us wise. The peace which we covet would come on the cessation of hostilities by those who fake prophesies from natural phenomena, which science has never shown to have any relation to earthly conditions. There is danger and disaster enough in human affairs to alarm credulous people and to disturb them in peace of mind and industry. There is no excuse for frightening people by deductions from sky events, which occur only in the everlasting harmony and beneficence of the universe. Human experience in the north temperate zone is condensed in these beautiful lines:

What is so rare as a day in June!
Then, if ever, come perfect days.

And yet, one of these pestilential prophets is allowed, by a local journal, which should have more sense and self-respect, to publish a forecast of more gales, hailstorms, tornadoes and earthquakes during the last half of this month than any person is apt to encounter in a lifetime. And all of these are unwarranted deductions from the regular conjunctions and oppositions of planets, of which more than half are either so small or so far away that they are never seen with the naked eye, and all of them have been conjoining and opposing each other, ever since creation's dawn, in the course of their regular movements, and have never been caught doing anything amiss to mankind since the human race laid the foundations of astronomy on the plains of Chaldea.

A man has a right to exercise his mind with speculations of this kind, of course, and to communicate the results to scientific bodies, which will receive them; but to publish them as lessons in science to a public not trained to judge their value and disposed to receive them as teachings of science, for which the public has naturally respect, should be prohibited by law as a pernicious form of misrepresentation. Such publications are not only against peace of mind, but they discourage industry and unsettle business by making fools of people who happen not to be endowed with the normal modicum of common sense.

AMERICANISM IN FRUIT SELLING.

VERY sharp rivalry prevails this month among the political platform-makers as to which shall put forth the most stalwart pronouncement of Americanism for their presidential candidates to march on. We are quite in sympathy with such declarations of an attitude for Americans. European patriotism is generating so much heat that the milk of human kindness abroad is forced into fermentation, the alcoholic and vinegary products of which are surely very offensive to American ideals of humanity, and they must be protected from such pollution. But the campaign orators will ring all the needed changes on that subject during the next five months. What we are particularly thinking of is the greater appreciation, protection and patronage of American products by Americans, which surely should be promoted, but we shall not try to take that subject away from the campaign orators. It is the duty of the general government to provide adequate protection against ruinous competition with foreign capital and labor. The particular duty which is up to the California producers of unique American products is to popularize them in this country. Consumption of them is but a fraction of what it should be—in the interest of both producer and consumer. It is hard to realize how small the consumption actually is. Take a few instances of what the per capita consumption would be if the people of the United States should actually eat all we produce in our best years of a few products distinctively Californian:

Four-tenths of a pound of dried apricots.
One-tenth of a pound of dried figs.
Seven-tenths of a pound of dried peaches.
One and two-tenths pounds of dried prunes.
One and six-tenths pounds of raisins.
One-quarter of a pound of English walnuts.
One-twentieth of a pound of almonds.
One-twentieth of a pound of pickled olives.

And the list might be extended to cover all our special products with similar showing. Remember that this is the per capita of the United States' consumption for a whole year. A prize-taker at an eating-match might take the whole collection between the meals of one day, just to sharpen his appetite. And yet, with a consumption so small, considered in its relation to the American disposition and ability to eat well, some people seem to be sure that we are suffering from over-production, and that we need the whole of hungry Europe to eat us up. European demand has served a good purpose; it will always serve a good purpose and should be developed to the limit, for California is in this unique business for nothing less than a world-purpose, but common sense clearly declares that we need more Americanism in our selling designs and policies. The citrus-growers' association, the raisin growers' association and others are advancing toward it with strong strides: the prune growers, peach growers, olive growers and others are striking out in the same direction. Growers must organize to pursue publicity declarations and demonstrations. No one else has the means and motive to do it adequately. We are inclined to believe that if there were nothing beyond this involved in the organizations to which we have alluded, this alone would be warrant for all the effort and money which these organizations have cost. But this is, of course, only one of the purposes involved, even if we do contend that it is the foundation upon which all of them must build their futures. Therefore, get together; vote money for publicity; increase the pitiable figures of American consumption which we have given, a hundred fold! Then the great American question will be, how can we get enough of these wholesome, delicious and distinctive California food products to hold America over all!

A TEST OF DIRECT TRADE.

QUITE in contrast with the breadth of the foregoing exhortation we give another of most direct local import, and that is to take an interest in an experiment which has been in progress in Sacramento for a month, and has been so productive of interesting results that it is to be continued for another fortnight. It is not an establishment of direct trade, but it is an experiment to give a clue as to whether such direct trade as it contemplates is practicable and capable of yielding benefit, both to producers and consumers of food products. The plan was devised by our distinguished Californian, David Lubin, who succeeded in bringing forty-odd nations into active membership in the International Institute of Agriculture, established and endowed in Rome by the King of Italy—as most of our readers know. During the last few months, Mr. Lubin has been in Washington, pressing upon the attention of Congress the need of provisions to make the trade in farm products fairer to both producers and consumers. One phase of his plan is to facilitate distribution of local products within the vicinity of their production by the parcels post service, and during a visit to California last winter he interested Sacramento Grange to carry out an actual test with persons and products in the vicinity of the State capital. This the Grange is doing most actively, and with such success that the experiment is to be worked out farther, as stated above. Meantime, Mr. Lubin is preparing a national organization to seek the action of Congress toward making such arrangements with the local operation of the postal service as shall promote direct trade in farm products, to the end that the buyer shall get his goods and the producer get his pay, with satisfaction to both. The Southern Commercial Congress, under the leadership of Senator Duncan U. Fletcher of Florida, is supporting Mr. Lubin and taking steps to reach the ends he has in view. A bill has been outlined providing for demonstration by actual tests, of the feasibility and popular interest in this method of direct trade, and, as we understand it, the experiment in Sacramento is a voluntary undertaking, entered into by the people and the local postoffice, to furnish data upon which a broader experiment can be reasonably called for. The plan, which has been followed closely in the Sacramento experiment, is that the postoffice will maintain a marketing bureau to which the producer will send tags or tickets stating the kind of produce, price and quality which he has for sale. Consumers then will order through the postoffice, and as the farmer turns his produce over to the mail carrier he is given coupons covering the price, redeemable at the postoffice. This makes a cash trade, which relieves the producer from all risk of collection, and for this advantage it is up to him to make the delivery of such quality as to be acceptable. The preliminary reports from Sacramento indicate that this mutual obligation is being most fully met, and receivers of produce are greatly pleased with the quality and freshness of the material delivered to them by the parcels post carriers. The members of Sacramento grange have provided the facilities for the trade for which the local postoffice is not fully equipped, and explains the undertaking so that active popular interest is secured. It should be understood of course that this is not a means of trade now undertaken by the government, but is a voluntary co-operation for the purpose of demonstrating facts. It will be up to Congress to go farther in the way of establishment and to arrange the operation of the parcels post to facilitate such a form of direct trade. It is very interesting and may be immensely beneficial.

FISHERS WORSE OFF THAN FARMERS.

STATE MARKET DIRECTOR WEINSTOCK is going fishing this week—which seems a very seasonable indulgence for a tired man. But he is not going fishing for fun. Some one has told him that farmers are not in the same class of extortion-sufferers as fishermen, and, surely, if he can find anyone worse off than a farmer, it is his duty to fly to his rescue. Besides, the law talks about fish, and the late Mr. McPherson, who made the law, lived in Santa Cruz and wrote fish into it, because there is more fishing on one side of Santa Cruz than there is farming on the other. It may be some consolation to the farmer to know that even if he gets only 35 cents out of every dollar he produces, he is still doing three and one-half times as well as a fisherman. Figures compiled by the Market Director show that under present conditions the wholesaler receives 40 per cent, the retailer 50 per cent, and the fisherman 10 per cent of the dollar paid by the ultimate consumer for fish. Of course, the fisherman has free range and no taxes to pay, but then he dodges sea sharks only to fill the maws of land sharks, and the claim is that he makes only an average of $5 a week for his labor. Still, of course, he can live by eating the stale fish which he cannot sell—but there he has no advantage over the farmer. So we must acknowledge that it is time Col. Weinstock went fishing, and we expect him to bring home a big string of smelt. But there is a broad aspect to fishing as there is to farming economics, for with the exactions noted above the retail cost of fish to the consumer is so high as to be prohibitive to a degree. As fish is particularly brain food, this is really a public calamity. Some figures are cited to

show the secret of intellectual supremacy. The people of Boston eat on an average of one pound of fish to eight pounds of meat. The people of San Francisco eat on an average of but one pound of fish to twenty pounds of meat. Thus, the Bostonians, per capita, eat two and a half times as much fish as do the people of San Francisco. And this, as the old showman used to say, accounts for the milk in the cocoanut.

EUGENICS AND AGRICULTURE.

SINCE it has been dawning on our slow wits that the new word "eugenics" does not mean running away with another man's wife, we have been gaining more respect for it. Instead of being synonymous with too much affinity, it may be equivalent to no affinity at all—which may be swinging too far the other way. However, we are learning also that eugenics signifies not alone the incidents of engendering, but the whole environment of it: not alone the actual endowment of the thing engendered, but the conditions amid which it grows up. And so being "high-born" or "well-born," according to the modern science of engenics, does not wholly consist in the quarterings on the escutcheon of the generator, but includes what goes into the lungs and stomach of the one generated. And so we come by easy stages to the thesis of Prof. O. F. Cook, of the U. S. Department of Agriculture, a distinguished plant-breeder who has lately taken to the fundamentals of breeding population. Prof. Cook's thesis is that, though "statistically speaking cities are centers of population, biographically or eugenically speaking cities are centers of depopulation," and he writes an admirable essay to show that "city-life is sterilizing the best lines of descent on a large scale, and population must be held on the farm if the race is to improve"—all of which is published in the Journal of Heredity for June. And he intimates that the most important problem of the day for the human race is "how to rearrange our social and economic system so that more of the superior members of our race will stay on the land and raise families instead of moving to the city and remaining unmarried or childless, or allowing their children to grow up in unfavorable urban environments that mean deterioration and extinction." And Prof. Cook supports his contention with very acute observations of existing facts and the fallacy of efforts to secure the desirable increase of people in rural life by "revolts or revolutions that would destroy or change too suddenly any important or well-established relation of life." This, of course, includes all "back to the land" schemes and sensations to which he probably refers when he forcibly points out the "danger of wasting too much time and effort in attempting to salvage the derelict populations of the cities." Evidently he believes that the larger rural population must come from growing up more children in the country, and that must, obviously, be done by rendering rural industries relatively more profitable and rural life relatively more attractive than they now are. And when he closes with the observation that "agriculture represents the constructive eugenic condition which must be maintained and improved if the development of the race is to continue," we feel impelled to join a eugenic society even if our charming wife should begin divorce proceedings forthwith. The situation certainly demands personal sacrifice.

Don't Say Algaroba.

To the Editor: Referring to your comment on the term "Algaroba," I might say that Algarobia, that is in full Algarobia glandulosa, is a name, now obsolete a half-century, for the mesquite. Strictly speaking, Algarobia is a synonym for Prosopis, the generic name for all the mesquites.—W. L. Jepson, Berkeley.

Thank you. We did not comment on the term algaroba. We dodged the question and commented on the carob, which we presumed the querist wished to know about. We are very glad, however, to have algaroba knocked out, authoritatively.

Why No Strawberries?

To the Editor: What is the reason our strawberries don't blossom and bear fruit? They are over a year old and only had a few berries on them. They look thrifty enough.—Subscriber, Van Nuys.

Without knowing more about the case than you state, we can only guess that you are treating them too well: either too much manure or too much water, or both. If they satisfy your ideas as an amateur in the way of being thrifty, they are probably too thrifty. We have several more guesses coming but this seems most likely to fit.

Black Aphis of the Cherry.

To the Editor: I send leaves and twigs from my cherry trees. Kindly advise me what the pest is and what to spray with. The grafts that were put in last spring are especially affected.—W. A. G., Hollister.

It is the black aphis, or plant louse, of the cherry. It has hatched from eggs wintering on the bark, and, as you cut back branches for grafting, the growing grafts are getting all that hatched out below, which would otherwise be more widely distributed. Spray at once, with either an emulsion or tobacco extract wash, being especially careful to reach the under sides of the leaves. Repeat the spraying as the insects appear later and next Spring give them a dash just as the buds are opening. As with other aphids, one early shot is worth several later ones.

Box Elder Bug on Strawberries.

To the Editor: Enclosed please find a bug that destroys our strawberry plants. I find them all around the plant in a circle and they seemed to be breeding. The plant gradually wilts and dies. The bugs also eat or suck the juice from the berries. Last year the bugs were in the patch, but I did not notice them around the plants until this year.—Subscriber, Healdsburg.

They are the box-elder plant bug (Leptocoris trivittatus). They are not reported as breeding except on box-elder trees, though they do infest other plants, including fruits which they cause to drop or to dry up on the trees. They do not usually occasion much loss, however, and it is possible that you may apprehend greater injury than you will experience. They can be killed by spraying with soap or tobacco solutions, but this will probably spoil more strawberries than the insects will. Hand-picking and crushing is effective to whatever extent you have patience to pursue it. As they suck and do not bite, poisons do not reach them.

Blister Mites.

To the Editor: What is the matter with my trees? I am sending leaves to let you see how they are affected. Please tell me if there is any way of saving them.—S. F., Woodland.

There is no way of saving leaves such as you send. They are gone with the work of the blister mite and the mites are also gone, so far as we can see. The insect is microscopic and your chance of seeing it is also very small. It did this work earlier in the season. The trees may be protected now by sulphuring just as you do for red spider. The proper treatment, however, is to spray with commercial lime-sulphur (one part to thirteen of water) just as the new growth is coming out of the buds before the blooms open. It is at that time that they are getting ready for work and they can be reduced below injury by that treatment. They injure both apples and pears, both leaves and fruit.

Treatment of Manure.

To the Editor: I enjoyed reading your article, "Manure Wet or Dry," in your May 27th number. I wish to have your opinion on the treatment of a pile of manure hauled in from a grain ranch and consisting mostly of old well-rotted mature. The pile is about 20 feet by 20 feet and is being stored over summer to be spread on a vineyard next fall. The pile is nearly dry now; will it be a good plan to plant a lawn-sprinkler on the pile and keep it moist during the summer?—Subscriber, Ingomar.

If the manure is really well-rotted it has already gone through fermentation and is not likely to be injured in the pile. If it is really dry, even though it has not fermented, the same is true for it is hardly likely to draw much moisture from the interior valley air at this season. But to be safe you ought to dig down deep into the pile once in awhile and see if it is heating. If so, spread it widely to get drier and cooler. It could be composted as you suggested but you would have to be ready to shovel it over from time to time to slow down any fermentation which might be started by the water. It would hardly be safe to wet it down and let it lie because you do not really know how much fermentable stuff there may still be in it.

Treating Gophered Trees.

To the Editor: I have five or six three-year-old prune trees which gophers have girdled nearly all the way around just below top of the ground. Their leaves have all turned yellow and they do not grow, but they are still alive. I think the gophers must have gnawed the bark off last winter or this spring. Can I save them or not and what could I put on them?—H. L. H., Tudor.

It would have been fortunate if you had discovered this injury last winter for the best treatment for a badly gophered young tree is to pull it out and plant a new one. As, however, you cannot do that now, you may try to save the injured ones. If there is even small show of connected bark, the tree will try to recover. You can help it by cutting back the top, saving only a bud or two of last year's growth. This will reduce the evaporation which the tree has to supply or die. Then mulch two or three feet around the tree with rotten straw, or other litter, so as to hold the moisture well up to the soil surface so that it may prevent the wound from drying. This will promote granulations from the edges of the wound and also from cells which the gopher may not have entirely cleaned off from the face of the wound. As the wound is entirely under ground it does not need any covering. Pour a few buckets of water on the mulch once in a while to help the injured tree to easy sap and to maintain all summer the moist conditions favorable to bark healing.

"Leak" of Potatoes—Midsummer Planting.

To the Editor: Last year I raised a crop of potatoes in the river bottom and dug them the first of July. They were ripe but rotted in the sacks within two weeks. What was the cause of this? Also is it good to plant little potatoes for seed? Would potatoes dug now be fit to plant for winter potatoes? I want to plant this month. Is it better to plant the whole potato than to cut it?—R. W. H., Sanger.

Your potatoes went off with what is called "the leak," because juice runs from the sacks, etc., in which the potatoes are stored. It is a rot caused by a fungus (Rhizopus nigricans) which attacks broken skin or bruises and quickly invades and destroys spuds stored in masses. It is prevented by careful digging, by storing so that the air can circulate to prevent sweating and by picking out decaying tubers. Though there has always been difference of opinion as to using small potatoes for seed and results may be dependent upon growing conditions to some extent, we would not choose very little potatoes nor buy such for planting. And yet perhaps seed should be small rather than very large: "small medium size" may give you the idea. These can be planted whole. Cutting is not essential unless you are using very large tubers and planting them whole is wasteful. You can use the last crop for seed if they matured well, but spread them in strong light (not burning sunshine) and allow them to get green and start sprouts before planting.

California Weather Record.

The following rainfall and temperature record is furnished the PACIFIC RURAL PRESS by the United States Department of Agriculture Weather Bureau, at San Francisco, for the week ending at 5 p. m., June 13, 1916.

STATIONS	Rainfall Data: Past Week	Seasonal To Date	Normal To Date	Temperature Data: Max'm	Min'm
Eureka	0	38.99	45.58	58	42
Red Bluff	0	20.21	24.83	98	58
Sacramento	0	18.28	20.07	98	50
San Francisco	0	27.12	22.23	68	48
San Jose	0	16.31	16.78	88	44
Fresno	0	11.72	9.68	100	56
Independence	0	10.34	9.53	92	—
San Luis Obispo	0	26.89	20.51	76	42

San Diego	0	12.55	10.01	66	56

June Work for Walnut Codling Moth.

[Written for Pacific Rural Press.]

To the Editor: The January 22 issue of Pacific Rural Press had a short article: "Band Walnuts for Codling Worm."

I have seen the larvae in all stages of growth on the walnut and am well assured that the eggs were laid on the green hulls of walnuts of all stages of growth, that the eggs hatch there, that the stem end seems to be preferred by the moth for laying, that at all events the young worm eats into the green hull and seeks the stem end, then eats through the soft tissue of the stem end into the walnut. There it eats the inner partition wall, apparently in preference, and before it attacks the meat of the kernel.

I have opened many codling moth culls in which the meat had hardly been touched, but Mr. Worm was a fellow of very respectable size, and about ready to leave the walnut. I have seen him make his exit, letting himself down by a silken thread. I have found him spun in his cocoon for the next cycle of his existence, the stage of preparation from which he or she will emerge as the full-fledged codling moth. To crawl up a tree is it, or to reach the young walnut by means of an aeroplane?

I have found the cocoons between the dried hull and the shell; in cracks of walnut trays on which walnuts were being dried, and rarely between the meat and shell of nut. And dry crack is good shelter. Fallen leaves and cull walnuts, if left on the ground undisturbed, will probably harbor most of the larvae. Therefore picking up all worthless culls and destroying them will be good. A flock of chickens will destroy all the worms they find. The harrow will, however, be found to be the most effective to grind up the leaves and culls left on the ground. If followed by irrigation there can be little chance for a new crop of codling moths.

The remedy which is so effective in the case of the apple seems inapplicable in the case of the walnut, because, if I judge rightly, the eggs are laid on the green walnut in any and all stages of its growth. The applications would therefore have to be too frequent to make the remedy practicable.

I have a strong suspicion that my walnut orchard and others had such a generous share of codling moth culls last season because the codling moth in this immediate vicinity did not find its most congenial host, the apple and pear blossoms. There was almost a total failure of pear blossoms and very few apple blossoms. I am well convinced that the walnut is not a congenial host for the codling moth, and it is reasonable to suppose that if apple and pear growers will do their duty, the walnut growers will not suffer greatly, provided always that the codling moth of the walnut and that of the apple are the same.

J. G. Berneicke, M. D.

Santa Ana.

Editorial Note.—Banding the trees is one of several means of getting the larvae and pupae before they turn into moths which can lay their eggs on the nuts. Because bands form a protection for larvae, the latter may be found there and destroyed in greater numbers than without bands. All other hiding places should be abolished as suggested by Mr. Berneicke.

Geo. P. Weldon, chief deputy State Horticultural Commissioner, suggests for codling worms on apple trees, "bands put on trees as traps in summer" and says that the worms not only let themselves down by silken threads but also crawl out and down the limbs and trunk where they find protected winter quarters. There they spin a cocoon around themselves and do not pupate till spring. He also says that worms which have fallen with the fruit and escaped, "can readily reach trees where hiding places may be found." Wickson's California Fruits says that if the worm lands on the ground "it usually seeks the trunk, which it ascends and soon finds a hiding place where it spins its cocoon."

Prof. H. J. Quayle, entomologist for the Riverside Experiment station, writes thus:

"Control of codling moth on walnuts has not been satisfactorily worked out. Except in possibly a few cases, their numbers have not been sufficient to warrant such an expensive treatment as would be involved in spraying.

"Practically the only other means available aside from spraying is to band the trees. These bands are placed on the tree at a season to catch the worms as they are coming down out of the tree. So far as our observations have extended the infestation of nuts seems to be in midsummer; that is, infestation by the second brood. We have noted a number of worms in hibernation in rough places in the bark. If additional situations such as loose bands could be provided which will enable the destruction of the worms later, it would prevent an infestation the following year, or if the worms come down the tree in any numbers from the first brood, the trees should be banded the latter part of May or June to capture the worms of this period.

"Infestation of walnuts by codling moth under general field conditions has arisen in the past two or three years. The insect seems to be increasing in its attacks on the walnut and is most abundant in Santa Barbara and Orange counties.

"A communication recently received from South Africa indicates that the codling moth is a rather serious pest of walnuts in that country. Whether it continues to increase in numbers in this state remains to be seen."

STATE AVERAGE FRUIT CONDITIONS.

[Written for Pacific Rural Press.]

"Apples are the only deciduous crop which showed better condition for the State as a whole on June 1, 1916, than on June 1, 1915," writes Geo. P. Weldon, Chief Deputy of the State Commission of Horticulture. Apple conditions are estimated at 3 per cent better than a year ago.

In arriving at the State average conditions as given in the percentages below, the conditions in each county were given weight according to the per cent of the total bearing acreage in that county, based on estimates of county horticultural commissioners.

While the figures indicate a light crop, they do not necessarily mean a bad year, for fruit in general will be of better quality and should command higher prices.

	June, 1915.	June, 1916.

SHURE-KIL SPRAY

is transforming hundreds of California orchards from a poor, scrawny, small-bearing condition to a state of perfect tree-health. It will make your trees sturdy, healthy and full-bearing. Sick trees can not bear healthy fruit—**SHURE-KIL** absolutely gets the pests that are getting your trees—one application proves what **SHURE-KIL** can do. Will not burn or otherwise injure Fruit or Tree when applied as instructed. **SHURE-KIL** is 50 per cent more efficient than fumigation, and it costs 35-60 per cent less! Send $1.00 today and we will ship a trial gallon can, prepaid to any Express Office in California.

KILLS SCALE KILLS RED SPIDERS KILLS MEALY BUG

Wipe Off Orange Suckers Frequently.

[Written for Pacific Rural Press.]

June is the time to sucker oranges, according to G. K. Hostetter of Tulare county. There are two or three other times about as good—when the new growth is just starting. Some years the suckers are "thick as hair on a dog's back," while other years the same trees bear none at all. By the time fruit wood is perhaps 8 inches long and the longest suckers 1½ feet, the suckers should be wiped out by brushing both hands along the main limbs and trunk. At the right stage, they break loose easily, leaving practically no wound. If left a little longer till the suckers harden, they tear out pieces of bark when broken loose; and a little later, there is no way but to clip them out at great loss of time and after stunting the fruit wood.

By that time, too, suckerous buds are forming at the base of the shoot, and if allowed to develop, will multiply suckers when the first one is cut off. Frequent cleaning out prevents this, and as emphasized by H. C. Crumrine of Ventura county, gives young trees the "fruit wood habit."

"Sucker citrus trees two or three times a year," says Fred Arth of Redlands, "but leave the last crop of suckers on to take the sap and help make fruit wood dormant so frost won't hurt it."

"Avoid suckers by keeping the tree thinned out so the sucker wood will become fruit wood. They are suckers only because they happen to come inside the tree and have vigor enough to grow to the light," says A. H. Nelson of the Mentone bench. He claims very little trouble with suckers; because he keeps the trees so light and airy.

PLUM PICKING AND PACKING

[Written for Pacific Rural Press.]

Plum picking for shipment to fresh fruit markets should be done earlier than the inexperienced like, and later than is done by those who spoil the market by shipping fruit too immature, according to H. C. Blake of Vacaville.

Proper plum maturity for shipment is also a matter of locality. The Kelsey colored on the tree at Vacaville is too ripe to ship, but at Lodi is all right. Picked green and hard at Vacaville it will color and soften en route. Straw colored Climax with slight pink at apex will ripen and color perfectly en route. Tragedy stands shipment if picked almost fully colored. It can be picked when color begins to show and will look all right on the market, but may not attract the buyer again.

Each plum in the basket should be perfect. It should be packed tight but not bruised; and the cover of the crate cleared just enough not to bruise fruit, but to prevent its shaking loose by hard bumps en route.

CARTONS FOR PRUNES AND APRICOTS.

[Written for Pacific Rural Press.]

A half emptied box of dried prunes or a sack of dried peaches at a grocery store. Are they dirty? Do flies help themselves? Do you hanker for them?

The Prune and Apricot Growers' Ass'n hopes to pack in family-size cartons containing three, five, and ten pounds each to keep the fruit fresh, sweet, and clean.

During the five years ending 1902, Americans ate an average of 17,000,000 pounds of prunes annually. In the five years ending 1914, this average had dropped to about 9,000,000 pounds.

This is due, among other things, to unattractiveness of the fruit as displayed before consumers. The Growers' Information Bureau says, "Obviously no individual packer or grower could afford to do the extensive experimenting necessary for the development of a satisfactory small package." Neither have they been enough able to stimulate prune and apricot consumption by advertising. Neither could they agree together enough to put out a really uniform standardized pack for the whole State.

Collectively, the growers can and must do these things or some must go out of business.

ALMOND ACREAGE.

Almond acreage was badly mixed in the table printed in our issue of May 6. Paste the following figures over the last two columns in the tables, which we suppose you are keeping for reference. Also give Mendocino county credit for 665 acres apples non-bearing:

County	Bearing	Non-Bearing
Alameda	385	.....
Butte	2,000	1,500

CABBAGE WORMS.

To the Editor: What will keep green worms off from cabbage?—G. W. I., Watsonville.

[Spray with lead arsenate paste 1 pound per 25 gallons until cabbages half grown. This is poison and should not be used stronger or later than above. Powdered white hellebore mixed with an equal amount of flour and sifted on the cabbage is effective and not poisonous.—Eds.]

The Kings County Packing Co. started operatons last Wed. on apricots. They expect peaches early in July. Upward fruit prices in the East are reported.

Compare the Cost

TWENTY years ago a farmer borrowed $1,000.00 at 6 per cent straight on the old fashioned loan plan. He has renewed the loan at intervals with constant expense of renewal commissions, abstract charges and recorder's fees, and he still owes the principal sum of $1,000.00

He has paid $60.00 interest every year for 20 years, a total of 1,200.00

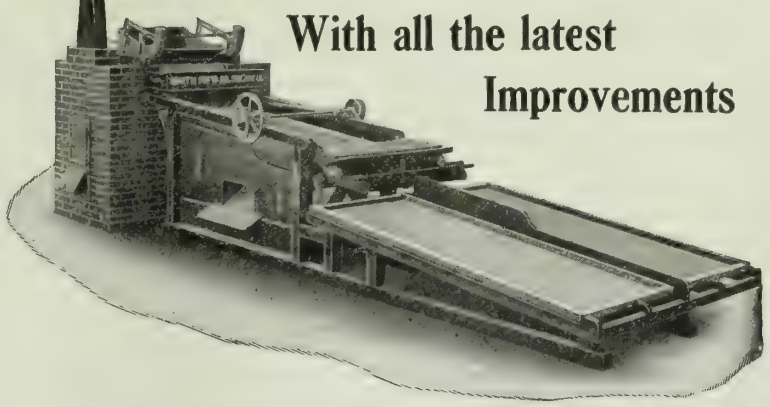
Total cost to farmer, including $1,000 still unpaid..... $2,200.00

Under the amortized rural credit plan, his total interest and principal payment would be $90.76 a year for 20 years, or..... 1,815.20

A saving on a loan of $1,000 of..... $ 384.80

The following table shows the amount of INTEREST SAVED by borrowing on the amortized or rural credit plan:

Amount Borrowed.	Annual Payment Amortized Loan.	Total Payments. 20 Years.	Straight 6 per cent for 20 years and Principal Repaid.	Interest Saving Amort. Loan.
$ 1,000	$ 90.76	$ 1,815.20	$ 2,200.00	$ 384.80
2,000	181.51	3,630.20	4,400.00	769.80
4,000	363.02	7,260.40	8,800.00	1,539.60
8,000	726.05	14,521.00	17,600.00	3,079.00
10,000	907.56	18,151.20	22,000.00	3,848.80



We think this amortized loan **which can be paid off any time** is the best loan, for the farmer, being offered in California, but if preferred, will make 10 year loans, annual interest and favorable prepayment options. Both types, each being for a long term, offer a big advantage in selling a farm, for each gives buyer longer time to pay out than sellers or other loan companies generally grant.

Better Apricot Drying With Less Labor.

(Continued from page 713.)

all burned, so the fruit will "sweat" in the fumes. It is tested by cutting a thick piece. Where fumes have penetrated, the flesh looks cooked or watery. They should penetrate entirely through.

The Information Bureau recommends five pounds sulphur per 200 pounds fruit in a fairly tight house. Larger fruit requires more. If the sulphur burns freely, 3½ hours in the fumes are enough. Fruit properly sulphured has the pit cups half full of syrup and will keep its bright color longer than poorly sulphured fruit. Oversulphuring gives an undesirable appearance and makes fruit stick to trays.

Convenient Equipment lowers cost of production. In Mr. Jenkinson's shed, a steel track runs from the north end to the other, down the center between two rows of cutting tables. Two women work on each end of each table, each filling one end of a tray. The trays are stacked four or five deep as they are filled, then set onto the car.

Pits are scattered out over a concrete slab 16x20 feet near the cutting shed; and left till the season is over.

Cars full of freshly filled trays are transferred to a track running from the south end of the cutting shed a little distance to the sulphur houses.

Labor Saving Sulphur Houses.—The sulphur house is 13x16, containing four "stalls," each four feet wide. The stalls are made practically air tight by fastening building paper each season over the frame of each stall. Paper makes a hotter house than wood. Galvanized iron or tin would soon be eaten up by the fumes. Concrete properly mixed makes a very satisfactory permanent sulphur house. Two 15-foot rails for the cars of fruit to run into each stall project two feet in front to the transfer track for convenient transfer of the cars. Two six-foot cars are put into each stall, end to end. This requires only one door and two rails for each pair of cars, instead of four rails, and two doors to handle. To get the rear car out, a tree-shaking hook is used.

The freshly sulphured cars of fruit are then run on past the sulphur houses and transferred to field tracks. These are in sections of one rail length so they are easily moved. After drying time, they are stacked back of the sulphur house both to leave the alfalfa drying ground open for pasture or hay making, and to save the ties from rotting. Mr. Jenkinson thinks alfalfa the finest dry yard. It should not be irrigated shortly before drying time, or the fruit will dry too slowly, but he has never noticed molding of fruit.

Depending on number of trays as compared with size of crop, the fruit is usually left in the sun a day or more. If there is a light crop, the fruit will be stacked after a day and will dry evenly and heavily a few days before the trays must be used for another batch. This is a good job for idle men when rush work is likely next day. If dried two days in the sun in the usual Kings county weather, one day in the stacks, with trays alternately shoved endwise a few inches for ventilation, will fix the fruit ready for storing. Three days in the sun and three to five in the stack are usually desirable in Santa Clara valley.

Soft Fruit Separate.—As usual, there is the problem of getting fruit cutters to cut entirely around the seam and not tear a corner of the fruit apart. Mr. Jenkinson thinks day work rather than piece work would solve the problem but it is too expensive. The Information Bureau advises that soft fruit be kept separate from the rest, and cut by a trustworthy day worker. "Careful cutting will save much ripe fruit that would otherwise go to the slabs."

A foreman or forelady in the shed will save more than good wages by insisting and watching that fruit be placed carefully right side up on the trays. Spilled juice means lost weight and ragged fruit, to be scraped from the tray at great loss of time.

Brass Tray Scrapers.—In this connection we repeat the experience of Mr. Goodrich, who would not take $5 each for his little sheet brass paddles to clean off stuck fruit from the trays, if he could not replace them. The brass does not gum up nor tear the fruit, while steel or wood is generally unsatisfactory.

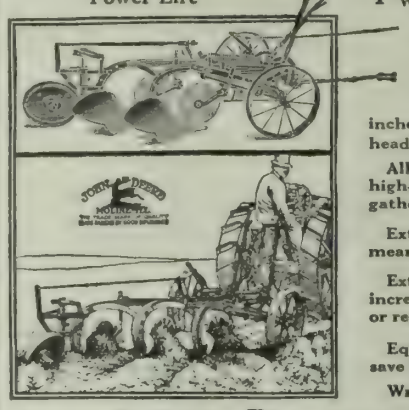
Labor-Saving Trays. — Redwood trays, if clean, do not stain the fruit as does pine, according to both Mr. Goodrich and W. K. Luce, also of Santa Clara county. The latter saves time and labor by having trays 3x8 feet instead of 3x6. The latter would require two men anyhow. They might as well handle the larger trays. At Mr. Luce's work, about 1½ boxes or 60 pounds of fruit are placed on each tray. Trays are piled 18 high on the cars—over shoulder high. It is easy enough to pile them up, but they must be careful in taking the top trays down as they come from the sulphur house or they spill the juice.

FENCE LAW.

To the Editor: My ranch in Kern county is surrounded with cattle-range lands. My fences were built by the party I bought my land from. What is the law as to fences?—B. G. C., Los Angeles.

[Answered by Bigler-Paul-Furlong, San Francisco.]

[Our first advice is that before any action is taken a lawyer should be employed.



However, the law of California is explicit as to fencing. Assuming the owner of a parcel of land desires to fence its exterior boundaries, in order to protect his property from without, he is entitled to serve notice upon abutting owners calling upon them to pay one-half of the cost of such fencing. In case they refuse to join him he then has the right, after a definite lapse of time, to erect such a fence, one-half of the cost of which, upon proper legal procedure, becomes a lien upon the abutting land.

After such a fence has been properly erected, of proper materials, in a workmanlike manner, then any damage to said fence, or to growing crops, trees or improvements within the fence, caused by stock or other controllable causes from without, can be collected through legal channels from the owner of such stock, or from the person causing the damage.]

John Deere Implements

John Deere Plows for Light Tractors

With High and Level Power Lift

PRACTICAL plows for the average farm. Work with any standard tractor.

Controlled by the man on the tractor. Pull the rope and all the bottoms raise high and level. Another pull lets them down.

Plows raised or lowered in fourteen inches ground travel. This makes square headlands.

All bottoms raise high—like a double-bail, high-lift horse plow. Plows do not clog or gather trash on the turn.

Extra wide and semi-floating front truck means uniform work and even depth of plowing.

Extra beam and bottom, readily attached, increases regular two-bottom plow to three or regular three-bottom to four, as desired.

Equipped with Quick Detachable Shares—save 80 per cent time changing shares.

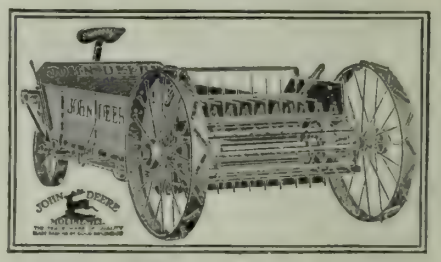
Write for free booklet.

John Deere Spreader

The Spreader With The Beater On The Axle

BEATER drive works on the principle of a horse power. No clutches, no chains, no trouble. Mounting the beater on the axle (a patented feature) does away with half the types of castings.

Only hip-high to the top—but has big drive wheels. Wheels out of way when loading.



Here are three exclusive John Deere Spreader features—read them over and then be sure to see them on the spreader itself:

1. Beater on the axle—nothing else like it.

2. Revolving Rake—load moving back to beater revolves the rake. Draft actually less. Even spread certain—no bunching.

3. Ball Bearing Eccentric Apron Drive—requires no attention.

If you want to distribute manure seven feet wide, use the John Deere Wide Spread Attachment. Write for free booklet.

A Farm Book For The Asking

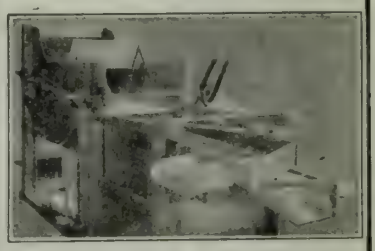
BETTER FARM IMPLEMENTS AND HOW TO USE THEM

A Big One—168 Pages

Tells all about a complete line of farm implements and how to adjust and use many of them. A practical encyclopedia of farm implements. Worth dollars. This book sent free to every one who states what special implements he is interested in and asks for package No. X-152.

Write for your copy today.

John Deere Moline Illinois



VACATION LAND

What section of California holds forth such inducement to the vacationist as that traversed by the Northwestern Pacific R.R. Anglers will find the finest fishing; sportsmen an abundance of furred or feathered game; swimmers and bathers have a wide choice of ocean, river and bay; lovers of wild, primitive spots will find miles of great redwood and other forests; rugged mountains and elevations will appeal to trampers; cozy camping locations will entice the family; this wondrous collection of nature begins at Sausalito and extends to the world-old forests of Humboldt county.

A very interesting description of this territory is found in the booklet — Vacation — 1916, free copies of which may be obtained at 874 Market Street, San Francisco, or on application to J. J. Geary, G. P. A., 808 Phelan Bldg., San Francisco.

Northwestern Pacific R. R.

"THE PERFECTION"

Prune Dipper and Grader

This is an automatic machine; no guess work about it; gives three grades, three trays up at once; dipping fluid is heated by a large oil-burner and a superheater, to supply hot water to the tank when needed. The prunes pass through every inch of 65 gallons of hot water, therefore no sediment. Fuel expense from 6c to 7c per ton; labor cut 50 per cent; no installing expense; most efficient and economical machine on the market.

F. J. Yandle,

Santa Rosa, Calif.

Cement mill men in southern California had to keep their dust off the orange orchards. In catching it they found potash; and one mill sold $100,000 worth last year at $80,000 profit. U. S. had been buying $20,000,000 worth of potash per year from Germany.

DRIED AND CANNED VEGETABLES AND FRUITS INCREASED.

Canned vegetable production increased 58.4 per cent from 1909 to 1914 in U. S., and canned fruits increased 96.5 per cent. Canned soups made from vegetables are becoming popular in modern living, as indicated by a 204.3 per cent increase. Figures are taken from the preliminary statement of a manufactures' census issued by S. L. Rogers of the U. S. Dept. Agr.

Packs of Vegetables and Fruits, 1909-1914.

Squirrels and Almonds.

To the Editor: I have a few acres of almonds with a good crop on but the squirrels are eating them rapidly. What is the best method to get rid of the squirrels? — Subscriber, Modesto.

The best way to kill squirrels in the dry season is to use poisoned grain. We have published the best poisoning way dozens of times and have put it in all our books, but we never are able to catch up with the new subscribers.

Poisoned barley is preferred, since it is more attractive to the squirrels and less likely to be eaten by birds: Clean barley, 20 quarts; Strychnia sulphate (ground or powdered), 1 ounce; saccharine, 1 teaspoonful; gloss starch (ordinary laundry starch), ½ teacupful; water, 1½ pints.

Dissolve the starch in a little cold water and add 1½ pints of boiling water, making a rather thick solution. While hot, stir in the strychnine and mix until free from lumps; then add the saccharine and beat thoroughly. Pour in the poisoned starch over the barley and stir rapidly until the poison is evenly distributed; then allow the grain to dry. When dry it will keep indefinitely without deterioration. A coating of poison is formed on the outside of the grain. Squirrels are readily killed by carrying such coated grain in their cheek pouches while storing food for future use.

The poisoned grain should be scattered (not placed in heaps) on clean hard places about the colonies, the trails between the holes, along fences and roadsides and other places frequented by the squirrels. This poisoned grain, if scattered about, is not dangerous to stock, but is fatal to poultry.

LIPPIA VS. MORNING GLORY.

To the Editor: You published an article stating that lippia grass kills morning glory. I have ½ acre of morning glory. If I plant lippia to [illegible] I get rid of the lippia? [illegible] ights.

(Answered by John F. Swett, Martinez.)

[If the ground is planted with Lippia roots and these are kept cultivated and watered until they are well rooted, they will begin to choke out the morning glory and at the end of two or three seasons, you will have a handsome Lippia lawn entirely free from morning glory.

If the beauty of a handsome lawn does not prevent, you can then hoe off the Lippia turf, spade up the ground and have it absolutely free from either of its former tenants. The expense of buying Lippia roots, the care necessary while rooting them and the necessity of waiting a couple of seasons while the choking out process is taking place, make other methods for eradicating large fields of morning glory simpler and more economical.]

Spot and future prunes are reported on a 5 to 5⅛ cent basis by the Growers' Information Bureau. Business is quiet. European export orders for Oct. delivery have been confirmed last week by San Jose packers.

TEN MILLION FEET OF Clean, Seasoned Lumber

At Less than Wholesale Prices.

Moving ¼ of a Million Feet a Day Place Your Orders Immediately.

THE 8 MAIN PALACES—THE COURTS AND THE TOWERS—of the P. P. I. E. are being dismantled, and we are disposing of the lumber. It is coming out, not only clean and in good shape, but thoroughly seasoned. All Oregon pine.

Don't delay sending us your lumber bill, for prices will be so low you cannot afford to overlook the savings, and the lumber is moving very rapidly.

SIZES: 2x3 to 2x16; 3x12 to 3x16; 4x8 to 4x18; 6x6 to 6x14; 8x8 to 8x20; 10x10 to 10x20; 12x12 to 12x18; 14x14 to 14x20. Lengths up to 32 ft.

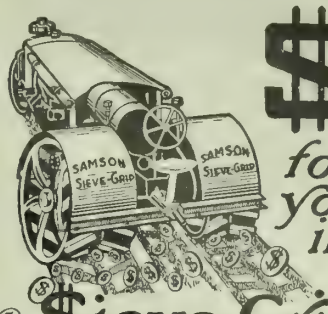
SHIPLAP

Subject to previous sale, in carload lots, we offer the following f. o. b. Expo. Grounds, San Francisco.

2x6, 2x8 and 8x10 Oregon Pine Shiplap—suitable for warehouse floors, sub-floors, flumes, etc.—**$9.50 per M. ft.**

As the above is laid it matches neat and snug.

We have 1000 FLAG POLES—25 ft. to 100 ft. long. While they last we are giving



One 25-Foot Flag Pole Free

with each carload of Shiplap, as a Souvenir of the World's Greatest Exposition.

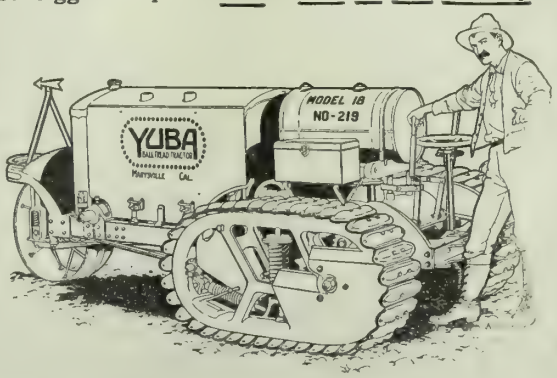
Success in Farming

Success is the prosperous termination of any enterprise—prosperity.

Success is not just getting along halfway—it's beating the game, and winning—it's prosperity.

Success in farming requires the use of every means to raise bigger crops at less expense—to get the work done at the right time, at the lowest cost.



Success means getting the soil in good humor, so it will produce big crops and will not be exhausted.

Success in farming means getting big tasks done with least effort and least expense.

Success in farming means the use of modern machinery—the saving of human effort by utilizing mechanical power—the saving of money by introducing one machine to do the work of ten men and forty horses.

Success in farming is holding the young men in the country instead of attracting them to the overcrowded city.

Success in farming is made possible by the tractor to plow and harrow and cultivate and haul the thresher and the grain, in the orchard and the rice field.

You can use a tractor to your advantage on your farm.

Let us prove to you why you should have a money-making tractor.

[Written for Pacific Rural Press.]

ORCHARD TRACTOR VS. WIND.

"Our tractor beats the North Wind to it," says C. L. Moseley of Butte county. He referred to the delayed plowing which enabled the cover crop in his young almond orchard to make maximum growth. When danger of north winds drying the ground approached, the Yuba 12 was run over the 40 acres quickly with a double disk. This enabled the plow which followed at once, to turn under the heavy growth including milo stalks to a depth of 9 to 10 inches. "Then let the north wind come," which it did. The ground however, was well cultivated clear to the bottom of the plowing, and the loss of moisture was not great enough to injure the trees.

Orange Tractor.—"I am working 100 acres of orange orchard this year with a 14-disk cultivator and a Samson 6-12 tractor bought last February," says R. W. Job of Plano. He carries five sacks of adobe soil on the disk; and the finely cultivated soil is much better than if left in clods for lack of time to work it down at the proper condition.

The picture shows an International Harvester tractor doing better work at one trip than Mr. Job does, because a double disk is being used.

Better Work with Less Traveling.

HOME-MADE TRACTOR.

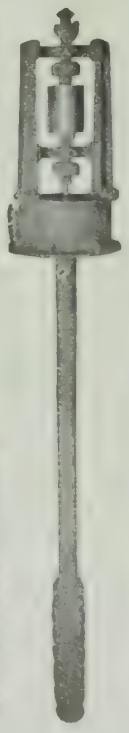
To the Editor: In reply to your request for information concerning our tractor: The wheels and engine are second-hand; but the gears, clutch boxes (or bearings) and shafting are new. The engine is a 25 h. p. Overland, but being an auto engine we designed it to develop 12 h.p. on the belt and six at draw bar. This it will do continuously with plenty of reserve power. It weighs 3300 pounds and has a speed of two to four miles per hour. It cost a little less than $250 and does all the heavy stationary work, such as grinding grain and cutting hay, etc.; as well as tractor work. The wheels are from a harvester and another tractor, and the gears and bearings can be obtained from any company handling transmission machinery. The tractor pulls a 14-inch plow in dry hard adobe. **M. Van Hook.**

Dos Palos.

HYDRAULIC WELL DIGGING.

Considerable interest has been created in Madera county by the bringing in of a fine well by the Lewis Company of San Jose, which concern owns and operates the Island Ranch, four miles east of Madera.

Efforts have been made from time to time in the past to secure water in this section of the country, but it was not until the Bean Spray Pump Co., of San Jose, was induced to enter the field with one of their hydraulic deep well boring machines that the district was given a thorough test with satisfactory results.



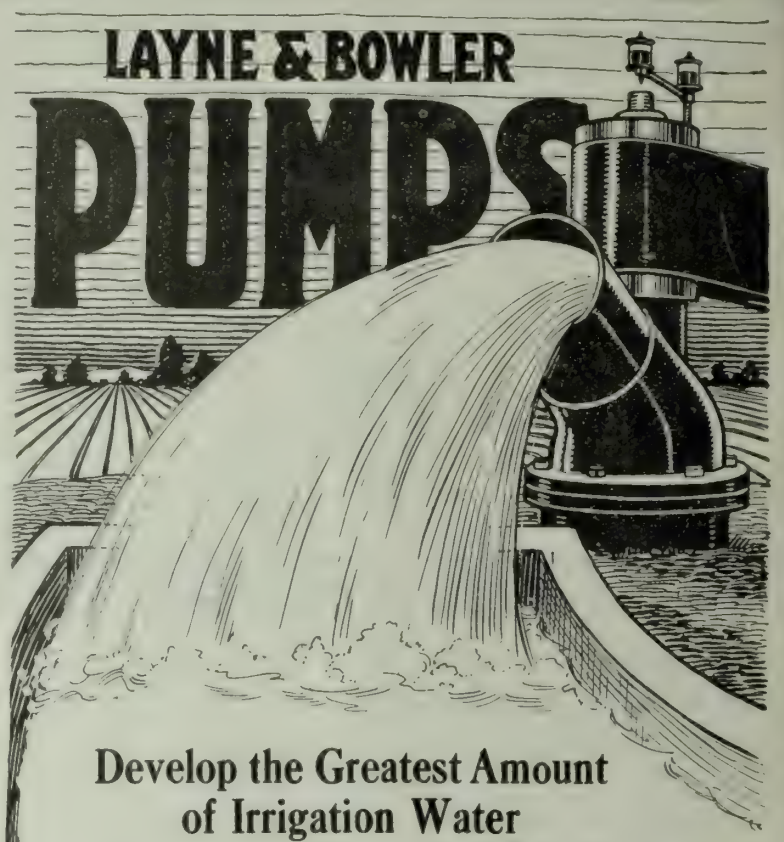
A test hole was first put down. This is a plan used by the Bean concern, which enables them to determine the possibilities of a permanent well and the approximate cost of the complete installation, before much money has been invested. The test hole is 477 feet deep, but the well is finished off at 317 feet, there being but little water-bearing gravel below this.

The well was put down by the Bean hydraulic system, which not only does the work quickly, but enables the well to be put down before the casing is put in. A heavy clay mixture is pumped into the hole

No Pit

is required with the

Krogh Deep Well Turbine Pumps



For bored or drilled wells from 10 inch inside diameter up; and for capacities of 250 to 3000 gallons per minute. Built for pumping from any depth to and including 250 feet. They are absolutely water balanced and are self-aligning. More water can be obtained from such wells than with any other type. Built in belted or direct motor driven types. If interested, write for Bulletin.

while the work is being done and this holds back the water and prevents the walls from collapsing.

After the well has been sunk by this method, special screens are constructed for the various sand and gravel strata encountered. This is preferred to the plan of inserting stove-pipe casing and perforating afterward.

Before the casing was put in, charges of dynamite were exploded at different depths which broke up the formation and permitted the water to flow in for a radius of several hundred feet. The Bean hydraulic developer was then inserted and the fullest possible flow secured.

When completed, the well was tested and developed a fine flow of 1395 gallons per minute, lowering the water level only 29 feet and making a total lift of but 41 feet.

The pump is a Bean Turbine, 15-inch size, and requires no pit. All oiling and adjusting is done from the top. The well is one of the finest in the county and Mr. Lewis states that he would not take $25,000 for it.

TRACTOR AIDS HORSE BREEDING

[G. F. Sampson in Orange Judd Farmer]

I have raised more colts during the three years in which I have had a tractor than in the previous 10 years. The machine does all the heavy work and thus saves overworking brood mares as their foaling season approaches. The machine also enables me to let the mares run to pasture at breeding time.

Formerly I had worked my mares to the very limit every day, because my work simply had to be done. The consequence was that the mares were not bred. Now that horses are so scarce and high, especially good horses, it will pay everyone who is doing much farm business to operate a tractor, if only to enable his mares to raise more colts, horses, or mules.

Instead of the tractor hurting the horse market, my experience is that the machine will benefit the trade. Besides the destruction of horses and mules by the war, the demand for good horses and good mules is going to insure a good market at fair prices for all good stock of that kind for many years to come. At the same time, farm work also is so increasing in variety and amount, that the tractor has become indispensable. I can plow with it more deeply, cultivate more thoroughly and raise better crops at less cost than with horseflesh or mules. Both forms of traction have their uses, and there is room enough for both.

I remember that when the electric light became a commercial success, shareholders in gas companies feared for their investments. Experience showed that more and better light created an increased demand. Today gas companies are more profitable than ever, while the electric concerns are doing well also. The same principle applies to this tractor, horse, and mule business—the more power that becomes available, whether mechanical or animal, the more use there is for it.

The California Hydraulic Engineering and Supply Co., San Francisco, have closed a contract with the McGillvary-Raymond Granite Co. for 12 American centrifugal pumps. This latter firm is subdividing 480 acres of land near Livingston into 40-acre tracts; and is to install one of these pumps on each tract, to be run by a motor.

Endurance

General Agricultural Review.

GRAIN AND FIELD CROPS.

Merced grain harvest is well along.

Some of the Oakdale barley is going 15 bushels per acre.

Oats look especially good in certain parts of Salinas Valley.

Alfalfa hay is being sought around Hollister at $12 per ton f. o. b.

A ton of Eldorado county hay sold June 7 for $25. The usual price is $20.

The fine grain crop of the Tracy district was partly threshed by the wind.

The onion crop of the Sacramento river is estimated at half of normal acreage.

Rice on the 900 acres around Pixley last year is said to have yielded 43 sacks average.

The Healdsburg Canning Co. will can this summer nearly 200 acres of tomatoes.

A million grain bags were destroyed when Pier 46 in San Francisco was burned.

The largest oat hay crop in years is estimated for Stanislaus county by H. G. Turner.

Cool May weather helped the Mendocino grain and grain hay crop more than expected.

Fire destroyed 200 acres of barley and 200 of wild oats near Crows Landing. Was it insured?

The Eureka Girls' High School Club is raising beans which they are to can as part of the contest.

Uninsured grain on 680 acres was burned near Los Banos before the 150 fire fighters could stop the blaze.

About 365 acres are contracted for beets around Bishop, Inyo county, as an experiment to determine suitability.

Lima bean carryover June 1 is estimated at 250,000 bags; blackeyes at 60,000. Over 2-3 of these are in Ventura county.

Santa Barbara grain has been largely cut for hay so that the grain will be only about 15,000 sacks instead of 50,000 as last year.

Asparagus canning in the Delta is expected to continue until July, the cold May having delayed growth. The pack to date, however, is greater than to date a year ago.

An American rice polishing machine was recently installed in Hong Kong and the first shipment of polished rice ever made from China to U. S. was soon on the way.

Shipments of beans from Ventura and Santa Barbara counties were 760,000 bags between Sept. 1, 1914, and Mar. 1, 1915; there were 820,000 bags during the same period last season.

Better inspection of cantaloupes in Imperial Valley and better organization of the market distribution is bringing better demand for the greater crop at better prices than in previous seasons.

The U. S. June 1 wheat forecast for Cal. is 4,380,000 bushels. Last year the production was 7,040,000 bushels. Similar figures for barley are 29,100,000 bushels and 39,440,000. Oats 5,700,000 and 6,963,000.

CITRUS AND OLIVES.

Riverside has shipped nearly 300 cars of lemons.

The navel season is reported as one of the most satisfactory in many years for Upland growers.

Lindsay-Porterville orange growers think the fruit could drop pretty heavily and still leave a good crop.

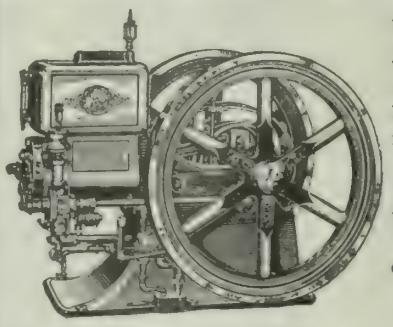
A three-acre Valencia orchard four years old, with no buildings, recently sold near Orange at $2200 per acre.

The California Olive Growers' Ass'n has been dragging out a feeble existence. Col. Weinstock comes to the rescue with the raisin plan of organization to include 7000 acres of olives and $100,000 capital in $5 shares; 50,000 shares are to be preferred. Jan. 1, 1917, is the date of final organization or dissolution.

DECIDUOUS FRUITS.

Porterville has been shipping fresh apricots to the East.

Early Crawfords are sought at Atwater for $20 per ton.



The Libby cannery at Selma opened on Royal apricots June 8.

Dried apricot pack this year is estimated at less than half that of last year.

No revision of the Growers' Information Bureau apricot crop estimate.

Arsenate of lead is suggested when the 12 spotted green "lady birds" get busy.

Tulare and Kings counties report full prune crops. They have 6 per

Reg. U.S. Pat Off.

Don't say Caterpillar unless you mean Holt!

Practically all the wear that can occur in the track is confined to this point—the pins and sleeves with which the tracksprocket engages. These are of case-hardened steel, and on many Caterpillars have lasted for years. They can, however, be replaced at a very slight cost.

The Caterpillar track combines greatest wearing qualities with least frictional loss in turning brake- into drawbar-horsepower.

It is this ideal combination of long time wear and power saving — characteristic not only of the track but of the whole construction of the Caterpillar — that largely accounts for the fact that two out of every three tractors on the Coast are Caterpillars.

From among the 3000 Caterpillar owners we receive many such reports as this:

"Our engine has made an average of 7½ to 8½ months' work for three years—the track which came with the engine is in good shape."

"Have used my Caterpillar 5 years. The original track chains are still in use."

Why not write for Bulletin C- 338, explaining the details in Caterpillar construction?

MR. BROWN'S IDEA OF GUM-ROT.

To the Editor: After considerable study I have come to the conclusion that the cause of gum rot and gummosis, especially on old trees and in old groves, is caused by lack of moisture during the summer season.

Year after year, especially in years of light rainfall, the subsoil around trees dries out, and once being dry and not having a sufficient amount of rainfall the next winter to wet the subsoil, the coming dry weather finally kills the fibre roots and causes gum to ooze from the bark of the tree.

The orange tree is more subject to gummosis than the lemon tree and is mostly found in old groves. Upon grubbing out one of these trees affected with gummosis you will find that the fibre roots are all gone, nothing but a few straight roots remaining which are also affected in the same manner as the body of the tree.

While the tree is in that condition the gopher comes along and his gnawing at the roots harms the tree that much more. I have, on first noticing the gum rot on orange trees, run water around, wetting the subsoil thoroughly. By this method the rot will dry up and disappear inside two or three months and if this precaution is taken in the early stages it will entirely cure the disease.

As a proof of this you will notice that the gum rot, on trees affected, completely dries up in the winter, after the ground gets well soaked up with water, but as soon as the dry summer season sets in the gum rot reappears. I have watched this year after year. **G. T. Brown.**

Pomona.

[Although our notion of the matter does not entirely coincide with Mr. Brown's conclusions, growers will do well to measure them by their own observations.—Eds.]

Other Unrivaled Records

All made under A. A. A. supervision, by a certified stock car or stock chassis, and excelling all former stock cars in these feats.

100 miles in 80 min., 21.4 sec., averaging 74.67 miles per hour for a 7-passenger touring car with driver and passenger.

75.69 miles in one hour with driver and passenger in a 7-passenger touring car.

Standing start to 50 miles an hour in 16.2 sec.

One mile at the rate of 102.53 miles per hour.

1819 miles in 24 hours at average speed of 75.8 miles per hour.

Over 3800 miles at speed exceeding 75 miles per hour without evident wear on any engine part.

Hudson Super-Six Sets New 24-Hour Endurance Mark

Fastest Time for Such Distance ever made by a Traveling Machine

No man today—if he knows the facts—doubts the Super-Six supremacy.

At first the truth seemed like a romance. Think of one new invention, applied to a light six, adding 80 per cent. to its power.

Then official records began to pile up, certified by the A. A. A. The whole motoring world then had to concede this the greatest motor built.

But many men asked, "What about the endurance? Can a motor so flexible, so speedy, so powerful, stand up in years of road use?"

So we asked Ralph Mulford to take a stock Super-Six chassis and, under official supervision, show the world its endurance.

All Records Broken

He took a Super-Six stock chassis—certified by A. A. A. officials.

It had already been driven over 2000 miles at speed exceeding 80 miles per hour.

It had made a mile at Daytona at the rate of 102.53 miles per hour.

And he drove that car 1819 miles, on Sheepshead Bay track, equal to the distance from New York to Denver—in 24 hours of continuous driving—at an average speed of 75.8 miles per hour. At the end of that test—after nearly 4,000 miles of record-breaking strain—the car, when officially examined, showed no appreciable wear.

How Much Endurance Has It?

It will be many years from now before we can tell you how long a Hudson Super-Six will last. But the records we cite cover the greatest strains a motor car ever met. Many a great engine has gone to pieces under far lesser strain. Years of ordinary driving would never tax a motor like those thousands of miles of speed tests.

Yet the wear on the Hudson Super-Six was almost nothing. Certain it is that no man has ever built a traveling machine to compare with this car in endurance.

Greatest Endurance Proved

That was the last question—this one of endurance. In all other ways it has long been evident that the Super-Six stands supreme. Never has a motor of this size shown anywhere near such power. Never was an engine made to match this in smoothness. Never has a stock car recorded equal performance—in hill-climbing, quick acceleration or speed.

Handsomer cars have never been shown. Finer engineering is simply unthinkable, with Howard E. Coffin at the head of this department.

You are getting the car of the day when you get the Super-Six. Every man who knows the facts knows that. And, in view of our patents, rivalry is impossible.

No Need to Wait

It is natural to say, "Let us wait and see," when we meet such radical advancements. We think that nothing can excel in so many ways without falling behind in one.

But not one fact about the Super-Six is left unproved today. Not in one respect has its performance been matched. Not in any way has a rival motor been made to compare with this.

There is no need to wait to get Time's verdict on the Super-Six. The records prove the Super-Six supreme. A half-hour's ride without those records would convince any man of the fact.

Thousands of these cars are now running. You will find them in every locality. And every owner will tell you that he never meets a car to compare with his, in looks or performance.

These are things to consider when you buy a car.

Breeding 300 Pound Grade Cows.

[Written for Pacific Rural Press.]

The April reports of the Napa-Sonoma Cow Testing Association showed 21 cows that had given 40 pounds of fat or better during the month. Seven of these belonged to W. L. Mitchell of Napa county and were then in the seventh month of their lactation period.

Mr. Mitchell attributes this record as well as the fact that his mature cows average 300 pounds or better of fat, yearly, to the continual use of purebred Jersey bulls for the past nine years.

When he started dairying on his present 200-acre ranch Mr. Mitchell used a grade bull for one year. Then he recognized his mistake and always since then has paid a good price for registered bulls, bringing them from the East at times, and in other instances purchasing them in California and Oregon.

He used equal care in selecting as foundation females, heifers from the best grade Jersey herds in Sonoma county at that time. He never buys a cow now, preferring to raise them himself, and in this way guard against contagious diseases.

The average production of the milking herd at that time was about 175 pounds of fat yearly. For a number of years he weighed the milk from each cow once a month and tested it three or four times during the ten-month lactation period of the cows. In this manner he was able to weed out the poor producers and gradually increase the production to its present high average. He is a strong advocate of the cow testing association, having been elected president of the one in Napa and Sonoma counties at its inception, and has all of his cows entered. He believes a cow should be dried up two months in the year, usually breeding them to freshen August 15 to September 15.

A Natural Dairy Ranch.—The ranch is well situated for dairying purposes, comprising 110 acres of hill land and 90 acres of bottom land. Of the latter, 40 acres are planted to alfalfa, yielding three cuttings and pasture without irrigation. Corn is also grown on this lower land, averaging 15 tons of silage to the acre.

Since establishing the dairy, a silo has been in continuous use. The 14x32 resaw silo furnishes 30 pounds daily to the 40 milking cows from September 20 to February 20, fed in connection with alfalfa hay.

To supplement the silage and alfalfa hay, hill pastures are used as early as January and as late as June 1, in favorable years. Because part of this hill land is more fertile than the rest it will be planted to vetch and oats another year.

Besides its suitability for growing feed the ranch is well situated for building and drainage. The milk barn, separator house, and shed for winter shelter are located at the foot of the hill land. Well graveled lanes allow the cows access to either the hill pasture or the shed shelter. Mr. Mitchell says that the latter has more than repaid him; for with its concrete floor, it not only aids in keeping up the milk flow in bad weather, but is easily kept clean.

When he built it the present milking barn was thoroughly modern but advanced ideas have made it old fashioned now. Accordingly it is being remodeled this summer, with concrete floors and splash walls. The separator house is already a model of convenience and cleanliness, being equipped with steam boiler for running the separator and for sterilizing utensils. All buildings are drained to the lower land. A manure pit and shed has been built some distance from the buildings.

Profitable Dairying on Grain Ranch.

[Written for Pacific Rural Press.]

Twenty years ago, C. A. Beecher of San Joaquin county decided to keep a small herd of dairy cows on his grain ranch, to clean up the wastes. From the beginning he used registered Holstein bulls, gradually improving the producing abilities of the cow till 1913, when he sold the entire milking herd, retaining only the heifers.

During the past year those heifers averaged 271 pounds of butterfat from a little more than 7,000 pounds of milk, according to the report of the San Joaquin Cow Testing Association, of which Mr. Beecher is a member. And what is more, they did this on volunteer oat hay and wild pasture.

Mr. Beecher believes that they would have done better if they had been fed alfalfa hay; but alfalfa does not do well on his adobe land; and by feeding hay and pasture he is able to dispose of those crops at a profit as well as practice a rotation system in connection with his wheat farming.

There are 325 acres in the Beecher ranch, one-third of which is farmed to wheat, one-third allowed to grow a volunteer crop of hay and one-third pastured. Seasonal conditions sometimes alter this system; but in the main that has been the outline for 20 years.

Probably one of the most important reasons, next to breeding, why Mr. Beecher's cows do so well under this system is the manner in which the hay is cured. It is cut earlier than is usual with volunteer hay, and a rake follows directly behind the mower. Within six hours after it is raked it is in the shock, where it is allowed to cure. This method insures a nice green, tender hay.

Costs and Profits.—From the field, it is taken to the barn and stacked for fall and winter feeding, it being the practice to allow the cattle access to the hay early in the fall but usually they do not eat it till the pasture runs out along in October. They continue to eat it then, till about March 1, when the pasture is again ready for them. During that time they have eaten on the average three and a half tons of hay which is charged up to them at the rate of $10 a ton, a higher price than the average which hay buyers pay for such hay.

The hay ground last year is the pasture land this year, an acre of this being sufficient for one cow during the pasture season and being charged up to the dairy at $15 an acre.

The third of the ranch farmed to wheat is neither charged against or credited to the dairy, but Mr. Beecher believes that his grain yields have continued good longer than they would if the land were not pastured every third year.

As to the profits of his system, he points to the following cost and income per cow per year: Cost: three and a half tons volunteer hay, $35; pasture, $15; labor, $30; interest on cows, equipment, and depreciation, $10. Total cost per cow, $90.

Income: 7,000 pounds of milk, sold sweet at $1.50 a cwt., $105; one calf at weaning time, $5. Total income, $110. Profit per cow, $20. Mr. Beecher's own labor is figured in the cost of labor above.

Thirty cows are now being milked; but this number will be increased to 40 in the fall, which will reduce the overhead per cow accordingly.

Mr. Beecher's 20 years' work would seem to indicate that good dairy cows will consume feed, even on a grain ranch, more profitably than it can be disposed of otherwise, besides conserving the fertility, which is no small problem in itself.

Mr. Dairyman or Breeder---

Intensifying Hog Quality.

[Written for Pacific Rural Press by R. K. Walker, Devore.]

With the climate of this state so splendidly adapted to the needs of livestock, I look for California to be well represented in the future national champions of all breeds.

At the present time, the breeder of registered Durocs in California is very much handicapped, due to the scarcity of choice breeding stock and the right blood lines. He is often compelled to use sires that are distinct "outcrosses" in order to get a good individual to mate with his sows.

It is a well recognized fact that the best breeders of today are the men who have stuck to a certain family or line of breeding, often spending years to correct some fault such as a poor back or feet, at the same time keeping in mind the good points and weaknesses of the grand sires and grand dams and the hogs back of them. A careful breeder of today who has attained success with his herd by this continued line breeding would no more think of using a sire whose breeding made him a distinct outcross than he would of using one of another breed.

This success of line breeding is nicely illustrated by the methods used by McKee Bros. of Kentucky, the largest breeders of Durocs in the world. They paid five thousand dollars for the twice grand champion at the International, Defender, because his breeding was such that in crossing him on their sows, they were not making a distinct change in blood lines, but merely using an outstanding individual of the same blood lines. They have continued this line breeding and now are bringing it even closer and practicing inbreeding to some extent by crossing grand Champion sons of Defender on sows sired by him. Mr. McKee tells me in a letter of sometime ago, that the pigs of this breeding "are showing unusual stretch, large bone, and all the qualifications necessary to make unusually large Durocs." The class of hogs these men are producing, showing as they do, great scale, and extreme quality together with hardiness and prolificacy, justifies them in the lines of breeding they are following. These men are experienced breeders however, and can follow these practices with safety. Younger breeders should be careful about inbreeding, as this practice intensifies bad characteristics possessed by the sire and dam, as well as their good points which he is trying to fix. The inexperienced breeder should at first merely stick to the same general family lines and not use boars in his herd whose breeding makes them distinct out-crosses with his sows.

The possibilities for live stock raising, and especially hog raising in California, are absolutely unlimited to the man who understands and follows the correct principles of breeding, combined of course with proper feeding, without which all breeding operations must be a failure.

SUPPLYING BUYERS UNIFORM HOGS.

[Written for Pacific Rural Press.]

It is generally known that the man who buys livestock, whether he be professional buyer or farmer, is always attracted by herds and flocks uniform in size and color.

With none is this more true than with the hog buyer; and it is to cater to this preference that W. R. Stokes, near Orland, grades all of the stock hogs and pigs that he buys for feeders, as soon as they are placed in the feeding pens.

In April of this year he had between 125 and 150 head in the fattening pens. These were divided into a number of pens, one for red hogs, another for spotted ones, and another for black ones. They were also graded for size, so that you could hardly determine any difference in an entire pen.

But uniformity in size and color is not all that the buyer finds on this ranch. He finds uniform quality, for every hog is fed alike on a ration of skim milk, grain, and alfalfa pasture, from the time it is weaned till turned off in the finished stage.

The feeding quarters on this ranch consist of a house 90 feet long and 20 feet wide with a four-foot feeding alley running lengthwise of the entire building. Originally it was intended for a farrowing house, being divided into 30 pens, but at present most of the division panels have been removed to enlarge the pens for fattening purposes.

Because the 20 acres of alfalfa in the ranch was made into a hog establishment in the spring of 1916, Mr. Stokes is not yet certain which will prove the most economical ration for fattening.

In April he was feeding skim milk and ground barley, the barley being soaked with all of the milk it would hold. This made a fairly stiff wet mash which was fed three times a day with about twice as much skim milk, making the proportions about four of skim milk to one of barley. Mr. Stokes gets better results in feeding a light ration three times a day than he does in feeding a heavier one twice.

PIG CLUB POLICY.

[Written for Pacific Rural Press.]

The board of directors of the California Swine Breeders' Ass'n recently suggested that the financing of the Boys' Pig Clubs can best be done by banks and commercial clubs. It was also recommended that the breeder could aid in creating and maintaining these clubs by selling registered bred gilts to members of the clubs at $25 each.

This policy was agreed upon after carefully studying reports from agents of the U. S. Bureau of Animal Husbandry submitted by R. R. Ingals and reports of pig club organizers and bankers by D. O. Lively.

IT IS BETTER TO BUY AT THE

Welch Dispersal Sale

OF

Registered Holstein Cattle

Los Banos, Cal., Wednesday, June 28,

THAN WISH YOU HAD.

Remember, There Are

85 cows and heifers—candidates for great records. Make money and a reputation for yourself by buying some of these great producers and daughters of great producers and putting an A. R. O. record on them.

Remember, There Are

20 males—ready for service, including the three Herd Bulls. Don't overlook King Segis Wayne Pontiac, whose two nearest dams average over 34 lbs. butter in 7 days. Dairymen and Breeders should seize this opportunity to put a fine young Herd Sire at the head of their Herd at a price well within their reach.

DAIRYING AND DAIRYMEN.

I. Moss of San Francisco bought 22 dairy cows at the Harlan sale for his new dairy ranch in Glenn county.

The Porterville Co-operative Creamery Ass'n is advocating a Cow Testing Ass'n to enable dairymen to check up the creamery fat tests.

Chowchilla people are expecting a $20,000 creamery to be completed by Sept. to handle the product of 3500 cows.

The Cow-Testing department of the Kern County Farm Bureau has 830 cows signed up to begin testing July 1.

A $641 average was obtained for 126 Jerseys at the T. S. Cooper & Sons' sale in Penn. May 30. Nineteen cows sold at over $1000 each, and two sold at $3000.

While the number of establishments producing butter, cheese, and condensed milk in U. S. decreased 518 from 1909 to 1915, the total value of products increased 34.7 per cent.

An official record of 16,623.1 pounds milk in 180 days was just finished by Mosetta Mutual Paul Johanna, a Holstein cow owned by Mrs. Anita Baldwin. From this was made 697.917 pounds butter. She is in for a year's official record.

F. M. Johnson of Napa has sold his entire herd of grade Jerseys to H. T. Harrold of Orland who is substituting Jerseys for his large herd of grade Holsteins. Mr. Johnson will continue to enlarge his choice foundation herd of registered Jerseys.

J. M. Smullen, who delivers milk and cream to Sonora, is installing a refrigeration plant in his new modern dairy barn, in order to cool the milk and cream before bottling. He has splendid results feeding millet, mostly cut and fed green. The cows clean it up readily and keep up a good flow of milk.

Stanislaus County Cow-Testing Ass'n records for May show H. E. Cornwell's Holstein produced 76.2 pounds fat and two others over 60 pounds; L. D. Thompson had three Holsteins which produced over 60 pounds; F. D. Keeney a Jersey 61.3 pounds; J. M. Bomberger, Jersey, 63.5 pounds; 76 cows produced over 45 pounds in the month.

The Iowa Meadow Co. of Chino has just received four young registered Holstein bulls from the Stanford Vina Ranch for use on their 400 dairy cows. Two of the bulls were sired by King of the Pontiacs 14th; the others by Dutchland Colantha Sir Ormsby and by Geneseo Lad. The Vina Ranch has made some fine records and its herd is considered one of the best in the State by Manager H. C. Witherow of the Iowa Meadow Co.

SWINE BREEDERS AND STOCK.

W. W. Everett of the Riverbend Farm, Napa, will show purebred Durocs at the State Fair.

Otis Burrell was the winner of the pig-raising contest of the Armijo High School Agr. Club.

H. E. Boudier and Son of Napa have sold four weanling sow pigs to Geo. L. Horine of Winton, Merced county.

Bankers are being urged for their own good to extend credit to wide-awake farmers to purchase purebred hogs.

Geo. M. York of Modesto got the 1st prize 500-pound Berkshire sow shown at the Chico fair by Geo. Murphy of Perkins.

John Cantoni of Napa Jc., who went east last year as one of the winners in the Boys' Corn Club contest, s raising purebred pigs this year in a similar contest.

The Porterville Boys' Pig Club exhibited their stock at the end of the four months' contest. Lester Anderson received the full 30 per cent allowed for fitness of his two hogs for the block.

The Duroc Breeders' Ass'n of Stanislaus county will meet at the rooms of the Stanislaus county Board of Trade instead of the Modesto Chamber of Commerce as announced last week.

BEEF CATTLE AND BREEDERS.

A. W. Foster of the Hopland stock farm received a Shorthorn bull by express June 13 from Iowana Stock Farms.

New range grasses are needed in Humboldt county and Farm Adviser Christiansen is starting experiments to determine the best variety.

Lee Gill and H. Sickles of Porterville each shipped two cars of fat cattle to Portland June 7. Gill's cattle averaged 1300 pounds and $91.

On account of the campaign against cattle tick in the southern States, there is sure to be a heavy demand for stock there in the near future when tick eradication makes stock-growing safe.

MISCELLANEOUS.

Goats are practically free from tuberculosis, according to E. C. Voorhies of University Farm.

Goat milk cheese is to be made on the J. Howland ranch at Redlands, by Laurence Nourse, a recent University Farm School graduate.

SAN FRANCISCO LIVESTOCK SHOW.

[Written for Pacific Rural Press.]

An annual San Francisco Livestock Show to compare with those held in Portland, Denver, Kansas City, and Chicago, has taken firm prospects of realization.

Some 30 big stockmen and San Francisco business men met in San Francisco June 13 and launched the project by naming a committee of seven with power to work out details, finance the proposition, and pull off a show this fall if they see fit.

This committee consists of M. W. Newhall, A. W. Foster, F. L. Wash-

BREEDERS OF REGISTERED HOLSTEIN CATTLE—McAlister & Sons, Chino, Cal.

burn, R. B. Hale, B. F. Schlesinger, W. T. Sesnon, and A. P. Giannini.

A $10,000 guarantee fund is to be raised, as it was shown by M. H. Tichenor that all the big shows had to be financed that way in their early years, but all are now self-sustaining. He made the point that the Nat'l Dairy Show always had a deficit until four years ago when they began appealing to the country people. Since then it has been a great financial success.

D. O. Lively showed that California needs such a show, to encourage production of more and better stock. California spends $30,000,000 annually to buy 70 per cent of the pork we eat, from Utah and Idaho where production conditions are far less favorable.

Such a show would benefit San Francisco business men, who will be asked to put up the guarantee fund, as it does the business men of the other show cities. Letters from those were read highly endorsing their shows as a benefit to city business and country livestock breeding.

Mr. Newhall pointed out that such a show should have two objects; that it would fail its opportunity if it did not provide the second: (1) opportunity to standardize the ideals of livestock breeders, and through them, their livestock; (2) disseminate better stock throughout the State. If there is a chance to buy good stock at reasonable figures, people would be attracted from all over the State. This, more than any other factor, would work for State livestock improvement. Seeing the animals would educate to higher ideals, but there should be lecturers to point out why certain conformation is desirable and profitable, what the better higher-priced stock will do, and what "better livestock" means.

DAIRY CATTLE.

BREEDER OF REGISTERED JERSEY CATTLE—Duroc Swine. Young Stock for sale. W. J. Hackett, Ceres, Cal.

SUNNYSIDE HERD—Registered Holstein cattle. R. F. Guerin, R. 3, Box 58, Visalia, Cal.

Lively, 216 Hobart Bldg., San Francisco.

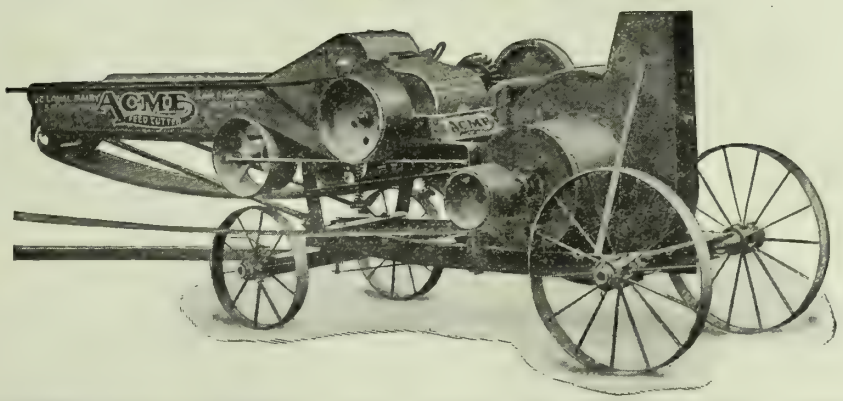
CROLEY'S CALF FEED with skim-milk will raise fine dairy heifers cheaply. Geo. H. Croley Co., Inc., 631-637 Brannan St., San Francisco.

D. O. LIVELY, 216 Hobart Building, San Francisco, buys and sells live stock—any kind—any quantity.

DUROCS AND GUERNSEY BULL CALVES—Gilts bred to 900-lb. boar. Ed E. Johnson, Turlock, Cal.



THE LIGHT RUNNING

ACME FEED CUTTER AND SILO FILLER

BUILT IN SEVEN SIZES

A FEW OF ITS SPECIAL FEATURES:

All Steel Frame
Triple Frame Construction
Low Feed Table
Positive Safety Device
Malleable Knife Head
Can be belted from either front, rear or from either side.

Accurate Knife Adjustment
Automatic Feeding Device
Center Hung Blower
Six Arm Blower Fan
The blower never clogs.
Can be regulated to any height.
Reversible Feed Rollers

INDEPENDENT CONTROL OF BLOWER AND CUTTER HEAD SPEED.

The Triumph of the Silo Age

in strength, durability, simplicity, economical power, enormous capacity and absolute safety, the **ACME FEED CUTTER** excels all others.

The Acme Alfalfa Meal Attachment

Can be fitted to any size Acme Feed Cutter. This attachment will enable the making of an excellent grade of **ALFALFA MEAL** from alfalfa hay at a cost not exceeding that for baling.

Cut Out the Mill Feed Expense Bill by Feeding Silage and Alfalfa Meal Made with an Acme Cutter.

Send for catalog and sample of alfalfa meal, stating the kind of feed you have to cut.

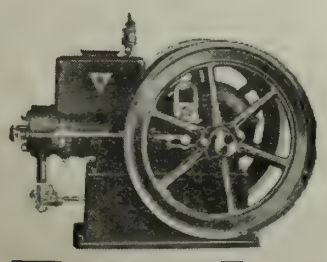
GOOD SILAGE INCREASES THE MILK FLOW 25 PER CENT AND REDUCES FEED COST 15 to 20 PER CENT.

IT IS NOT A QUESTION of whether you can afford a silo. It is a question of how long you can afford to be satisfied with the lowest milk yield from your cows and the highest cost for feed.

SILAGE IS BY FAR the least expensive feed that you can use and at the same time the greatest milk-producing feed.

Ideal Green Feed Silos

are increasing the profits of thousands of Pacific Coast farmers. The men who use these silos are getting big returns because their cows are giving a large flow of milk.



THERE IS NO QUESTION about the value of silage—GOOD silage. The only men who doubt the value of silage are those who bought cheap makeshift silos that produce a poor quality of silage.

IT DOES NOT PAY to try to save a few dollars on the first cost of a silo. The loss due to spoiled silage is likely to amount to many times what you hope to save on the first cost.

REMEMBER that you will get from 20 to 30 years' service from an Ideal, and that it is a strong, tight silo that will protect your silage perfectly. In the better quality of silage you get, the Ideal saves each year more than the difference between its cost and that of an inferior silo.

DO YOU WANT PROOF of the extra value of the Ideal? Do you want to know just why it will give the best silage and last the longest? Then ask us to send you our large illustrated catalog that shows every detail of this silo; how the parts are made and put together and the quality of the material used.

YOU CAN THEN JUDGE for yourself. The crop you put into a silo is worth a lot of money. Don't take any chances on having it spoiled by putting it in a cheap silo, but buy the best you can get. Ask for the catalog.

Dependable Power

CAN YOU AFFORD AN ENGINE THAT BALKS?

When IT'S TIME to separate the milk, grind feed, cut silage or pump water for the stock or to irrigate, you cannot afford to waste time tinkering with an engine.

YOU WANT ONE THAT "will deliver the goods" any and all the time.

ALPHA ENGINES

GASOLINE, KEROSENE, or DISTILLATE are always "on the job" ready to deliver power when you want it.

NO BATTERIES OR COIL needed. All sizes are equipped with a "built-in" magneto that makes starting quick and easy without cranking. Send for Engine Catalog. **IN SIZES 1½ TO 50 H. P.**

De Laval Dairy Supply Co.

SAN FRANCISCO SEATTLE

Everything for the Dairy

Veterinary Queries and Answers.

[Answered by Dr. H. B. Wintringham, Petaluma, Cal.]

[Subscribers wishing an immediate reply should send money order for $1.00. No charge for questions answered through this department. Name and address of subscriber must accompany each query.]

COLT RUPTURED.

To the Editor: My colt is ruptured around the navel.—G. W. I., Watsonville.

[Have your veterinarian operate on it.]

SAND CRACK.

To the Editor: My mare has a sand crack on the inside of her front hoof. It extends the whole length of hoof and sometimes bleeds. —D. R. P., Richfield.

[Cut this crack right down to the quick on both sides and then cauterize with a red hot iron.]

PIGS ITCH.

To the Editor: My 40-pound pigs itch on the rump and sides. Absolutely free from lice and I think they have no worms.—E. S. H., Niland.

[They have a mange mite. Dip these pigs once a week in a solution of liquor cresolis compositus 2 per cent.]

CHEMICAL DEHORNING.

To the Editor: Is there a safe chemical to use in dehorning a 3-year cow, to be used by one experienced in handling drugs.—B. T. S., Watsonville.

[No drug can be used for dehorning at this age.]

SWELLING ON TOP OF HEAD.

To the Editor: A mare has a swelling on top of her head. She travels with her head down. I have blistered twice in the last few days.—F. G. D., Madera.

[This is poll evil. An operation is the only cure. Consult nearest veterinarian.]

HEIFER BLOATED.

To the Editor: A heifer with second calf bloated three or four days ago and is still that way. She is short winded; eats and drinks; seems in no pain. Has not been on alfalfa pasture. Been feeding this year's first crop alfalfa hay.—W. J. L., Wheatland.

[This is indigestion. Give two pounds epsom salts in one gallon warm water. Then 1 teaspoonful fluid extract nux vomica three times a day for a few days.]

FAILS AFTER CALVING.

To the Editor: A heifer with first calf gave a little milk at first but flow reduced gradually to almost nothing. Eyes bloodshot; lies down most of the time; eats nothing; staggers when she walks.—P. D., Holtville.

[This cow has inflammation of the uterus and at this late date there is little that one can do.]

LEGHORNS THIN.

To the Editor: Have 700 year-old Leghorns, one and two fingers out of condition by the Hogan system. The house is 20x70, and there are just enough roosts for them to crowd on. Have a balanced mash before them all the time besides feeding wheat and Egyptian corn in the litter.—S. T. C., Santa Rosa.

[Crowding probably has a bad effect on these birds. A balanced mash fed with as wide a grain ration as you are feeding would not make a balanced ration. Reduce the carbohydrates in your mash and the birds will balance the ration themselves from the grain.]

GIVE THE BOYS SOME SHEEP.

To the Editor: I wish to call the attention of many farmers throughout this state to the possibilities open to them of carrying a few sheep as a side issue or a by-product of the ranch.

If you have fence lines, grain and weeds are growing which could be cleaned up by a few sheep.

Many localities labor with the problem of cleaning out irrigation ditches in the spring. Sheep will not only take all the growth out of these ditches to facilitate the flow of water but will at the same time firm the bottoms and banks better than anything else and punch in gopher and squirrel holes for you.

Sheep are voracious weed-eaters. Of 480 miscellaneous varieties of weeds, sheep will eat 430; can you beat that?

How about your stubble fields? Of course you turn stock in on them or rent them, in which case the other fellow makes a piece of money at your expense; your sheep, however, will make you good returns here, along with other stock. Then you have them for use in other ways the rest of the year, where you could not handle other stock.

How many side county roads are there in your neighborhood lined with an abundance of feed going to waste?

For the Boys.—I have often wondered if the average rancher appreciates the opportunity offered by a small flock of sheep for the education of his young boys and the stimulation of their interests in the ranch.

My father made his first nineteen dollars out of three ewes which were given to him personally by his father. The feed they ate was never missed, while their boy owner made out of them more money than he had ever had before. It opened his eyes to something more than living and going to school. It gave him a personal interest; it showed him a way of making money and the possibilities of ranching as a business. He never forgot it.

In the average locality it will surprise you how many places a boy can hunt up, where he will find free feed for his sheep, if they are HIS sheep!

Go to it, Mr. Rancher, a few sheep are a good thing for you; they are a supremely good thing for your boys. The city doesn't need your boys; the ranch needs them more, because they know the business. Train them to realize that it is a good business.

Oakland. Wm. Curtis Clark.

What a
DE LAVAL
Cream Separator
SAVES
Over any other Separator or Creaming System

QUANTITY of cream that no other separator will recover completely, particularly under the harder conditions of every day use.

QUALITY of cream as evidenced by De Laval butter always scoring highest in every important contest.

LABOR in every way over any gravity system, and also over any other separator, by turning easier, being simpler, easier to clean and requiring no adjustment.

TIME by hours over any gravity system, and as well over any other separator by reason of greater capacity and the same reasons that save labor.

COST—since while a De Laval Cream Separator may cost a little more than a poor one to begin with it will last from ten to twenty years, while other separators wear out and need to be replaced in from one to five years.

PROFIT in more and better cream, with less labor and effort, every time milk is put through the machine, twice a day, or 730 times a year for every year the separator lasts.

SATISFACTION, which is no small consideration, and can only come from knowing you have the best separator, with which you are sure you are at all times accomplishing the best possible results.

EASILY PROVEN—these are all facts capable of easy demonstration and proof to any user or intending buyer of a cream separator. Every De Laval agent is glad of a chance to prove them by a De Laval machine itself — without the slightest obligation to the prospective buyer unless entirely satisfied.

If you don't know the nearest De Laval agent simply address the nearest main office as below.

De Laval Dairy Supply Co.

LARGEST DAIRY SUPPLY HOUSE ON THE PACIFIC COAST. We specialize in Alpha Gasoline and Distillate Engines, Ideal Green Feed Silos, Irrigation Equipment, Centrifugal and Deep Well Pumps and Alpha Spraying Outfits. Send for special catalog.

SANTA ANITA RANCHO
ANOAKIA BREEDING FARM

HOLSTEIN CATTLE

The breeding herd of registered Holstein cattle at Santa Anita Rancho is made up of individuals selected strictly upon their merits as producers, high individual quality, and production and proven transmitting power of their ancestors. **PRINCE GELSCHE WALKER,** whose combination of breeding, individuality, and the production of his daughters stamp him as one of the greatest young sires of breed.

Females in the herd are making large official record as rapidly as they freshen, and the herd is being developed to become one of the largest groups of high producers in the West.

At present a few bull calves are offered for sale. These are straight, well-marked youngsters, bred right, and priced moderataely.

BERKSHIRE HOGS

The breeding herd of registered Berkshires has been carefully selected, and represents the blood lines that are in the very first rank of the breed. The herd is headed by **KINTYRE LAIRD,** first prize junior yearling and reserve senior champion boar at Panama-Pacific Exposition. He is an unusually good type, and comes from a family noted for uniformity and prize-winning quality.

A few boar pigs are offered at this time.

POLAND-CHINA HOGS

In founding the herd of registered Poland-Chinas at Santa Anita Rancho, the choicest individuals of the most noted prize-winning families in the the West were drawn upon, and for uniformity, desirable size and quality the herd is unexcelled in the West.

At the head of the herd is **BANKER'S BOY,** junior champion and reserve grand champion at P. P. I. E.

Anita M. Baldwin — **W. H. TAYLOR, Superintendent.**

The Madera Creamery Co. has been found to take over the business and property of the Madera Co-operative Creamery Ass'n.

Hay and Forage for the Horse.

[By Prof. F. W. Woll, University Farm, Davis, Cal.]

The hay and forage crops used in feeding horses include nearly all rough feeds that are of value for stock feeding. Only a relatively small number are fed by California farmers, however, although a good many more might be fed to advantage in special cases where there is a shortage of the forage commonly fed, or where other feeds become available at prices that render them economical for feeding purposes.

To make good feed for horses, the hay must meet at least three requirements: It must be palatable to this class of animals; must be free from dust and mold; and handle with the least possible loss of leaves and fine stems. It is generally considered by farmers and horsemen in the Eastern and Central States that timothy hay fulfills these requirements better than any other forage crop; and this hay is the most important horse feed in that section of our country. It is, in fact, considered as essential in feeding horses as are oats among the grain feeds.

For horses that are hard worked or driven fast it is probably true that no single hay crop will prove more satisfactory than timothy; but this does not hold good in the case of colts, growing horses, or brood mares. These need some forage crop that furnishes a larger proportion than timothy does, of the class of nutrients known as protein, or flesh-forming substances, like mixed clover and timothy, red, alsike or crimson clover, alfalfa, cow peas, etc. We thus find clover and timothy hay commonly fed in the East, and in Western States various leguminous crops, especially alfalfa. These hay crops are in general less satisfactory for working horses than straight timothy, as they are often dusty and are likely to cause looseness of the bowels; but they have the advantage in being higher in protein than timothy. A good grade of timothy contains about three per cent digestible protein and forty-five per cent digestible carbohydrates and fat (starchy components), while alfalfa contains over ten per cent digestible protein and nearly as much carbohydrates and fat as timothy.

Timothy Unnecessary. — In this State timothy is grown to only a small extent by farmers from the Eastern States whose previous experience led them to believe that horses must have timothy hay and that no other kind of forage can take its place. That this is a mistaken idea is proved by the fact that few horses in the Western States ever taste timothy, and still look as well and do as good work as horses in any other part of the country.

There is a prejudice against legume hay among many horsemen, and perhaps especially against alfalfa, as it is believed to make the horse soft and unfit for heavy work. Trials at a number of experiment stations, as well as extensive practical experience, have shown, however, that the health or the efficiency of the animal will not suffer from long-continued exclusive feeding of alfalfa when this is made and fed right. Attacks of colic and other disorders that sometimes occur are due to the method of feeding practiced and are not a necessary result of the alfalfa ration.

Precautions with Alfalfa.—The main precautions to be observed in feeding alfalfa and other kinds of legume hay to horses are: It should be fed in only limited amounts, for work horses not over 12 to 15 lbs. per 1,000 lbs. body weight. It must be bright and clean, and as free from dust as possible.

Alfalfa intended for feeding horses should not be cut until quite mature. Such hay is lower in protein and higher in fiber than early cut alfalfa, but comes nearer to timothy and is a better horse feed than the latter. Alfalfa hay was found more valuable than timothy hay for hard-working farm horses in trials at the Illinois Station, as shown by the fact that less grain was necessary to prevent them from losing weight than when timothy was fed.

Grain hay, wild oat, and stock hay are the main horse feeds in the Coast regions and other sections of the state where alfalfa is not grown. Hay from oats cut when in the milk will compare favorably with clover hay and cow pea hay according to trials at the North Carolina station; and this as well as other kinds of grain hay, are important forage crops in the sections mentioned. There is no marked difference in the chemical composition of these hay crops and timothy hay, or in the amounts of net energy that they furnish. They may, therefore, be considered of approximately similar feeding value.

(To be continued next week.)

PROFITABLE STEERS WITHOUT CORN.

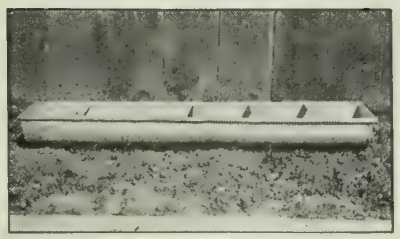
[Written for Pacific Rural Press.]

A recent experiment carried on by the University of Missouri in beef cattle finishing should be of interest to those who have been interested in finishing steers on the alfalfa ranches of this State.

Five lots of six two-year-old steers were included in the experiment, and while the average daily gain per steer was larger where shelled corn had been included in the ration, the most economical gains were secured when an average daily ration of 5.05 pounds of old process oil meal, 37.62 pounds corn silage and 4.03 pounds of alfalfa hay were fed.

The steers receiving the above ration were fed 133 days, being started on two pounds of oil meal per day and gradually increased during the latter part of the fattening period till they were eating seven pounds apiece daily. They were fed all of the alfalfa hay and silage they would consume.

With corn silage figured at $4.50 a ton, oil meal at $37 a ton, and alfalfa hay at $14 a ton, the cost of gain per hundred pounds was $8.58 and the net profit per steer for the feeding period was $14.56. Where the above ration was fed, hogs were practically eliminated as a profitable factor.



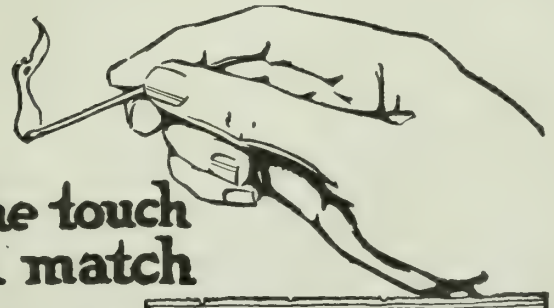
There are 850 creameries in Minn. of which 622 are co-operative. They are said to pay 5 to 8 cents per pound more for fat than the private creameries.

More Hogs Die

Or Become Sickly and Unprofitable from Causes which Are Absolutely Preventable than the Average Swine Owner Realizes

Filthy and ill-smelling surroundings and food receptacles are an ever present menace to the health of any hog. They invite disease, and once the disease is contracted, do more to help spread it than all other causes.

ARMCO IRON HOG TROUGHS



because of their smooth, heavily galvanized surface, can easily be kept bright and sanitary. There are no cracks or crevices in which germs can lodge and multiply, no rough or sharp edges to injure the animals, and no leaks to cause sloppy and unhealthy pens. Built from a highly rust-resistant material—ARMCO IRON—they are permanent, and on account of their light weight can be transported with ease from one place to another.

AN OUNCE OF PREVENTION IS WORTH A POUND OF CURE. The expense of installing our troughs is comparatively small—the results obtained will more than justify your good judgment.

Troughs can be furnished in sizes to suit your requirements, and will fit into almost any type of frame. Further particulars and literature on request.

Poultry for Profit---Producing and Marketing.

WOMEN'S POULTRY INTEREST.

[Written for Pacific Rural Press by Susan Swaysgood, Pomona.]

The farm hen in California has been somewhat set aside in recent years for the automobile and other excitements. That was but natural, for farmers' wives and daughters like to have some outside diversions, and they need it too. But diversions, while they are pleasant and wholesome in moderation, don't keep the pot boiling; and farmers' wives and daughters are great hands for liking to give their men folks a full dinner-pail. So they are going back to the old pastime of raising chickens. This pastime is wholesome, profitable, moral, and gives toothsome dinners for the family while increasing the pin money for the women.

Need Clean Poultry Quarters.—The Press has given much space to the expert who wrote so well on the egg question. Every farmer's family should read and reread those articles on the betterment of the farm egg under the $7,000,000 heading.

If every one would be honest and keep poultry quarters clean, the farm egg would soon be placed among the best eggs from the large poultry plants that are run on sanitary principles. The fact that an egg has a shell that is supposed to keep it clean, is responsible for a great deal of neglect along the lines of cleanliness. But the shell is porous. It absorbs any foul odor or filth, and is nearly as easily contaminated as if it lay unprotected in the dirt.

That is one reason why we oppose the Chinese egg. We have all to eat at public restaurants and hotels sometimes, and we don't relish having to eat when we know these public places are using eggs that are produced under insanitary conditions. But people who live in glass houses should not throw stones, so we should make up our minds to keep the nests and poultry houses as clean as we would want to see them if we were the purchaser and the other fellow the producer.

There is no State in the Union where women can make good with poultry as easily as in California. An invalid, if able to walk around, will gain health and strength quicker in caring for a few fowls than by sitting in a rocker, thinking of her aches and pains.

Tending chickens is a panacea for aches and pains, because it occupies the mind and carries it into one of the most natural channels; that of helpfulness to something that lives and needs help. If a man has a sickly wife, the greatest kindness he can do is to buy her a few good chickens of a variety she admires and let her have room to keep them and raise a few chicks. Some women love flowers and they are good. I love flowers, but they never fill the bill; I like something I can talk to.

Eat Orchard Pests.—The farm is the natural home for poultry, and where a man has a five or ten acre fruit orchard and has but one crop a year the poultry makes an awful good side line to help out. In an orchard hens pay threefold, namely to provide meat and eggs for the family table, and groceries, and at the same time enrich the land. You can soon see where the poultry have run in a prune orchard; the leaves are a dark rich green, no faded out, sickly green, but a color that tells of vigor and life in the tree. Fruit growers, above all other farmers should have a good flock of hens; they keep insect pests down to where they can't hurt much. With a little feed they make eggs out of the pests and they help out amazingly between crops. I know, for I've been there, and will say that my poultry always kept me clear, so that I did not have to take the first price a buyer offered.

Debtor Makes Fruit Prices. The fruit crop was mine till the right price was offered; it's the man who gets in debt that makes the price of fruit, and his name is legion. Keep out of debt, farmers, and you can name your own price—presuming, of course, that you know the law of supply and demand. I always practiced the keep-out-of-debt game on crops, never mortgaged a grain crop in Dakota; we always went without what we could not buy for cash and kept the crop clear; then if a prairie fire got it or hail or one of the many things that do take grain crops, we were just where we stood before and all we had to do was either starve or hustle. We generally hustled, and if it had been absolutely necessary would have rustled before starving.

Debt is almost as bad as war; it holds the family in bondage; it's better to raise a flock of fowls and do a little hustling.

DUCKS MOLTING.

To the Editor: How long does it take ducks to molt? They began last year, about the first week in July. I feed alfalfa, bran, middlings, sand, shells, blood, and meal when they are laying; but when they stopped I discontinued the latter. I gave several doses of oil cake meal.—S. M. F., Richfield.

[Answered by Geo. H. Croley.]

[There is no way to determine, with any certainty, just how long it requires for any fowl to molt; your ducks may require two or three months to complete a new coat. The length of time is determined by probably not less than one hundred variations of conditions, including feed, previous care, and climatic disturbances. If you are not particular as to the time they take to molt, provided you get lots of eggs for table use—but not for breeding purposes—we advise keeping them almost entirely out of the sun, feeding the best egg-producing feed with lots of greens, using every means to induce the ducks to eat all they can possibly digest. The ability to form new feathers and at the same time lay eggs is determined by the amount and quality of the food consumed. To keep them to eat enough, observe the flock.

If the feed you mentioned induced satisfactory egg-production, feed it right along, but feed often; don't let them get "stalled on their feed." Oil cake meal—a small amount every day—is desirable in that it not only seems to directly assist the process of molting, but will render the feed more appetizing.]

Fat and flesh are not the same thing. Some fat is necessary to fowl, but not overmuch.

DROPSY IN HEN'S ABDOMEN.

To the Editor: I have some Black Minorca hens, 4 years old. In the abdomen there has formed a big bag full of thick water. Does it affect the flesh of the hen in any way? —A. E., Kingsburg.

[Answered by Geo. H. Croley.]

[Dropsy is almost always the result of a run down condition. In fowls, it is usually caused by an excess of starchy or fattening foods, in connection with a lack of sufficient exercise. The fowls may be relieved by inserting a hollow needle through the skin, letting as much of the liquid escape as possible. Before using the needle, and after operating on each fowl, put the needle in boiling water. Permanent relief can only be secured through a general improvement of the health of the fowls. They should have more nitrogeneous food, and less fat forming material. When the trouble is not serious, the following remedies assist in giving temporary relief, without tapping with a needle: Two

Get the Real Ru-ber-oid

No other roofing has been imitated as much as RU-BER-OID. There is no connection whatever between RU-BER-OID and the roofings called "Rubberoid." More than 300 imitators have referred to their roofing as "Rubberoid," solely to make the buyer think he is getting

Pronounced "RU" as in RUBY
RU-BER-OID ROOFING
COSTS MORE - WEARS LONGER

Many have bought the so-called "Rubberoid" only to learn in a year or two that they have been misled. The U. S. Appellate Court has enjoined manufacturers of imitations from using the word "Rubberoid or any similar name as the trade name or brand" of their roofing.

RU-BER-OID is spelled with one "B" or it is not genuine.

TRADE MARK REG. U.S. PAT. OFF.

Only the real RU-BER-OID has the "Ru-ber-oid Man" on every roll. He is your protection against imitations which may resemble RU-BER-OID in *appearance* but not in *durability*. RU-BER-OID comes in Slate Gray and in permanent Tile Red and Copper Green.

Send For A Sample Of Calmade Graduated Poultry Fence

10 inches graduated in mesh from ½ inch to 1½ inches then 20 inches of 2¼ inch mesh, topped by 4½ inch mesh for the height of the fence.

The Fence Without a Sky Line

It is the most economical as well as the most practical of all poultry fences. It costs no more to buy than the old style poultry netting and costs much less to put up.

It is the only fence made with a bottom mesh smaller than one inch. It will turn the smallest chickens. Because of the straight line, continuous weave of "CALMADE GRADUATED" Fence, baby chicks won't hang in it, [illegible] can't get through it. "CALMADE GRADUATED" Fence will not slip at the joints after weaving when cut. Uniform in weave and width. It unrolls flat as a board—it is easily put up and stretches without bulge, kink or bend on posts 16 feet apart. Learn all about these advantages and let your next fence be a "CALMADE GRADUATED." Write at once for free samples of wire used, free illustrated folder and name of nearest dealer.

teaspoonfuls of nux vomica in one gallon drinking water, or 4 grains arsenate of iron to one gallon of water. In case the needle is used, substitute for the above remedies, 4 tablespoonfuls sulphate of magnesia to each gallon of water for one week and then change to iodide of potassium, using 80 grains (1-6 of an ounce) to one gallon of drinking water. Fowls that have had dropsy should never be used for breeding. The flesh is unfit for food while the fowls are ill, but after complete recovery, it is perfectly wholesome.]

U. S. CONTROLS INTERSTATE SHIPMENTS OF BAD EGGS

[By Geo. H. Croley.]

Shipments containing more than five per cent of bad eggs are regarded by the U. S. Dept. Agr. as a violation of the Food and Drug Act.

"In the opinion of the Department, eggs which contain yolks stuck to the shell, moldy eggs, black spots, mixed rots, addled eggs, black rots, and any other eggs which consist wholly or in part of a filthy, decomposed, or putrid substance, are adulterated.

"The investigations of the Department have shown that it is commercially practicable, by the methods of candling, to eliminate from any given shipment most of the eggs of the kinds which the Department regards as adulterated. It is not the practice of the Department, however, to base proceedings under the Food and Drugs Act on shipments of eggs unless there are present larger percentages of bad eggs than are ordinarily present in recognized commercial grades of candled eggs. The Department is informed that cases of eggs are not allowed to receive even the lowest candled egg grades if they contain more than one and one-half dozen or 5 per cent of bad eggs. Country shippers who are not certain of the freshness of their eggs should candle them before shipping them in interstate commerce."

POULTRY THIEVES.

As a protection against thieves, who have stolen $10,000 worth of fowls in four months, Petaluma poultrymen recommend passage of an ordinance requiring poultry dealers to keep a record of all purchases. The following items would comprise this record: Date of purchase; residence of person selling fowls; breed, as nearly as possible; number of fowls of each breed; approximate age of fowls; if person selling raised fowls. In case person selling purchased fowls, name of person from whom they were purchased; the records must be kept open for inspection by officers of county or cities.

MRS. BEST'S LETTER.

My dear Friends: As the season runs along, the popularity of checks seems to be unabated. Not only the always good black and white, but green and yellow, blue and black and other combinations are much in evidence. They make very nobby, striking looking suits, especially this year when the skirts are so short and the shoes are so pretty. But the extreme combinations are only for the women who have many changes — the more conservative blues or grays or dark greens are better style for those of us who must wear a suit a long time and for many occasions.

I have seen a number of well-dressed women wearing silk one-piece dresses of dark striped patterns. These were worn without any coat and with a neck-piece of fur. I had thought perhaps our cool bay climate was responsible for the wearing of furs through the summer months, but a friend of mine from Chicago told me they wore their furs there all last summer—if it was too suffocatingly hot to wear them around the throat, they were carried over the arm. So in that locality, it is style, rather than comfort, that makes women wear fur in mid-summer.

White suits are always pretty, especially for young people, and here in California a substantial white suit can be worn for dress the year round—this year there have been many combinations of taffeta and cloth.

Shoes are wonderfully attractive—in all the light shades and combinations of light uppers and black vamps, they are a joy to look at. The white shoe is much in evidence and now that there are such good cleansers on the market, there is no excuse for their not looking clean and nice. I know one college girl who wore white shoes to school last fall who cleaned them every night. It was just as much a part of her toilet as washing her face.

Colored stockings worn with low white shoes should harmonize with either a tie, hair ribbon or sweater to be nobby.

The white corduroy tam-o-shanters are being shown again for use in machines. They are made with a solid band part of the way round the head and elastic the rest of the way, so that they can fit any size head.

The white middy hat is always good for outdoor use and it is quite commonly seen in machines. Turned down all the way around, it shades the eyes and does not catch the wind. The custom of wearing flying veils in machines is not as prevalent as it was—now most women wear small hats or caps and face veils.

Silk and lisle gloves seem to be more worn this spring than for some years. They are very much more comfortable for hot weather wear than kid and they can be washed with soap and water when soiled. Some of the best makes are guaranteed against the tips wearing out while the rest of the glove is in good condition and if that happens, the glove will be replaced. Yours devotedly, **Rosabella Best.**

DELICIOUS FRUIT DROPS.

Fruit drops can be made any desired flavor, but cherries, raspberries and currants are particularly good and attractive in color. Crush the fruit and put through a sieve. To each pint of strained fruit, add 1 pound of granulated sugar and cook slowly until very thick. Care must be used that it does not scorch. Drop small amounts on waxed paper and let dry. These are very delicious, and as wholesome as any candy can be.

THE INFLUENCE OF THE VOICE.

American women are criticised the world over for their shrill, harsh voices. It is much to be desired for one's own pleasure and that of their friends, that a low, subdued but clear voice be acquired. If the effect upon our friends of a disagreeable voice is unpleasant, how much more so must it be on the sensitive ears of little children. Every mother owes it to her family as well as to herself to cultivate a low, firm tone. It is not only soothing to very small children but has the effect of causing older ones to be more attentive and observant. No household can be quiet and orderly where commands are shouted at children, for children give quick obedience only where they feel the quiet, controlling power of the mother, which is evidenced by self-contained, careful speech.

CRYSTALLIZED FRUITS.

One of the Rural Press subscribers, Mrs. H. B. Monteith, of Santa Rosa, sent the office a very fine box of crystallized fruit consisting of figs, strawberries and orange peel that she put up herself. She advertises to sell the recipe and send samples to interested parties. This might prove to be an interesting as well as lucrative business for women who have a little spare time. Good crystallized fruits sell in the stores at the price of the very best candies and as they are more wholesome, there should be a good demand for them. Even if one had no desire to manufacture this product commercially it would be worth while to be able to make it for friends and family.

TO REMOVE PAINT.

To the Editor: How can I best remove dried paint from windows and bathtub?—R. H., San Bruno.

Any of the following are recommended for removing paint: gasoline, turpentine, chloroform, oxalic acid, alcohol, caustic potash, salsoda and quicklime. There is also a liquid paint remover that can be purchased at any hardware store that will soften the paint, so that it can be scraped off with a knife.

CLOSET SPACE.

The available space in every closet can be doubled by having either a curtain pole or gas pipe fastened across the closet, the ends resting in sockets. Place it about 10 inches from the wall it parallels, and use wire or wooden hangers for the garments.

INQUIRY FROM ARGENTINA.

To the Editor: I have read with interest a little article on your page called "Shine the Silver." In this country, those "Silver clean" pans are not to be had and I have been wondering if an ordinary zinc pan or dish would do. Would you mind letting me know if it is the same and how much salt and baking soda to put to the litre of water.

We have received the Pacific Rural Press for many years and think a great deal of it.—A. M. K., Argentine Republic.

Directions for the use of Silver clean pan are as follows: for each quart of water, add one teaspoonful of common baking soda and one tablespoonful of salt. These proportions do not need to be strictly observed. As to the use of the zinc dish, why not try it on some silver. It could do no harm.

OF INTEREST TO WOMEN.

A number of courses in which women are vitally interested will be given at the Summer School in Berkeley this summer. One is on "Food Conservation," another is on "Practice in Cooking," still another is "Practice in the Preparation of Meals," and there will also be training in the planning of diet so as to make people happy, contented and well.

LINGERIE PINS.

The use of lingerie pins is very general but many people object to their showing through a thin waist. A very good way to obviate this difficulty is to crochet a simple rosette and fasten the small safety pin to the back of it.

PARSLEY EASY TO HAVE.

Every kitchen ought to have fresh parsley at hand, for soups and gravies, and for garnishing dishes of meat.

If the yard is not convenient, a large flower pot will do. Or even a box. Some should be kept growing all the time. Five cents' worth of seed will last years unless the parsley is too liberally cropped. In a yard, it will grow practically without cultivation.

SHOWING THEIR SPEED.

She looked with some apprehension over the ginghams spread before her.

"These don't look like fast colors to me," she said.

"Indeed they are, ma'am," answered the clerk earnestly. "You just ought to see them when they begin to run."

FLORAL DEPARTMENT.

[By Geo. N. Tyler.]

Chrysanthemums that were planted out in early May are now in strong growth—if you have not staked them, do so at once, using the split shakes as described in former article. They also like water on the foliage and on hot days should be sprayed two or three times and be sure and give them a good spraying after sundown; they are one of the plants that like spraying in the evening, and besides you keep down black and green aphis, one of their worst enemies. Singles and pompons that you want for sprays should be headed up to July to make them stocky and also make more flowers. You can still put in cuttings up to July and get good flowers, but the stems will not be so long.

Pelargoniums are making strong growth now and will shortly have a second crop of flowers. It is time now to think of getting your bulbs for fall planting; make out a list of what you want and send it in to your florist and he will fill your order as fast as the different varieties arrive. By ordering early you get better and stronger bulbs, and it doesn't do any bulb good to remain long out of the soil.

Dahlias that are blooming or showing flower buds should be given a mulching of half rotted manure; and give them abundance of water through this manure. To do their best they should have such an abundance of water that if you break off a stem the hollow part will be filled with water.

Early planted Gladioli are now coming into flower. Give them an abundance of water and as soon as the first flower opens, cut the stalk leaving three or four leaves, and your bulb will not be injured in the least. Every bud will open in the house, and the old flowers will not dry up or wilt as they do when left on the plants and allowed to dry out.

You can do budding on roses this month and get good results; also put in all the cuttings you can of the half ripened wood, and they will bloom next spring.

Friesias, to bloom for Christmas, should be planted in July. Friesia Purity is the best on the market, although there are some new novelties in colored ones being sent out, but the prices are prohibitive. There is a lavender tinted one and also a strain called rainbow. In another year or two they will be cheaper. In potting or boxing friesias, use one-third thoroughly rotted manure in your compost, put six to ten bulbs, or rather cones, in a five-inch pot, give them a good watering, then plunge the pots in the ground and cover with a board; do not let them dry out or they will not bloom.

After the growth starts they should be given some sun, but still be careful with them and do not let them dry out. Further cultural directions will be given later.

Wire "vine staples" make prettier and more permanent vine supports than leather or string.

THE CITY FARMER.

I read the seedsman's catalogue
With eyes that open wide.
I'm frank to say I'm all agog
At what I find inside.

The prize tomatoes fairly seem
To burst their ruddy skins.
The radishes and parsnips gleam
Like newly burnished tins.

I am enraptured with the corn.
I love the early quince.
The cauliflower might well adorn
The garden of a prince.

I read the book with greatest heed
Its final page I scan
And then I buy a turnip seed
And plant it in a can.

—Ex.

FAMILIES.

A family will do you a lot of good, and it is very fortunate to be born into a family, rather than into an asylum.

When you are young you are always bumping into your family. You start out 'cross-lots to El Dorado, and your little sister gets in your way. Perhaps El Dorado is a cookie jar, and your little sister has taken the last cookie.

It is not until years later that the comforting thought comes to you that it is merely because you had a little sister and a mother and a father, that there was such a possibility in the world as a cookie, for you. Orphans do not have cookies between meals. They eat standardized meals, out of standardized dishes, at standardized hours.

A family teaches you that roses grow on thorny stems, but that roses grow close to home. It also teaches you that with every delight there is a division table. At the schoolhouse they teach the multiplication table; at home they teach the division table. A jar full of cookies must be divided by five.

And the nice thing about it is that a family teaches this very hard, relentless, unescapable rule of life in a very soft way. Mother rubs you soothingly, and says, "That's a nice boy, George. That's the last cookie, and I would give sister half of it, that's a nice boy."

Mother kind of eases half a cookie away from you for little sister.

You are lucky that somebody didn't punch your face and take the whole cookie.

Still, everybody in a family is hard on each other, for the reason that they rehearse on each other. A family is all behind the scenes; there are no calcium lights or electric spotlights on your little sister when she comes down to breakfast in her nightie. You think it is careless; you hate little sister's bare feet; yet when you grow up you will pay money for a theatre ticket to see Marguerite Clark's bare feet. That is funny, too, because there is a whole lot more naivete about little sister's bare feet than there is about anybody's commercialized bare feet.

But a family is all behind the scenes, and this teaches you that to everybody, on street cars, or in stores, there is a behind-the scenes side. Knowing your own father and mother, and how kind they are, you give stolid-faced old men and old ladies on the street car credit for some kindness at heart which they don't show on the surface.

And knowing the utter uselessness of your 16-year-old sister, you are suspicious of the beauty of other 16-year-old queens. You can see them lolling late in bed. You know women.

And then you see responsibility spring up in little sister. By and by she takes a broom seriously. This teaches you that there is possibility in every clod.

It is a great thing that we cannot run away from our families. (It is only in books that any boy ever gets more than 45 miles away from home before he ought to). All our lives life is pulling us back and telling us to take another look at our family, and the kaleidoscope has always changed.

In time we get father and mother on their proper pedestals, and no heroes in the world are so heroic; and, in time, we come to classify our barbarous little brothers and big brothers and big and little sisters, all as human beings.

A family is one of the finest things into which to be born.—Selected.

Pacific Rural Press Market Report

PRICES QUOTED AS PAID TO PRODUCERS

San Francisco, June 14, 1916.

WHEAT.

The local wheat market is very firm, and California club has been marked up a little since last week, other grades being scarce. The firmness, though due largely to the waterfront strike which cuts off supplies from northern and interior points, is in line with Eastern markets.

Cal. Club, ctl. .....$1.65 @1.70
Northern Bluestem ...1.87½ @1.90
Northern Red ..... 1.85 @1.95

BARLEY.

New barley is now coming in fairly well, and the average quality is said to be unusually good. The new offerings, together with reports of a comparatively large holdover from last season, have caused some weakness, and both grades are lower locally. Buying, however, is now quite active in the country, and new grain is beginning to move East by rail.

Shipping, ctl. .....1.35 @137½
Choice Feed, ctl. ...1.27½ @1.30

OATS.

There is little new in this department, as no new stock of any consequence has appeared, and old offerings are limited, with no active demand.

Red Feed .....$1.40 @1.42½
Whte ..... 1.55 @1.60

CORN.

Eastern corn is moving about as usual to the local mills, with little demand elsewhere. Egyptian and similar grains are in good demand in many parts of the country, but inferior offerings will hardly bring the prices quoted.

Eastern Yellow, ctl ....$1.80 @1.85
Milo Maize ..... 1.40 @1.45
Egyptian ..... 1.45 @1.50

BEANS.

Not much movement in most lines at present; recent sales have left stocks very light; trade not much inclined to take hold at these prices. The recent advance, however, is quite firmly held, and any renewal of demand would no doubt send values up another notch. Large whites, indeed, are already held at an advance, being cheap as compared with small whites. Limas, however, are receiving more attention than anything else at the moment. This variety moved slowly for a long time, but stocks held by the trade are cleaning up, and the extreme prices of other varieties have given them a better position. Purchases for Eastern shipment have been very heavy in the last fortnight, resulting in a sharp advance in values.

(On wharf, San Francisco.)

Bayos, per ctl. .....$5.00 @5.25
Blackeyes ..... 2.90 @3.00
Cranberry Beans ..... 4.85 @5.10
Horse Beans ..... 3.00 @3.25
Small Whites (south) .. 7.00 @7.10
Large Whites ..... 6.50 @6.70
Pinks ..... 5.10 @5.25
Limas (south) ..... 5.10 @5.20
Red Kidney ..... 6.50 @6.75
Mexican Reds ..... 4.90 @5.25
Tepary Beans ..... 4.00 @4.50

HAY.

All quotations are now on new crop hay, which is coming in freely, old stock being about cleaned up. Though increasing, arrivals have been curtailed by the river strike; and the same trouble has stopped shipments to Hawaii and coastwise ponts. The harvest is pretty well over in many districts, and baling is actively under way, while many rail shipments are leaving the interior for Nevada, etc. Arrivals here show very fine quality, and conditions have favored an unusually high-grade harvest. This has caused an easier feeling in wheat hay, while wild oats and barley are higher. Local trade is quiet, partly for actual lack of consuming demand, and partly due to the belief among consumers that prices will be lower as receipts increase. Offerings of alfalfa are light.

Special Deciduous Market Report.

By J. L. Nagle.

Sacramento, Cal., June 12, 1916.

Shipments of deciduous fruit increasing; apricots will be lighter from now on. Active demand for all varieties, especially plums and late cherries. Practically all the cherries, however, are now cleaned up except a few cars remaining in the Santa Clara Valley.

Unprecedented prices are being paid for fancy Japanese plums and inquiries are numerous for pears. The first Bartletts have already been shipped from the State, which is the earliest that has been known in years.

The demand for fruits is more active east of Chicago than it is west, which would indicate that our prices are too high for the smaller markets and as soon as the movement is heavier, prices must necessarily be lowered to conform with conditions and to put the fruit into consumption.

California has had practically no competition from the East as yet, but Georgia will shortly be shipping, and this may affect our peach prices on the Atlantic seaboard; but with it all we anticipate a brisk demand and high prices, though there will be a slight easing off within the next ten days.

Prices for the week:

Chicago — Royal apricots averaged$1.55; Clyman plums, $1,17; Climax, $1.78; Beauty, $1.70; Formosa, $1.60; Comet pears, $1.50; Kounce, $1.70.

New York—Royal Anne cherries averaged $1.80; Bing, $2.27; Oregon, $1.87; Republican, $1.95; Tartarian, $1.75; Royal cots, $1.80; Clyman plums, $1.25; Beauty, $1.77; Formosa, $2.00; Climax, $1.85; Tragedy, $2.40; Alexander peaches, 95c.

Boston — Republican cherries, $2.07; Bing, $2.35; Annes, $1.90; Beauty plums, $2.25; Clyman, $1.65; Formosa, $2.45; Apricots, $1.70; Alexander peaches, $1.35.

[Total shipments to date 787¾ carloads as compared with 360¾ to the same date last year.]

No. 1 Wheat .....$12.00 @13.50
No. 2 ..... 9.00 @11.50
Tame Oats ..... 12.00 @15.00
Wild Oats, new ..... 10.00 @12.00
Barley, new ..... 10.50 @12.50
Alfalfa, new crop ... 8.00 @12.00
Stock Hay ..... 7.50 @ 9.00
Straw, per bale ..... .25 @ .40

FEEDSTUFFS.

Rolled barley is lower in sympathy with the whole grain, and oats also are easier. Alfalfa meal has dropped sharply, and no alfalfa-molasses meal is offered.

(Wholesale prices, per ton, carload lots, San Francisco.)

Beet Pulp, per ton ..$22.50 @23.50
Alfalfa Meal, per ton. 17.50 @20.00
Alfalfa Molasses Meal, per ton ..... Nominal
Bran, per ton ..... 28.00 @29.00
Oil Cake ..... Nominal
Cocoanut Cake or Meal 23.00 @25.00
Cracked Corn ..... 40.50 @41.50
Mddlings ..... 35.00 @36.00
Rolled Barley ..... 28.00 @29.00
Tankage 45.00
Rolled Oats ..... 29.00 @30.00

VEGETABLES.

Offerings in several lines of garden truck are running rather light, and values are well maintained, with some advances. Good string beans are scarce, and everything in this line is higher. Values for green peppers are well maintained, and tomatoes also are comparatively high, with little really good stock available. Rhubarb has stiffened up a little, with only moderate offerings, while the top price of asparagus has been marked down. The best offerings of green corn are doing better, though there is plenty of ordinary stock.

String Beans, lb ..... 4 @ 7 c
Summer Squash, box..60 @75 c
Peppers, bell, lb .....15 @20 c
Rhubarb, box, bay ....65 @90 c
Asparagus, box ..... 1.25 @2.25
Lettuce, small crate ...50 @65 c
Eggplant, lb .....10 @15 c
Peas, lb. ..... 4 @ 5 c
Tomatoes, crate .....60 @90 c
Green Corn, doz .....15 @35 c
Okra, lb .....20 @25 c

POTATOES AND ONIONS.

Oregon potatoes hold steady at the recent advance, and new river stock is firm. Arrivals from that district are comparatively light, and include some very attractive stock. Onions are quite firm, and new local stock has been marked up. Australians are still offered in a limited way. Fancy garlic is higher.

New Potatoes, ctl. .....$1.75 @2.25
Oregon Burbanks ..... 1.90 @2.10
Onions, red ..... 1.75 @2.15
Australian 2.50
Garlic, new crop, per lb ..5 @ 8c

POULTRY.

Offerings are ample, both from local and Eastern points, but good stock is readily disposed of. Large broilers and both grades of hens have been marked down a little, but are steady at the new prices.

Broilers, 15 lbs. to doz. and less, lb. .....21 @22c
do, over 15 lbs. to doz ...23 @25c
Fryers .....25 @30c
Hens, extra, per lb. .....19 @20c
Small .....15 @17c
Smooth Young Roosters, per lb. .....25 @28c
Squabs, per doz. ..... 2.00 @3.50
Geese, per pair ..... 2.25 @3.00
Ducks .....15 @16c
Old .....14 @15c
Belgian Hares ..... 9 @10c

BUTTER.

Offerings have increased again this week, and with the vacation season on the local street demand is limited. Prices have accordingly dropped a little, though no continued depression is likely in view of conditions in other markets.

	Thu.	Fri.	Sat.	Mon.	Tu.	Wed.
Extras	26	26	26	25½	25½	24½
Prime Firsts	25	25	25	25	25	24
Firsts	25	25	25	24½	24½	23½

EGGS.

Arrivals for the last week have been rather large, but there is a strong shipping demand, especially for the south end of the state, which has taken up all surplus lots at a slight advance.

	Thu.	Fri.	Sat.	Mon.	Tu.	Wed
Extras	25	25	25	25	25½	25½
Sel. Pullets	23	23	23	23	23	23

Special Livestock Market Report.

Heavy cattle may be in better demand during the next two or three months, though they are too plentiful just now. Prices are being held however. More than 2-3 of the cattle on the Portland market were from California, ranging a little lower at $8 to $8.25.

Hog receipts in San Francisco are letting up; they were more plentiful in Portland at lower values than last week.

Sheep are slightly stronger at San Francisco, enough to raise the lamb quotations, though there is no great demand for more than are coming. They have been scarce at Portland.

Wool holds strong as last week with a rise on Mendocino staples. London sales closed 5 per cent higher on fine wools but closed at last sales prices on coarse staple. Australian sales are postponed indefinitely as the embargo prevents shipment elsewhere than to England.

CHEESE.

The market continues firm, with a good demand, and notwithstanding large arrivals from the East, both local grades are higher.

DECIDUOUS FRUITS.

The comparatively easy price of berries is bringing a better movement, but loganberries have dropped sharply, on heavy arrivals. Only strictly fancy strawberries will bring the top figure, most offerings being easy. Old apples are still a factor in the market, while green stock is easier, with increased supplies. Cherries are stiffening up a little, shipments from various sections being lighter, especially of really good stock. Royal Annes are especially firm. The best apricots have been marked up a little, and everything in this line is steadily held, with a good demand. Ordinary peaches have declined, but fancy stock remains fairly firm. Black figs have dropped sharply, and cantaloupes also are much lower. Plums are offered in several varieties, but the general range is unchanged.

Currants, chest .....$4.00 @5.00
Loganberries, chest .... 2.50 @3.00
Gooseberries, lb ..... 3@6 c
Blackberries, chest .... 4.00 @5.00

DRIED FRUITS.

The dried fruit market remains fully as firm as last week, and packers appear to be taking more interest, though they are not as a rule going in very heavily, and still refuse to meet the views of the more optimistic growers. They cite many conditions which they believe will prevent the realization of the top prices asked, and there is certainly much to be said against getting prices too high, even if it is possible to do so temporarily. On the other hand, crops in practically all lines are short, and the prices prevailing for shipping and canning fruit will greatly limit the amount dried in most varieties; while the general prosperity in consuming districts East may warrant higher values than usual. Apricots are now being bought at as high as 13c, and little can be had below 12½c, while many growers are holding for 15c. New York reports an active movement among packers to buy back from the trade contracts sold earlier at much lower prices. There are still a good many old peaches, but they are firmly held at about 5c; while new crop peaches are being contracted as high as 6c. Canning prices generally are high.

Apples, old crop .....5½ @6 c
Apricots, per lb, 1916.12½ @13 c
Figs, white, 1916 .... 6½ @ 6¾c

Bulk, layers, 50-lb. box. 1916 2.75

CITRUS FRUITS.

The 27 cars Valencias sold in New York June 12 averaged $3.50 to $4.70. Three cars Navels averaged $3.35 to $4.30. The good demand for large sizes is interesting. Valencias are good sizes and fine quality. Lemons averaged $3.60 to $4.20. Cool weather has curtailed demand. Grapefruit averaged $2.50 to $4.25. At Boston large sized oranges were lower and lemons better; oranges averaged $3.70 to $4.35, lemons $4.50 to $5.00. The St. Louis market averaged $3.45 to $3.95 on oranges, $2.25 on grapefruit, and $3.35 on lemons.

The top figure on lemons in San Francisco has been shaded a little, but otherwise last week's figures prevail on all lines. The advance has tended to limit the local movement somewhat, especially as deciduous fruits are steadily becoming more plentiful, and oranges are rather quiet here.

Oranges, Navels	$1.75@3.15
Valencias	2.75@3.25
Grapefruit	1.50@2.50
Lemons, box	2.50@4.25
Lemonettes, box	1.50@2.00

HONEY.

Shipments of new honey are coming in steadily, and while there is still a good demand for desirable offerings, values show a little less firmness. Both grades of comb honey are much lower, as this class of goods has been very scarce for some time. Fancy extracted holds up well, but the lower grades have declined.

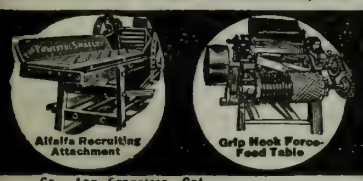
Water White, comb	13 @15 c
Amber	8 @10 c
Water White, extracted	8 @ 9 c
Light Amber, new	5 @ 6 c
Dark	4 @4½c

HORSES.

More horses are offered here this week than for several weeks previous, the sales including a lot of livery stock and a good-sized shipment from northern California, mostly heavy, attractive stock. The sales developed no particular change from recent conditions, however, this market being rather apathetic, and all but the most attractive horses are slow of sale. Values, however, are pretty well maintained. Large shipments are still going from country points.

Reduce Your Silo-Filling Cost

Cut down your power cost 1-5 to 1-4, save the cost of one or two men and put more and better feed into your silo. Thousands of farmers are doing it every day with the powerful



Smalley Silo Filler

Grip Hook Table feeds cutter automatically, saving wages and board of one to three men, depending on size.

Blower built independent of cutter. Fan speed can be increased or decreased without changing speed of knife shaft. Patented, low speed, one pulley chain drive blower saves 1-5 to 1-4 power cost and unnecessary wear on belt. Extension table on hopper prevents accumulation of litter.

Patented recutting attachment makes dandy Alfalfa Chop for fattening cattle, sheep, hogs and poultry. Needles leaves, stems and all without waste or injuring color of the hay. Sell your No. 1 hay and mill the off-grades for feeding. Make combination feeds from clover, rice straw, bean straw, pea vines, oats and rye, or dried cornstalks. Capacities 1200 to 2700 lbs. per hour. 500 to 800 pounds of meal per hour can be made with recutting attachment on Junior mill (operated with 6 to 8 H. P. engine.) Send QUICK for FREE Book.

Publisher's Department

Mr. Frank Honeywell, publisher of this journal, left last Saturday on a business tour of some of the middle and eastern states. While in New York he will attend a meeting of the "Standard Farm Papers," of which organization the Pacific Rural Press is the western representative. Mr. Honeywell is expected in San Francisco again about the middle of July.

187 new names were added to our mailing list during the past week.

Le Grand McDonald, P. P. I. E. Junior Champion saddle horse. Foals by this sire and mares bred to him will be auctioned by the Bridgeford Co. June 20 in San Francisco. It is proposed to hold an annual auction of this company's saddle horses. There will be 25 in the first sale, many of them trained.

GRADE COWS OVER 50 POUNDS BUTTER FAT PER MONTH.

[Written for Pacific Rural Press.]

That grade cows can make about two pounds of butterfat per day for good farmers is proved by the following report of cows in the Gridley Cow Testing Ass'n, which produced over 50 pounds in May. Official Tester C. C. O'Hara sends us the report:

	Pounds Milk.	Per ct of fat.	Pounds Butter-fat.
C. Goetz, Tudor, Shorthorn	1593	4.6	73.3
J. H. Guill, Chico, Holstein	1643	4.2	69.0
W. J. Condon, Chico, Jersey	1159	5.7	66.1
J. H. Guill, Chico, Holstein	1761	3.5	61.6
J. H. Guill, Chico, Holstein	1938	3.1	60.1
S. C. Doin, Oroville, Shorthorn	1314	4.5	59.1
H. Berg, Marysv., Jersey-Shorthorn	1603	3.5	56.1
J. H. Guill, Chico, Holstein	1597	3.5	55.9
C. Goetz, Tudor, Jersey	1271	4.4	55.9
J. Froncathy, Tudor, Shorthorn	1172	4.6	53.9

The Holstein Friesian Ass'n of America met at Detroit June 7. They have about 9000 life members. There are about 300,000 Holstein cattle in U. S. owned by about 30,000 people. The Ass'n has $215,390 on hand and an annual income of $230,806. Movies of the P. P. I. E. Holstein exhibit were shown at the meeting.

Fresno union stockyards will be discussed again at a meeting of all interested at Fresno Chamber of Commerce July 19. D. O. Lively will address them. Considerable financing would be required for successful maintenance of the project.

Productive Feeding OF Farm Animals

F. W. WOLL, PH.D.

Professor of Animal Nutrition, University of California.

FIRST EDITION—1915

360 pages; handsomely illustrated. Cloth bound.

Prof. Woll has had long experience in the work covered by his book. Before coming to California a few years ago to take up his work at the University Farm, Davis, he was for years Professor of Agricultural Chemistry, University of Wisconsin. This book in a practical way covers productive feeding from a scientific standpoint. Every breeder of stock needs this work to make a success of his feeding operations.

Price, $1.50 Postpaid.

California Fruits and How to Grow Them

EDWARD J. WICKSON.

Seventh Edition, Extended and Revised.

Contains over 500 pages of text with many illustrations. Goes thoroughly into every phase of that immense industry, California Fruit Growing.

In the preliminary chapters, the important subjects of Climate and Soils are handled in a masterly manner, with the necessary modifications called for by the immense latitude, the topography of the country and the different regions with their relation to coast, valley and mountain.

The book then goes into the subject of Fruit-Growing from the nursery, on through budding and grafting, preparation for planting; planting, pruning the trees and thinning fruit; cultivation, fertilization and irrigation right along to picking, canning and preserving, with chapters on injurious insects, tree diseases and the protection of the trees therefrom. Every fruit and nut which can be grown commercially in California or countries possessing a similar climate, has received the attention which the forty years' experience of the author makes of incomparable value to the fruit grower.

Price, $3.00, Postpaid.

Humboldt's Co-operative Cow Testing.

California's oldest and largest cow-testing association had over 3,800 cows last year, besides 1,000 withdrawn to form another association.

[Written for Pacific Rural Press.]

THE Ferndale Cow Testing Association of Humboldt county is seven years young. Perhaps that is the most apt way of describing California's oldest and largest cow-testing association; for while it is old enough to have passed through the early stages of enthusiasm it is hard to imagine a more enthusiastic set of men in any co-operative organization.

"With some of us who have been in the association since it was organized in 1909 by F. L. Mitchell, then employed by the U. S. Department of Agriculture, it is rather an old story," said Bernard Crowley, secretary of the organization, in reply to our request for historical information. But before we left, he had evidenced the same enthusiasm that successful co-operation always develops.

Poor Cows a Factor.—Like all co-operative organizations this association has not had a continual path of roses. At its inception, membership was easily secured, because the dairymen of the district were awake to the dangers of high-priced land and boarder cows. The records show that during that first year, 2600 cows were tested, two testers having been brought from Wisconsin for the work because there was no one in this State who felt qualified for the work. Those having more than 25 cows, paid a flat rate of one dollar a cow, boarding the tester and transporting him to the next ranch that he was to visit. Those with less, paid the same price and took their own samples as well.

The first discouragement came the second and third years, when a number of the first year's members were under the false impression that they could test one year and from the "weeding out" done at that time conduct their business at a profit for two or three years, when they would test again for a year. Due to this notion being prevalent, especially among several of the larger members, the number of cows tested during the next two years fell to 1300.

The State record-breaking herd of grade cows owned by John Hansen, whose average for 80 cows in the Ferndale Cow Testing Association in 1915 was 427.18 pounds of butter fat. Purebred Jersey bulls have been used continuously in this herd for 30 years.

Change Fee.—The third year, the testing fee was changed to meet the new conditions, the following rate being charged: $.80 a cow for herds over 50 head; $1 a cow for herds under 50 cows where tester took the sample and $.80 a cow in herds under 25 cows, the owner taking his own samples.

The fourth year, the value of the association began to be more appreciated, the records showing that the 2600 mark was again sustained for that year, two testers performing the work. That year also another change was made in the testing fee, this time all new members with less than 150 cows being compelled to pay $1 unless they had over 150 cows, in which case the charge was reduced to $.80. Under this new ruling herds that had been entered the year previous got the $.80 rate, those members with less than 25 cows taking their own samples. This arrangement is still in force.

The Best Years.—During 1914 and 1915 the association enjoyed unusual prosperity with 3800 to 3900 cows tested, giving the organization the distinction of being one of, if not the largest cow-testing associations in the United States. This, too, in face of the fact that over a thousand cows in the Arcata district were withdrawn and entered in another association in 1915.

Such in brief is the history of the organization. But there have been many policies to try out and finally establish and no one is better qualified to offer advice to younger associations in this respect than Bernard Crowley, who has, through the office of secretary, been the active head of the association since its founding, aided, of course, by an active board of directors.

Essential Policies.—One of the points which Mr. Crowley emphasizes is that the cow-testing association should confine its work to the weighing and testing of milk for the benefit of its members in building up their herds rather than to check up the creamery test. He believes it a poor policy to antagonize the creamery manager. He maintains that when the tester has made his report to the member, showing the amount of milk the herd has produced and the fat test, he has finished his duties and should not be drawn into any dispute the member may have with the creamery.

Another thing that he strongly advocates is that the association be conducted on business principles. The association's contracts were drafted by an attorney. They clearly specify that the member will test all cows in his herd in the association for one year at the rate agreed upon, and that he will pay in advance, quarterly, for all cows tested. This binds the member to carry out his contract with the association for a year, whether the cows are sold or other unforeseen conditions arise. If for any reason he tries to evade payment, the account is put in the hands of the bank for collection, this latter, however, never having been necessary.

Cows on Waiting List.—"We take the ground," he says, "that this association is for the dairyman's own benefit, and that he is therefore obliged to pay for services rendered the same as he would for any other benefit. And our dairymen thoroughly understand this, as is evidenced by the fact that we do not need to solicit members. They come to us of their own will and at this time, May 15, there are between 400 and 500 cows on the waiting list, whose owners did not sign up at the beginning of our year in February."

Costs.—Each month a meeting of the board of directors is held; and at the annual meeting officers are elected. The secretary directs the testers and keeps a set of books. For this he receives $5 a month for each tester employed. This, with the stationery and printing bill, which amounted to $47 this year, and the salaries of the testers, $67.50 each per month, represents the expenditures of the association. An audit of the books is made at the end of each year. The largest number of cows ever handled by one tester was 1300, but this number cannot well be handled unless the herds average 50 cows. Arrangements have been made with the various breed associations that allow the association testers to do official work which is of importance to those members with purebred herds.

Results.—"Of course," said Mr. Crowley, "the herd averages have been materially increased, but a comparison of averages for the entire association in the seven years would not show the true condition, as many of the original herds are not now entered and the newer herds bring down the average. You have to get that from the individual members for the entire period. That is where you can best appreciate the work we have been doing."

And we did later appreciate it in a number of instances, but that is another story, also an enthusiastic one.

The special interest manifested in reports of results of the dozen or so active cow-testing associations in the State shows that dairymen are finding that there really is a difference in the production of cows, that with all their practical dairying, they have failed to find without the aid of scales, Babcock tester, and a disinterested party authorized to certify results. In at least one new association, it is expected that the superior record of the purebreds will also have a strong effect on pure breeding.

EDITORIALS

THE WEEK.

TROUBLE with Mexico, which has been long incubating, seems now to be picking holes in the shell of American peaceability and forbearance, and an ill-fledged conflict of uncertain dimensions and endurance is likely to emerge. If such be the case, surely the world can see that we have neither desired nor provoked it. There may be difference of opinion as to whether we have too long spared the rod and spoiled the child. We shall have all sides of that view set forth in the presidential campaign which is now opening. There can, however, be no difference of opinion that effective and condign punishment for trespass and outrage, neither explained nor disavowed, is long overdue and must be inflicted. So far as we can understand the motive and attitude of the United States in this matter, all acquisitiveness is absent, forbearance has been exercised to the limit, and anger has not been aroused, except as born of righteous indignation. If, then, punitive expeditions grow to declared war, the American people enter upon it with strength of purpose, but with sad heart and clear conscience. At the moment it seems most deplorable that the American ideal of neighborly republics, working together for the uplift of the hemisphere and submitting all questions at issue between them to arbitrament, with disavowal of intent to offend or do wrong, cannot yet be realized. We shall, however, cling to the ideal, though the way be dark and desperate, never yielding the conviction that it is the only hope of humanity, elevated through enlightenment to a true national altruism. It will be our duty in Mexico to suppress anarchy most swiftly, and to establish civilization with most clear guaranty of endurance. Only this can entitle Mexico to regain national existence which she has forfeited by the performances of the last few years.

MUST WE FEED MEXICO?

WAR with Mexico, if it should really arise, as now seems probable, will place great obligations upon California. There will be great call for food supplies from this State, not alone for the troops operating on the western front of the conflict, but to keep starvation from the Mexicans whom internal dissensions have already impoverished by distraction from their always incapable industry. We shall have the obligation to feed as well as to fight, for we shall be going to war with a most improvident country, thus assuming some responsibility to assuage its suffering. Unless our job in Mexico can be very quickly done, which no one thinks possible, we shall experience a sharp and continued demand for horses and mules, food and forage staples, for which our rail and water transportation will be largely open, because men and munitions, chiefly drawn from east of the Rocky Mountains, must have the right of way over food supplies on the eastern transportation lines. Fortunately the Pacific States have now considerable grain surpluses which can be delivered at once, and with the large production of beans in California and the potatoes and roots which can be still planted on moist beds, it will be possible to guarantee supplies to supplement eastern surpluses which cannot be increased for a year. If the war really begins, it is very likely that California farmers may have a very busy time for months to come.

THE CONDUCT OF THE WAR.

OF COURSE every American citizen has a right to a voice in that—in fact, we have already fired off much speech in the line of prenatal blessing and cursing of it. If, then, the war really comes, we shall suggest that our Mexican brethren be shot full of prunes instead of schrapnel. If that is denied, we shall try to compromise with the new Secretary of War, Mr. Baker, on the proposition of bombarding them with prune pies, for he is presumably more familiar with the construction of them. If we can fill the Mexican sky with exploding prune pies, we shall have the inhabitants too busy chasing prunes to interfere with a quick settlement of the difficulty and, if we cannot find any one to settle with, we will quietly take possession and install Mr. Bryan as provisional president—a job for which he has ample preparedness. The sublimity of our plan for the prune-pacification of Mexico lies in the marvellous efficiency of it. California is capable of producing 14,000,000,000 prunes in a year. This compares flatteringly with the modern European numerical standards of projectiles required, and we can land every prune in a Mexican stomach—which is an ideal place for efficiency in placing a projectile to take the fight out of a man.

But, of course, we may have to be patient with our prune-proposition. The administration seems to have another idea. As we write, the announcement comes that, in competition with large Eastern concerns, the Joseph Gutradt Company, soap manufacturers of this city, has secured a contract from the Government to supply the Brooklyn Navy Yard with salt water soap. One million pounds of the product will be shipped annually to the Brooklyn Navy Yard. We have full confidence that free use of salt and soap would go far to settle the trouble in Mexico, but we fear the plan of the administration is too academic. It does not allow for the fact that it would take at least two Americans to get each Mexican into a bath and, even if the shock killed him, the plan would require an army for Mexican service which, perhaps, we could not muster, while the prune-pie proposition would only require a few thousand bakers and catapulters. We submit our claim to the calm judgment of the American people—quietly rejoicing in the fact that whether the new conquest of Mexico be accomplished with prunes or soap, the effective munitions must come from California.

AMERICANISM AND PRUNES.

BUT this reminds us of another thing in connection with prunes which we are more glad about and that is that figures recently published, indicating a marked decrease during the last few years in the American consumption of California prunes, are probably incorrect. We doubted the accuracy of the statement from our own knowledge or dislike of the matter, and yet the statement seemed to have an authoritative basis. It is, however, now clearly controverted by E. N. Richmond of San Jose, who gave figures, at a meeting of the San Jose Chamber of Commerce, indicating that the average annual domestic consumption of prunes from 1900 to 1905 was 49,308 tons, and in 1915 it was 49,512 tons. The other figures, which he controverted, showed a consumption during the first period of 57,500 tons, falling to 22,500 tons at the present time. We hope, of course, that Mr. Richmond has the right of it, because though the local consumption has not advanced as it should, and relatively there has been too much dependence upon the European market, it is much better for the building-up effort, which is now proposed, to start from a good foundation rather than from one which has been crumbling away. Besides, it agrees better with our idea of the American ability to know a good thing and to get possession of it. This applies to California prunes—not to Mexico.

There are evidently at least two ways to impress prunes upon the American people. One is to advertise them as so delicious and wholesome that they will run after them; the other is to so equip the prune that it will run after the people. Probably both ways should be employed so as to catch the public coming and going. The promoters of manufacturing interests in Oakland, who are now particularly and systematically busy, announce with much glee that they have landed a great factory for shredding prunes, which will grind up prunes and shoot them among the other components of the shredded rations, which are now helping weak gastric juices to get a stranglehold on their jobs. The process has not much on the man who can gulp a boiled egg or a plate of hot cakes without mastication and then smile—for he does not need anything but more common sense. But the average American may find himself greatly helped if his landlord can get wholesome prunes into his system without his knowing it Therefore, we count the enterprise which disposes of the small prunes by grinding them (flesh, stone and kernel, if they like), and bringing them under the glorious, artistic advertising which common breakfast foods are paying for, will be a good thing for the prune growers and for the people also.

A POTASH PROBLEM.

SPEAKING of California soap as a war munition, as we did a way back, reminds us of a local conflict which is arising over one of the constituents thereof. It would hardly do to speak of potash as a bone of contention, because a bone is phosphate, and yet, it was over potash that we were at war with Germany long before the present war began. At the present moment California seems to be about the liveliest potassic thing on earth. First, Uncle Sam threatens to let himself into the ownership of the Death Valley potash deposits, which we understand is what the Kaiser did at Stassfurt, so that has imperial precedent and may be a form of preparedness. Second, there are the chemists, who have shown that they can get potash profitably from the tail ends of cement factories, which formerly have sent forth much poisonous dust, to the detriment of adjacent vegetation. In this way food for the plant will be had instead of poison, and growers who have been weeping over cement works may remain to laugh. But the third lurking place for potash is in the sea weeds, of which California has a thousand miles of length, and we know not what width, of plants, which grow 300 feet in sixty to seventy days and take out of the sea water about all the chemicals which man has any need of—including oodles of potash. This sea-weed growth is so high and broad that picturesque writers speak of it as "groves" or "meadows" of kelp, according to the way they look at it. There are said to be at least four great concerns mowing these kelp meadows on the California coast with gigantic submarine machinery, and making potash to beat the band. This may be one reason why the San Francisco soap man can underbid his Atlantic competitors, who can get no German potash at present. This may also be a reason why California may have home-grown potash to compete with potash mined in Germany in the years to come. But we anticipate the immediate interest is that all Californians do not like this activity in kelp. R. D. Sepulveda of Los Angeles county has brought a suit against the kelp farmers on the ground that kelp harvesting may exterminate the areas of fishing by robbing the fish of their spawning grounds. It is the contention of Mr. Sepulveda that "the fish deposits are of diverse natures, with some laying their spawn on the under side of the heavy kelp beds, which have grown and lain upon the surface of the water for years, growing softer with age and making an ideal receptacle for spawn, and others laying the spawn in the bottom growth." This question of whether the fish spawn in or under the bottom growth, or the kelp, must go of course, to a profound piscatorian like Dr. Jordan, but we imagine the question will be settled much nearer the surface than that, and we shall watch with interest for it.

INQUIRERS MUST GIVE FULL NAME AND ADDRESS.

BURNING GRASS TO MAKE PASTURE.

AFTER all, may not submarine farming be much like aerial farming? Is it not possible that mowing kelp may make more kelp grow, and if the fish find a nice, newly-mown lawn to roll their eggs on, will they not like it better?. This question will, of course, have to be settled by the sea-board county farm advisers in bathing suits. In our own notion it may be as reasonably settled as the National Forestry Service is disposed to settle reasonably the question of burning-over forest areas to make more pasture, when it can be safely done. The stockmen have long contended that burning out rubbish from time to time not only makes more pasture, but renders forest fires much easier to control and less ruinous to the trees. The earlier forest administrators prohibited burning and the tender-hearted nature-lovers supported them, but the stockmen did not lose an atom of their conviction that circumspect burning is a good thing. And the stockmen seem to be gaining their point for the forest service is reported to be on the point of heeding their insistent appeals that the underbrush in the forests be burned off, in order to preserve the range for stock. We read that last week Forest Supervisor R. S. Hammatt of the Shasta National Forest went out to Squaw Creek Valley, in accordance with the request of stockmen of that region, to inspect the forests and undergrowth, and if conditions are such that forest trees will not be damaged by burning off the brush, with the co-operation of the stockmen, he will apply the match. We are very glad to record such action, because rational forestry maintains that forests are for use, and it is a benefit to individuals, to counties and to the State, that national forests should not be held in idleness, to breed dangerous beasts to prey upon farmers and to store up inflammable rubbish for their own destruction and to lay waste the whole countryside.

Rye as a Cover Crop.

To the Editor: What do you think of sowing rye between the rows of young almonds, during the fall and plowing it under in the spring? Our soil is a light sandy loam and the grain farming ahead of us has robbed the top soil to such an extent that we are having trouble in getting legumes to grow sufficiently to get any good of them before the ground has to be plowed in the spring for the summer cultivation. This pertains to non-irrigated land.—D. S. N., Arbuckle.

The idea is good providing you have rainfall enough to fill the subsoil and enough to spare to grow the green rye crop. Usually there is enough in your valley and therefore the practice you propose is good. But where winter rain is scant for the needs of dry-farmed trees, no cover crop should be grown and you should make a drive for stable manure to increase your humus supply—applying it at the beginning of the rainy season and turning it under at the early winter plowing. The year after manuring you can usually get a good growth of legumes but the amount of water you can spare is still a problem to be worked out carefully.

Lime on Light Soils.

To the Editor: I would like to know if we can expect much good from liming the soil where it is a sandy loam and no heavy, cloddy, clay land to contend with?—Reader, Colusa.

You do not need it for mellowing or granulating action on the soil particles but this is only one of the functions of lime. Read again about the things lime does in the article entitled "Lime makes fertilizers available" in our issue of June 3. For some of these things lime may be valuable on sandy loam, as on other soils, but for many reasons a light soil may need it less than a heavy soil. In growing lime-loving plants like alfalfa it is surely desirable in most cases.

Will Rabbits Eat Bran Mash?

To the Editor: Is arsenic mixed with bran effective for killing rabbits? Do they eat it readily? —T. K., Lincoln.

We never saw or heard of their taking to it. Has any reader killed them that way?

The Melon Aphis.

To the Editor: What is the green bug I send which is practically taking my watermelon crop? I have sulphured and sprayed with soap suds and nicotine with little or no avail.—Reader, Redlands.

The insect is the melon aphis—the same which does so much injury to cantaloupes. Sulphuring is of no avail but soap and nicotine washes are. But the trouble with this pest is that it multiplies with such incredible rapidity that enough breed from a few survivors to convince you that your spraying did not kill any. The way to fight this pest is to begin early, as soon as you can see any, and then keep spraying at short intervals so long as they continue to be abundant. You must use a nozzle which enables you to reach the under sides of the leaves as well as the top sides.

Fertilizers for Alfalfa.

To the Editor: What is the best substitute for stable manure on aged alfalfa and when is the best time to apply it—now just before an irrigation or when dormant in fall.—I. P., Acampo.

The best imitation of stable manure is what the dealers in commercial fertilizer supply as a "complete fertilizer." For alfalfa which usually may be relied on to provide its own nitrogen, the things which alfalfa cannot get for itself are phosphoric acid and potash and lime. Alabama experiments gave best results with 400 lbs. acid phosphate and 50 lbs. muriate of potash per acre. These are best applied before an irrigation in the growing season. Lime should be applied by itself and as it is less soluble, fall or early winter application, at the rate of 1000 lbs. or more per acre, is reasonable.

Root-Knots on Alfalfa.

To the Editor: It has been discovered that the alfalfa, in certain parts of Glenn county, is badly affected with root knot. I have planted almond trees in an old alfalfa field and am expecting to plant more. I would like to know whether the root knot from the alfalfa will affect the almonds.—Planter, Glenn county.

The root knot to which you refer is presumably a rather conspicuous swelling or excrescence on the main root or large branch roots near the ground surface and having a general resemblance to the root knot of fruit trees. In that case you do not need to worry about it. In the course of an article on this knot in the Pacific Rural Press of July 24, 1915, Prof. Horne wrote this: "The fungus which causes these swellings does not attack other plants, so far as I am aware. It has nothing to do with the crown gall of stone fruits and other trees. There is no possibility of the alfalfa deriving it from old peach or almond roots left in the soil when an orchard is removed nor is there any danger of this disease being communicated from alfalfa roots to fruit trees." This seems to fully cover your case.

It may be added that there are at least two other kinds of enlargement found on alfalfa roots, but they occur on small roots and are themselves inconspicuous. One is the tubercle caused by the nitrogen gathering bacteria. This is for the good of the plant. The other is the gall caused by a microscopic worm, called a nematode, and is bad for the plant. It has been observed that the first has no rootlets starting from it while the latter usually has. They are also otherwise dissimilar as studied with a magnifying glass.

There is no "Best Cover Crop."

To the Editor: What do you consider the best cover crop? Is bur clover better than barley and vetch? What does bur clover seed cost a pound and how many pounds to the acre would you use? Would winter rye be better? Would it make more growth in the same length of time and how much per lb. is the seed? When would you plant?—Reader, Guinda.

There is not, and can never be, any "best cover crop"—because that crop is best which makes most green growth with the soil, water and temperature conditions which you can give it. Which plant that is, you have to determine by trying plants and by observing what your neighbors get from conditions like yours. The way to get information about what seeds cost, is to write to the seedsmen who advertise in our columns. That is one of the reasons why we are kind enough to let them advertise. If they would not help us teach people practical things we would run over them with automobile advertisements. It is up to the reader to make the seedsmen work and not spend all their time playing with their picture books.

In choosing a plant for a cover crop it is for you to figure out from the size of the seed which plant would give you most seedlings from the pound, for the real cost to you depends upon that more than upon the quotations you get. Then you have to watch the amount of growth which you get from each seedling, up to the time when it should be plowed under, and this will show you whether the plant requires you to sow thickly or thinly—at more or less cost for seed, of course. Your purpose is to get just as much green stuff as you can plow under completely and you must study the ease or difficulty with which that can be done with different plants—for that is another point in the relative cost of different cover-crop plants, under the conditions of your implements and motive power. And there are other things like that which you can think out for yourself. The chief thing about a cover crop is not to cry out for a tip but to get right down and watch and weigh or measure, and think for yourself.

In choosing between a non-legume like rye and barley and the legumes like bur clover, vetch, etc., remember, of course, that the latter can trap nitrogen for you from the air, which the former cannot, but for forming humus and securing the benefits thereof, a greater growth of the former will do more than a less growth of the latter, because of the greater amount of organic matter which it furnishes for decay. Obviously, too, a seeding of a non-legume may be had for something less seed-cost than a legume seeding, but you ought to watch and figure on that, for most legumes are spreading plants and may spread faster than a grain can stool. You may find that a thin seeding of a legume may cost less than a heavy seeding of grain. Get the prices; study the plants; peel your eyes, punch your brain-starter and get under way. We do not do farming in these columns. We only try to get the readers mad enough so they will do it for themselves.

Yellowing Prune Leaves.

To the Editor: I have some prune trees which have yellow leaves and the prunes are not so large on limbs that are so affected. Can you give me the cause and effect. The trees are on adobe soil, watered twice a year. I send you some twigs.—J. M., Santa Clara.

It is the chlorosis, or yellowing, of trees, or parts of trees, which is usually seen at this season or earlier. We are not aware that the cause has been demonstrated and there may be several causes which produce this abnormal growth. So far as we now know, as it is not a disease of which a definite causative agency can yet be assigned, no pest controlling treatment can be reasonably prescribed. The effect is often transient, the trees assuming healthy color later in the season; on the other hand some trees, or parts of trees, may die. If it is a case of limbs on trees otherwise healthy we should saw them out at their starting points. Where whole trees are affected we should wait and see what happens. Our guess is that the trouble is usually due to lack of drainage which allows too much winter water to collect at that particular spot.

California Weather Record.

The following rainfall and temperature record is furnished the PACIFIC RURAL PRESS by the United States Department of Agriculture Weather Bureau, at San Francisco, for the week ending at 5 p. m., June 20, 1916.

STATIONS	Rainfall Data: Past Week	Seasonal To Date	Normal To Date	Temperature Data: Max'm	Min'm
Eureka	.02	39.01	45.87	58	44
Red Bluff	0	20.21	24.95	102	58
Sacramento	0	18.28	20.09	98	52
San Francisco	0	27.12	22.27	68	48
San Jose	0	16.31	16.79	82	44
Fresno	0	11.72	9.68	102	52
Independence	0	10.34	9.53	96	—
San Luis Obispo	0	26.89	20.51	76	44
Los Angeles	0	19.92	15.64	76	54
San Diego	9	12.55	10.01	68	56

Crown Gall Starts From Seedling Stubs.

[Written for Pacific Rural Press by C. J. Oswald, Bakersfield.]

I have a thousand thrifty two-year apricot trees. I have examined every tree and have discovered about twenty cases of crown gall. My trees have been planted on desert land 75 or 80 feet above water level. They are irrigated by pumping plant.

I find the crown gall on my largest and most thrifty trees. Most of the knots were as large as an orange. I find by taking and breaking them off with a chisel that the wood is apparently healthy. The only indication is a kind of a curly core running into the tree, but no discoloration of any kind. This core leads directly to the old stump that had been cut off above the bud.

The old stumps smell sour. From all indications the disease is caused by the dead stub left in there and sealed up. A kind of gum oozes out.

I believe that the nursery is directly responsible for root-knot and crown gall.

When I planted the trees I found the old stump where they had been cut off and left about an inch long, very rough and unclean work.

If the nursery would cut seedlings off next to the bud, making a clean smooth cut properly shellacked or varnished so they could heal over healthy wood, the source of the disease would be conquered.

Simply cutting off the knots and painting with Bordeaux mixture does not seem to be effective. The galls seem to show up again. But dig in, and take out the old dead stump. Then varnish the clean cut, bringing the varnish up to the bark so as to keep water and air out. It heals over very rapidly and no signs of affection show up.

Barnyard manure may be a preventive. The fall after planting my trees before the rain set in I hauled dry stable manure—a two-horse load—to about thirty trees; making a pile of manure about one foot high and about three feet across to every tree. Later on I went around the trees and pulled away the manure so it wouldn't lie against the tree. It stayed in that condition all winter. People told me that it would ruin my trees, so I took a fork and scattered it from part of them. Being short-handed and pressed with other work I neglected taking away the manure from balance of trees.

In my examination I have found these trees free from crown gall or any other disease. It apparently absorbed all excess moisture, and kept ground mellow and soft.

It would seem unnatural to allow a splinter or any foreign substance to penetrate the flesh and heal up on man or beast. Neither would I expect a dry dead stump to heal over and absorb moisture without causing disease. Nurseries ought to be inspected by state or federal inspectors so as to give some protection for clean and healthy trees to innocent purchasers.

[Mr. Oswald's connection of stub-decay with crown gall is an interesting suggestion which should be farther looked into and observations recorded. The close-cutting of stubs and painting to exclude decay has always been urged as desirable but in the haste of nursery work is usually neglected. If such points are to be enforced by regulations, trees must be sold at a higher price and they would probably be worth more than the extra cost. But if not done in the nursery, the planter can insure better trunks for his trees by careful treatment of stubs before planting; and some growers make a point of doing that.—Eds.]

HAS BIG PRUNE CROP

[Written for Pacific Rural Press.]

Two years ago we found Dr. M. T. Moore's prune crop the best seen on a trip through Sacramento valley. This was largely due to his irrigation the previous fall, after fruit was off but before the leaves fell. The water enabled the trees to strengthen and build up the fruit buds already formed. Next year when the crop was light most everywhere on account of previous dry seasons, Dr. Moore sold his fall-irrigated crop for nearly $200 an acre. One of his orchards not fall irrigated had less than one-third of a crop.

Now comes the word through the Corning New Era that in this year of prune scarcity his trees are loaded with fruit, estimated at 25 per cent more than the good crop we saw.

Dr. Moore believes in gradually renewing his trees by cutting out old branches, top working the trees in some places and pruning generally for a vase form, the inside of which is allowed to fill more or less with good potential fruit wood.

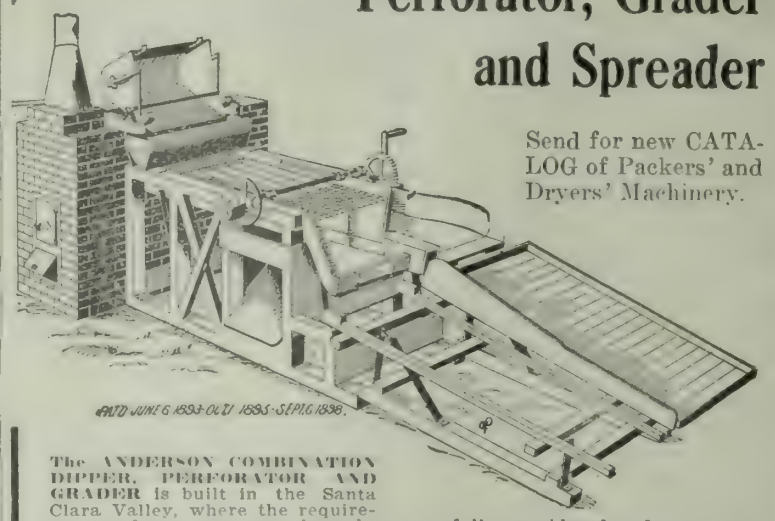
He claims that one reason his blossoms do not fall, is that the stored up food supply of the tree due to its autumn irrigation, brings the bloom earlier than otherwise; so the fruit is set before hot weather is likely to cook the blossoms. The doctor began farming nine years ago at about 60 years of age.

WATER TREE ROOTLETS.

[Written for Pacific Rural Press.]

Irrigation water in many Placer county orchards runs in a diminutive furrow directly down the hillsides and close to the trunks of the trees. How do those fruit growers expect the trees to get what little doesn't run away?

"It isn't right," says Howard Snelling. "The water ought to be checked and zigzagged back and forth, or on contour, so it could soak in. The most important thing in irrigation here is to keep the ground moist by running three or four furrows between the rows, where the rootlets are. Where we encourage them with irrigation, and then allow them to dry dead for two weeks and start with another irrigation, we are injuring trees and losing use of ground."



LATE GRAPE IRRIGATION.

[Written for Pacific Rural Press.]

Irrigation when fruit is near ripening is generally condemned by practical growers. However, R. D. Stephens of Mayhew, Sacramento county, who has been raising fruit 25 years, says it is all right in his district, to irrigate fruit at any time, whether the fruit is for drying, canning, or shipping, if it needs water.

Anderson Combination Dipper, Perforator, Grader and Spreader

Send for new CATALOG of Packers' and Dryers' Machinery.

The ANDERSON COMBINATION DIPPER, PERFORATOR AND GRADER is built in the Santa Clara Valley, where the requirements of prune growers have been carefully considered and every possible advantage incorporated into the machine. Can be furnished with or without rinse tank. Made in various sizes for hand or power.

SEND FOR 1916 CATALOG.

It illustrates and describes the entire Anderson-Barngrover line of Fruit Packers and Dryers' Machinery. A copy will be sent free to all who are interested. A postcard will bring it.

Anderson-Barngrover Manufacturing Co., 20 West Julian Street, San Jose Cal.

California Garden Flowers, Pacific Rural Press, $1.50 Postpaid,

His soil is such that a very heavy head of irrigation drains away quickly.

"The more water that goes into the fruit, the more sugar it takes with it," says he. "Even if the water evaporates more or less, the sugar won't, and you have extra size and weight, and it carries or dries better on account of its extra sugar."

Mr. Stephens has checked his orchard in big rather irregular areas, with levees that hold two to seven feet of water. These are filled with a big-capacity pump described elsewhere. On June 16, he had just finished cultivating plums and prunes after the irrigation, and was picking them.

Another part of his 221 acres of orchard and vineyard is interset with table grapes.

When the pump was first put in, he flooded the orchard and vineyard and "got phenomenal prices." One interset check was flooded in October, and the grapes picked as soon as possible without miring down. Grapes from neighboring vineyards which were sent in the same car with these, showed more or less mold; but "no whiskers on mine," says Mr. Stephens. "They contained more sugar."

Reputation Sells Oranges.

[Written for Pacific Rural Press.]

Everybody concerned is rightly happy because of the reputation Collins Fruit Company of High Grove, Riverside county, have worked up with an orange dealer in the prairie town of Salina, Kansas.

A car shipment made Feb. 24 and another Feb. 25 illustrate the case. Salina wired for prices on a car. The western firm through John L. Bishop wired their price; but that there were plenty of tramp cars en route which Salina could get cheaper—"only look out for brown rot."

Evidently Salina did not want brown rot, for the order came Feb. 23. The oranges were picked that afternoon, packed the next morning and shipped out shortly after noon. They reached Salina in just six days. The Salina people had advertised this car meanwhile as "on the tree in California last Wednesday; will be ready for you to eat next Wednesday." On similar transactions the cars have often been all sold to local dealers before they arrived.

A car a week, and sometimes more, goes this way to Salina from Christmas till July. Christmas oranges have been supplied to this market by the Collins Fruit Company ever since 1903. Occasionally the Eastern people call attention to a defect, but always send the full price on receipt of the fruit. This arrives in nine days after shipment from High Grove. If there was anything serious with the car, adjustment is made satisfactory to all.

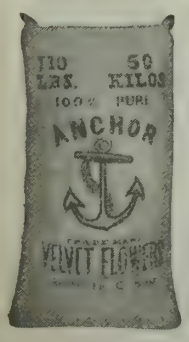
These eastern folks depend on this company for their supply, and they are never disappointed, either in getting it or in the quality. The company depends on Salina to take this part of their output and always gets the money on time.

PEEVED ABOUT SOUR-SAP.

To the Editor: This year we have had to dig out 185 sour-sapped trees besides leaving many that ere long will join the departed. A neighbor claims that his 10-acre apricot orchard 3 or 4 years old was wiped out just after he had been exclaiming over the wonderful growth they had made. Undoubtedly thousands of dollars have been lost to orchardists these last 2 or 3 years due to sour sap.

Now: Are our farm advisers or investigators doing anything about it, or dismissing the subject with "climatic conditions"? It seems to me that our experts visiting various localities and noting the differing conditions might suggest a more resistant root for instance, or other precautions to avoid the evil.

"Water standing on, or in the soil" does not hold good on our ranch, as it is very gravelly. Another neighbor having apricot trees in his alfalfa and irrigated every month were not affected, whereas nearly all on the unirrigated portion were sour-sapped.



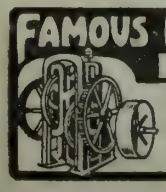
Another rancher I know grafts his apricots on the almond root, and claims immunity, while others around suffer losses.—J. C. J., Santa Clara.

[We understand that systematic study is being made of sour-sap phenomena by some of our plant disease experts and results will no doubt be announced when reached.

At the moment it is believed that sour-sap in root or in branches may be due to three causes, acting singly or sometimes, perhaps, acting together. They are (1) loss of root-hairs by too dry soil in the autumn; (2) loss of root hairs by decay in water-soaked soil in the winter; (3) injury to branch tissue by sharp frost after sap-flow has started. All these conditions interfere with normal sap circulation and induce fermentation which gives rise to the name "sour sap."

Your neighbor's experience with irrigation and what you say about your soil being gravelly suggests the conviction that you lose your trees through drouth in late summer and until rain comes. It is also supported by what you say of the behavior of almond root because it can stand loose soil better than other roots. But the almond root is not safe for the apricot, which is apt to break off even when three or four inches in diameter.

The chances are that your trees need summer and early autumn irrigation.—Eds.]



SULPHUR

Fleur de Soufre, Anchor Brand, Velvet Flowers of Sulphur and Eagle Brand. Packed in barrels and double sacks. Are the fluffiest Sulphurs that money can buy; the best for vineyards; the best for bleaching purposes. LEAVING NO ASH. SEND FOR ILLUSTRATED BOOKLET; also PRICE LIST and SAMPLES.

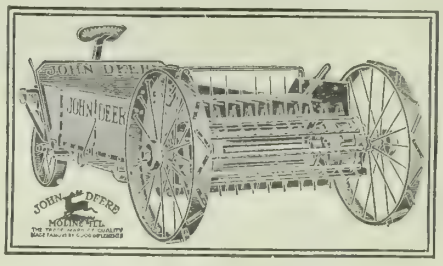
John Deere Implements

John Deere Spreader

The Spreader With The Beater On The Axle

BEATER drive works on the principle of a horse power. No clutches, no chains, no trouble. Mounting the beater on the axle (a patented feature) does away with half the types of castings.

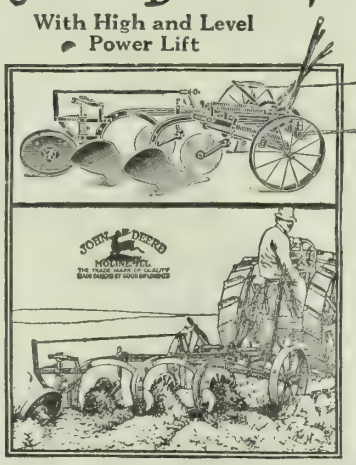
Only hip-high to the top—but has big drive wheels. Wheels out of way when loading.



Here are three exclusive John Deere Spreader features—read them over and then be sure to see them on the spreader itself:

1. Beater on the axle—nothing else like it.

2. Revolving Rake—load moving back to beater revolves the rake. Draft actually less. Even spread certain—no bunching.



3. Ball Bearing Eccentric Apron Drive—requires no attention.

If you want to distribute manure seven feet wide, use the John Deere Wide Spread Attachment. Write for free booklet.

John Deere Plows for Light Tractors

With High and Level Power Lift

PRACTICAL plows for the average farm. Work with any standard tractor.

Controlled by the man on the tractor. Pull the rope and all the bottoms raise high and level. Another pull lets them down.

Plows raised or lowered in fourteen inches ground travel. This makes square headlands.

All bottoms raise high—like a double-bail, high-lift horse plow. Plows do not clog or gather trash on the turn.

Extra wide and semi-floating front truck means uniform work and even depth of plowing.

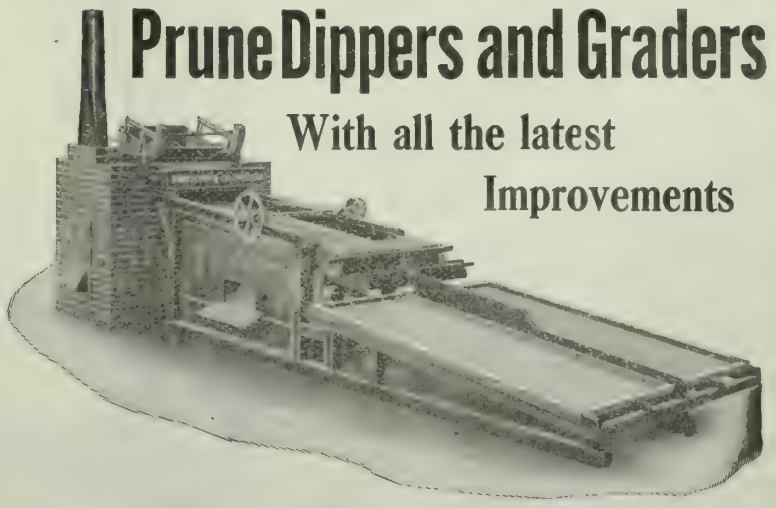
Extra beam and bottom, readily attached, increases regular two-bottom plow to three or regular three-bottom to four, as desired.

Equipped with Quick Detachable Shares—save 80 per cent time changing shares.

Write for free booklet.

A Farm Book For The Asking

BETTER FARM IMPLEMENTS AND HOW TO USE THEM



A Big One—168 Pages

Tells all about a complete line of farm implements and how to adjust and use many of them. A practical encyclopedia of farm implements. Worth dollars. This book sent free to every one who states what special implements he is interested in and asks for package No. X-152. Write for your copy today.

Plums on Peach Roots.

To the Editor: I have noticed articles in your paper by E. A. Amundsen and J. E. Hassler with reference to defective unions of Diamond, Grand Duke and Hungarians. I have planted quite a large number of these trees in Nevada county in your State and had intended to keep on planting them until I would have a big plum orchard. However, if any considerable proportion of them are going to die off in eight or nine years nobody should plant them at all and the proposition therefore is a most vital one in the planting of plum orchards. — P. H., Winnipeg, Canada.

[Answered by E. O. Amundsen, Farm Adviser, Auburn, Placer Co.]

I find as a general thing that the Diamond plum, grafted on peach stock, does not live over six or seven years. There are many orchards in the county where a very large percentage of the trees have died before the seventh year. I have found but one orchard ten years of age in which very few of the trees had been lost. I could not ascertain the variety of peach stock upon which these were worked.

Most of the Diamond grafting has been done within the past three or four years and the trees seem to do pretty well for a time. Dr. O. L. Barton of Loomis has a number of Diamonds on the peach root and also on Myrobalan. Within the last two years he has lost about two hundred on the peach root and none on the Myrobalan.

The union of a peach and Diamond is very much enlarged after a few years. The Diamond graft seems to grow out of proportion to the peach stock. In many cases, the Diamond top may be five inches in diameter while the root stock below the union is only three to three and a half inches.

After my observations throughout the county, I would not advise working the Diamond on the peach root. Of course, as the Diamond has brought good prices, there has been considerable grafting to this variety on peach trees, although there is a general acknowledgement of the results. Some people will take a chance at the same game that a neighbor has failed at; and it is hard to prevent them doing anything in which there is a chance.

In regard to the Grand Duke and Hungarian on peach, I have not observed much trouble. Although the unions are more or less enlarged, they are not so pronounced as in the case of the Diamond and there is very little loss due to this combination.

Your correspondent did not mention anything about the peach root but I take it that he meant the plums on such root.

CROWS, BLACKBIRDS AND DOVES.

To the Editor: We are new farmers, and lack knowledge. Shall we kill crows, blackbirds and mourning doves?—H. P., Bonsall.

[Answered by H. C. Bryant, University of California.]

Except under unusual conditions all three of these birds are considered beneficial rather than destructive in our State. Crows may occasionally give trouble in the poultry yard. When they do the State laws give permission to destroy them. Red-winged blackbirds are often destructive to Egyptian corn and barley when it is in the milk. Where one lives near a marsh it is sometimes necessary to frighten away and to destroy red-winged blackbirds. The Brewer blackbird (the shiny black one) feeds upon grain to some extent, but probably more than pays for the grain he takes during the year by destroying injurious insects. Almost all eastern States give protection to the mourning dove because it is so valuable as a seed-eater. Here in California we receive no complaints regarding depredations by the mourning dove, and we are convinced that it should be given careful protection.

KILLING SEDGE GRASS.

To the Editor: A grass (sample enclosed) grows in our pasture with a solid mass of roots. I fear plowing won't kill it. Would spraying be good?—W. K. B., Santa Rosa.

[Answered by Dr. H. M. Hall, University of California, Berkeley.]

[It is a species of sedge, Carex laciniata. It is a perennial with strong underground rootstocks and so cannot be killed by sprays such as those used against mustard. Plowing and clean cultivation will eradicate the sedge, if continued long enough. It might, however, take an entire season, and perhaps longer. Grow some crop such as corn or potatoes on the ground. See that the sedge sends no green shoots above the surface until the underground parts have been completely starved out.]

A promotion campaign which brought outside peach buyers to the Modesto-Turlock district resulted in sales which will bring $90,000 this year for the bumper crop of 3600 tons of clings. The co-operative pool takes credit for getting $20,000 more than the growers would have received otherwise.

GOOD BYE! MorningGlory

Don't let this troublesome weed sap your soil and ruin your crop.

NONPAREIL

is the one sure exterminator that does the work without injury to the ground. Read what Luther Burbank says: *"We find that Nonpareil destroys not only morning glory but also horse-radish. We consider it a thoroughly satisfactory weed exterminator"*—Luther Burbank.

One gallon of Nonpareil is sufficient to kill 250 plants. It does not prevent the ground from producing regular crops. It acts as a tonic to the soil. It is easy to apply and economical to use.

ONE MAN

The Bates Steel Mule

"One Man Tractor"

Does All Farm Work and One Man can Run It

THE BATES STEEL MULE does everything that horses do, and does it better, quicker and cheaper. Any implement that you have on your farm today can be hitched to and hauled by a BATES STEEL MULE. You can get twice the work in a day out of a BATES STEEL MULE hitched to any implement than you can get out of three span of big, strong horses hitched to the same machine.

ONLY one man is needed on any implement hitched to a BATES STEEL MULE. The operator sits on the implement and drives the machine as he would drive horses, except that it is much easier. Take harvesting for example; you only have to steer the BATES STEEL MULE with one hand while he is pulling you along as four horses would. The corners are cut as square as with horses, and you get double the acreage cut in a day.

FREE CATALOG TELLS FURTHER FACTS

"*** There were three 35 h.p. tractors plowing where I was harrowing, but my BATES STEEL MULE was THE TRACTOR that toddled along all day. I like the machine very much; one of its features is that it does not eat a bunch of hay and feed when idle, * * *" — (Name on request.)

Bates Steel Mule Co.
of California
320 N. SAN PEDRO STREET,
Los Angeles, Cal.

"***We had no repairs on your 30 h.p. BATES STEEL MULE during 120 acres of plowing, and we used 14 gallons of distillate per day. We plowed about an acre per hour. The machine was in as good condition when we were through as it was when we received same."— (Name on request.)

Red Spider Control

All species of the so-called red spider or mites occurring on fruit trees can be successfully controlled during the summer season by the use of Atomic sulphur applied as a liquid spray. This form of sulphur is so treated as to render it in very finely divided condition in paste form. It is not caustic and is more safe to use during the growing season when solutions of sulphur might prove injurious. Atomic sulphur can be diluted easily in water and is adhesive. Because of this adhesiveness it remains effective, giving protection to both fruit and foliage for a long period of time.

In using Atomic sulphur for red spider control, dilute and thoroughly mix with water at the rate of 10 gallons for each 100 gallons of spray, and thoroughly cover all of the fruit and foliage of the tree, especially the under surface of the leaves as most of the mites feed on the lower surface and the spray will therefore be more effective. Prices and full information furnished on application.

San Francisco, Calif.

VACATION LAND

What section of California holds forth such inducement to the vacationist as that traversed by the Northwestern Pacific R.R. Anglers will find the finest fishing; sportsmen an abundance of furred or feathered game; swimmers and bathers have a wide choice of ocean, river and bay; lovers of wild, primitive spots will find miles of great redwood and other forests; rugged mountains and elevations will appeal to trampers; cozy camping locations will entice the family; this wondrous collection of nature begins at Sausalito and extends to the world-old forests of Humboldt county.

A very interesting description of this territory is found in the booklet — Vacation — 1916, free copies of which may be obtained at 874 Market Street, San Francisco, or on application to J. J. Geary, G. P. A., 808 Phelan Bldg., San Francisco.

Northwestern Pacific R. R.

CALIFORNIA GARDEN FLOWERS,
By E. J. Wickson.
$1.50 Postpaid, Pacific Rural Press

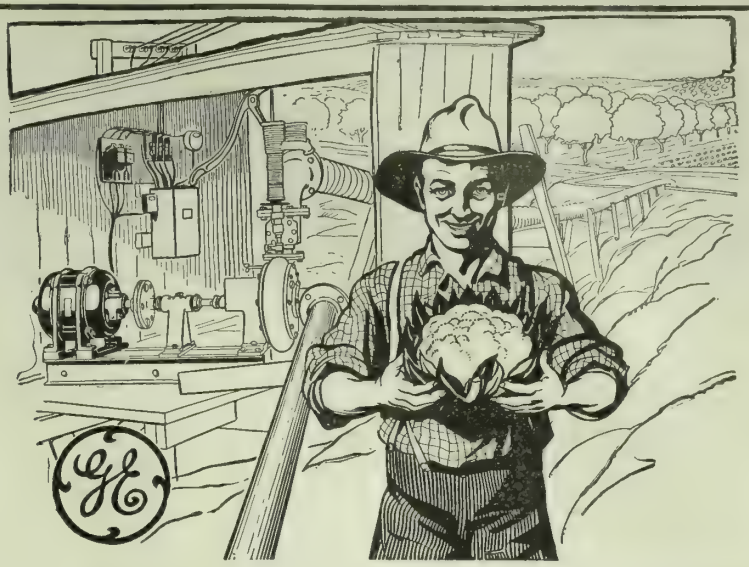
HOUSE FOR HOT WEATHER.

We saw a house which looked about the coolest possible while we were in Imperial Valley. E. Steiner who lives near Brawley has one on his ranch.

It is made of two rooms, 10x12, with a 7-foot gallery between. The floor is of tongue and grooved boards. The sides are 1x12s three feet high; then open two feet high entirely around; then 1x12s, two feet more to the eaves. The opening is covered with wire screening. The roof plates are of 2x4s. A 2x4 is used at each corner of the room, and two between each two corners.

The roof is the ordinary "A" shape made with a 1x3 ridge pole and supported by three pairs of 2x4s. This frame is covered with a canvas which also extends over the gables.

The second roof extends over both sections and the gallery, several inches above the canvas roof. This has a double 2x4 for the ridge pole and is supported by vertical posts resting on a beam across the gallery between the ridges of the canvas roofs. It is covered with 1x12 boards which rest on 2x4 plates, and extend two or three feet beyond to make wide eaves. Three-by-four timbers support this fly roof and these are braced to the roof plates with elbow braces to prevent their blowing down or racking.



The openings around the rooms are covered on the outside with a canvas which is tacked tight around the top, but fitted with hooked wire loops at the bottom to fasten down over nails in the heat of the day, or to be hung up to nails above the opening when a circulation of air is desired in the cooler night time. No windows are necessary. Screen doors open in the gallery from each room. The boards are slow heating through during the day time, and the canvas roof allows as much circulation of air as possible without blowing in.

EXTERMINATING WEASELS.

To the Editor: Please publish in the Rural Press some practical means of getting rid of weasels. Hardly a family in this community has had any success in raising chickens and turkeys on account of weasels killing them this year.—C. L. Adair, Stratford.

[Answered by Prof. H. C. Bryant, University of California.]

[Weasels are easily trapped. Steel traps set level with the ground and carefully concealed should be placed near the entrance or near the hole through which the weasel gains access to the poultry yard. If bait is used with a setting of traps it should be freshly killed. Strychnine inserted into a freshly killed bird or small mammal is sometimes effective.]

Profitable Farming

G-E Electric Motors are increasing profits for hundreds of farmers by saving money in running irrigation pumps and doing "chores".

A G-E Motor is always ready to run when you throw in the switch and costs very little to operate. The absence of fire risk is a big advantage of electric power. Some of the other advantages of electric motors are:

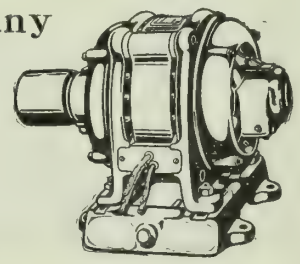
Only one moving part and two bearings—run for years without a moment's trouble.

Can be set wherever a wire will go—on the wall, ceiling or floor. They occupy less space and have less weight than any engine of equal power.

Capable of higher and more constant speed than any engine.

Require no attendant and can be stopped and started from miles away if desired.

Are safe and sure—no water to freeze—no inflammable gases—no starting troubles—JUST THROW THE SWITCH.



Let a G-E Motor increase *your* profits.

SOME PUMPING PLANT FOR ORCHARD.

Sixteen thousand gallons of water per minute is some irrigating plant. It will do the equivalent of covering 35 acres an inch deep in an hour, and have some 30,000 gallons to spare. Such an outfit is owned by R. D. Stephens of Sacramento county who uses it for his 221 acres of prune, plum, peach, cherry, etc., orchard and table grape vineyard. To handle the flow, the land is laid off in big checks with levees often three feet high and more. Such a volume of water is needed because it quickly soaks away into a great deal of the soil. Ordinarily only 13,000 to 14,000 gallons per minute is pumped, to avoid overflowing the ditches.

The orchard is near the Sacramento river, whence the water is lifted 15 to 18 feet by a 150 h.p. motor-driven pump. The land slopes from the river pump outlet to a sump in the midst of the orchard, where the other pump is located, This is run by a 125 h.p. motor which took the place, 18 years ago, of a $4,000 steam plant which was too much trouble to run. A 15-inch belt is used here on the four-ton centrifugal pump, while at the river, a 20-inch belt is used.

The motor rests on a concrete base on a concrete floor. There is a foot valve at the lower end of the 20-inch intake and there is a 20-inch discharge. A 1000-gallon galvanized iron tank rests above the centrifugal, ready to prime it.

The pump must run a certain amount of water or it will "kick." If it is running too much, one or more of three ½-inch plugs in the intake pipe is removed to let air in. The air acts as a lubricator for the water where it rubs against the pipe, and reduces the amount down as far as the "kicking" point. A heavy belt-wheel on the end of a frame which would rise or fall on an axle at its other end, was formerly used to tighten the belt, but its vibration seemed likely to damage the journals of the motor. A non-slipping substance is now applied to the belt.

Where the water dropped into the sump from the canal, it caved out a long deep gulley. To stop this a concrete floor and wings at the end of the ditch receive the water, which is then dropped through a vertical concrete chute to a concrete bottom whence it spreads out over an apron about level with the bottom of the sump. Of course there is no washing after the sump is filled, for it is kept full until the irrigation run is ended. Should that pump get out of order, the water runs from the ditch over a spill way into the orchard until the river pump can be stopped.

1 or 2 Row Beet Plow

KILLEFER QUALITY

KILLEFER EFFICIENCY

Was designed for the smaller grower where horse power was not available for handling the larger two-row plow. The draft is very light and no more weight has been used than was necessary to give the proper strength.

The axles are large with long wheel bearing. This plow is equipped with a compound lever which enables the driver to level it to any of the irregularities of the ground. At the same time it is only necessary to use the one lever to raise the plow at the end of the row. The compound lever works in connection with a heavy coil spring, which assists materially in handling. The foot lever controls the shifting hitch and is below the frame, making it much easier on the driver than the old style.

We build this plow with either straight, sloping, or bent standards and with any style of wing or point required.

tions has not rotted and that small particles of rubber have not gotten into the cooling system. Also that the formation of scale and sediment in the water jackets is not so serious as to impair radiation.

To remove sediment and particles of foreign matter from the cooling system, fill the radiator with boiling water in which three to five pounds of salsoda has been dissolved. Allow this solution to stand in the radiator and water jackets for 24 hours, after which it should be drained off and the system thoroughly flushed out with clean water. If this is done once a month, or at least every 2,000 miles, it will keep the radiator and water jackets in very efficient condition, according to the Standard Oil Co.

Care should be taken to see that the fan belt is not slipping, and that the blades have not straightened out, as in this case the fan will not draw sufficient air through the radiator to insure proper cooling.

Not less than seven per cent of the power developed by the cylinders is lost in overcoming the friction of the piston, and it is, therefore, necessary that the cooling medium be kept at its highest point of efficiency to enable the lubricating oil to perform its duty. Experience has proven that oil made from the Western asphalt-base crude maintains its lubricating efficiency at cylinder heat better than oils made from other crudes, thus aiding materially in keeping the motor at the proper temperature.

While the University does not as yet fully advise spraying, the following taken from a recent bulletin by Prof. H. J. Quayle is so much to the point that it is quoted:

"The most important phase of the whole process of spraying a citrus tree is thoroughness of application. . . . Since the scales are largely on the under sides of the leaves at the time of spraying, the 'uppershot' should be used almost entirely. By the time this spraying from below is finished, and the excess spray falls on the upper surfaces, very little 'overshot' work is necessary. . . . A power sprayer is necessary. . . . with a pressure of 200 pounds or over. . . . The 45 degree nozzle is preferable, because it enables better undershot work to be done."

Much trouble with spraying is resulting from use of dangerous spray strengths and poor workmanship.

New Layne & Bowler Catalog *Now off the Press*

Ready For Distribution

Write for a Copy.

Our latest catalog has been in course of preparation for over five months and is absolutely the most elaborate booklet of its kind ever published. It contains information invaluable to prospective water users. One hundred and twenty-five new illustrations are shown and interesting hydraulic data is given.

In this booklet we announce and illustrate a number of new Layne & Bowler products, including horizontal pumps, pump heads, cylinders, drill stems, swivels, etc. You'll find the booklet entirely different and far superior to all other catalogs. It's prepared in such an interesting manner you can understand every word. Practically all phases of irrigation from the standpoint of water development have been touched upon and clearly described.

Every prospective water developer should send in his name at once for a copy. Ask for Catalog No. 25.

Layne & Bowler Corp.

General Agricultural Review.

GRAINS AND FIELD CROPS.

Livermore Valley sugar beets look good.

Bean planting is in full blast around Live Oak.

Fair to good barley is coming into Gridley.

Lovelock Valley, Nevada, has one of the biggest hay crops ever.

Wheatland oat farmers find considerably better yield than they expected.

The State garlic crop is estimated at 55 carloads of 20,000 pounds for 1916.

V. Marchetti of Oakdale claims 150 sacks of onions on ¼ acre, sold at $1.50 per sack.

To store 1000 tons more hay this year than last is the plan of Henry Scullion of Altamont.

A carload of watermelons flooded the Stockton market and sunk prices to 2½ cents per pound.

Cabbage, 264 cars of it, had been shipped by rail from producing districts of Cal. before June 13.

Two thousand and twenty carloads of cantaloupes have been shipped from Cal. this season previous to June 15.

Standardization is held responsible for the good cantaloupe market prospects in spite of one of the biggest crops ever.

The Butte County Rice Mills Co. has let the contract for a 50x60 four-story corrugated iron addition to their present plant.

Between 500 and 600 acres of barley were burned north of Winters last week. On some, the grain was in the sacks. All were insured.

Second cutting unbaled Orland alfalfa sold to the mill at $7, was disposed of so quickly that the mill is offering $7.50 for third crop.

The 210 acres of cantaloupes around Le Grand have a good stand. The melons are to be marketed through the growers' organization of Turlock.

Last year's hemp crop of the Rindge Land Co. of San Joaquin county, was recently baled and sold for $50,000. Another crop is being grown on the same land.

The paddy-rice carload freight rates have been reduced by the Railroad Commission at the instance of the Pacific Rice Grower's Ass'n. by 20 to 30 per cent. From Biggs to Oakland it will be 14 cents instead of 17½ cents as formerly.

Oat harvest had not begun June 15 around Oakdale, except on poorer fields, though barley was being hauled. Prices were $1.15 at Oakdale as against 95c to $1 last year at opening.

Grasshoppers are threatening Gridley alfalfa. Tulare countyites use green alfalfa dipped into a barrel full of a mixture made by boiling two pounds of white arsenic and 8 pounds of sal soda in two gallons soft water, then diluting it to 40 gallons.

MISCELLANEOUS.

Gilroy rats are eating poultry and garden vegetables.

A vigorous campaign has been waged for a farm adviser in Fresno county.

Oregon has a rural credits system on the ballots as an initiative amendment to the constitution.

The Industrial Accident Commission has decided 2240 formal cases since the Workmen's Compensation act became effective Jan. 1, 1914.

The Stanislaus County Beekeepers' Club has decided to co-operate in buying supplies, and marketing in connection with the State Market Director.

Weeds on State highways are endangered by the campaign in which the State Horticultural Commission and the State Highway Commission hope to co-operate.

Work has been obtained for 11,112 men and women by the State Employment Bureaus since they were organized Feb. 1. This service is gratis to employers and people who want work.

Not only is all of the eastern white pine threatened with blister rust, but if rigid State quarantines do not stop it, the disease will ravage the great forests of the west, according to the U. S. Dept. of Agr.

Timber in California's eighteen national forests measures approximately 119,000,000,000 feet and has an estimated value of $250,000,000 according to Coert Du Bois, United States District Forester.

Congress is to be asked by the Chamber of Commerce of the U. S. to direct the Interstate Commerce Commission to investigate railroad men's wage scales involved in the threatened strike all over the U. S.

It is proposed to spend $6,000,000 to build a levee around 260,000 acres of the Tulare lake bottom lands twelve feet higher than the highest water ever known. Water is also to be pumped onto the Huron plains.

CITRUS, OLIVES, NUTS, FIGS.

About 800,000,000 lemons are shipped out of the State per year.

Ground rats are girdling some of the orange trees in the Porterville district.

The Orange Cove Citrus Ass'n. is investigating modern packing houses, planning one for themselves.

Fifteen navel oranges per capita per year for U. S. are produced in California, according to G. Harold Powell.

The Rumsey and District Almond Growers' Ass'n. will build a 100-ton warehouse and sulphur house in Rumsey for this year's crop.

Santa Barbara olive growers met June 11 with State Market Director Weinstock. They have raised $15,000 for a packing house plant.

Distribution of caprifigs infested with blastophaga has been proceeding under direction of Sutter county horticultural commissioner H. P. Stabler.

The Banning Almond Ass'n recently made plans for a 57x48 addition which will nearly double the capacity of their fine concrete warehouse, at a cost of about $3500.

Mr. Brown proved that blasting pays

This shows part of the 18-year-old orchard of George W. Brown of Mount Cory. Trees in row at left were planted in ordinary dug holes; those at right were planted in blasted beds.

The trees in blasted beds now average 25 feet high with trunk girths of 42 inches. Those not in blasted soil average 18 feet high with trunk girths of 27 inches.

Plant your fruit trees in beds blasted with

GIANT FARM POWDERS
STUMPING — AGRICULTURAL

and *you* will find, as Experiment Stations have found, that "trees planted in blasted holes develop deeper and stronger root systems than trees planted in spade-dug holes," and will bear earlier and yield larger crops.

The two Giant Farm Powders are made especially to suit *western* farm and orchard conditions. They pulverize the soil instead of packing it. Ask your dealer for either of them—Giant Stumping or Eureka Stumping Powder—and for other Giant blasting supplies. Be sure to get the genuine, bearing the Giant brand. If your dealer has only ordinary dynamites, we will see that you are supplied with the real Giant Powders.

Book, "Better Orchard Tillage," FREE

Every fruit grower will find valuable information in our illustrated book, "Better Orchard Tillage." We send you a copy free—mark and mail the coupon. Other books, on stump blasting, boulder blasting, subsoiling and ditching, also free on request.

Pests!

"CORONA DRY" will get 'em!

No elaborate equipment necessary — no messing about with a sloppy spray mixture. "Corona Dry" is applied in dust form and gets the bugs before they start to eat the growing things. Call or write for a free copy of 20-page instructive book "Garden Pests and Their Control"—it tells how to get rid of all bugs, worms and plant diseases. Ask your dealer for "Corona Dry."

GERMAIN SEED & PLANT CO.
326-328-330 So. Main St., Los Angeles, Cal.

DECIDUOUS FRUITS.

The two new canneries at Hemet and Ontario began operations on apricots June 15.

An apricot crop on a little over 10 acres near Salinas recently sold on the trees for $5,000.

The Banning Canning Co. has about 400 tons of apricots and 1500 tons of peaches to can this year.

The Hanford cannery of the C. F. C. A. will commence operations about July 15. It was not run last year.

Sales Mgr. J. F. Wilson of the Cal. Growers' Ass'n reports heavy future sales of canned goods at attractive prices.

Rumsey apricots are practically all harvested, most of them having been shipped east, a few dried, and a few shipped to cannery.

That co-operative canneries will be built for the Stanislaus county clings, was the sentiment of a meeting of peach growers in Turlock June 18.

Sebastopol red Astrachans are ripe and being packed. Gravensteins will probably be ready early in July. Old trees bearing heavily this year.

The Cal. Growers' Ass'n recently elected Benton Ballou of Ontario president, D. E. Brown of Kingsburg vice-president, Claude Congdon of Hemet secretary-treasurer.

A deciduous experiment station of the University is urged by the Santa Clara Growers' Information Bureau. A small shipment of pears is to go east from Suisun June 24.

Pajaro Valley apple growers complain of the cheap scabby northwestern apples which ruin California's markets for good California fruit. They want scabby imperfect fruit excluded by law.

Shipment of pears from Sacramento county was forbidden by the county horticultural commissioners recently until June 24, when they should have reached maturity.

Under organization, prunes and apricots will be packed, to a large extent, by the same men and in the same packing houses as now. The organization merely proposes to market the goods.

GRAPES AND SMALL FRUITS.

Vineyard run Thompsons in Sutter county are reported to be sought at $30 per ton for drying.

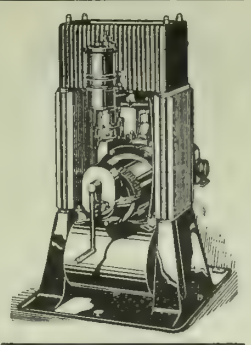
Frost seems to have caused a large percentage of shot-grapes in the Tokay section, San Joaquin county.

Bowman (Placer county) berries have been shipping full force, while peaches and plums also are going out.

Forty-six express refrigerator carloads of Logan and blackberries had been shipped East from Sebastopol June 16.

The Calistoga district will not have over 10 per cent of a crop according to Napa horticultural commissioner J. J. Fox.

A new raisin tray to protect the fruit from dust and rain is said to have been perfected by a member of the San Quentin Agr. Club.



Raisin sales now are 20 per cent greater than at the same time last year. A 25-acre Tokay crop in Lodi district recently sold for $5.000 cash, the buyer to sulphur, cultivate, and harvest the crop.

SULPHURING DRIED APRICOTS.

To the Editor: Our letter on "quality dried apricots" states that 5 lbs. of sulphur to 200 lbs. of fruit is ample. This should read 1200 lbs. instead of 200, the original statement containing a typographical error. We note that you quote this statement in your June 17 issue. 1200 lbs. of fruit is about the capacity of the common Santa Clara Valley one-car sulphur-house.

San Jose. G. E. Merrill.

Your living-room can be made attractive and spring-like by placing star-moss in bottles of water behind the pictures. It grows beautifully and gives a restful feeling the moment you enter the room. A home always looks attractive no matter how plainly furnished it may be if you have growing plants in the windows. If the room is lacking in sunshine choose ferns, umbrella plants and star-moss for the best results.

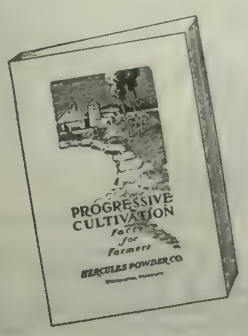
Don't Pay Taxes on Unproductive Land

EVERY cent that you pay in taxes on unproductive land is money wasted. You can eliminate this waste—not by getting rid of the taxes but by getting rid of the land—the *unproductive* part of it.



Take it out of the unproductive class—make it *pro*ductive by means of

HERCULES DYNAMITE

If you own land rendered useless by water, stumps, rocks, or by all three combined, Hercules Dynamite will clear it at the least possible expense.

If you have ever run a drainage ditch, pulled stumps, or removed rocks by hand power you know the amount of work involved. Hercules Dynamite will do the same job, and do it more thoroughly, at a small fraction of the cost in time, labor and money.

It will pay you to write us for an instructive and interesting book called "Progressive Cultivation". It is sent free on request. It treats fully not only the question of land clearing by means of dynamite but also subsoiling, tree planting, irrigation work, etc. Write for your copy today. Please use the coupon opposite.

Breeding and Testing Pays in Heifers.

[Written for Pacific Rural Press.]

The practices of weighing and testing milk to determine its butter-fat, and building up grade herds by the use of registered sires are growing ones, but seldom can the financial benefits be so easily pointed out as in the experience of T. J. Baltimore of Gridley.

For the last six years Mr. Baltimore has been weighing and testing milk from his herd, having missed but two months testing in all of that time. For the last four years he has been using registered Guernsey bulls. Since the heifers from these bulls freshened, he has been offered $75 to $90 a head for them; whereas the ruling price for grades sired by mongrel bulls and out of untested daughters has been $50 to $70. He has not sold them, for he is using them to replace some of his older and lower-producing animals.

The increased value of females is not the only benefit from the six years' weighing and testing of milk. It has also furnished him with a tab on feeds as well, a case in point being the advantages of good pasture. The first two years the herd was tested, the average for every cow in the herd was one pound of fat a day for the entire year. During that time they had free access to a low pasture where good green feed was abundant all the year round.

Later this land became unavailable; and since then it has been impossible to maintain such a high average. This spring a stave silo has been erected and filled with the first cutting of alfalfa.

As a result of his success with Guernsey bulls on grade cows, Mr. Baltimore has purchased a few registered Guernsey cows, with additions to which he hopes to eventually develop into a purebred breeder. Already his increased heifer values have paid the cost of testing and the difference in price between scrub and registered bulls.

Hay and Forage for the Horse.

[By Prof. F. W. Woll, University Farm, Davis.]

[Continued from last week.]

Millet, sweet sorghum, and varieties of grain sorghum are used to some extent for horse feeding in the central states. Millet cut at the beginning of bloom and well cured makes a good quality of hay that is nearly equal to timothy in feeding value; late-cut millet is a poor horse feed. The grain sorghums are often cut and fed to horses, "heads and all," without threshing the grain.

Corn stalks and cereal straw are of value for wintering horses and young stock and may always enter into the horse's ration to a limited extent. Enormous values of these by-products in grain raising are wasted every year in this land of plenty. European farmers and horse owners carefully utilize straw for feeding horses and cattle. For horses the straw (preferably oat and rye straw mixed) as a rule makes one-third to one-fourth of the total roughage eaten. It is fed cut, moistened, and mixed with the grain feed.

Succulence.—Another class of feeds that should be mentioned in this connection is succulent feed, either silage or roots. The stomach of the horse is relatively small and cannot take as large amounts of bulky feeds as cattle can. The feeds mentioned contain one-tenth to one-third of dry substances, the rest being water, and it follows that these feeds can make only a small part of the ration of work horses. Succulent feeds are of especial value in stimulating the milk secretion of brood mares. Their value as appetizers and regulators of the digestion is also recognized by most horse owners.

Silage.—As much as 10 to 20 lbs. of silage made from well-matured Indian corn or sorghum varieties may be fed per head daily, provided care is taken to feed only freshly exposed silage, free from mold. Horses are more sensitive to moldy or musty feeds, apparently, than other farm animals; and unless bright, fresh, well-cured silage is available, it had better not be fed to horses at all.

Root Crops.—Of the different root crops, carrots are fed mostly to horses, 5 to 6 lbs. per head being an average daily allowance for work horses. More may be fed to brood mares and young horses, if desired. The carrots are preferably fed sliced, longitudinally, so that they may not choke the horse. Sliced beets and potatoes are also fed to horses at times, especially in Europe, and are then generally mixed with cut straw or hay, in amounts up to 10 lbs. per head daily.

There are many points as to feeding this class of animals that have not even been referred to, like pastures for horses, different systems of feeding, rations for different kinds of horses, etc. These will be covered in other papers of this series. In a second article we shall consider the other parts of the horse's ration: the grain feed or so-called concentrates.

SECOND GROWTH FETERITA POISON.

To the Editor: Is second growth feterita injurious to stock?—W. T. S., Capay.

[Answered by Prof. F. W. Woll, University Farm, Davis.]

[Green growth which comes after the main plant has been checked either by frost or extreme drouth is dangerous on account of containing substances that yield prussic acid. This poison decomposes when the green growth is dried.]

BLACK LEG

LOSSES SURELY PREVENTED by Cutter's Blackleg Pills. Low priced, fresh, reliable; preferred by Western stockmen because they protect where other vaccines fail. Write for booklet and testimonials. 10-dose pkge. Blackleg Pills $1.00; 50-dose pkge. Blackleg Pills 4.00. Use any injector, but Cutter's best.

The superiority of Cutter products is due to over 15 years of specializing in vaccines and serums only. Insist on Cutter's. If unobtainable, order direct.

THE CUTTER LABORATORY, Berkeley, California.

REDWOOD TANKS—SILOS.

Hogs on Young Fruit Ranch.

[Written for Pacific Rural Press.]

S. S. Southworth of Napa county turns off between 65 and 70 purebred Durocs a year from his 52 acres of land. At the same time, he is growing 32 acres of young orchard.

Like most of the hog growers of that district Mr. Southworth grows Indian corn as the chief grain crop, planting it between the rows of trees. Beets are also grown between the trees on a small piece of bottom land; and pumpkins are planted in the tree rows.

The farrowing pens on this ranch are located on a high piece of land, well drained by a deep gulley. Adjacent to this is a five-acre field of alfalfa which furnishes pasture during the summer. Another small field on the other side of the farrowing quarters provides winter pasture.

The brood sows are fed tankage and middlings while suckling the pigs. After weaning, the pigs are turned into the alfalfa pasture and fed corn on the cob, with tankage in a self-feeder.

Pumpkins and beets furnish the main succulent feed during winter; and at times a ration of three parts corn and one part ground alfalfa is fed to the brood sows.

Mr. Southworth does not believe it advisable to crowd the trees with inter-crops; and this year has two rows of corn in each middle. Last year he had four.

Mr. Southworth believes that too many breeders have sold hogs for breeding, regardless of their quality. He expects to cull heavily, selling only his best hogs for breeding, and consigning the rest to the pork lot.

TEMPORARY HOG FENCES.

[Written for Pacific Rural Press.]

A 20-acre hog ranch with no permanent fence except the one along the boundary lines. Such is the situation on the Hayden Smith ranch near Woodland. In many respects it is more satisfactory than if permanent cross fences were used.

Panels three feet high and 16 feet long are used by Mr. Smith instead of wire fence, allowing "one to fit the pen to the number of hogs it is to hold."

The usual way of using the panels is to make a fence of them along the levee of an alfalfa check, where a water pipe from the tank houses is also laid, with a small tank and float valve at regular intervals. Pens are then made with the panels, across the check, set zigzag so that they are self-supporting.

The houses, which are made almost square, with a removable roof for ventilation, are on runners so that they may be readily moved by team. They are usually at the rear end of the pen.

As soon as the alfalfa is pastured down along the entire check, the panels are moved to the next check, which has been irrigated previously and is in fine growing condition. In this wise the entire 20 acres can be pastured, and the hogs do not interfere with irrigating, and vice versa.

Mr. Smith raises purebred Duroc-Jerseys, usually keeping about 15 brood sows and a couple of good herd boars. At present, he is using an old boar, U. F. Royal, an outstanding animal which he purchased from the University of California, when they were no longer able to use him.

Besides alfalfa pasture, the hogs are fed tankage, rolled barley, and middlings. While these have to be purchased, enough hay is sold each year to pay for the mill feeds; and the breeding stock sold from the ranch represents the income.

HOG LICE KILLED WITH AUTO OIL.

[Written for Pacific Rural Press.]

Crude oil is one of the accepted cures for lice on hogs, but while effective, it does not make an attractive looking hog, especially if it be a red or white one.

Fully as sure a cure for lice and not more expensive is the residue oil from the crank case of an automobile, according to John Daggs of Modesto, who buys it cheap from local garages.

It is not used on fence posts, but poured into a concrete wallowing hole that is always kept filled with water. The hogs dip themselves in the water—they also give themselves a thin coating of oil, which kills the lice.

Mr. Dairyman or Breeder---

Do you want to improve the butter-fat output of your herd? If so, I have just the bull you want.

Pietertje Cornucopia Creamelle

His dam on her first test made a record of nearly

25 Pounds, Testing 4.7 per cent.

He is just ready for service and just the sire for your herd.

Write, or come and see him.

F. STENZEL

Breeder of Holsteins.

SAN LORENZO, CALIF.

Son of Segis Pontiac De Kol Burke READY FOR SERVICE.

We are offering at a very low figure a splendid son of this coming young sire. Born March 6, 1915.

His record dam has the following records:

Butter 7 days 26.41 Milk 605.5
Butter 1 year 755.40. Milk 20260.2

She is a daughter of Ignaro De Kol, ten of whose daughters have records above 20,000 pounds milk, including Aralia De Kol 28,090. Three nearest dams of this bull average 26.68 lbs. butter, 668.8 lbs. milk. Dam and sire's dam average 920.27 and 24,543 lbs. milk in yearly test. A full sister to his dam has produced 885 lbs. butter in one year.

Price and pedigree on request.

DAIRYING AND DAIRYMEN.

The Sanitary Dairy of Modesto is shipping milk to Madera county.

The Orland Cow-Testing Ass'n has signed up 908 cows owned by 58 dairymen.

J. W. Benoit of Modesto, has a cow which he expects to make over 600 pounds of fat in a test now on.

The N. H. Locke Co. sold to the Hearst ranch, Pleasanton, the three-year Jersey bull Norma's Gertie's Son.

High-protein concentrates should be fed with silage for economical results according to U. S. Dept. of Agr.

The Kings County Creamery of Lemoore has been incorporated for $10,000. They will make butter and cheese.

Tuberculin testing of 2,616 Jerseys owned by E. C. Lasater of Texas, has recently been completed. No reactors found.

The Western Yolo Sheep Cheese Co. is reported to have made about 17,000 pounds of cheese since beginning operations April 26.

A Holstein consignment sale will be held at Hanford Oct. 18, the day before the Poland China sale. A number have already said they will consign.

The Stephens Dairy at Mission San Jose, Alameda county, has just completed a 126-cow dairy barn fitted with up-to-date appliances, twin silos, and a model milk house separate.

Gradual milk shrinkage or failure to breed may be due to lack of minerals in the feed of high-producing cows, according to Ohio Expt. Sta. Alfalfa is rich in minerals.

Ground was broken June 14 for the new creamery at Chowchilla to be operated by the Cal. Dairy Products Co. It is to be able to make 5,000 pounds butter and 10 tons of ice daily.

In the scoring test of the 141 dairies, supplying milk to Los Angeles, E. and J. Kellenberger won first prize with a score of 96.25. "Every cow in our herd is a pet," says Mr. Kellenberger.

Wisconsin leads the States in pure-bred Guernseys and the number of cattle under test for advanced registry. There were recently 88 Wisconsin members of the American Guernsey Cattle Club, of whom 50 had 215 cattle on test. New York was next.

C. W. Meyers of Standard, Tuolumne county, has just completed a 48-cow modern cement floored dairy barn and milk house. He is putting in a cement reservoir at some distance above the barn to get water pressure to flush out the manure into a ditch that will carry it onto alfalfa.

Among records made by cows owned by the Santa Anita ranch are: Diotime Clyde Korndyke, 5 yrs., 31.913 lbs. butter in 7 days; Molly Woodcrest Pontiac, 1 yr. 11 mos., 17.66 lbs. butter in 7 days, and 68.69 in 30 days; Filled Segis, 4 yrs., 26.54 lbs. butter in 7 days; Lily of Bloom 2nd, 4 yrs.., 27.51 lbs. butter in 7 days.

The Jersey cow, Dosoris Park Lily, owned in New York, produced 16,728 lbs. milk containing 957.4 lbs. fat in the year ending last Dec. 4. This was sold at 20 cents per quart, or $1,556.08. Valuing her grain at $37 a ton, alfalfa hay at $26 a ton, and silage at $5 a ton, Lily returned $1,357.16 over the cost of her feed.

SWINE.

JNO. P. DAGGS, Modesto, California.—Breeder of the leading strains Duroc Jersey Swine. The best blood that can be had in the world. None better in the Daggs herd today. Daggs gone out of business, because he did not show at Fair. I should say not. He was just taking a little layoff; just a little rest from the hard work of the show ring. But not a rest from raising prize-winning Durocs and buying the leading strains of the world to improve his herd. So don't fail to write or come and see the Daggs Durocs before buying elsewhere.

BILLIKEN HERD OF IMPROVED CHESTER WHITES—The kind that makes the money. Pure-bred—registered—cholera immune. An extra fine lot of weaned pigs—both sexes—representing the best and most popular blood lines this breed produces. Five different sires used. Can mate up not akin. Quality combined with size. Rapid growing—early maturing. A few nice fall gilts that will be bred and ready to ship in September. Write for prices and circular. C. B. Cunningham, Mills, Sacramento County, Calif.

REGISTERED DUROC-JERSEYS—Fall boars and gilts. Weanlings sired by an excellent son of the 1020-pound Royal Muncie. We have pigs sired by this boar weighing 240 pounds at 7 months, and out of line bred Golden Model, Crimson Wonder, Orion, Chief, and Colonel sows. For information write Haden Smith, R. 1, Box 84D, Woodland, Cal.

YOUNG POLAND CHINAS, LARGE TYPE—Boar IBA Wonder won first and Reserve Championship P. P. I. E., weighing 730 pounds under 2 years and in breeding condition. 60-day special—fine young sows bred to IBA Wonder at very low prices; also weanling pigs, either sex. Satisfaction, or money refunded. W. A. Young, Lodi, Cal.

BIG TYPE POLAND CHINAS—The profitable money-making hog. The hog for the farmer. The real mortgage lifter. Large herd to select from. Bred sows, bred gilts, open gilts, weanlings of both sex. Boars ready for light service. Extra special prices. Geo. A. Smith, Corcoran, Cal.

REGISTERED DUROC-JERSEY — Weanlings, shoats gilts and boars. Unrelated. Many of our hogs are related to the several prize-winners at Panama Exposition. This herd is undoubtedly the finest in the State. Have had as many as 19 pigs to a litter. Grange Stock & Poultry Farm, Yountville, Napa Co., Cal.

HAMPSHIRE SWINE—Both males and females from Grand Champion 700-lb. boar and Grand and Junior Champion sow. Also Guernsey bull calves from Grand Champion bull. BELLA VISTA HERD, J. W. Henderson, 1st National Bank Bldg., Berkeley, Cal.

REGISTERED BERKSHIRES — World's Fair Grand Champion at the head of the herd. Also winners of Senior, Junior and Reserve Grand Champions. Stock of all ages for sale. Grapewild Farms, A. B. Humphrey, Prop., Escalon, San Joaquin Co., Cal.

BARGAINS IN CHESTER WHITES—Few excellent bred gilts, $30; sows, $35. Service boars, $20 and up. Weanlings, $10. Best blood lines. Only good individuals shipped. Dallas Bache, Hollister, Cal.

BERKSHIRES—I have one of the best herds on the Pacific Coast, including Grand Champion Sow, Reserve Grand Champion Boar under one year, Third Aged Boar, etc. Frank A. Brush, Santa Rosa, Cal.

DUROC-JERSEYS—Some great weanlings of both sexes by "RIVER BEND HIGH MODEL." Improve your herd by introducing this blood. RIVER BEND FARM, St. Helena, Cal.

FOR SALE—Fancy belted Hampshire hogs. Well belted young sows and boars registered. Prices reasonable. Ben F. Thorpe, Manager, Canfield Estate Ranches, Bonsall, California.

REGISTERED BERKSHIRES — BOARS — 5 and 6 months old $15 and $20 each. Also a few year-old ones. All pure-bred animals. G. A. Casey San Jose, Cal.

R. F. D. C., Box 420, Modesto, Cal.

This represents 5 per cent interest on $27,143. Her heifer calf is valued at $2,000.

SWINE BREEDERS AND SWINE.

California Swine Breeders Ass'n meets at Hanford during the fair week.

Kings county Fair directors have added special classes with double awards, for Holsteins and Poland Chinas.

Glenn county swine growers met the supervisors June 20 to elaborate a plan of hog cholera quarantine and inspection.

James Cass of Cayucos writes that he has gone into the registered Duroc game. This is his third hog venture since the first at Ione in 1853.

The Del Dayo Farm has sold to G. O. Lovett, Mgr. Galland-Lowenstein ranch at Germantown, 8 Berkshire gilts; and to the Kinney ranch, Walnut Creek, one gilt.

The U. S. Government has discovered a new method of producing sterile hog cholera serum. Extract of navy beans is added to immune blood which is then centrifuged to remove the red cells, after which the clear serum may be sterilized by heat. Addition of ordinary salt enables the recovery of 74 per cent serum.

OTHER LIVESTOCK.

Wool was sold in Mendocino county last week at 30¾ cents.

A new raid by the French upon California horses for the war is being rapidly executed.

During 1915, California horses numbered 493,000, but were of same total value as the 503,000 in 1914, according to State Statistician Geo. Robertson.

It is reported that Eastern meat dealers expect meat prices higher than ever before for several months following July 1. Much meat has been sent to Europe.

John M. McMarble of Los Angeles county recently received four very fine registered Romney ewes from New Zealand. He purchased a pure-bred Romney buck at the P. P. I. E. last fall.

C. E. Barnhart of Suisun plans to show, at the State Fair, some of his registered Shropshire bucks and grade ewes, bucks, and lambs. He has 3200 ewes and also some Durham cattle.

A. H. Mc Innes of Red Bluff has recently purchased 6,000 high grade Rambouillet yearling ewes from Idaho. They will be driven all the way. He paid $6.60 per head.

CARRUTHER'S BERKSHIRE SALE

Swine breeders will be interested in the announcement of Carruthers Farm that the first annual auction sale of Berkshires from their large herd will be held during the early part of August.

Mr. Carruthers has aptly termed this the "greatest sale of 'Rival's Champion Best' Blood ever made." His herd is almost entirely of this blood, which he secured from Rookwood Farms at Ames, Iowa, owned by Dean C. F. Curtiss of the Iowa Agricultural College.

While a comparatively new herd in the state, the quality of Carruthers Farm Berkshires was ably demonstrated at the Panama Pacific Exposition last fall when a large portion of the prize money was awarded to them. Since then competent Berkshire judges have pronounced the band of brood sows on this ranch to be one of the choicest large herds in the United States.

Mr. Carruthers is a firm believer in annual auction sales, if properly conducted, and expects to dispose of a large part of his choicest young breeding stock at this sale in order to insure the success of future sales. In order that buyers may take advantage of the sale to strengthen their show herds, all animals will be entered before the sale in their respective classes at the coming State Fair at Sacramento.

Veterinary Queries.

BLOAT ON GREEN HAY.

To the Editor: My cows bloat on hay, the last crop of last year. The hay was a little green. I salted it well. I lost a heifer.—J. E. W., Hughson.

[Your trouble is with the hay. It has been improperly cured and the salt will not remedy this.]

CALVES' EYES WATER.

To the Editor: Ten calves water from the eyes—no matter comes. I feed skim milk. How many pounds of milk in a gallon?—W. J. C., Finley.

[This is a cold. Place a few drops of a 25 per cent solution argyrol in the eyes twice a day.] [Practically 8 pounds of milk per gallon.]

HORSE HAS WART.

To the Editor: A wart on the side of my horse's head chafes and bleeds.—W. C. M., Saratoga.

[Paint the wart with a 5 per cent solution chromic acid once daily until it disappears.]

SWELLING UNDER TONGUE.

To the Editor: A cow has a lump under her tongue between the jaws. It is about 6 inches long and 3 to 3½ inches through. Liniment has no effect. It is not fast to the bone. —J. A. G., Chico.

[Have a qualified veterinarian lance this and prescribe treatment.]

LUMP ON HORSE'S HEAD.

To the Editor: My horse has a lump just back of where poll evil comes on. He acts as if he had a headache now, though it didn't bother him a year ago.—W. M. W., Groveland.

[This is poll evil. Have a qualified veterinarian operate.]

HORSE FULL OF WATER.

To the Editor: My 3-year horse became sickly, walked a little lame. As I was driving to town, he stopped short and acted as if he would drop dead. Later, on going to the veterinarian he staggered backward and dropped dead. I cut him open. He was full of water.—H. G. N., Dinuba.

[This was ascites. There is no remedy absolutely effective.]

COW GRUNTED AND STAGGERED

To the Editor: One of my milk cows started to grunt and could scarcely walk and stopped giving milk. I gave her a good dose of liniment. She stopped grunting but looks miserable.—H. G. N., Dinuba.

[Cut out the liniment and use epsom salts in two-pound doses.]

CALF SCOURS.

To the Editor: About 10 two-months calves became sickly. Three of them died. Had scours. Droppings thin as water.—H. G. N., Dinuba.

[Give them three 30-grain tablets sulpho-carbolates twice a day and cut the feed in half.]

BLOODY MILK — LUMPY TEATS.

To the Editor: My cow gave bloody milk from all four teats shortly after calving. I gave her potassium iodide and it stopped in a few days. A few weeks later a hard lump developed for a few days in one teat in the upper part and the milk from this teat was bloody. A similar lump came in another teat a month later. There was a scratch or bruise on the skin. The milk was bloody for a few days. Two weeks ago one quarter of her udder became caked and next day the milk was ropy and slightly reddish. This lasted a day or two. This evening the same quarter is hard.—A. L. P., Kingsburg.

[Have this cow tested for tuberculosis.]

BERKSHIRES AT AUCTION

47---HEAD---47

The Greatest Sale Ever Held of
"RIVAL'S CHAMPION BEST" BLOOD
AT

SANTA ANITA RANCHO

ANOAKIA BREEDING FARM

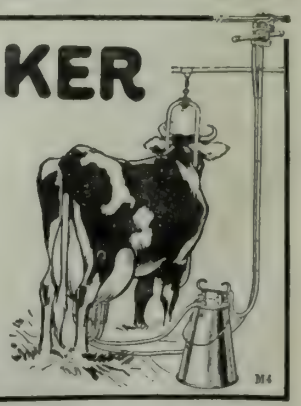
HOLSTEIN CATTLE The breeding herd of registered Holstein cattle at Santa Anita Rancho is made up of individuals selected strictly upon their merits as producers, high individual quality, and production and proven transmitting power of their ancestors. PRINCE GELSCHE WALKER, whose combination of breeding, individuality, and the production of his daughters stamp him as one of the greatest young sires of breed.

Females in the herd are making large official record as rapidly as they freshen, and the herd is being developed to become one of the largest groups of high producers in the West.

At present a few bull calves are offered for sale. These are straight, well-marked youngsters, bred right, and priced moderately.

BERKSHIRE HOGS The breding herd of registered Berkshires has been carefully selected and represents the blood lines that are in the very first rank of the breed. The herd is headed by KINTYRE LAIRD, first prize junior yearling and reserve senior champion boar at Panama-Pacific Exposition. He is an unusually good type, and comes from a family noted for uniformity and prize-winning quality.

A few boar pigs are offered at this time.



POLAND-CHINA HOGS In founding the herd of registered Poland-Chinas at Santa Anita Rancho, the choicest individuals of the most noted prize-winning families in the West were drawn upon and for uniformity, desirable size and quality the

At the head of the herd is BANKER'S BOY, junior champion and reserve grand champion at P. P. I. E.

Anita M. Baldwin W. H. TAYLOR, Superintendent.

SILAGE AND BREEDING PAYS

[Written for Pacific Rural Press.]

Though some California dairymen are not partial to alfalfa silage, L. Kaiser of Biggs found that his cows preferred it to sweet corn, Egyptian corn or Egyptian wheat silage last winter.

Mr. Kaiser was short of silage crops last year, so filled his stave silo with all of the above crops, cutting about 40 tons of Egyptian corn first, followed by alfalfa, sweet corn, and Egyptian wheat. While the cattle seemed to relish all of the silage they cleaned up the alfalfa best.

His one year's experience has made him a great advocate of the silo, as it increased the average production of each cow in his herd five to 10 pounds although he started feeding the silage in extremely bad weather just after they had been taken off of alfalfa pasture and when they would ordinarily have dropped off in their milk flow.

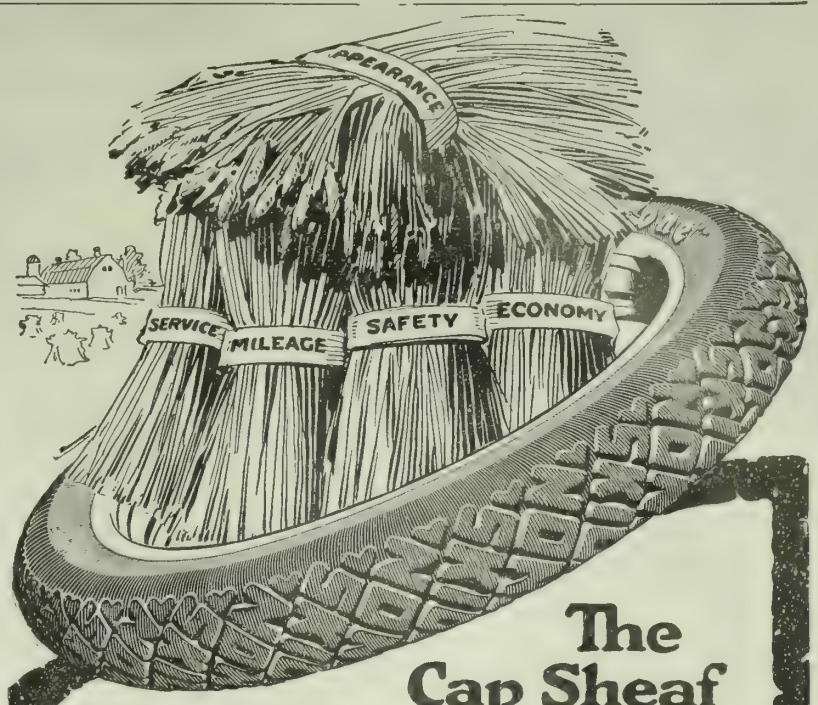
It has been Mr. Kaiser's custom in former years to feed concentrates during the winter months in connection with alfalfa hay in order to maintain the milk flow; but it is now his belief that the silage is equally efficient.

A purebred Holstein bull, a grandson of Aralia De Kol, is being used on his grade herd. As an evidence that the grade dairyman can well afford to buy high class bulls Mr. Kaiser points to his average production per cow of 317 pounds of fat last year with a herd of 80 cows. Of this lot 36 were heifers with their first calves from the better bred bull; and according to Mr. Kaiser, "those were the ones that kept the average so high."

DRYING SWEET POTATOES FOR HOGS.

[Written for Pacific Rural Press.]

Cull sweet potatoes have been utilized as a hog feed by farmers in large sweet potato growing districts for several years; and experience has shown that at $3.50 a wagon load they are an economical feed.



L. D. Collins of Denair, Stanislaus county, has fed sweet potatoes for the last couple of years to his purebred Duroc herd; but like all feeders of them found it impossible to keep them for any length of time after digging.

Last fall he experimented in drying them, in order to have a continuous supply during the entire year to feed with barley. He secured a regular root shredder, running them through that first and then laying them on fruit trays. In hot or windy weather they dry quickly and can then be stored in sacks.

The fruit trays were not altogether satisfactory as they retain moisture; and that tends to rot the potatoes unless the trays are turned. To overcome this Mr. Collins will stretch wire screen on a frame this year, allowing the air free circulation all around.

The loss in weight in drying is about 60 per cent, depending somewhat on the length of time the potato has been dug. In Mr. Collins' experience in feeding fresh potatoes he has found that his hogs will consume three times as much weight of fresh sweets as they will barley, and do better on them. As the loss from evaporation is not quite two-thirds he believes that a ton of the dried potatoes is worth as much as a ton of barley, and their cost is much less. In feeding them dry he uses one part potato and one part barley.

A. Giovanetti auctioned his 100 Durham, Jersey, and Holstein cows June 16.

For Water Deep Under The Ground

Jackson Deep Well Turbine Pumps give continuous and efficient service. They do not get out of order as they have no valves or plunger rods. Very little care or attention needed as they are oiled from the surface. Are much lower in cost than other types of deep well pumps when the expense of dug pits, cribbing and timbering is reckoned. They raise water from the very bottom of the well, thus eliminating heavy vacuums and delivering all the water the well yields. They develop slow wells and increase their flow.

Like all Jackson Made Pumps These Deep Well Turbine Pumps Are the Very Best Pumps Made for the Purpose—They are Dividend Earners, Not Expense Makers

Whatever your water problems may be our Expert Pumping Engineers will help you out free of charge—write

FIGURES GIVEN ARE INDEPENDENT AND RELIABLE

Pacific Rural Press Market Report

PRICES QUOTED AS PAID TO PRODUCERS

San Francisco, June 21, 1916.

WHEAT.

Little new crop wheat has appeared yet, but some Sonora arrived last week, and sales were made around $1.70 California club is nominal, while northern grain is coming in a little more freely, and has receded from the recent advance, with further declines expected.

Northern Club ....$1.70 @1.72½
Calif Club ctl..... Nominal
Northern Bluestem 1.82½@1.85
Northern Red .... 1.80 @1.90

BARLEY.

Trading in futures was quite active for a few days, but is now quiet again, though there is a fairly firm feeling. On the spot choice bright feed is a little firmer, and moves well while shipping is steady at the recent decline, being a little quiet owing to lack of transportation facilities. Considerable Eastern demand is reported.

Shipping, ctl. ....$1.35 @1.37½
Choice Feed, ctl. .. 1.27½@1.32½

OATS.

A few offerings of new red oats have appeared and sales have been made for stock to arrive at the old range. While there is no very urgent demand, the market is well sustained.

Red Feed .....$1.40@1.42½
White ..... 1.50@1.60

CORN.

Eastern yellow has been offered rather sparingly here of late, and as a result the price has advanced a little. Other lines are unchanged, all feed varieties finding a good country consuming demand, while comparatively little is handled locally.

Eastern Yellow, ctl.. $1.85@1.87½
Milo Maize ..... 1.40@1.45
Egyptian ..... 1.45@1.50

BEANS.

Beans retain all their recent firmness, and the advance continues on the leading lines: whites and limas. Both large and small whites are getting rather hard to find in round lots, and holders are taking a very firm view of the market, while the demand in some quarters is quite urgent. Limas continue to move off rapidly, and with prospects of a good cleanup values continue on the upgrade. While no further advance is noted on other varieties, there is a firm feeling in the whole list, with stocks moving off steadily and further advances expected. The new acreage is large, but cannot affect the market for several months.

(On wharf, San Francisco.)

Red Kidney ..... 6.50@6.75
Mexican Reds ..... 4.90@5.25
Tepary Beans ..... 4.00@4.50

HAY.

Hardly any old hay is arriving now, requirements being met with new stock, which is arriving quite freely. New red oat hay is not yet arriving in any large quantity, and most offerings are of No. 1 and medium grades, all fancy hay being very scarce. Mixed barley and oat hay is plentiful, and finds considerable sale. There is considerable export business, but local buying is rather slow, as the trade is looking for some decline in values. The only recent drop has been on tame oat hay, while alfalfa has been in light supply and is higher.

No. 1 Wheat .....$12.00@13.50
No. 2 ..... 9.00@11.50
Tame Oats ..... 11.50@14.00

Rolled Barley ..... 28.00@29.00
Tankage 45.00
Rolled Oats ..... 29.00@30.00

VEGETABLES.

General supplies are arriving in a little better shape this week, though on the whole prices are fairly firm. Cucumbers are now arriving from several sources, and lugs from northern California sell around $1. Summer squash also is arriving freely in large packages, and is easier, while peppers and eggplant are getting down to the usual summer level. Rhubarb is firm with the crop about over, and asparagus is cleaning up well. Peas are easier, while beans are steady, with a good demand. Tomato prices hold fairly steady, though supplies are increasing. Arrivals of green corn have increased materially, causing much lower prices, and okra is much lower.

Cucumbers, lugs $1.00
String Beans, lb ..... 4 @ 7 c
Summer Squash, lugs, 1.00@1.25
Peppers, bell, lb. .... 10 @15 c
Rhubarb, box, bay ....90 @1.00

Peas, lb. ..... 3 @ 4 c
Tomatoes, crate .....60 @90 c
Green Corn, sack, ...2.50@3.50
Okra, lb. ..... 5 @ 7 c

POTATOES AND ONIONS.

New potatoes are now coming in from several sources, but the supply is limited as compared with other years, and high prices still rule. Onions also are extremely firm, an Eastern demand having brought a sharp advance this week. The garlic crop is turning out unusually heavy, and values are rather easy.

New Potatoes, ctl. .....$1.75@2.25
Oregon Burbanks ..... 1.90@2.10
Onions, red ..... 2.60@2.75
Yellow, ... 2.35@3.50
Australian 2.50
Garlic, new crop, per lb... 6@7c

POULTRY.

The egg producers are now shipping in their young roosters, with the result that the market has its usual summer glut of young stock. Broilers and fryers are both lower. Hens are fairly steady, but prices are nothing extra, and Belgian hares are lower in sympathy with young chickens.

Broilers, 18 lbs. to doz. and less, lb. .....20@21c

Eggs	24	24	23	22½	25	25

DECIDUOUS FRUITS.

All kinds of berries are coming in freely, including a good deal of trashy stock, and easier prices prevail on strawberries, raspberries, logans and currants, with little stock that will bring the top quotations. Green apples are arriving in considerable quantity, but cold storage stock is still in the market. A few pears have appeared, but are not yet much of a feature. Cherries as a rule are lower, though the crop is about over and offerings are decreasing. Good apricots are very firm, though there is considerable poor stock offered which brings irregular prices. Peaches are in fairly good supply at lower prices, and figs have dropped sharply. Clyman plums are lower, but tragedies are still quite firm. Larger offerings of cantaloupes have met a much heavier demand, preventing much recession of prices; and watermelons at lower figures have found a fair call for the last few days.

Currants, chest .....$3.50@5.00
Loganberries, chest .... 1.50@3.00
Gooseberries, lb ..... 3@6 c

Grapes, Thompson, crate 1.25@1.75

DRIED FRUITS.

There is no sign of easiness in the dried fruit market, and in fact the trade seems more disposed to meet the prices that are being asked for new crop fruit, though buying is naturally on a very conservative scale, especially on such fruits as apricots, a car of which ties up too much money to be purchased off-hand. Packers, however, are paying as high as 13½c. for choice goods, and admit that this price is justified, in view of the prices paid by canners and shippers, who are likely to get the bulk of the crop. Prunes are very firm, and the trade is taking hold in a little better shape, as there is no indication that growers will recede from their position, Eastern buyers still show some reluctance, but there is more activity in covering early requirements. The local trade is taking hold of new crop peaches with confidence, conceding that the growers' organization has the situation well under control. There is a general expectation that higher prices will rule on raisins.

Apples, old crop .....5½@6 c

Special Deciduous Market Report.

By J. L. Nagle.

Sacramento June 19, 1916.

An unprecedented high market continues to remain firm on all varieties except peaches, which have slumped because sizes have been up to date unusually small. The fruit seems to have ripened without sizing.

Bartlett pears are moving in small lots, though an effort is being made by all shippers to hold back the movement of pears until the middle of this week, in order to prevent the shipment of immature fruit to the Eastern markets, the arrival of which usually has a depressing effect upon the demand.

Pears from practically all districts, with the possible excepton of Placerville and Colfax, are sizing up at the same time; and this would indicate that the movement will be heavy in ten days and will be very short lived. Considerable difficulty will be experienced in securing Bartletts for desirable assortments within a month.

Apricot shipments are practically cleaned up, after having had a wonderful season, the best in the history of the State; and indications are that the balance of the fruit will sell equally well, though Eastern competition may depress the market at times during the season.

The first shipment of Thompson Seedless grapes will move from Coachella Valley Wednesday; and Malagas will be ready for shipment the last of the week.

Prices for the week:

New York: Royal cots averaged, $1.50; Clyman Plums $1.12; Formosa, $1.62; Climax $1.58; Beauty $1.55; Burbank $1.28; Tragedy $1.76; Royal Anne Cherries $2.10; Republican $2.25; Bing, $2.45; Alexander Peaches, 86c.; Triumph, 82c.; Wilder Pears H. B. $1.92; Comet, $2.13.

Boston: Clyman Plums, $1; Climax, $1.65; Beauty, $1.75; Formosa, $1.75; Burbank, $1.12; Red June, $1.47; Tragedy, $1.95; Royal Cots, $1.25. Alexander Peaches, $1; Wilder Pears H. B. $1.50.

Chicago: Climax Plums, $1.48; Tragedy, $2; Abundance $1.20; Formosa, $1.55 Clyman, 98 c.; Burbank, $1.38; Beauty, $1.65; Royal Cots, $1.46; Alexander Peaches 85c.; Sugar Pears 1.27.

[Total shipments to June 2, 1228 carloads as against 660 to same date last year, This is 440¼ carloads since last report.]

Special Livestock Market Report.

Cattle are down a little in San Francisco. The demand is lightest in June of any month of the year since people are off on vacations, schools closed, and grass stock can go cheaper anyway. Still an oversupply of stock. Portland slow except for well-finished cattle.

Hog receipts are a third less than for two weeks but enough.

Sheep have been coming about as last week, but not enough, so prices are advanced on wethers.

Wool still strong but no change in prices. Cloverdale sales on today. Mendocino sales last week made at 26½c for 6 mos. and 31½ for year staple.

By E. J. Wickson
$1.50 Postpaid, Pacific Rural Press

CITRUS FRUITS.

Navels were out of the eastern auctions June 19. Citrus markets are firm and higher on the seaboard; slightly easier in central west. Central Calif. is about through shipping oranges for the season. In New York, June 19, Valencias averaged $3 to $4.65; lemons $3.80 to $4.30; grapefruit $2.50 to $4.25. At Boston, Valencias $3.45 to $3.90; lemons, $3.50 to $4.40. At St. Louis four cars sold and market easier, averaging $2.75 to $3.60 for Valencias and $3.15 for lemons. Locally there is not much movement.

HONEY.

There is still a very fair demand locally, as supplies have not accumulated much, but the situation is easing off a little as the new crop continues to come in, and there has been some recession in prices for comb honey. Dark extracted is hard to move, but the better grades are fairly firm.

NUTS.

The Almond Growers' Exchange is getting in reports on the crop outlook, which are still incomplete. The old acreage, however, appears to be short, the crop being between 50 and 75 per cent, but there is considerable new acreage this year, which is expected to nearly make up for the shortage. The Exchange is fully sold out on orders subject to approval of prices.

HORSES.

Some fairly interesting sales have taken place in San Francisco this week, including a small lot of high-bred saddle stock and a large lot fresh from the country, which consisted mainly of medium heavy drafters and wagon horses, among which were a good proportion of attractive animals. These offerings have brought out a little more show of interest than has been noted of late, but on the whole buyers have been conservative, and it is not easy to obtain satisfactory prices. Local buyers still have difficulty finding stock in the country at attractive prices, as all available stock is being picked up for military use.

(Approximate values in San Francisco, based on auction sales.)

Drafters, 1700 lbs and up	$ 250
Drafters, 1550 to 1650	150@200
Chunks, 1350 to 1500 lbs	150@175
Wagon horses, 1050 to 1350 lbs	110@150

Publisher's Department

This issue completes the ninety-first volume of the Pacific Rural Press and an alphabetical index of the contents will be found on another page. The publication of this index and a rush of advertising orders just before press time crowded out some interesting articles scheduled to appear, but we hope to make amends to our readers in future issues. The advertisements will be found of much interest, however. Read them.

179 new names were added to our subscription list during the past week.

Forty-one Years of Telephone Progress

The faint musical sound of a plucked spring was electrically carried from one room to another and recognized on June 2, 1875. That sound was the birth-cry of the telephone.

The original instrument—the very first telephone in the world—is shown in the picture above.

From this now-historic instrument has been developed an art of profound importance in the world's civilization.

At this anniversary time, the Bell System looks back on forty-one years of scientific achievement and economic progress, and gives this account of its stewardship:

It has provided a system of communication adequate to public needs and sufficiently in advance of existing conditions to meet all private demands or national emergencies.

It has made the telephone the most economical servant of the people for social and commercial intercourse.

It has organized an operating staff loyal to public interests and ideals; and by its policy of service it has won the appreciation and good will of the people.

With these things in mind, the Bell System looks forward with confidence to a future of greater opportunity and greater achievement.

MRS. BEST'S LETTER.

My dear Friends: The old saying—there is nothing new under the sun—certainly does not apply to handbags, for each season sees something different.

I saw pretty silk bags this week in white, rose and black trimmed with rows of ruffles of the same material as the bag. In the same window were black leather bags with wide bands of white leather trimming and the same style was developed in rose and white leather. There are also plain white silk bags in simple designs.

The fad for wrist watches is still popular—so much so in fact that jewelers are making over the old style chatelaines watch into the bracelet watch. You can have this done for $5.00. That includes the bracelet and the labor. The effect is prettier if your watch is not too large, but the very small Swiss watch is not as popular as it was, for it is not so dependable for time-keeping.

You can buy the leather bracelets to hold a watch from 75c up—they are very satisfactory, but not as dressy as the gold bracelet. And still a newer idea is the crocheted wrist-watch bracelet. This is made of fine thread with a rosette to hold the watch and the two ends snap together.

Another leather novelty seen lately was a leather bracelet with a purse in place of the watch. This was only 25 cents.

One of the big drug stores has a window display of what they called Dressing Aprons. These are made of cretonne or linen or other heavy material and have pockets applied to hold the various toilet articles you want when you travel. By fastening this apron around the waist, you have all your toilet articles at hand, without requiring a place to lay them down. An added advantage is that the apron rolls into a compact bundle and does away with the searching for misplaced articles. These range in price from 75c up, but they could easily be made at home.

There has been an apron made of oil cloth, similar to this in design, on the market for some time. It is called a bath apron and is for use in handling and bathing a small baby. Ostrich feather fans in the size our grandmothers carried are among the new conceits in one store and at the same counter there were broad white suede leather belts fastened with three small buckles that would be awfully pretty on a trim waist.

Rosabella Best.

SPINACH.

The best way to cook spinach for preserving its refreshing and laxative qualities is not to add water, for after thorough washing, the leaves retain enough moisture to steam it. Put it dry in a saucepan over the fire; in ten minutes, it will be ready to drain and chop. Afterwards return it to the pan and season with 2 tablespoons butter and a teaspoon of salt. Let simmer ten minutes before serving.

NEW RECIPE FOR STUFFED EGGS.

Cut hard-boiled eggs in halves, lengthwise. Remove yolks and put whites aside in pairs. Mash yolks and add half the amount of deviled ham and enough butter to make of consistency to shape. Make in balls size of original yolks and refill whites. Form remainder of mixture into a nest. Arrange eggs in the nest and pour over one cup white sauce. Sprinkle with bread crumbs and bake until crumbs are brown.

HOUSEHOLD EFFICIENCY.

Scientific management for the household is to be taught at the summer session of the University of California this year.

Housewives are to be trained in time-saving arrangement and labor-saving devices to render them more efficient in their work.

In addition, there will be instruction in the knowledge of fabrics, such as the detection of the loading of silk with tin to give it a luster, or the distinguishing of the presence of cotton in linen fabrics or any other frauds in textile manufacturing.

To make soup more nutritious, mash the corn, beans or similar vegetables that would otherwise have been wasted, put through a sieve and add the liquid. Pleasing and piquant flavors may thus be obtained.

DO YOU KNOW THAT

Sags in roof-gutters may act as mosquito breeding places?

America's most valuable crop is babies?

The typhoid rate measures accurately community intelligence?

Whooping-cough annually kills over 10,000 Americans?

Bad housing produces bad health?

Plague is a disease of rodents?

Malaria is spread by a special mosquito?

House screening is a good disease preventive?

Fingers, flies and food spread typhoid fever?

The United States Public Health Service believes that the common towel spreads trachoma, a disease of the eyes?

Children from sanitary homes advance more rapidly in school than those from dirty premises?—United States Public Health Service.

MOTHS IN FEATHERS.

Moths will not get into feather pillows, feather beds, etc., unless the ticks are ripped or torn, but should they infest feathers, the best remedy is to boil the feathers for half an hour or more, then thoroughly dry them. Soaking the pillows in gasoline is equally effective.

TO CLEAN CLOCKS.

To clean a clock, saturate a cloth or pad of cotton with kerosene oil and lay it inside on a small dish that will keep the woodwork from being saturated. As it evaporates the fumes will lubricate the works.

ODOR DESTROYERS.

One of the large stores of the city is showing a perfumed plaque to be hung in the house. It is supposed to destroy all bad odors and as the perfume becomes faint, more can be applied.

JELLIED PRUNES.

Two tablespoons granulated gelatine, ½ lb. prunes, 2½ cups cold water, 1 cup sugar, ¼ cup lemon juice. Pick over, wash and soak prunes for several hours and cook until soft. Remove prunes, stone and cut into quarters. To the water in which the prunes were soaked add enough hot water to make 2½ cups and to it add the gelatine that has previously been soaked in ½ cup cold water. Add sugar and lemon juice. Set away to cool and when it begins to stiffen add the prunes. Stir twice while it is hardening to prevent the prunes from settling to the bottom.

WHY, OF COURSE.

The teacher was hearing the class in history recite. "Now, Dorothy," she said, "who followed Edward VI?"

"Queen Mary," replied Dorothy.

"Very good. And who followed Mary?"

The class was silent, but small Elsie waved her hand wildly.

"Well, Elsie, you may tell us who followed Mary."

"Her little lamb."

IT SOUNDED THAT WAY.

The cat settled herself luxuriously in front of the kitchen range and began to pur. Little Dolly, who was strange to the ways of cats, regarded her with horror.

"Oh, gran'ma, gran'ma!" she cried. "Come here quick. The cat's begun to boil."

TO STIFFEN SILK.

To renovate a piece of silk that has lost its stiffness, sponge the surface with a weak solution of gum arabic. To prevent it becoming glossy, iron while damp on the wrong side.

One night when Marion was saying her prayers she said, "Bless daddy and mother and Margaret, and who else?" Her mother said, "That's all, I guess." The next night she said, "Bless daddy, mamma, Margaret, and everybody. There! I guess that will get Johnny Smith in." He's a little boy who attends the same kindergarten.

A minister came to the Episcopal church at Williamsport, Pa., to speak. "Do you wish to wear a surplice?" asked the rector. "Surplice!" cried the visitor. "Surplice! I am a Methodist. What do I know about surplices? All I know about is a deficit!"—New York Evening Post.

FIORAL DEPARTMENT.

[By Geo. N. Tyler.]

Growing Carnations.—Out of four entries of carnations at the Marin county flower festival held at San Rafael May 19-21, I won three first prizes and one second, and have received a query asking me to give my methods of growing.

My houses are twenty-four feet wide, have continuous ventilation at the ridge, on two sides, and one end low down. These ventilators are screened with fine galvanized fly wire to keep out moths, grasshoppers, etc. I take my cuttings in January and February; these are taken from plants that show strong growth and free flowering traits and are absolutely free from disease or fungi of any kind. The cuttings are never allowed to wilt, and are started in clear sand that is changed after every batch of cuttings. When first put in, they are thoroughly watered and sprayed for the first week. After that the shading is removed, and spraying continued once or twice a day for another week or two. They root in four to five weeks—the early struck cuttings are potted off in 2¼-inch pots, and the late ones planted out in the beds outside, which have been enriched with manure, bone meal, and dressed with hydrated lime.

I plant out in March direct from the propagating bench. These are watered, and encouraged to grow from the start, and are never allowed to receive a check, all summer. When they are four inches high they are headed by pulling the center out. This causes them to branch low down. I continue heading the resulting branches until August, never allowing them to make a flower shoot. In August I empty my benches in the houses of all the old plants and soil; let the benches dry; and in the meantime fumigate thoroughly with sulphur; also cover the benches and sides with whitewash in which some sulphur has been mixed. This thorough cleaning and fumigating clears the house of all fungus diseases, red spider, etc., and makes it sweet and clean for the new soil and plants.

During the summer I make a compost of four parts fibrous loam, one part rotted manure, and one part sand. To every wheelbarrow load of this compost, I add a four-inch pot full of bone meal; and to every three loads a five-inch pot full of hydrated lime. This is all thoroughly mixed together, being turned over three times. My benches are six inches deep and the bottoms are six-inch redwood boards, with half-inch spaces to allow drainage. When I fill the house with new soil, I put about one inch of straw manure on the bottom to keep the soil from going through the cracks, first wetting it down thoroughly after it is in the benches. I fill the benches full to the top with the compost and level them off with a board; this soil is dry, and is tramped to make it as firm as possible. After it is tramped thoroughly, I fill in any low places, and then give a thorough watering, when it is ready for planting the field grown stock.

Hog and Stock Fencing at Cut Prices

HOG FENCING, 45c ROD
—Heavy woven wire hog fencing with graduated mesh and barbed wire at top and bottom. Number 9 and 12 gauge wire used, fully galvanized. This price in 20 rod rolls.

IDA AND THE SPIDER.

By William Ware Locke.

There once was a girl they called Ida
Who hated the sight of a spider;
But one summer day, when she was at play,
One came and sat right down beside her.

But she did not jump up and scream,
For she had been dreaming a dream,
A prince in disguise had seen her brown eyes
And offered to make her a queen.

The spider perhaps was enchanted.
A queen should be always undaunted.
She made up her mind to be very kind
And give to him just what he wanted.

Oh, what could she do for his sake,
The spell of enchantment to break!
Without any fear, she let him draw near
And gave him a piece of her cake.

The spider remained still a spider,
To be a proud queen was denied her;
At first she was sad, but then she was glad
To be just a girl they called Ida.

BREAKING IT GENTLY.

A small boy went to his mother and asked her to lend him a pencil.

"But," said the mother, "I left a pen and ink for you to do your lessons with on the nursery table. Why don't you use that instead of a pencil?"

Clarence hesitated for a moment.

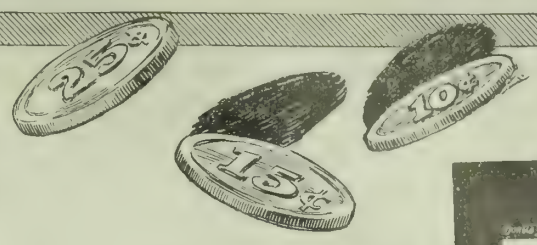
"Don't you think, mother," he said at length, "that the "Times" is a very useful paper?"

"Of course I do," answered mother; "but what"—

"Well, you see," the little lad explained, "I want a pencil to write to the editor and ask him what'll take ink stains out of a carpet."—Exchange.

MORE GROCERIES for LESS MONEY

This Big Book is FREE



We issue a new money saving grocery catalog every 90 days. This one is just off the press. It is brimful of the biggest grocery bargains you ever heard of. For example—

25 Lbs. Pure Cane SUGAR $1.39

Write for this big book and learn how you can secure your sugar at from 3 to 4 cents less than the wholesale price. Every item in this catalog means a saving. Many women who buy their groceries from us dress themselves with what they save. You can do the same. Write today for this free book. A postal will do. We are the largest distributors of America's Best Goods on the Pacific Coast.

Wood-Crane Company
141-149 Main St., San Francisco, Cal.

You Can't Find their Equal at this Price!

Good, sturdy hosiery for every member of the family at 10, 15 and 25 cents. Our location and manufacturing economies enable us to sell Durham Hosiery for a price that makes home sock knitting expensive.

DURABLE DURHAM HOSIERY
FOR MEN, WOMEN AND CHILDREN

is knit strongest where the greatest wear comes. Heels, soles and toes are reinforced, and tops can't pull from the bottoms. Famous Durham dyes give permanent colors.

(California)

Poultry for Profit---Producing & Marketing

[Written for Pacific Rural Press by Susan Swaysgood, Pomona.]

Forcing; Washing Eggs; Skim Milk Mash.—I notice your remarks in "California Poultry Practice" on the bad effects, on the offspring, of hens that are forced to the limit for laying by feeding certain rations; would forcing winter eggs by turning on electric lights at 3 or 4 a. m. have the same effect? Am selling my eggs in cartons. What is the best way to clean them? Am paying five cents a gallon for skim milk, using ten gallons a day. Is the price too high? Would you feed laying hens mash mixed with milk through the molt beginning now? Is it best to feed the same to four-month-old pullets just put in laying houses?—E. F. B., Hollywood.

[The forcing of eggs by electric lights would not be harmful to the offspring provided the hens are not fed too much mash and meat. It is the internal forcing that does the mischief; feed the hens grain in plenty of litter and it will never harm anything if they have 24 hours in the day. Wash eggs in warm water with sal soda dissolved in proportion to one tablespoonful to a gallon of water; for grass or any green stains rub vinegar and soda on spots, then wash; drain in wire trays in sun for a few minutes. Five cents a gallon is the usual price for skim milk and is cheaper than beef scrap. Milk enough to moisten the mash will bring eggs and keep hens in good condition, but molting is quite a time away yet. Don't feed pullets moist mash; feed dry mash, and give them milk to drink.]

Cheesy Eyes.—My young chickens have swollen eyes with cheesy matter; I sometimes pick out a foxtail and wonder if that is the cause, or could it be the lint from the oats? They are otherwise healthy.—R. F. H., Richgrove.

[The cheesy growth is canker. Usually this is caused by colds, but is sometimes caused by irritating substances, and no doubt this is the case with your chickens, if they run at large among wild oats and foxtail. Squeeze the substance out and wash the place with a strong solution of peroxide of hydrogen.]

Turks Mope and Die.—My turkeys two weeks old with a chicken hen are dying. They mope around and eat little, until they get weak and die. I feed cornbread mixed with water and baking powder; sometimes put in a few eggs and a little oatmeal, give them grit and charcoal. They are free from lice.—Mrs. E. M. B.

[Your turkeys lack green feed and animal food of some kind; if you have no milk put some beef scrap in your bread and feed hard-boiled eggs and onion tops chopped raw; a few heads of lettuce would set them all right and some meat of some kind.]

Hens in Apple Orchard.—My hens have the run of an apple orchard. Will the apples stop them from laying?

[Not if they are fed a full ration. What apples they eat of their own free will after being fed otherwise will not hurt them at all, but if you were to shut them up in a yard and feed the apples to them in place of something else, it would stop egg production. This enquirer is a lady who lives in Guerneville, who wrote me enclosing a stamp, inquiring about eggs of White Orpingtons. I was very sick at the time and the letter got mislaid. All I forgot about that letter was the most important item for me to have in order to answer, and that was her name. I beg her pardon, hoping she sees this and writes again.]

WEDDING PRESENT.

Wedding Present.—Because she knew how to use it, a wedding present which came to Mrs. Albert Messenger, a recent graduate of the University of California, is contributing largely to her family income. The present was a case of eggs, and the brood of chickens which Mrs. Messenger raised therefrom is winning all sorts of prizes in the Imperial Valley.

Mrs. Messenger was formerly Miss Margaret Slater, a popular member of a well-known Berkeley family. At the University of California she specialized in agriculture, and after her graduation she was married to Albert Messenger, a rancher of Brawley, Cal. One of her wedding presents was the case of eggs. This she took with her to her husband's ranch and promptly put into execution the poultry lore she had gleaned at the university.

According to letters received here by her friends, the results in a year have exceeded even her own expectation. She has marketed a large part of her product and is still reaping handsome profits by the sale of poultry produce.

Poultry Breeders' Directory.

Rates in this directory, 3c per word each issue; or if carried weekly for one year, 2½c per word.

MODEL POULTRY FARM—White Leghorn Specialists. We are now booking orders for Hatching Eggs. Baby Chicks and 10 weeks old pullets for delivery after January 1st, 1916. Prices on application. Twelve years of breeding have made our Leghorns the desired **Heavy Winter Layers.** W. C. Smith, Prop., Corning, Cal.

NO BABY CHICKS DURING JULY.—Fall hatching starts in August. Get in touch with us immediately, and assure chicks when you want them. Ask for special "Fall Chick" circular. White and Brown Leghorns, Barred Rocks, R. I. Reds, and Black Minorcas. Campbell Poultry Ranch, Campbell, Cal.

CLOSING OUT—FOR SALE CHEAP—3 Electric Incubators, 576 egg capacity each. 2 Electric Incubators, 144 egg capacity each. 16 Electric Brooders, 150 chick capacity each. Complete with circuit breakers, thermostats, connecting sockets, etc. Address T. R. Jacobs, P. O. Box 395, San Mateo, Cal.

BARRED PLYMOUTH ROCKS—"The kind that Win and Lay." Eggs for batching and choice stock for sale. Have bred Barred Rocks for over nineteen years exclusively. Write for catalog showing winnings at California's leading shows. Chas. H. Vodden, Box 396, Los Gatos, Cal.

New Mid-Year Model
257 CARS IN ONE

Mitchell SIX

$1325 F. O. B. Racine
26 Extra Features

700 Improvements—Cost Cut 50%

by John W. Bate, the Efficiency Engineer

This Mid-Year Mitchell shows the final result of what efficiency means in car building.

It is the 17th Mitchell model built by John W. Bate, each better than the one before it. It is offered by a concern which for 82 years has stood for the best that was possible.

$5,000,000 Invested

The Mitchell motor car factory now represents an investment of $5,000,000. It was built by John W. Bate, the efficiency expert, to build Mitchell cars economically.

It has thousands of up-to-date, time-saving machines. By splendid methods it has cut the cost on 10,000 operations. This New Mitchell is built here for just about half what it would have cost six years ago.

As a result, you get in this Mitchell by far the greatest car sold around this price. And you get 26 extras, nearly all of them features which even costly cars omit.

700 Parts Made Better

Mr. Bate and his staff have spent years and years in bringing this car to perfection. They have taken up part by part.

They have attained utter simplicity, wonderful lightness and matchless accessibility.

They have displaced castings by steel, much lighter and tougher. The latest Mitchell has 440 parts which are either drop forged or steel stamped.

They are using a wealth of Chrome-Vanadium steel, to get maximum strength and endurance. For safety's sake, all steering parts are made of Chrome-Vanadium. And for easy driving they are fitted with ball bearings.

Some 30-Year Records

The wondrous endurance attained in this car is shown by these mileage records.

One Mitchell car — built by John W. Bate—has run 218,734 miles. Six Mitchell cars have already averaged 164,372 miles each. That is more than 30 years of ordinary service.

Mr. Bate argues for lifetime cars. He says cars should last like watches. And the cars he has built have broken all records for endurance in the hands of owners

No Broken Springs

The Mitchell is the only car with Bate cantilever springs. They make this the easiest-riding car in the world. Not one of these springs in all their history has ever yet been broken.

Broken springs would come back to us, so we know this for a fact.

The Mitchell has a power tire pump. You don't pump the tires by hand. It has reversible headlights, a light in the tonneau, a locked compartment for valuables, an engine primer right in front of the driver. These are some of the features which other cars lack. There are 26 in all.

The Engineers' Choice

Famous engineers, when they buy cars for themselves, are choosing this Bate-built Mitchell. Your Mitchell dealer has a long list of them—men known the country over. That fact shows how the greatest experts regard this engineering marvel. And what they think of John W. Bate.

All the New Ideas

This Mid-Year Mitchell was completed after the New York Shows. It combines all the best ideas, in design and equipment, found in 257 show models.

You will see in this Mitchell more new ideas, more luxuries and beauties than any other car embodies.

When you buy a car to keep you want a car like this. So prove it out. If you don't know the nearest Mitchell dealer, ask us for his name.
